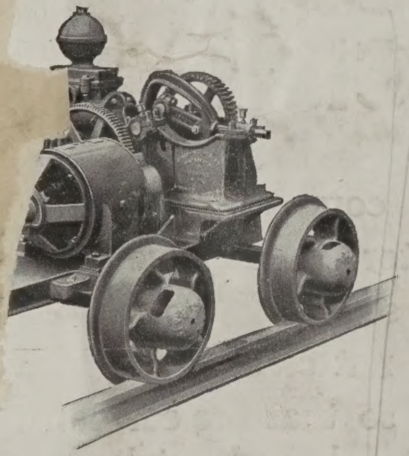
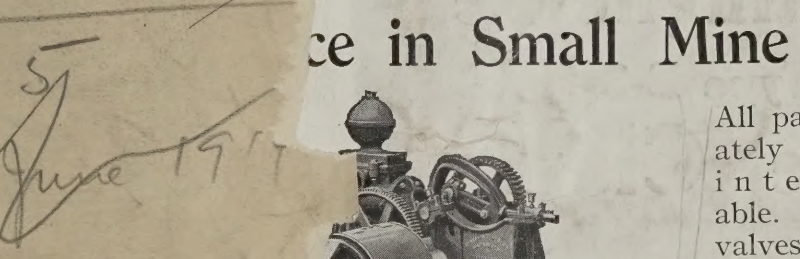
bears us
assertion.



All parts are accurately machined and interchangeable. Cylinder, valves and seat cast from acid resisting bronze. When mounted on a truck, as illustrated, may be taken anywhere in the mine with same ease as mine cars.

It's Ultimate Mine Tie Cost That Counts

The following will give you an idea of what one user thinks of Fairmont Steel Mine Ties. "In my judgment, the steel tie will take the place of the wood tie in a few years, and will be **cheaper** to the small vein operators, where it is necessary to shoot roof rock for height." This is part of just one of many letters we've received along a similar vein.



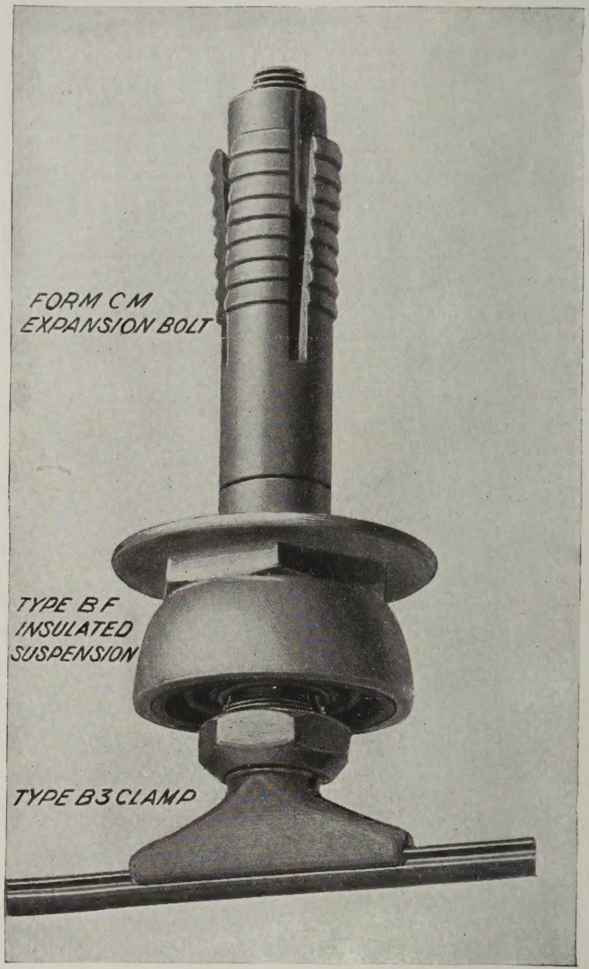
FAIRMONT STYLE "C" STEEL MINE TIE

Look at the mine tie situation seriously. The wooden tie when used once or twice is done for—while **steel ties** last **indefinitely**. Can't you see that it isn't a **low first cost** that counts, rather a low **ultimate** cost, that ought to influence your decision?

Write for the Bulletin now.

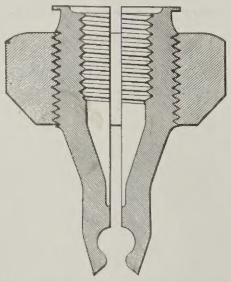
Fairmont Mining Ma
Fairmont

Here is a mine clamp that has only three parts, and that can be installed quickly because it is so simple.



Westinghouse
Type B-3
Mine Clamp

THE clamp complete, with nut loosened, is screwed on the insulator stud.—The wire is inserted in the lips of the clamp and slips freely into place.—Screwing down the nut clamps the wire and also clamps the stud, so that the ear can be placed in any direction and yet be tight on the stud.—Loosening the nut permits the wire being drawn through, without dropping out, for taking up slack.



Cross-section of B-3 Clamp for Fig. 8 Wire

Type B-3 clamp gives absolutely perfect clearance for the trolley wheel, and is as foolproof as a clamp can be. It is suitable for round, grooved or figure 8 wires.

Folder 4224 gives more particulars.

The New Advertising

By George W. Coleman

Ex-President Associated Advertising Clubs of America.

The Weekly Ad-Talk Page

A quiet revolution is going on in the advertising world. This is in accordance with the general trend of things everywhere. Marked changes are manifesting themselves today in every form of organized activity. The advertising men themselves are too close to their work to realize in full the significance of the rapid changes which have been taking place.

In the first place, a new spirit is permeating the whole business. The old motto, *Caveat emptor*, "Let the buyer beware," is fast becoming a relic of the past, and the new philosophy that the Golden Rule pays is being widely accepted. This new spirit is working itself out in countless ways, the effect of which is to put an entirely new face on advertising.

The trade-mark of modern advertising.

But in addition to the new spirit there is a new method also. It has been found that the rule-of-thumb measure of advertising values is an exceedingly wasteful and inefficient standard. Advertising is at last being subjected to the scientific method of study which has wrought such marvelous changes not only in the natural sciences but in many other realms of thought. Advertising is being submitted to laboratory tests—typographical, statistical, psychological and pragmatic. The result is a steady elimination of some of the extravagances and waste which heretofore have characterized altogether too much advertising matter.

It is a rather remarkable coincidence that with this new spirit and new method in advertising there should have come into existence at about the same time a new instrument for the accomplishment of the new ideals which lends itself most naturally to the new order of things. It is the Advertising Club movement that has taught advertising men the tremendous value that lies in co-operative endeavor, and through the perfection of the Advertising Club organization facilities are being afforded for the study and practice of advertising such as were entirely impossible in the days that are gone by.

This is the significance of this great convention at Baltimore at this time. It represents that new instrument for the advancement of American Civilization through industry and commerce—the Advertising Club—which in turn embodies within itself this new spirit and new method that is revolutionizing the advertising business.

This renaissance in the advertising world was first made apparent to the public mind through the widely heralded success of the great Boston convention of the Associated Advertising Clubs, two years ago, although the roots of the matter run back to the formation of the national association, nine years ago, and still further beyond that to the organization of isolated advertising clubs in different parts of the country, the first of which was formed in Chicago eighteen years ago and still flourishes—the well known Agate Club, composed largely of men interested in magazine advertising. This Baltimore convention marks the beginning of a new chapter in this remarkable movement. Our organization has been more highly perfected, our resources have been amplified, our ideals have been clarified, and we have been given a vision such as we have never had before of the possibilities that lie before us.

COAL AGE

Vol. 4 NEW YORK, JULY 5, 1913 No. 1

The Secret

By Berton Braley

Written expressly for Coal Age

The way to reach the man who toils
Amid the dingy workings,
Is not by stratagems and spoils
Or oily smiles and smirkings,
You give him model homes and such,
Or clubs in which to revel,
You still will find yourself "in Dutch,"
Unless you're on the level.

It isn't coddling that he likes,
Or lordly condescension,
Such methods will not stop his strikes
Or banish all contention.
You must be fair and square and just,
A man among your brothers,
Before old doubtings turn to trust
Or ancient hatred smothers.

Whatever motive yours may be,
In time he's sure to find it,
He looks through every deed to see
The spirit that's behind it,
And though he may misunderstand,
Repel, at first, and doubt you,
He'll warmly grasp the proffered hand
When he is sure about you.

The boys within the breaker shed,
The miners, deep below them,
Are slow of faith and hard of head,
You've simply got to show them,
And prove your varied aims and ends
Are *not* those of the devil—
For man and master can be friends—
If *both* are on the level.

A Hydro-Electric Plant to Supply Coal Mines

SYNOPSIS—A plant in Virginia which purposes to find a large market for hydro-electric power in West Virginia coal fields, though these are situated nowhere less than 45 miles from the central station and though some mines which are to be supplied are located 65 miles away.

⁂

The question of the ability of hydro-electric plants to transmit power several miles so as to compete with steam plants using waste fuel at the coal mines is being tried in southern West Virginia. The company expects to use a steam-power plant at times of low water or excessive load. Another power house on which reliance is placed, is that of the Roanoke Railway and Light Co., which is situated 116 miles from the coal fields by railroad. As this plant is operated by steam, it will be placed at a great disadvantage in competing with a plant at a mine receiving its coal direct from the mine tipple. Yet, as it is a standby plant, it will probably be but little used.

The Norfolk and Western R.R., which is about to electrify its lines through this same coal field is reported to be about to erect a steam-power house for its own use, at Bluestone, though the lines of this hydro-electric company will approximately parallel the railroad. The length of line to be so electrified is 30 miles but the actual trackage is in the neighborhood of 85 miles. Apparently, the railroad officials believe they can produce their own power more cheaply than they can buy it.*

Among recent hydro-electric developments which are worthy of special notice, is that of the Appalachian Power Co. This corporation was organized in May, 1911, to develop the water power of the New River, in Virginia, and to distribute it by electric transmission through southwestern Virginia and southern West Virginia.

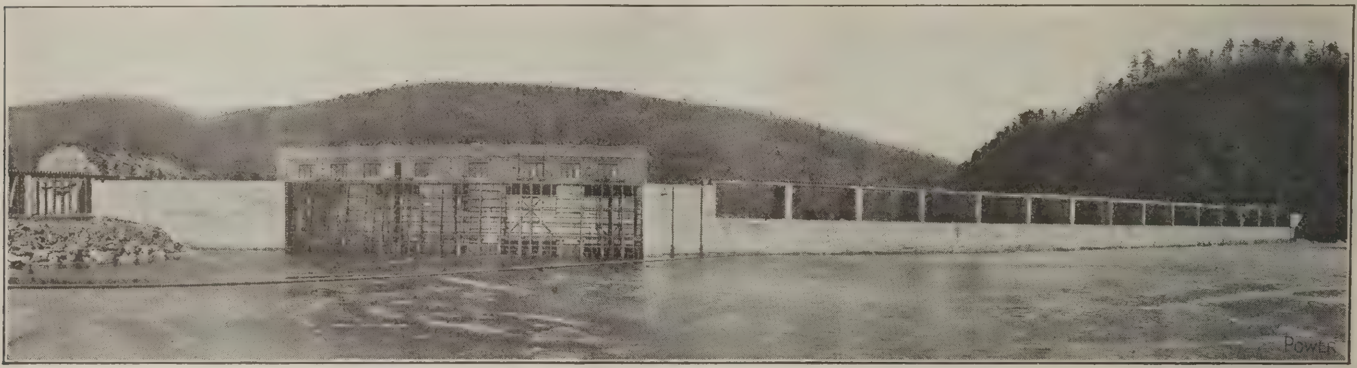

Fig. 1. View of No. 2 Plant and Spillway Dam from Above

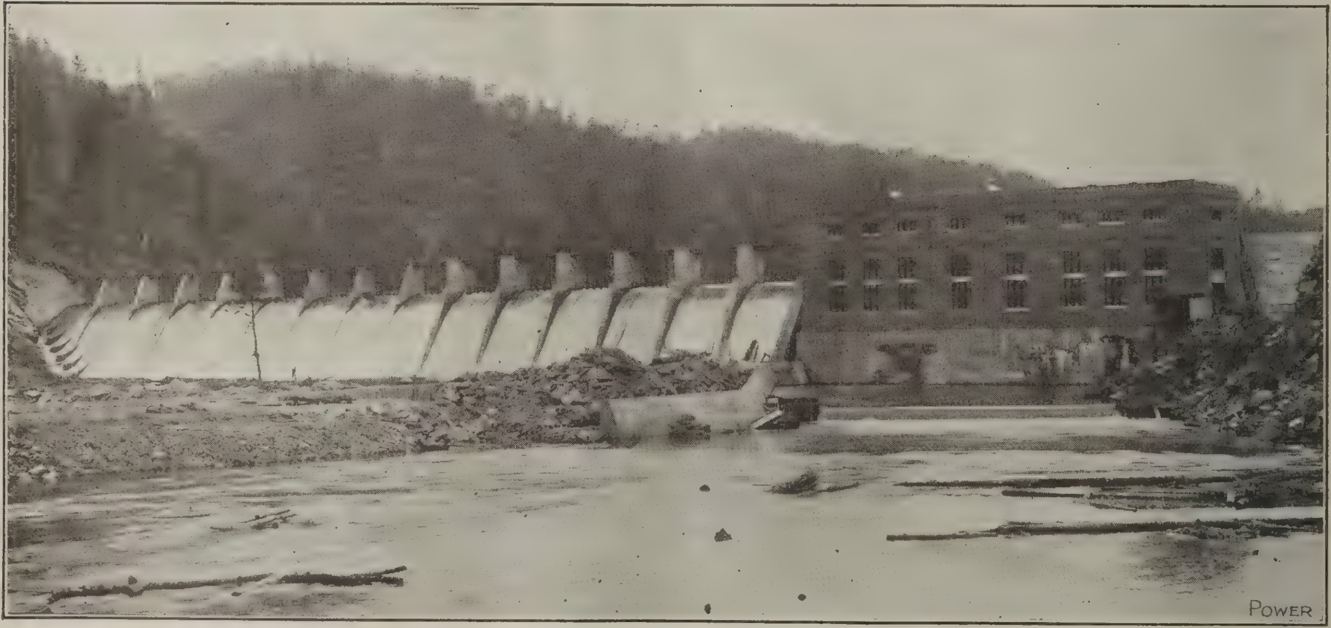

Fig. 2. No. 2 Power Plant and Spillway from Below

When completed, this development will consist of five dams and power houses to be known as Nos. 1, 2, 3, 4 and 5. They will all be built on the New River in Carroll and Pulaski Counties, Va. The aggregate water head will be 225 ft. and the total capacity of these plants will be 75,000 hp. Already plants Nos. 2 and 4, with a combined output of 29,000 hp., have been completed.

Plant No. 2 consists of a dam, the main spillway of which is 504 ft. and the low spillway 198 ft. long. The power house is built in one end of the dam, the overflow of the latter being approximately 50 ft. in height. The dam is built directly across the river. An auxiliary spillway above the power house has been constructed by cutting through a ridge. This discharges into a natural sluiceway back of the ridge; thus saving approximately 200 ft. of dam work. The dam is of concrete and the power house of brick and steel. There are five hand-operated and one motor-operated 6x30-ft. Tainter gates in the main spillway dam, and nine spans of flashboards. The low spillway has six spans of flashboards, which can be applied to a height of 8 ft. The total length of the spillway is 702 ft. There is also a sluice duct for passing drift wood at the end of the power house. The tailrace is 400 ft. long, 90 ft. wide and has an average depth of 12 ft. Approximately 11,000 cu.yd. of material were excavated.

---

*Note—The concluding remarks are quoted from an article by Warren O. Rogers on the "Appalachian Hydro-Electric Development," which appeared in "Power," Mar. 25, 1913.

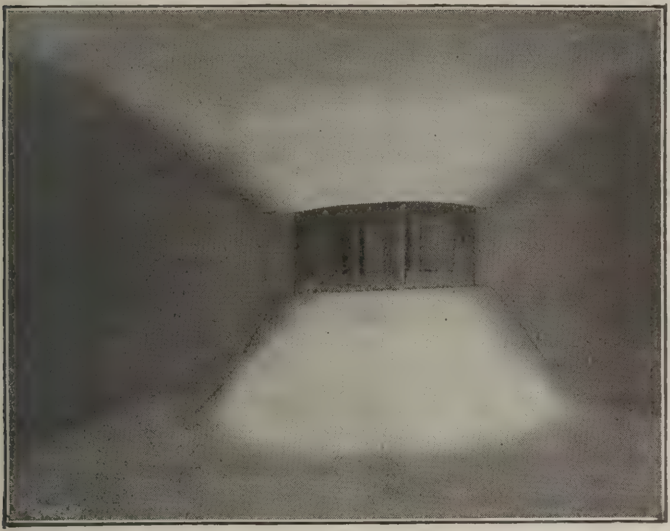

Fig. 3. Concrete Wheel Pit

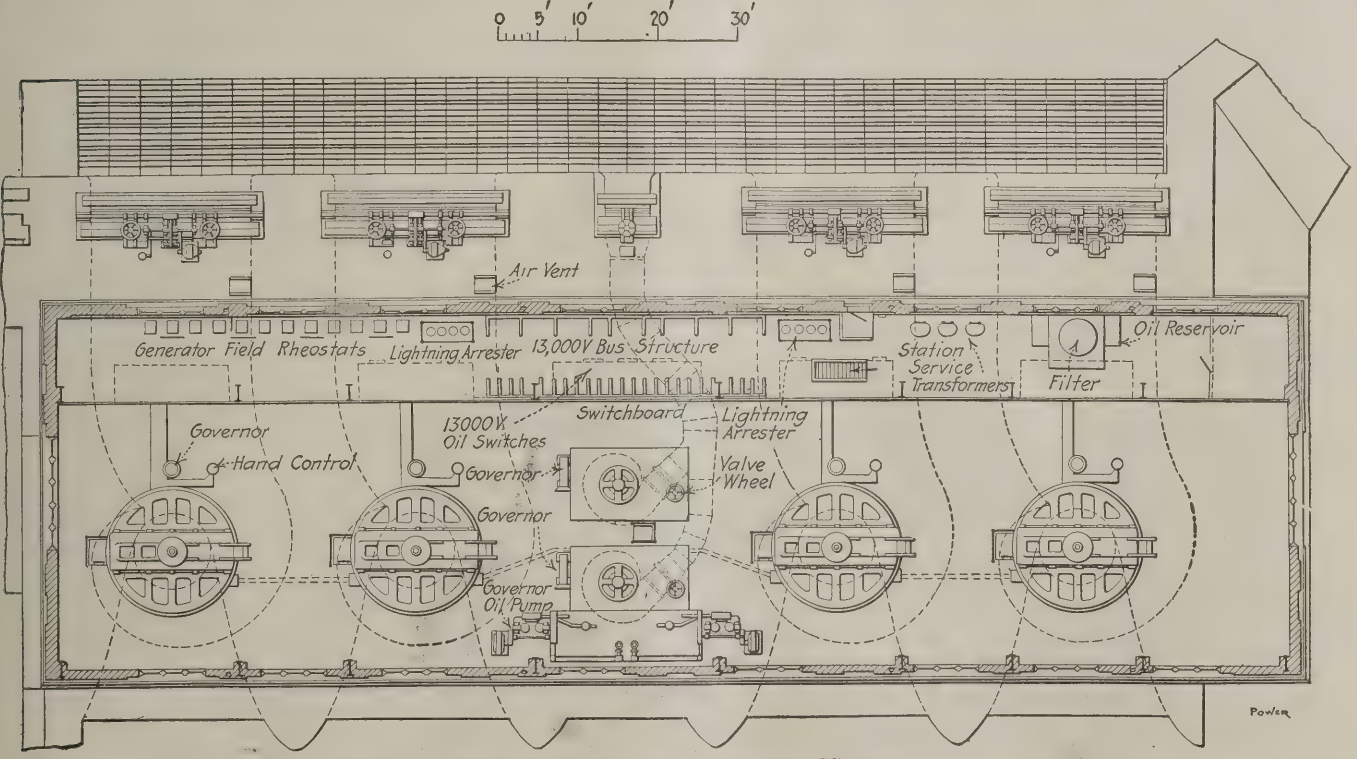

Fig. 5. Plan of No. 2 Power House

Power House No. 2

In this power house there are four vertical-shaft units generating 5000 electrical horsepower. The waterwheels are of the single-runner Francis type. The wheel rests on a circular concrete foundation, and water enters the wheel casing through a spiral-shaped passage formed in the concrete of the foundation. This construction is shown in Fig. 3, which is a view in the wheel pit.

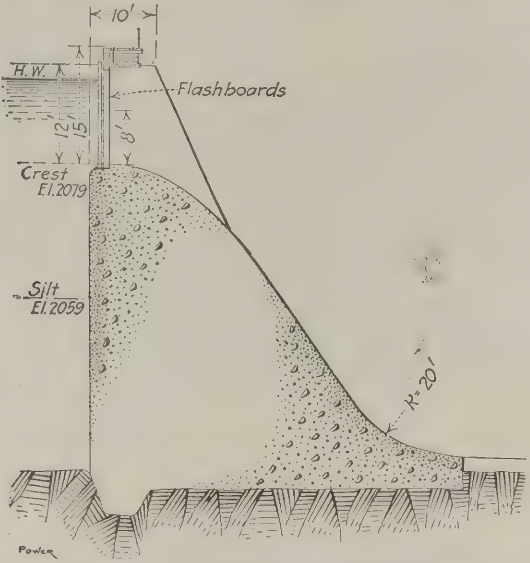

Fig. 4. Section of Spillway Plant No. 4

These four waterwheels are coupled by vertical shafts to four 4000-kw., 13,200-volt, three-phase, 60-cycle generators of the internal revolving-field type. The speed is 116 r.p.m. The water from the wheels discharges through concrete draft tubes into the tailrace in the river bed. Water is admitted to the waterwheels through eight 14x25-ft. motor-operated, screw-actuated sluice gates. With the flashboards in place the average head of water

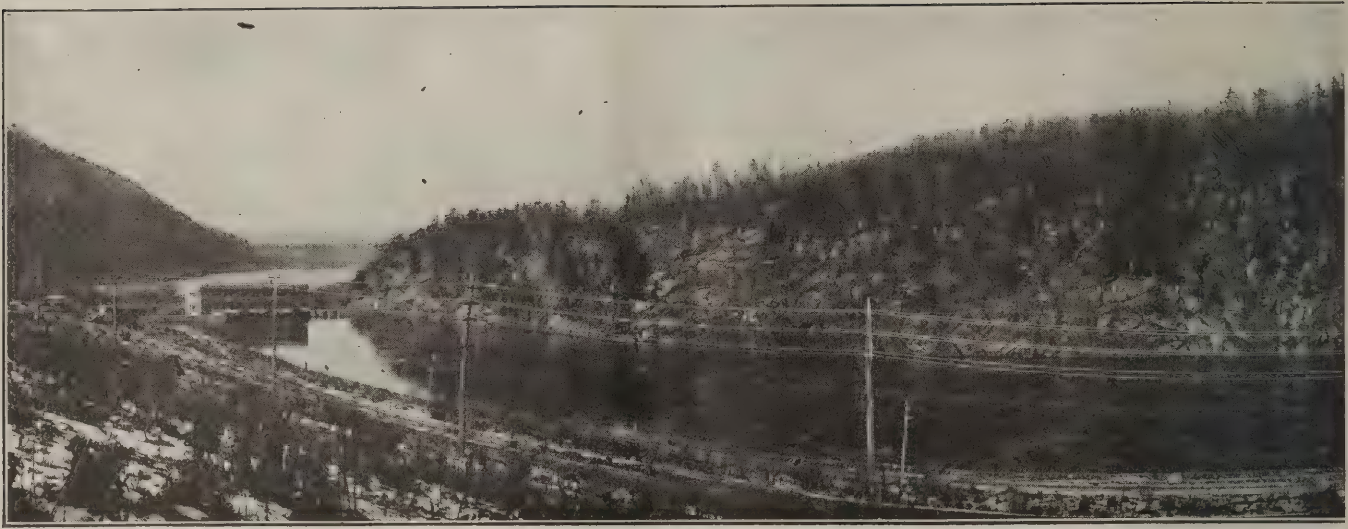

Fig. 6. Panoramic View, Showing No. 4 Power Plant, Headrace and Spillway

to the wheels is 53 ft. The Tainter gates and flashboards are for storing the water and regulating the head. By this arrangement, ample water can be stored above the dam for operating the plant at any daily load factor.

Exciter Units

Between Nos. 2 and 3 generators are two water-turbine-driven exciter units. The wheels are of the inward discharge, single-runner type and are rated at 430 hp. each. They are set vertical and are shaft-connected to two 600-amp., direct-current, 250-volt generators, running at 330 r.p.m. The speed of the units is controlled by a special type of oil-actuated hydraulic governor. The same type of equipment is installed in No. 4 power plant, the only difference being that in the latter plant the two exciter units are located at one end of the generator room, and are of slightly smaller capacity.

Machines for Oil System of Governing

Both power houses contain two triple-plunger, motor-driven oil pumps for operating the governors. The motors are of the induction type and of 25 hp. capacity. They operate with three-phase, 60-cycle current, of 220 volts, at a speed of 845 r.p.m. The motors are gear-connected to the pump crankshaft.

A 7¼x3¾x6-in. motor-driven air compressor is at one side and at one end of each plant. The 10-hp. motor is of the induction type. It operates with three-phase, 60-cycle, 220-volt current, at a speed of 1145 r.p.m., and is gear-connected. The air is used to maintain a uniform pressure of 200 lb. in the tanks of the oil system supplying the turbine governors.

Power House No. 2 is of brick with concrete foundations. It is 162½ ft. long and 89½ ft. wide from the rack to the end of the draft tube. As the electrical equipment is practically the same in both plants the description of plant No. 2 will apply equally well to No. 4.

A cross-section of No. 2 spillway dam is shown in Fig. 4, and a plan view of No. 2 power house in Fig. 5.

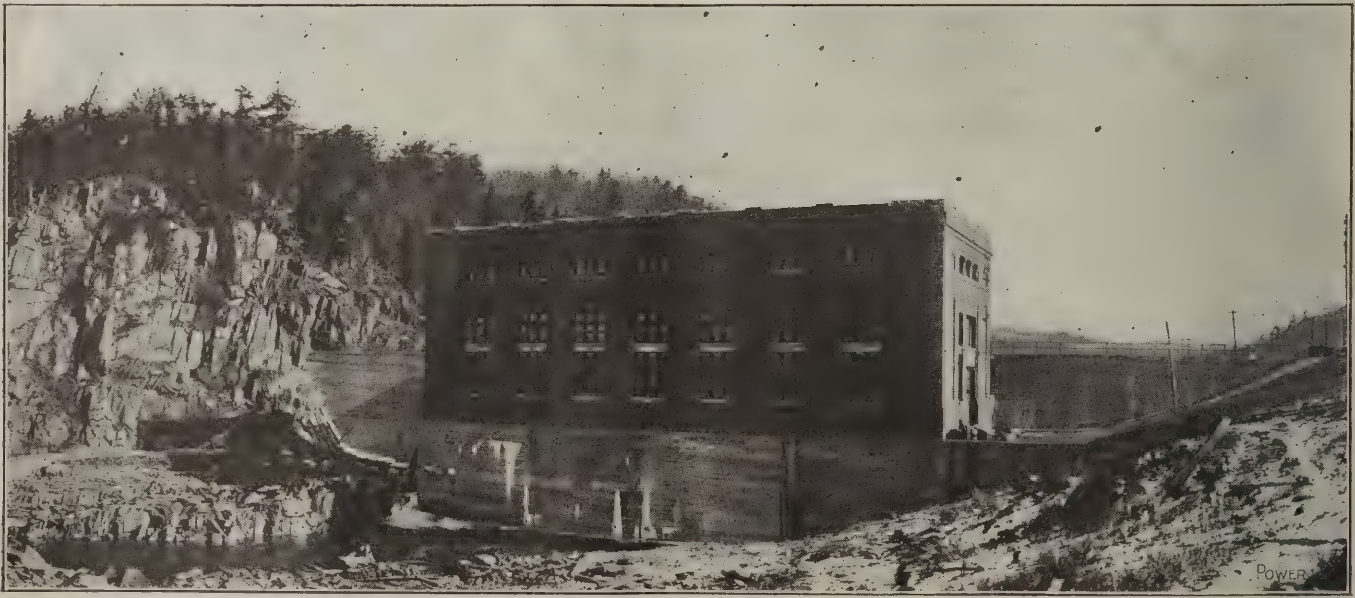

Fig. 7. No. 4 Power Plant from Below the Dam

Plant No. 4

Although plant No. 4 is the smaller of the two, it is of no less interest. It is between Mountain Island in the New River and the river bank. The spillway dam is

Dam on the New River in Virginia; Mountain Island in the Foreground

at the upper end of the island, extending from the south shore of the island to the south shore of the river; the power house is at the other end of the island and it and its dam extends from the north end of the island to the north bank of the river.

The spillway dam, which is built across the main channel of the river, is 1005 ft. long. It has six spans of Tainter gates and 24 spans of flashboards designed for 6½ ft. height. This dam diverts the water to the power house which, with the retaining dam, is at the lower end of this natural headrace.

Below the power house is a tailrace 1900 ft. long, 60 ft. wide and 12 ft. deep. This necessitated the removal of 66,000 cu.yd. of rock. This tailrace provides for an additional head of 15 ft., giving a total average head of 38 ft. Fig. 5 is a general plan of plant No. 4, Fig. 6 a panoramic view of the headrace, spillway dam and power plant, and Fig. 7 is the view from below No. 4 power house. The building is a brick and steel superstructure, 126 ft. long and 34 ft. 4 in. wide, with a solid concrete foundation. The equipment comprises three 3000-hp. units, with vertical-shaft, single-runner waterwheels.

Mounted on the upper ends of the shafts of these wheels are three 2300-kw., 13,200-volt, three-phase, 60-cycle, internal-wound, revolving-field generators; the speed of each is 97 r.p.m. Fig. 8 is a cross-section of No. 4 power house. Fig. 14 is a view of the generating units in plants No. 2.

The special type of double floating-lever governor used is operated from the generator shaft, by bevel gears and shafting. It is oil-controlled, and operates a piston and a lever connected to a rocking ring above the outer casing of the waterwheel. The rocker ring operates the arms attached to the stems of the 20 gate vanes set in the inlets of the waterwheel casing. As the speed of the wheel increases the governor closes the gate vanes enough to shut off the flow of water to the wheel and to maintain a constant speed. If the wheel tends to slow down the vanes are opened.

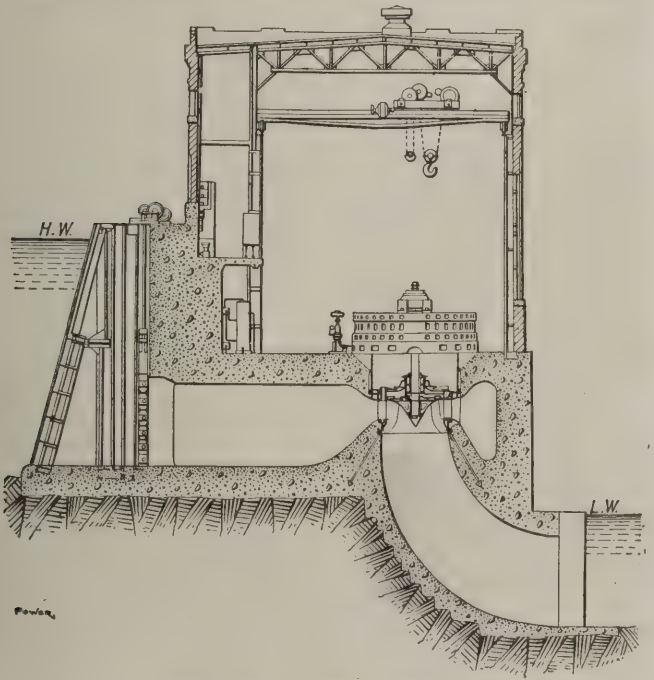

Fig. 8. Cross-Section of Power House No. 4, Showing Turbine and Generator

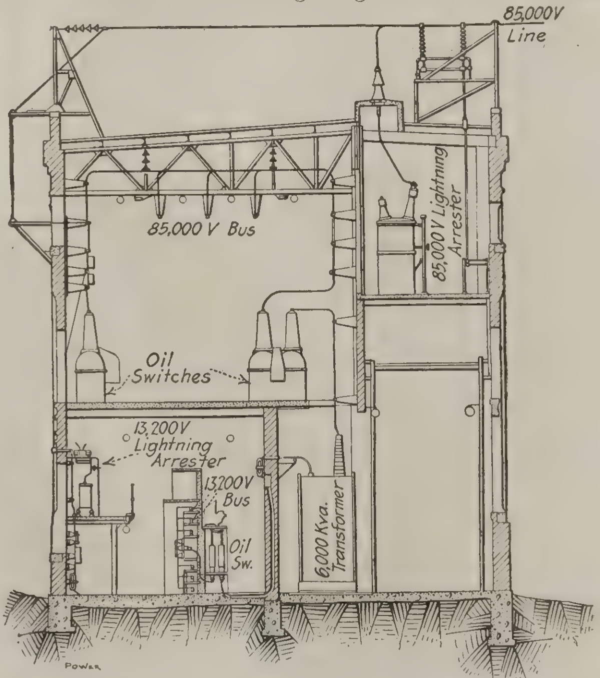

Fig. 9. Cross-Section through Step-Up Transformer House

The exciter waterwheels have 14 gate vanes, similarly

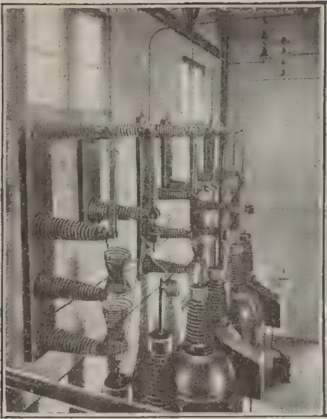

Fig. 10. Choke Coils in Transformer House

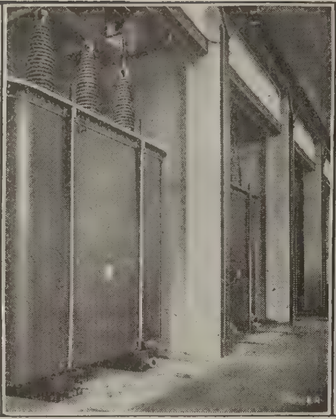

Fig. 11. 6000-Kv.-A. Transformers

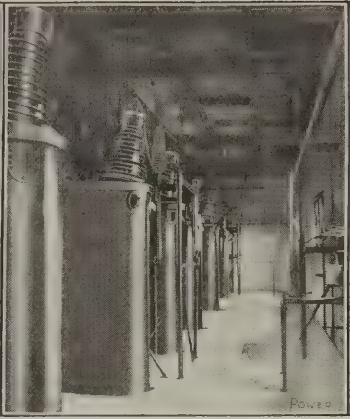

Fig. 12. Single-Phase Transformers

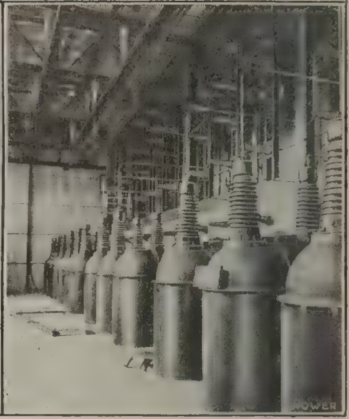

Fig. 13. Oil Switches for Transformers

controlled. The generating and exciter units in both plants are governed in the same way. The shaft of each unit is hung on roller bearings at the top with two steadying bearings below the generator. These bearings are lubricated by a gravity-flow oil system, oil from the bearing flowing to a well and being pumped to the bearings again by a small rotary pump, belt-driven from the generator shaft.

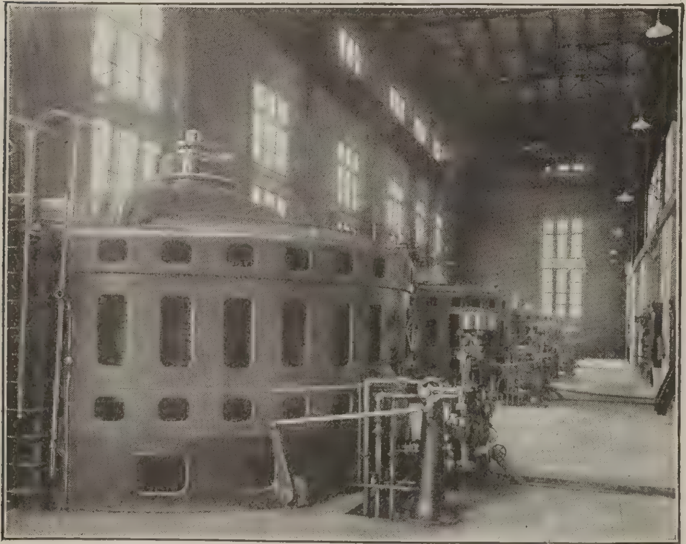

Fig. 14. 4000-Kw., 13,200-Volt Generating Units in Plant No. 2

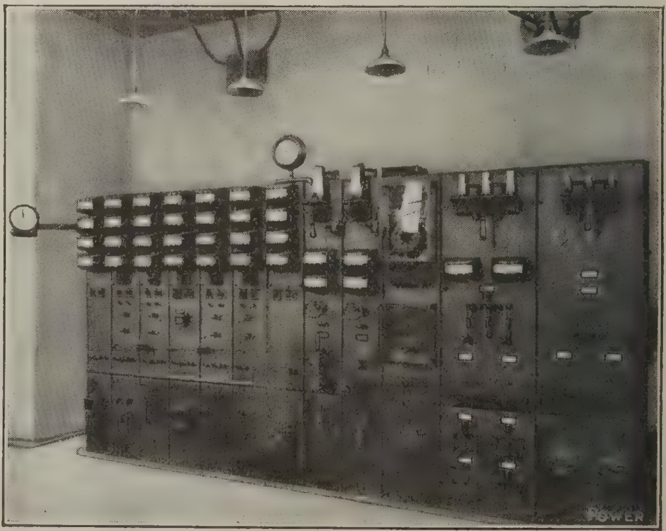

Fig. 15. Switchboard at Main Transformer Station

The waterwheels operate with a head of 38 ft. Water is admitted from the headrace to each wheel pit through two 14x25-ft. motor-operated, double-screw lift gates. The wheels are set on a concrete base, the walls of which are 4 ft. thick, with a draft tube in the center.

Each generator is equipped with an indicator to show the gate opening, and they also have a speed tachometer. In case of an accident to the governor and when starting up the machines, the flow of water to the waterwheels can be controlled by hand.

Electrical Control Apparatus

In both plants the switchboard apparatus only controls the generators. The switchboards are at one side of the building. Back of them are the busbars, in concrete isolated compartments. All oil switches are remote-controlled and are of 13,200-volt capacity. They are on the concrete balcony above the switchboards. The field rheostats are on the balcony, also the lightning arrester with the helical choke coils on the two No. 000, 13,200-volt lines which extend to the transformer house near No. 2 plant.

EXCITER UNITS

Both exciter units are at the end of the generator room. Each is of 250 kw. capacity and generates 250-volt current. The waterwheels are of the inverted, single-runner Francis type, each of 250 hp. capacity. The oil pumps and air compressor are of the same design and size as those of the plant No. 2.

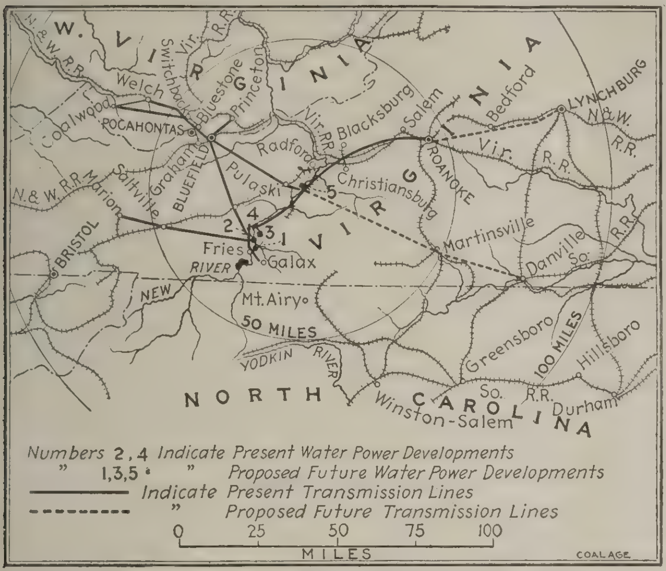

FIG. 16. MAP OF APPALACHIAN POWER CO.'S OPERATIONS

TRANSFORMER HOUSE

Electrical energy from both power plants is carried by overhead lines supported by wooden poles to the step-up transformer house adjacent to No. 2 development. A cross-section is shown in Fig. 9. Here the electrical energy is transformed from 13,200 to 88,000 volts and distributed over the high-tension transmission system. This transformer house is designed for ultimate extension, so that all of the power from the plants Nos. 1, 2, 3 and 4 will concentrate at this house and be regulated and distributed from it. Fig. 10 illustrates the arrangement of the choke coils.

At present there are four 6000-kw., water-cooled, three-phase transformers (Fig. 11) with 13,200-volt primaries and 88,000-volt secondaries, together with the various regulating and controlling devices, consisting of 21 oil switches, all remote-control, and 12 lightning arresters on a balcony over the transformers. The busbars are in concrete isolated compartments; the transformers are on trucks and can be rolled out of their bays if necessary.

The low-tension, 13,200-volt inlet lines enter the house 15 ft. above the main floor; the high-tension 88,000-volt outlet lines are 59½ ft. above the floor. The transformers are delta connected on both sides. Figs. 12, 13 and 15 show single-phase transformers, oil switches, and the switchboard of the transformer station. The latter is on the ground floor.

FIELD DISTRIBUTION

From the transformer house there are three outgoing 88,000-volt lines. One extends to Switchback via Bluefield. The second goes direct to Roanoke, but there is a branch from this line near Pulaski going through Pulaski and on to Bluefield and Switchback. This provides a double circuit into the latter station. The third high-tension line runs direct to Saltville. There is also a high-tension line connecting the Switchback and the Coalwood substations.

In addition there are three 13,200-volt transmission lines outgoing from the transformer house, one direct to Galax, one to Wytheville, on the same poles with the first of the higher tension lines, and one to Hiwassee, mounted on the same poles as the second of the higher tension lines.

The company has a large distribution system in the Pocahontas coal fields radiating from the Switchback and the Coalwood substations. There, a number of contracts have been made with collieries to provide power for their coal-mining operations. This is probably the first instance where a water-power development has supplied power to coal mines.

The company also operates the utilities in the towns of Marion, Wytheville, Pulaski, Bluefield, Pocahontas, Welch and Keystone. It also sells power to the Roanoke Railway & Light Co.

STANDBY COAL PLANTS

In addition to the hydro-electric plants there is a 7500-hp. steam plant at Switchback, W. Va., which has been leased by the company, and will be used as a reserve station and to supplement the power from the hydraulic plants. This steam reserve will be in addition to that available from the various steam plants of the utilities purchased by the power company, and also to the steam power available from the steam plant of the Roanoke Ry. & Light Co. The map, Fig. 16, shows the water power, transmission line and district served by these hydro-electric developments.

Viele, Blackwell & Buck, of New York City, are the consulting engineers. This firm built the hydraulic developments and the high-tension transmission lines and substations. H. M. Byllesby & Co., of Chicago, are the engineers and managers of the company. This company built all the low-tension distribution system in the coal field and in the different towns which are now being supplied by the company.

⁂

Portland Cement Production in 1912

According to figures of the United States Geological Survey, the production of portland cement in the United States in 1912 was 82,438,096 bbl. This production was reported from 24 states. The first ten, namely, Pennsylvania, Indiana, California, New York, Missouri, Illinois, New Jersey, Michigan, Iowa and Kansas, given in the order of their importance, reported 69,682,321 bbl., or about 85 per cent. of the total.

These states ranged in production from 26,441,338 bbl. in Pennsylvania, to 325,040 bbl. in Kansas. The first three reported over one-half of the total production.

⁂

Rocky Mountain Coal Mining Institute

The paper by John McNeil on "Prevention of Accidents and a Higher Standard of Sanitary Conditions in Coal Mines," which was read at the Salt Lake meeting, will be published in our next issue. We also expect to print the paper of D. J. Griffiths, on "Falls of Roof and Sides," in COAL AGE next week.

West Virginia Coal Mining Institute

SYNOPSIS—Following a two-day program, which included the reading of several interesting technical papers, automobile trips to nearby industrial plants and a banquet, the members made an all-day inspection tour of mining and coking plants in the famous Connellsville region.

⁂

The summer meeting of the West Virginia Coal Mining Institute convened in Morgantown, Tuesday morning, June 24. Following addresses of welcome by Mayor Stewart and Prof. C. R. Jones, of the State University, came the presidential address of Neil Robinson. After President Robinson had finished his interesting and instructive talk, a paper on "Gasoline Motor Haulage in Mines," was read by R. O. Hodges, mechanical engineer of the George D. Whitcomb Co., Rochelle, Ill. This lengthy discussion on gasoline locomotives will be published in COAL AGE, probably next week.

In the afternoon of the opening day of the convention, the members and friends of the Institute boarded special cars and were taken to Sabraton, where they inspected the works of the American Sheet & Tin Plate Co., and the Pressed Prism Plate Glass Co. Returning to Morgantown at 4 o'clock in the afternoon, the Institute members were taken in automobiles for an extensive ride to the plant of the Hydro-Electric Co. of West Virginia, on Cheat River, and from there to Mt. Chateau, where a luncheon was served.

On Wednesday morning, President Robinson having been called away, George T. Watson, vice-president of the Institute, presided. The following papers were read: "Welfare Work in Mining Communities," by Ira D. Shaw, secretary Central Y. M. C. A., Pittsburgh, Penn.; "The Hess Dustless Mining Machine," by Raleigh C. Taylor, secretary Hess Dustless Mining Machine Co., Ansted, W. Va.; both of these papers are printed elsewhere in this issue.

On Wednesday afternoon, J. Clark Evans, secretary of the Fairmont Mining Machine Co., Fairmont, W. Va., read an interesting paper on "The Uses of Steel Ties in Mining." Following Mr. Evans' address came a talk on "The Power Development on the Cheat River, at Cheat Haven," by George F. Rowell, engineer-in-charge, Cheat Haven, Penn.

The members of the Institute attended a banquet at the Madeira Hotel, Wednesday evening. Short after-dinner talks were given by H. M. Wilson, engineer-in-charge, Bureau of Mines, Pittsburgh, Penn.; Dr. T. E. Hodges, president West Virginia University; Floyd W. Parsons, editor COAL AGE; J. B. Hanford, general superintendent Elkins Coal & Coke Co.; E. B. Wilson, editor *Colliery Engineer;* J. B. Johnston, editor *Coal and Coke Operator;* and E. N. Zern, professor of mining, West Virginia University. Dr. I. C. White, of Morgantown, acted as toastmaster.

On Thursday morning, at 7 o'clock, the Institute members left Morgantown via the B. & O. R.R., for an all-day trip to various modern mining and coking plants in the Connellsville region. Mines of the W. J. Rainey Co., the H. C. Frick Coke Co., and the Oliver & Snyder Steel Co., were inspected. The meeting as a whole was interesting and instructive, although the attendance was not as large as it has been at other recent meetings of the West Virginia Institute.

⁂

The Use of Steel Ties in Mining

By J. Clark Evans*

SYNOPSIS—The steel mine tie has not only greater durability than its wood rival, but has the advantage of taking up less room so that in low places either less brushing is required or else the cars can be more fully loaded. The many advantages of steel mine ties in beds of coal of all kinds are here summarized.

⁂

The scarcity of timber, among other reasons, has caused the introduction of the steel tie into mining, but that has not been the sole reason for its development. Many operators have realized that the wood tie has several disadvantages, such as excessive cost of handling, short life, and height of track above room floor. At first every operator who used steel ties had a special design of his own, and none were manufactured or used extensively.

It has been only within the past four years that steel mine ties have been put on the market and pushed by manufacturers in this country and the strides this product has made are remarkable. Mines that a few years ago were using a hundred at a time are now ordering them by the car load. I have collected a few statements from mining men relative to the availability of steel ties for use in mining, and I feel that I can do no better than to quote some of these.

Relative First Costs

C. H. Meade, the general manager of the Peytona Block Coal Co., Peytona, W. Va., states: For laying one pair of rails we use four steel mine ties which cost us 32c. each, or $1.28 per pair of rails. When laying the same length of track with wood ties, we place them at three-foot centers and so have to use 11 cross ties at a cost of 5c. each, or $0.55 per pair of rails. We also use spikes costing about 10c., making the cost for material 65c. as against $1.28 for material where steel ties are used.

To offset this greater cost for material, however, we find that there is a large difference in the labor required to lay the pairs of rails, using the two different methods of keeping them in gage. At most mines, the miners do not object to laying the tracks in their working places themselves if steel ties are used as they can lay them without any tools, but they demand that wood ties shall be placed for them by a track layer. Moreover they can lay the rails and be loading coal in the time they would be waiting for a tracklayer to reach their places. The difference of cost in laying (63c.) is practically absorbed by the time demanded to gather up the necessary wood ties and haul them to the working place, and to pay a track layer to go to the room and lay the rail.

---

*Secretary Fairmont Mining Machinery Co., Fairmont, W. Va.

Note—Paper read before the West Virginia Coal Mining Institute, June 25, 1913, at Morgantown, W. Va.

First Cost of Both Ties Really Equal

Therefore, I regard the original cost of one pair of rails laid with steel ties and one pair laid with wood ties as practically the same. My experience has been that wood ties are very seldom used more than twice. I have not been using steel ties long enough to make an estimate as to how many times they may be used, but it would certainly take a long time to wear them out.

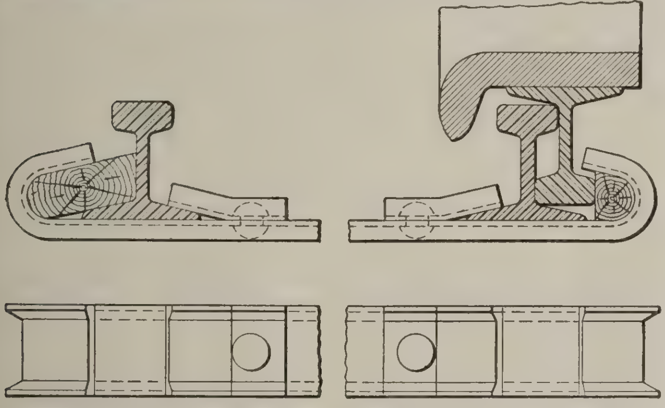
We find that we recover a much greater number of ties made of steel than we do when they are made of wood. If the top gets bad in a working place it only takes a few minutes' labor to tear up and remove the track if laid with steel ties, and the miner can do this work when to spend the longer time required to remove a track laid with wood ties would be dangerous.

Moreover, if a mine foreman, tracklayer, or any other dayman sees a steel tie or two in a part of the mine which is not in use the natural thing for him to do is to pick this tie up and bring it out as the work is trifling, whereas had it been a wood tie, he would probably intend to come back and get it or send back for it some other time, which time would probably never come.

Track Extension

One of the chief values of the steel tie lies in the fact that its use has made possible the most satisfactory method of advancing the jumper rail that has ever been developed. I find that by turning the "jumper" upside down, right over the track rail which has already been laid, but on the outside of it, thus leaving the base of the jumper up instead of the ball, that the jumper will lie right over the track rail and extend past it, thus allowing the miner to keep his mine car right up to his coal all the time.

A regular wooden wedge will hold this jumper in place just as it will the rails in the track. The miner then to extend his jumper has only to loosen this wooden wedge and pull the jumper rail forward the required length. When the full length of the jumper is used in this way the miner simply turns it over and wedges it up, making it a part of his road track. We do not make special wood wedges for this work but use cap pieces and no tools at all are necessary as these wedges can be driven in with a piece of slate if no tools are at hand.



Steel Tie with Exterior Reversed Jumper Rail

When taking up bottom slate for the roadway where we use wood ties which are 5 ft. long, we have to remove material about 6 ft. in width, but when using steel ties that width can be reduced to four feet. This difference is strongly in favor of the steel ties; moreover, that type of tie takes up not more than ½ in. of height, while the wood ties take up 4 in. We have just 3½ in. less slate to handle to get the same height over our mine car.

The Economy Ratio Three to One

Fred Norman, chief engineer of the Allegheny River Mining Co., Kittanning, Penn., makes the following statement relative to steel mine ties: The length of time during which the steel tie has been in use in our mines is not sufficient to permit me to certify to its durability, but it appears that a steel tie would last as long as six wooden ties and half as many of these more expensive ties are required to lay the same length of track as is necessary when wooden ties are used. The ratio of utility is, therefore, as 1 to 12.

We pay 32c. plus freight for our steel ties and the wooden tie costs us 8c. delivered. Overlooking the freight charge, which is not considerable, the ratio of costs is as one to four in favor of the wood tie. Hence it is easy to see that it is three times as profitable to use a steel tie as one made of wood. This estimate does not take into consideration the fact that there is a saving in spikes and a saving in tie waste because the miner takes more care to save steel ties than he will to recover wooden ones. Moreover, steel ties are not suitable as substitutes for props and the wooden ties are very often used for this purpose replacing material which might be purchased much more cheaply.

Convenience in Laying Tracks

There is also much saving in the laying of tracks. As it is easy to relay a road in an abandoned room or along a coal pillar with the use of these steel ties, the miner often does the work himself rather than wait for the tracklayer to do it for him. Under the old system in which wood ties were used he would sit down and wait patiently, or impatiently as the case might be, and have the tracklayer lay his track.

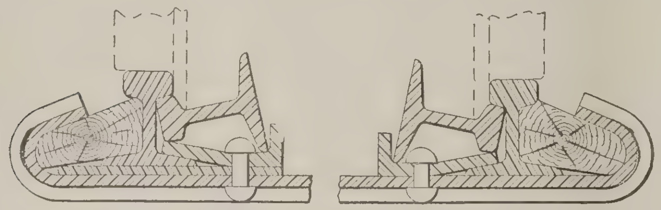
There is also a considerable saving in brushing rooms in low coal where a few inches would have to be removed either in the top or bottom in order to permit the passage of the car, and we can lay the track with the top of the rail four inches lower than on wooden ties unless the wood ties are sunk down into the floor which has to be paid for when done. Steel ties sink readily into the clay so that the base of the rail rests on top of the floor.

In other cases where it is not necessary to lower the rail for the passage of the car it is an advantage to have a thin tie because we can get a topping of four inches of coal on each car in excess of what could be loaded if a wooden tie were used. This amounts to about 10 per cent. more coal per car.

Miners are more careful to remove steel ties where drawing pillars than they would be were wooden ties provided. Miners prefer the steel tie as it is less work to lay the track with them; they are easier and lighter to handle, and spikes are not needed. It is sometimes hard to get these spikes from the trackman who is not desirous of giving the men any more than they absolutely need, because he fears that if he is too liberal he will not have enough for himself and large quantities will be wasted.

Better Room Tracks

As the ties sink into the bottom and leave the base of the rail resting firmly on the slate there is a more stable track for the car with less bending of the rails. The additional height permits better loading with less difficulties.



Steel Tie with Interior Jumper Rail Used as Channel Track

The stability of the track makes it easier for the miner to handle his cars where he has to push them in and out of his rooms. If a car leaves the track it is generally not so badly distorted when a steel tie is used and it is a great deal easier to get the car or cars retracked when there is a lift of only about two inches to replace the car as against six inches with wooden ties.

We find that track laid with steel ties in rooms gives excellent satisfaction with electric-gathering motor haulage and consider that we are saving many wrecks or derailments when gathering with locomotives because the track is laid solid on the floor.

This company has its own mills and is manufacturing timber and the wood ties are cut from odds and ends which will not make marketable lumber, but the steel tie has so many points in its favor that we find it more profitable to make them than to buy our own wood ties.

Four Steel Ties to a Pair of Rails

Lee Ott, general superintendent, Davis Coal & Coke Co., sends reports from two of his superintendents at mines where steel ties are being used. The first letter, from W. W. Brewer, superintendent of the Dartmore mine, reads: Steel mine ties have been used in the Dartmore mine for the past seven months. We use four steel ties under a 30-ft. rail, one at each end and two at equal distances apart in the middle. As the ties cost 32c. each, $1.28 is the total material cost of laying a track 30 ft. long. No spikes, bolts, splice bars nor the service of the trackman are required.

If wood ties were used for the same distance, placing them three feet apart, it would take 10 ties at 10c. per tie, making $1 plus 12c. for spikes. Thus the cost would be $1.12, making a difference of 16c. more for the steel ties. The cost would figure the same in proportion for a longer track, that is, about ½c. per foot more where steel ties are used.

If wood ties were adopted an additional expense would be added for we would be compelled to send a trackman to help many of the miners with their tracks. There are many miners who cannot lay a good track.

Use in Pillar Work

Miners would have to be supplied with track tools especially on pillar work to tear up the track; short rails would have to be supplied for each place and the miner would lose much time in tearing up and relaying the rails.

Steel ties are convenient in pillar work; the last rails at the face of a pillar are turned upside down and the top of the rail slipped from the outside groove of the tie in place of the wedge, and as the pillar is drawn back the rails are slid in the outside of the other rails until the full rail length is used up. It requires practically no time or effort on the part of the miner. With the wood tie the men would be running from place to place, hunting spikes and hammers and we would lose tonnage, especially on a day when men were scarce.

I believe the steel tie would work successfully on a heading if splice bars were used on the rails with the heavier ties. I feel sure they would hold the track under a heavy load. The rails cannot get out of gage or turn and after the track was run over for a time it would become stationary and not work sideways.

M. H. Harrison, superintendent of mines 14 and 20, writes: The steel mine tie saves shooting the rock to obtain height in the rooms of our mines and so saves a dollar per yard. Allowing one tie for every yard of rock, which we would be obliged under ordinary conditions of working to shoot, we have a saving of 63c. per yard on the initial cost and have the tie to use elsewhere for the same purpose as it is practically indestructible. In this way these ties are a great boon to the operators of mines in thin coal.

When the Moores Run Coal Co., which owned the Kirkwood mine, near Bridgeport, Ohio (now operated by the Hutchinson Coal Co.), equipped that mine with steel rails and ties they collected data showing the economy effected.

YEAR 1907—ALL WOOD TRACK

Month	Tons produced	Cost per ton
September	16043	$0.0480
October	26216	0.0402
November	22617	0.0370
Average cost per ton		0.0410

YEAR 1908—75% STEEL TRACK

Month	Tons produced	Cost per ton
September	12620	$0.0398
October	16696	0.0336
November	16281	0.0321
Average cost per ton		0.0348

YEAR 1909—ALL STEEL TRACK

Month	Tons produced	Cost per ton
September	21556	$0.0284
October	22540	0.0281
November	25191	0.0282
Average cost per ton		0.0282
Saving per ton in favor of ALL STEEL TRACK		$0.0128
Saving for three months of 1909		$886.85
Saving per room measuring 24 ft. x 200 ft. and producing 1000 tons; coal 5 ft. 4 in.		12.80

The following comparison of cost of removing the coal from a room 24 ft. wide, 200 ft. long, 5 ft. 4 in. thick, by the use of steel rails with wood ties, and steel rails with steel ties was also made at the same time.

Wood Ties		Steel Ties	
Ties 2½ ft. apart, 80 ties at 12c.	$9.60	35 Ties at 33 cts.	$11.55
320 spikes, 40 lb.	0.90	Labor removing track	1.50
Labor laying and removing track	7.50	(Track laid by miners)	
Depreciation of ties and spikes.	3.50	Depreciation	1.00
Total	$21.50	Total	$14.05
Value of material left	7.00	Value of Material left	10.55
Actual cost	$14.50	Actual cost	$3.50

Saving per 1,000 tons $11.00 or $0.011 per ton.

A Coal Cutter with Saw and Auger Movement

By Raleigh C. Taylor*

SYNOPSIS—In this new mining machine, the bits are arranged spirally on a cone-shaped cutter. As they revolve, they grip the coal after the manner of an auger. A quick reciprocation serves to break the coal which they have gripped and prepare the surface for further cutting action. It belongs to the type of shortwall machines.

⁂

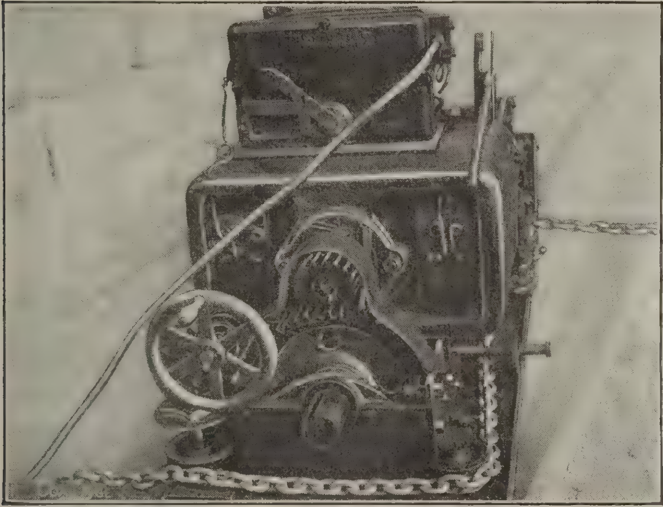
The Hess dustless mining machine is the invention of Louis F. Hess, who was born near Ansted, in Fayette County, W. Va., in the year 1862, and has remained there practically all his life, now living on the old homestead where he was born. His grandfather came to Nicholas County, W. Va., from Massachusetts, in 1816 or 1817, and perhaps it was from this Yankee ancestor that he inherited the ingenuity that enabled him to design his coal cutter.

The inventor has been at work in and around the coal mines of Fayette County, for about 33 years, and thinks he has mined with his own pick his full share of coal. From mining he was promoted to mine foreman, and then superintendent, so that he has filled almost every position connected with his line of work.

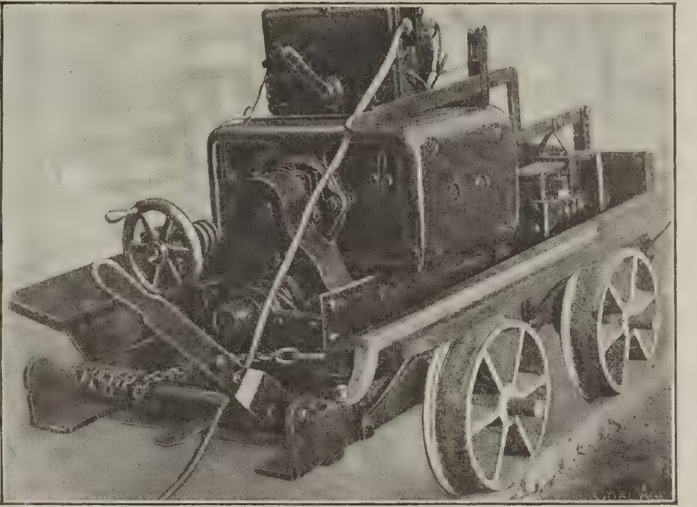
Evolution of the Machine

About 1896 he was in charge of two mines for W. P. Rend, the well-known coal operator of Ohio and West Virginia. Here, for the first time, he was in charge of mining machines, and they gave him so much trouble in various ways that he determined to build a cutter of better design. From that time to this he has been experimenting and working out his plans as spare time and means would allow. After several experiments, he finally worked out a satisfactory cutter bar and contrived the means for giving it a reciprocating as well as a revolving motion.

Shortly after this, in 1911, he built, partly at home and partly at the machine shop of the Gauley Mountain Coal Co., his first power-driven machine. To demonstrate his idea, he mounted the motor and shaft with cutter bar attached on a wooden frame, and with this contrivance proved to everyone who saw the resultant machine in operation that he was working on the correct principle. Then arrangements were made with the same company to build a machine of suitable materials and of substantial construction. At this point proper credit should be given to E. L. Morris, of Ansted, whose mechanical skill, good judgment and patience have been invaluable to Mr. Hess in working out all the necessary details.



Machine Rigged for Cutting across Face



Small Truck Conveys Cutter between Rooms

Finally, the first machine was completed and made the remarkable record of cutting a room the first time it was taken into the mine, and did it with little trouble; though, of course, many changes of detail and improvements suggested themselves.

Machine Bores and Saws Its Way through Coal

The Hess machine is of the revolving cutter-bar type and in operation combines the two methods that have long been regarded as the best for cutting coal, viz.: boring and sawing. The construction is strong and simple. On a substantial bed plate, shaft bearings are mounted at such an inclination from the horizontal as to hold the main shaft true with the center line of the cone-shaped cutter bar when that cutter is lying with its lower surface in the same plane with the bottom of the bed plate. The main shaft is surmounted by the motor, so that the armature pinion engages the gear on the rear end of the shaft, the ratio of their diameters being 3:1, giving a speed of 300 r.p.m. to the cutter bar.

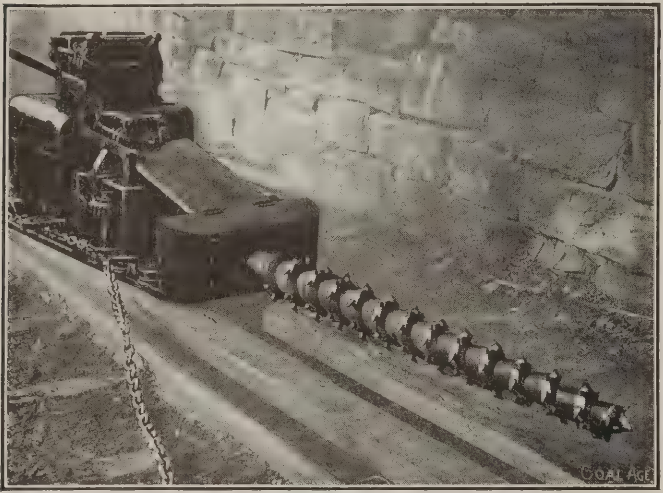
The reciprocating motion is derived from a worm, affixed to and revolving with the main shaft; but the latter is free to slide backward and forward through it. On

---

Note—Article entitled "The Hess Dustless Mining Machine" read at the West Virginia Coal Mining Institute, Morgantown, W. Va., June 25, 1913. This machine was described and illustrated in a somewhat briefer manner in our issue of Dec. 28, 1912, Vol. II, p. 914.

*Secretary, Hess Dustless Mining Machine Co., Ansted, W. Va.

a cross shaft immediately over the worm is mounted a worm wheel and two crank disks, which are also gear wheels. The worm wheel, of course, engages the worm on the main shaft with which its ratio is 1 to 15, giving the cross shaft a speed of 20 r.p.m. Rods connect the crank disks with a slide bearing on the forward end of the main shaft; in this bearing the main shaft is free to turn, but is held fast longitudinally by means of collars. The slide bearing being connected with rods to the crank disks on the cross shaft, is so moved backward and forward, and imparts the reciprocating motion to the main shaft and cutter bar. Engaging the teeth on the crank disks are two pinions mounted on a second cross shaft, which drives the feed mechanism.



A VIEW TAKEN IN OPEN AIR; MACHINE RIGGED TO COMMENCE CUT

THE SAW AUGER

The cutter bar is a spiraled, cone-shaped, steel casting, about 5 ft. long, 7 in. in diameter at the butt, and 3 in. at the tip. Along the spiral rib of this casting are set bits or picks of tool steel, so spaced as to give one bit to each inch of cross-section of the bar; and as the reciprocating motion of the bar covers a space of three inches, the space between the bits is well taken care of. A triangular center bit is set in the tip end of the bar. The bar is screwed to the end of the main shaft, so that they have a common center line, and this brings the bits into such a position as to make them revolve barely clear of the floor, and parallel with it when at the lowest point of a revolution.

The bed plate and casing, which contains all of the mechanism except the cutter bar, is 5 ft. long and 2 ft. wide; with the controller placed on top, the height is about 28 in., but this may be reduced to about 20 in. by placing the controller on the side of the motor.

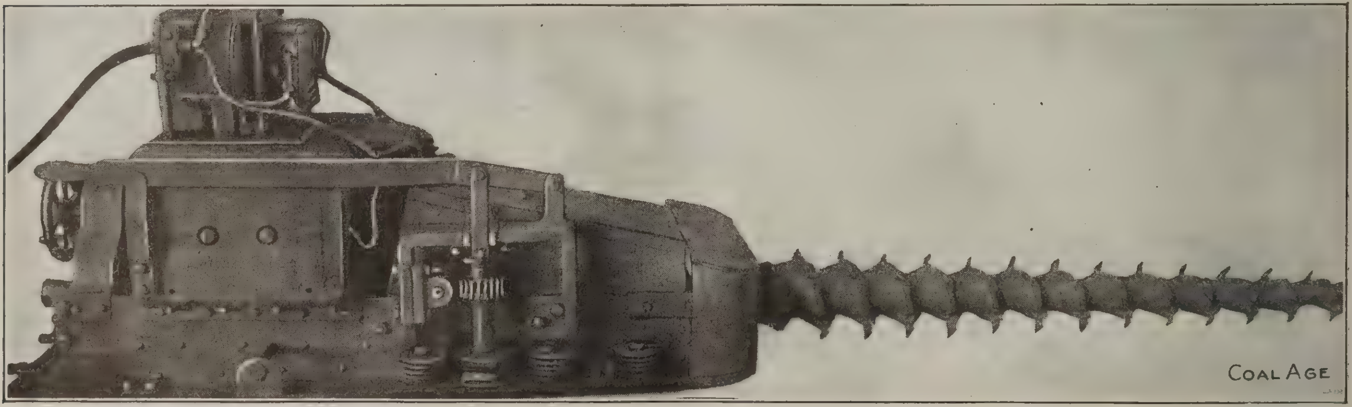
With the cutter bar attached, the machine weighs 2350 lb., the cutter bar itself weighing about 200 lb., as it is detached when moving from place to place, the greatest weight to be handled in one piece is 2150 lb.; the truck weighs 620 lb., and the box of fittings 560 lb., so that the total shipping weight is about 1.7 tons.

At present, a 23-hp. motor is being used, and it has given a surplus of power under all conditions so far encountered; if, however, it is necessary where the coal is of a harder nature, to use more power, or to strengthen the machine as a whole, this can readily be done without changing the general lines or plans materially.

METHOD OF CUTTING

In operation, the cutter bar is holed for its full depth in the left-hand corner of the room, in such a manner as to make practically a straight rib, the chain and jacks are then arranged so as to draw the machine across the face from left to right, sliding on the bottom, making a continuous undercut 5 ft. deep, 8 in. high at the front end and 3 in. high at the back, and flush with the floor, so that no scraping is necessary.

A double chain is used for holing in and for feeding across the face. For the latter operation the chain engages the drive sheave *B* on the machine and is then passed around a roller on the jack *A* in the right-hand corner of the room, after which the end is brought back to the machine and fastened to the forward right-hand corner *G* of the carriage. The rear end of the chain passes around the rear of the machine by pulleys *F* and *E*, then around a roller *H* on a jack set near the left rib, and is engaged in the chain sheave on the staff of the hand-steering gear *E*. By means of this hand-steering gear, the chain is kept tight and the rear of the machine may be retarded when necessary, in order that it may be held approximately at right angles to the face.



SIDE VIEW OF HESS DUSTLESS MINING MACHINE

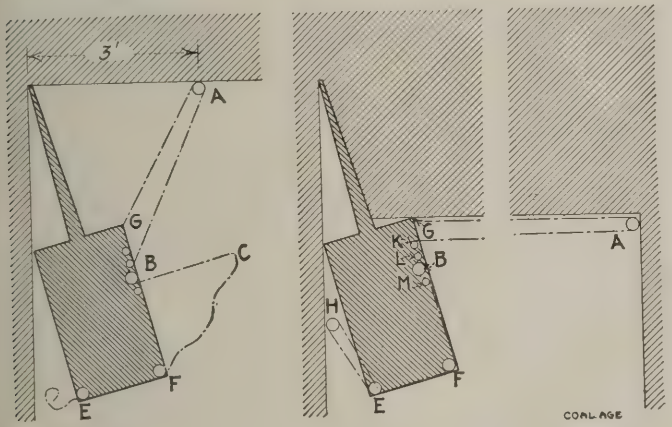
RATE OF OPERATION

The rate of feed is regulated to suit the coal in which the work is being done. The highest speed (across the face) that has been tried is 36 in. per minute and the lowest 13 in. This means a maximum of 15 and a minimum of 5 sq.ft. per minute undercut. The operation of unloading, loading, moving to any desired position, and propelling the truck, are performed quickly and easily by the machine under its own power, so that very little manual labor is necessary.

The amount of work that can be done in a given time will, of course, depend upon local conditions and the way in which the machine is handled, but records that have been made justify the claim that no other machine will do as much work in the same time under similar conditions, and with the same power.

Some of the advantages claimed are as follows:

1. Dustlessness. As the cuttings are not pulverized, and rather coarse, little or no dust is made.
2. Safety to machine men. There is very slight chance of injury to the workman.
3. Props may be set within six feet of the face without interference with undercutting.
4. The machine produces more coal per keg of powder than any other machine which uses electric power direct because it makes a tapered cut.
5. The cut removes the coal down to the floor, leaving a perfectly smooth bottom.



Holing in

Cutting across Face

6. A greater quantity of coal can be undercut with this than with any other machine in a given length of time and under similar conditions.
7. Owing to simplicity and strength of construction, repairs are reduced to a minimum.
8. Power consumption is comparatively small.
9. Owing to its lightness, and the fact that it is practically self-handling, manual labor is easier with this than with any other mining machine.
10. The machine is readily adjusted to irregularities in the floor both longitudinal and transverse.

The dustless feature of the cutter has been unanimously conceded by a number of expert mining men from all over the country, who have seen it in actual operation. The importance of this point cannot be overestimated in view of the stress that is being placed on the prevention of dust in coal mines and the great danger arising from this cause.

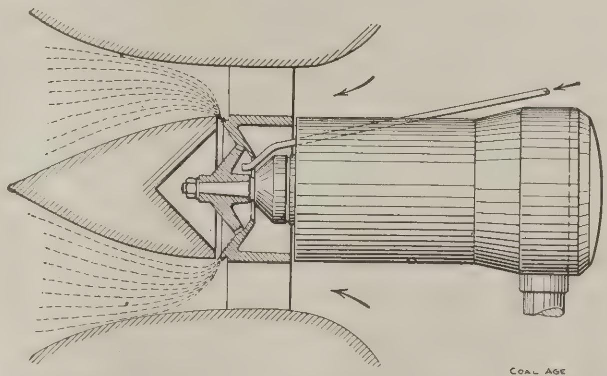
The suppression of dust, careful timbering and the prevention of solid or heavy shooting, are the three items receiving most attention and provoking most discussion at present. The Hess machine tends to eliminate the most fruitful cause of dust, allows timber to be set close to the face and makes a tapered cut, and in this way meets the safety requirements in coal mining.

The other points of advantage claimed are those of efficiency, economy and convenience. The tremendous saving of power, arising from the substitution of electricity for compressed air, will be readily admitted without taking into consideration the trouble, inconvenience and expense of maintaining pipe lines. The advantages of the tapered cut and the desirability of applying electric power direct to it are also clear, and an examination of the machine in detail will be convincing as to its simplicity and strength of construction and economy of maintenance.

⁂

A New Atomizer

Several effective spraying devices have been invented and sold, but most of these consist solely of a suitable form of nozzle, by which the water is split up into finely divided particles, capable of washing down any suspended coal dust in the air. The difficulty, however, with regard to such sprayers is that in order to secure fine division of the water, the aperture of the nozzles is necessarily very small, with the result that they often become clogged by the dirt contained in the water. To meet this difficulty, either pure water must be obtained or dirty water made suitable by straining.



A Simple Atomizer for Precipitating Coal Dust

If the fineness of the spray could be obtained by the use of infinitesimal orifices, some impurity in the water used, would not be objectionable.

A type of sprayer has been introduced by Gustav Schlick, of Dresden, which does not depend on the use of nozzles, but on the action of a disk revolving at a high peripheral speed. It is, therefore, somewhat similar in construction to that devised by H. H. Clark, of the Bureau of Mines. The construction of this type of atomizer is shown in the illustration. The disk, by its rapid revolution, throws the water introduced to it, tangentially from its outer edge with a high velocity, and the water is in this way forced out in fine stream lines in the form of a spray. These stream lines are uniformly distributed throughout a wide area by means of suitably shaped expanding surfaces, leading to the outlet of the sprayer.

By this means, considerable volumes of water can be dealt with by a comparatively compact apparatus suitable for use in the most constricted workings. Impure and pit water can, if necessary, be used without any fear of clogging, the amount of water atomized can be varied by changing the speed of rotation and the supply of water to the sprayer. In order to procure a high-speed of rotation, the disk can be speeded to 12,000 r.p.m. It is rotated either by means of an electric motor, belt-connected to the apparatus, or directly by means of a steam or compressed air-driven turbine.

A Review of the West Virginia Inquiry

SYNOPSIS—The investigation of the West Virginia mine strike was conducted in such a manner that the statements of the operators were delivered last and in a series of hearings which exhausted the reporters. Thus the record of the newspapers favored the miners' cause. The following is a presentation of the results of the inquiry from the operators' point of view.

⁂

The correspondents who covered the Senate subcommittee's investigation into mining conditions in this state, had to send their reports "running." Many sensational statements thus got on the wire which were shown on cross-examination to be untrue; but the original statements were not modified, for lack of time, rather than from any intent or desire to misrepresent, for the hearing was a continuous performance broken only by short intervals for food and sleep. All this being true, it may be worth while to review the hearing as a whole, in order to get all parts of the evidence into their proper relation to each other and in due perspective.

Briefly summarizing the results of the first installment of the hearing, these facts seem to have been clearly established by a preponderance of evidence:

1. The alleged fundamental grievance of the miners, namely, the employment of Baldwin-Felts guards was shown to be unfounded, because no guards were employed on the north side of the Kanawha and on Paint Creek, where the reign of violence began until after a number of crimes had been committed by striking miners. On Cabin Creek but four guards were employed. These were men of good character, who had lived on Cabin Creek for years and who were on friendly terms with the miners.

Attitude of Operators to Union

2. The real cause of the disturbance was the attempt by the United Mine Workers to force the operators to concede the "check off," which, if granted, would have resulted in the compulsory unionization of all the mines. The operators did not oppose the union any further than to insist on the open shop. Failing to obtain the check off, the miners struck for an advance of 2½c. a ton, as prescribed at the Cleveland conference of operators and union officials of Indiana, Illinois, Ohio and western Pennsylvania. The advance was granted on the north side of the Kanawha, but was refused by the Paint Creek Collieries Co., the entire output of which, for a series of years, had been sold at a price which did not admit of an advance in wages. The Paint Creek Collieries Co. was then, and still is, insolvent. After receiving what they had asked, the miners on the north side of the Kanawha, being incited by the person known as Mary Harris, alias "Mother" Jones, stenographic reports of whose profane, vulgar and incendiary speeches were offered in evidence, and others bought rifles and thus armed, went over to Paint Creek where they joined the strikers and in coöperation with them, committed many acts of violence. Not until all this had occurred were any mine guards employed on Paint Creek, and only then were the guards on Cabin Creek reinforced.

The Courts Were Unable To Repress Disorder

3. Many crimes were committed, for which no one has ever yet been indicted or punished; for the courts, while nominally open, were actually powerless to administer justice. Bodies of strikers, armed with rifles, openly paraded in Charleston and elsewhere or skulked in the woods around the mining camps, firing into houses and at men, women and children. Governor Glasscock thereupon declared martial law. The militia found "more than a thousand" armed strikers in the field confronted by 110 mine guards. The governor and the military authorities held that an insurrection actually existed. This view was shared by law-abiding citizens, and it has since been confirmed by the dictum of the State Supreme Court. Notwithstanding all this, the first act of the militia was to disarm the guards and send them out of the disturbed district. Then, finding that guards were absolutely necessary, even union officers conceded this, the governor, after confering with union officials and with their approval, put into effect a plan for selecting guards to be known as "watchmen" from the militia. "Watchmen" were as violently denounced as the guards had been and the disorders increased.

Wages Were Adequate, Commissary Prices Fair

4. The alleged secondary grievances of the miners were baseless. Numerous witnesses, even including many summoned on behalf of the miners, testified under oath that all who wanted to work could make good wages, but that many would not work. One witness swore his earnings ranged from $100 to $150 a month, and that three times he had earned as high as $190 a month. Others swore that they had earned good wages for years. Witnesses in behalf of the miners testified that the schools were as good as any in Kanawha County, but that many families neglected to send their children to school. The preponderance of evidence showed that in instances where company-store prices were higher than in independent stores, the goods were of superior quality. An interesting sidelight on the company store and its patrons was afforded in a statement submitted by President Connell, of the insolvent Paint Creek Collieries Co., showing that in the last year the company's stores had to write off $12,000 in bad accounts. Company houses, water supply and sanitary conditions were satisfactory.

The Train of Death

5. The "death train" story was related by a witness who admitted that he was a "free lance," ready for any job. He stated that he worked for a few days as a guard, was then discharged and has ever since been a union adherent without visible means of support. His story was published without qualification or reservation by newspapers throughout the land, and the operators were consequently represented as being worse than the Commanches of former days.

But note how different the story seems when all the facts are told: Three different men at Mucklow, which village had been shot up on several previous occasions, telephoned to Quinn Morton and Sheriff Hill in Charleston, Feb. 7, that the town had been attacked again. They appealed for rifles and for reinforcements. The Charleston & Ohio R.R. sent a special train for Sheriff Hill's posse of 11 men. This included the armored car which the company had equipped to protect its property. On the way, Sheriff Hill was warned that the miners at Holly Grove had planned to attack the train. As a measure of common prudence, the brakeman turned out the lights. Near Holly Grove, they saw a large number of women and children gathered in front of a cabin watching the train. Those on board concluded that the miners had sent their women and children to a safe place preparatory to an attack. As a matter of fact, this is exactly what had happened. Thus it seems that the train did not fire on a camp full of women and children as has been alleged, but only at an ambushed enemy. On reaching Holly Grove, the train was fired upon and replied. In the pitched battle that ensued, one man was killed and one woman who had refused to leave her husband was wounded. Every window in the train was shattered. The witness whose outrageous yarn had been sent broadcast has since been discredited.

6. "The present constitution of the United Mine Workers of America does not present the most inviting inducements to the operators to enter into contractual relations with it," declared the anthracite coal-strike commission appointed by President Roosevelt to settle the anthracite strike of 1902. W. L. Connell, president of the Paint Creek Colliery, who for nine years has been chairman of the Board of Conciliation, appointed pursuant to the recommendation of the Anthracite Strike Commission, and who is an anthracite operator, said in response to a question by counsel for the miners:

"If it was the purpose of the operators of West Virginia to destroy the union, my experience in the last year has almost persuaded me that their judgment was correct. I have received the most scant courtesy from the officers of District 17 of the United Mine Workers that I have received in all the 21 years I have been an employer of labor."

⁂

An Instrument for Measuring the Flow of Air or Gas

The accompanying illustration shows an instrument for the accurate measurement of the flow of air or gas in a pipe. As may be clearly seen, it is a Pitot tube attached to a differential monometer.

The monometer, which is by no means a new invention, consists of a hollow brass cylinder or well around the outside of which is wound upon a uniform inclination, a transparent celluloid tube. The whole apparatus is arranged so that it may be rotated about its axis and the height of the liquid in the tube be thus easily ascertained.

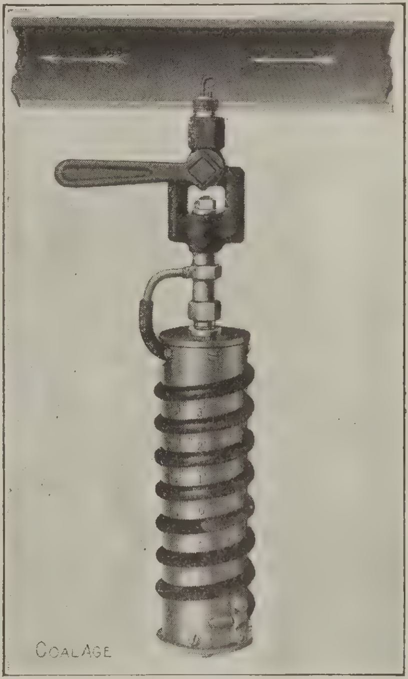
As may be seen, the part of the instrument within the pipe is a Pitot tube in the simplest form. To obtain the average velocity of the flow in the pipe the impact nozzle of the tube should be placed approximately $\frac{7}{10}$ of the distance from the center of the pipe to its inner circumference. The radial position of the static nozzle is immaterial.

The dynamic nozzle is connected with and transmits pressure to the liquid within the hollow cylinder, while the static nozzle performs a like service to that which is in the coiled celluloid pipe. This pipe, by the way, is connected to the cylinder near the bottom.

Suppose that the liquid in the coiled tube is brought to the zero marking upon the cylinder, when the cock in the yoke is closed, and consequently no pressure or rather an equal pressure is exerted upon the surface of the liquid in both the brass cylinder and coiled tube.

When the cock is opened the pressure of the moving gas due to its velocity is transmitted to the inside of the cylinder, while its static pressure is transmitted to the surface of the liquid in the coiled tube. As these two pressures are unequal, the liquid rises a certain amount in the coiled tube, this amount depending upon the velocity of the gas in the pipe.

When the instrument is set up as above described, the average velocity existing in the pipe may be determined from the formula: $v = \sqrt{2gh}$. Where v equals the velocity of the gas in feet per second, g equals the acceleration due to gravity and h equals the head in feet causing the flow.



Cross-Section of Pipe with Pitometer in Position

Since h in the above formula is a head of gas in feet but is measured by h_1, which is the head of liquid (usually either water, oil or mercury) it is necessary to know not only the density or weight per cubic foot of the gas flowing in the pipe, but also the specific gravity of the liquid by which this head h is measured.

Both these quantities are either known or may be readily calculated and letting V represent the velocity of flow in feet per minute and reducing our formula to its simplest form, it becomes $V = k\sqrt{h_1}$. Where k is a constant depending upon the density of the gas whose flow is being measured, and the specific gravity of the liquid employed.

As above described, this instrument is suitable only for measuring the flow of air or gas in a pipe. There is no good reason, however, why it could not be mounted in a fan house in such a manner as to show the velocity, capacity and horsepower being developed by the fan.

Rocky Mountain Coal Mining Institute

Editorial Correspondence

SYNOPSIS—An account of the second semiannual meeting of the Rocky Mountain Coal Mining Institute which was held at Salt Lake City, Utah, on June 11, 12 and 13, 1913.

⁂

The second semiannual meeting of the Rocky Mountain Coal Mining Institute was held at Salt Lake City, Utah, on June 11, 12 and 13, 1913. Previously 146 members and friends had left Denver on Monday, June 9, on a special train over the Union Pacific R.R., making stops at Superior, Wyo., and also at Rock Springs and Reliance, in order to inspect the plants of the Union Pacific Coal Company.

At Superior the visitors saw the unusual arrangement where the hoist is carried upon the headframe, being located directly over the opening, and the hoisting engineer stationed in the room where the weighing and dumping is done. At Reliance an endless-rope car haul was the principal feature, while at Rock Springs a demonstration of first-aid work was given. The special train left Rock Springs at 11:30 p.m., on the 10th and arrived at Salt Lake City 7 a.m., the following morning.

Members of Rocky Mountain Coal Mining Institute at Salt Lake Meeting, June 11, 1913

The regular meeting of the institute was called to order on Wednesday morning, June 11, at 10 a.m., by the president, E. H. Weitzel, addresses of welcome being given by Governor Spry, Mayor Park and the Rev. P. A. Simpkins. An adjournment was taken just before noon in order to attend the organ recital at the Tabernacle.

The afternoon meeting was called to order at 2 p.m., and after the reading and approval of the minutes of the first regular meeting and of an executive board meeting, which was held at Denver, a letter from A. J. Reef, of Denver, was read. This contained proposed amendments to the constitution and bylaws and upon motion was referred to the executive board with instructions to report at the next regular meeting.

Amendments to Constitution and Bylaws

The proposed amendments are as follows:

Article 2 (regarding who may become members and how), to be amended to read as follows:

Membership in this institute shall be of three classes, corporate, individual and honorary. Any company, firm or individual operator, actually engaged in the mining of coal within the territory of this institute, may become a corporate member upon application, and by consent of a majority of the members present at any stated meeting. Any person who is directly engaged, or interested in some branch of coal mining, may become an individual member upon application and by consent of a majority of the members present at any stated meeting. Honorary members may be elected at the discretion of the institute.

Article 10. (Regarding dues.) To be amended to read as follows:

The membership dues of this institute shall be for individual members, two (2) dollars per year, payable in advance; the corporate members ten (10) dollars per year, when operating one mine, or individual operation, and five (5) dollars additional per year for each additional operation conducted by said member, but not in any case to exceed fifty (50) dollars per year, payable in advance.

The funds derived from corporate membership shall constitute a special fund applicable only to conducting investigations into problems of coal mining, and the publication of the results of such investigations, and may not be used for the ordinary expenses of the institute.

A new article to be added to the constitution to read as follows:

> Article 13. Any individual member in good standing, present at any stated meeting, shall have the privilege of the floor and be entitled to one vote. Any corporate member in good standing may designate one person as its representative, who, if present at any stated meeting, can have the privilege of the floor and be entitled to one vote.
>
> A new article to be added to the bylaws to read as follows:
>
> Article 2. In order to carry out the purpose of this organization, as expressed in Article 1, of the constitution, "to promote study and research into mining problems," the executive board shall have the power to appoint committees to investigate mining problems, as selected by the board, such investigations to comprise the gathering of information by correspondence, or otherwise, and the conducting of experiments if necessary, and every form of investigation that may seem wise to the executive board. The executive board shall have the power to appropriate and pay out under proper vouchers, the accruing dues of corporate members, with the expenses of such committees, and may, in special cases, pay compensation to committee members."

An invitation to the Institute to become a member of the American Mine Safety Association was read, and upon motion was accepted and the secretary-treasurer instructed to remit the dues. Upon motion it was then ordered that the chair should appoint three members to represent the institute at the next meeting of this association.

SEVERAL INSTITUTE MEMBERS ON AN OUTING AT SALTAIR

From left to right, standing: T. J. O'Brien, sales manager, Gunn-Quealy Co.; P. J. Quealy, gen. mgr., Kemmerer Coal Co.; Floyd W. Parsons, editor, "Coal Age"; W. D. Brennan, asst. gen. mgr., Union Pacific Coal Co.; H. C. Campbell, asst. mgr. mines, Central Coal & Coke Co. Sitting, left to right: Frank Manley, vice-pres. and gen. mgr., Union Pacific Coal Co.; E. H. Weitzel, mgr. of coal mines, Colo. Fuel & Iron Co.; W. J. Murray, vice-pres. and gen. mgr., Victor American Fuel Co.

At 3 o'clock the meeting adjourned, and a trip to Saltair was taken, where the remainder of the day was spent. The morning meeting of June 12 was called to order at 10 a.m., with the president in the chair. After a few selections by the orchestra, the applications of new members were voted upon, the total number of new members being 169.

A COMMITTEE ON EXPENSES

A discussion followed regarding the defraying of the expenses of the local chapters, and upon motion it was ordered that the chair appoint a committee to investigate the various methods which might be employed. The committee which was appointed is composed of the following: Frank Young, New Mexico; Louis Hufty, Huerfano Chapter, Colo., and Mark Danford, Trinidad Chapter, Colo.

John McNeil then read his paper on the subject: "The Prevention of Accidents and a Higher Standard of Sanitary Conditions in Our Coal Mines." After a short discussion the meeting adjourned in order that a photograph might be taken of the members of the institute.

The afternoon session was devoted to a trip to the copper properties at Bingham, the members of the institute leaving Salt Lake City at 1:30 and returning at 6:30 p.m.

The morning session of June 13 was called to order by the president. The first subject upon the program was a paper by D. J. Griffiths, of Colorado, the subject being: "What Shall We Do to Avoid Falls from Roofs and Sides?" Afterward, Dr. J. E. Talmage delivered an address upon coal, its geological history and the part it plays in the conservation of energy. At the close of Doctor Talmage's address, the Institute entered into a discussion at considerable length of Mr. Griffiths' paper. As a result, the following resolution was presented and unanimously carried:

> Resolved, that it is the sense of this meeting that any systematic method of timbering which contemplates the placing of the supports at regular intervals, is not applicable to the character of the roof overlying the coal measures in the Rocky Mountain regions, and that the only safe method is to require timbers to be set to securely support the roof in each individual working place. It is further resolved that this institute use all fair means to prevent, or repeal, any legislation which would attempt to establish systematic timbering in the several states in which the institute operates.

Doctor Talmage then extended an invitation to all the members to visit the Deseret Museum some time during the afternoon. The president then read a letter on the use of coal dust in concrete stoppings in coal mines, directed to F. N. Cameron, general manager, Black Hawk Coal Co., Salt Lake City, Utah, and signed by H. E. Lewis, superintendent, Black Hawk, Utah. The latter gave the method of placing forms and mixing the materials which make up the concrete mass.

VOTES OF THANKS

Motions were made and carried, votes of thanks being extended to Governor Spry, Mayor Park, Rev. Simpkins, Doctor Talmage, John McNeil, E. J. Griffiths and F. W. Whiteside, for the part each had taken toward making the meeting a success. Motions were also made and carried, a vote of thanks being extended to the committee of arrangements, Union Pacific Coal Co. and to J. E. Pettit, State Coal Mine Inspector of Utah, for their help in the entertainment.

The afternoon of June 13 was spent in visiting various places of interest about Salt Lake City. In the evening the entire institute was entertained with a banquet in the grill room of the Utah Hotel, the ladies of the party being provided a separate feast and entertainment in a separate dining doom. At the close of the banquet the institute adjourned, the visitors leaving Salt Lake City at 1:30 a.m. over the Denver & Rio Grande Railroad.

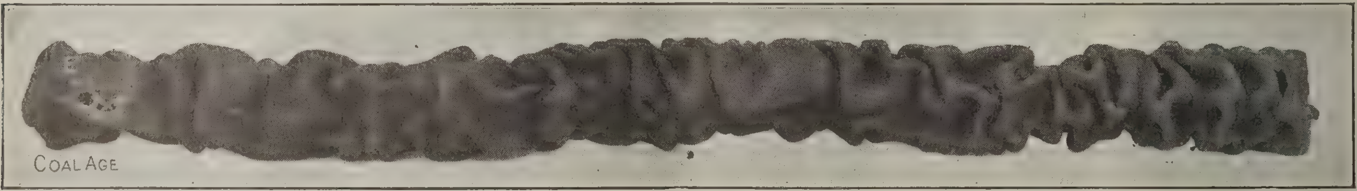
On the return trip, in a special train over the Denver & Rio Grande, the first stop was made at Castle Gate, Utah, where a modern double-steel tipple with all appliances was inspected, this being one of the few steel structures of this kind in the West. Leaving Castle Gate the party arrived in the evening at Glenwood Springs, where a stop was made in order to enable the members to indulge in bathing in the famous pool at this place. At 8 o'clock the following morning the special train arrived in Pueblo, where members from New Mexico and the southern portion of Colorado changed trains for their several destinations, the special continuing on its way to Denver, where it arrived at noon on June 15. The unanimous verdict of the delegates who attended the convention was, that it was one of unqualified success, the entertainment committee of Salt Lake City and Rock Springs having exhausted every resource in order to provide entertainment for the visitors. The total membership of the institute at the close was 445.

⁂

An Example of Good Manufacture

The malleability and ductility of some modern steel products are truly remarkable. The accompanying photograph shows a joint of steel well-casing manufactured by the National Tube Co., after its removal from a well which had been shot.

This pipe was in a well near Gore, Ohio, when a 150-qt. charge of nitrogylcerin, with a 20-qt. anchor-shot was exploded. After the blast this joint of inner casing which had been left in the well was found wedged about 1500 ft. from the surface, the well being 3000 ft. deep.



THE CASING AFTER REMOVAL FROM THE WELL SUBSEQUENT TO SHOOTING

The original length of this joint of casing was between 18 and 20 ft., while its diameter was $5\frac{3}{16}$ in. The force of the explosion crushed or compressed it endwise until its present length is only about 8 ft. As may be clearly seen in the illustration, it shows unmistakable evidence of hard usage, but a careful examination fails to reveal a single serious fracture or flaw.

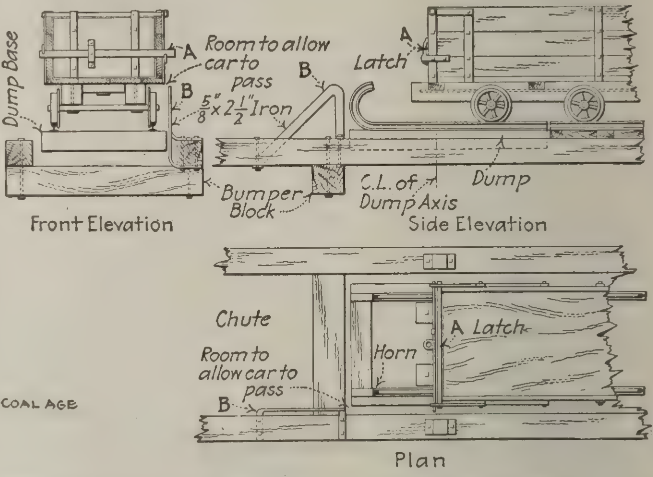
⁂

Device for Raising Mine-Car Gate Latches

By Simon H. Ash*

In most coal-mine districts of the state of Washington, the haulage arrangements and tipple equipments are such that all coal is conveyed from the workings to the tipple in mine cars. Of these there are several designs, which are usually discharged by hand from the end, over horned dumps.

The end gate is kept closed by some type of latch that must be raised before the car enters the horns; this latch is usually released by the dumper. In a great many instances, due to excessive speeds, failure to get in sprags, absence of car stops or a tight latch, a car will enter the horns with the latch closed, a continued repetition of which not only causes a considerable waste of time, but will eventually wreck the dump.



THE DUMP AND LATCH-LIFTING BAR ATTACHED TO THE TIMBERING

At the mines of the American Coal Co. the dumps are of the cradle type. The cars have a capacity of 45 cu.ft. The track gage is 3 ft., as is also the wheelbase. The car wheels are loose and 16 in. in diameter.

In the sketch is shown in plan and elevation an arrangement for automatically raising the latch of the mine cars at the dumps, the operation of which is as follows:

As the mine car reaches the dump, shown above, the end gate is closed and remains so until after the car enters the horns, whereupon it tips forward, causing the latch *A* to strike the 2½x⅝-in. strap iron *B* which moves the latch upward, thereby allowing the contents of the mine car to open the end gate.

As the car is tipping forward the latch *A* slides along the top of *B* until the car bumpers strike the bumper block. The iron *B* is long enough and sufficiently close to the car body to prevent the latch from getting caught or jammed by this iron, which would seriously hinder the dumper in returning the car.

By the use of such an arrangement no coal is scattered about before the car is dumped. The latches are always promptly opened, the tippleman has no occasion to be in front of the car while it is in motion, and the device can be adjusted to work on any type of end dump.

An Unusual Coal Market

In the face of one of the most severe financial stringencies in six years, the coal market is showing an almost unprecedented buoyancy and strength. Summer ordinarily finds the coal business at the low point for the year; consumption is light, coal difficult to sell, and buyers pound prices down to an irreducible minimum. But such is not the case this year. And it is even more difficult to reconcile the situation, because the natural supposition would be that the unsettled conditions in financial circles would tend to further depress the market.

Viewing the situation from a statistical standpoint, it is clear that the market is not being maintained by any restriction in production, as shipments for the year are showing substantial gains over those for last year. Thus the thirteen leading coal roads of the country, which handle about one-third of the entire production, show a fairly substantial increase in shipments for the first four months of the current year, the respective figures being 52 million tons in 1912, and 54 millions in 1913. Of course, this is in a measure due to the suspension in mining which occurred last year, pending the arrangement of a new wage scale. Nevertheless it is a significant fact that even with a larger production, prices are, at the same time, ruling higher. In June of last year the New York prices on soft coal ranged from $2.35 for the low-grade West Virginia steam fuels up to $3.15 for the best Georges Creek; the ruling price for this month, on the same grades, is from $2.25 to $3.25.

The shipments of anthracite naturally show a large increase for the first five months of the current year, as compared with last year, since practically the entire hard-coal production was completely cut off by the suspension in 1912. The output during this period last year was about 20 million tons, as compared with 29 million for the current year. In spite of this condition, it is interesting to note that the stocks at tide are far below those on hand at any time during the last five years, with the exception of 1912, when, of course, all available supplies were in sharp demand because of the strike. At the close of May the stocks at tide were 5,200,626 tons, the previous low record at the end of any month from 1908 to 1911, inclusive, being 6,100,916 tons.

A comparison of the lake movement into the Northwest for the year to June 1 also presents some interesting points. Of course, the greatest discrepancy occurs in anthracite, the shipments for the current year being six million tons, as compared with only 18,000 for the same period last year. Bituminous, however, also shows a most decided increase, the respective figures being 2,890,789 tons for the current year, and 1,653,922 tons last year.

It is thus obvious, as previously stated, that the market is not being artificially sustained by any policy of restriction or other conditions, and the unusual strength must be due entirely to a strong healthy consumption all along the line. The market has reached a point where forced sales, even of the lowest grade, are practically unknown, and buyers have definitely abandoned hope of forcing the producers to recede from their demand for higher prices. The situation is in part due to the restricted labor supply, but this is obviously not very severe, since the production statistics show such substantial increases in the movement of coal.

As a matter of fact, should the production be seriously crippled from this cause, it would create a rather interesting situation, and would probably precipitate a runaway market. Even as it is, the outlook for the producers during the coming fall is highly favorable, and the most conservative companies are agreed that business will establish new high records providing there is no pronounced relapse in industrial activity.

⁂

The Labor Supply

The coal industry seldom finds itself free from difficulties of one kind or another. When the demand for coal becomes urgent, and, as a consequence, prices are firm, it usually develops that the railroads are unable to cope with the heavy tonnage, or, as is now the case, the labor supply proves inadequate.

The coal market has seldom experienced such a buoyancy at this time of the year, except when abnormal conditions such as strikes, etc., have prevailed. It is difficult, however, to keep the miners at work during the pleasant summer months, for as is well known, there are few classes of people having such migratory habits as the average coal miner. The weather prevailing during the present spring has been particularly favorable to outside work and thus many of the miners have been attracted to this form of employment, with the result that complaints are general in all the mining districts that there is a pronounced inadequacy in the supply of labor.

It is thus natural that we should turn our eyes upon the inflow of immigrants into this country, as it is only in this direction that we can look for any relief so long as industrial activity continues general throughout the country. The official reports of immigration at present are highly favorable. There have already been several new high monthly records established this year, while the final figures for June promise to exceed the record for that month which was established in 1907. Another significant feature is the fact that the large steamship lines, sailing from continental ports, have found it necessary to put on extra ships during the last two months. Should there be a slowing down in industrial activity, which may be expected as an aftermath of the unsettled conditions in financial circles, it now seems probable that the country will be facing an oversupply rather than a paucity of labor.

In this connection it is interesting to review the new legislation pending, with regard to immigration. It seems now that the literacy test, by which it was proposed to restrict the influx of foreigners down to only the more desirable classes, has been definitely abandoned. But in its place there is now another bill being offered which proposes to restrict the number of aliens of any nationality to, not to exceed ten per cent. of those already residents in this country, according to the preceding census; it is provided, however, that not less than 5000 of any nationality may be admitted. Aliens returning from a temporary visit do not come under the provision of this act, nor do those coming to join near relatives; members of the professional and business classes will also be admitted without regard to these conditions.

⁂

Hydro-Electric Plants

We devote a large space in this issue to hydro-electric plants. View them favorably or not, they are certainly about to become an important factor in the development of the coal industry.

We do not believe that they will be found as disadvantageous to the coal operators as has been feared. The producer sometimes cannot keep pace with the large demand for coal in the winter. The hydro-electric plant serves to lower this "peak load," if we may so express it, as there is no lack of water power during that season. In the summer, a hydro-electric plant which is well supplied with customers may not meet the demand for power as the water is low. Then the standby plants will buy coal and they will enter the market just when the business of coal producing is dull. Thus water-power plants will serve as a flywheel for the industry in all those states where water power competes with coal, as in Maine, New Hampshire, Massachusetts, Pennsylvania and West Virginia among other states.

The disadvantages in the last two commonwealths mentioned and in others where coal is produced and where water power is available is that the water-power plants cut deeply into the market, which is fed only by one or possibly two fields. This local market is not subject to the fierceness of competition experienced in attempting to do business in more distant centers.

It is a well known fact that coal operators often look to the local market for their profits and to the more distant and larger centers of industry for the continued operation of their mines. The local hydro-electric plant tends to cut the ground under the operator's feet, still leaving him, however, the remote markets undisturbed. If it were not for this fact, the water-power central plant would be, it seems to us, a welcome visitor, for nothing is worse for the industry than feverishness in the winter and stagnancy in the summer.

It remains to be seen whether it will pay to construct water-power plants in coal regions. Unless the power developable is almost unlimited, a standby plant must be maintained and consequently the first cost is almost doubled. If the water supply is unlimited, then the cost of damming is excessive and the interest charge becomes equally exorbitant. As coal production can be made more steady, the need for a standby plant is not felt, when a carbo-electric central plant is erected.

Perhaps the coal industry would be better controlled if water-power plants increased in number and would be rendered less stable if numerous carbo-electric plants, using waste fuels, slack, bone and the like, were erected. Such plants would demand the production of higher-class coal that the lower class might be obtained as a by-product. As a result, the mines generating electric power for general manufacturing purposes would glut the market whenever the demand for coal at distant centers became low. They would have to continue operations despite the market demand in order to take care of their local patrons.

In short, the hydro-electric plant would stabilize and the carbo-electric plant might disturb the industry. Certainly coal operators may view water power more favorably than the development of oil and gas fields. The output of fuel wells is not affected by the seasons, and mine operation is made impossible by the strenuous and continuous competition thus developed and moreover the wells add dangers and responsibilities without number to other trials of the coal operator.

⁂

The Dead Level

We presume that if the question of socialism were broached in a conversation with almost any operator, he would deliver a short but effective address on the fact that the attempts of individuals to raise themselves above the mass have resulted in the betterment of humanity and that rewards should be permitted to those who earn them.

But that same operator is often a socialist when he builds his town. All his houses are the same, none are ever built any better or even any redder than the others. There are no finer houses for the man who deserves a better house and none for the man who will pay for a more desirable place of residence. The operators say to the working man: All men are equal who live here, there will be no award for merit. You may earn more money if you work more, but I will give you no better way in which to spend it.

The operator can readily see how such a method of reasoning holds back his business. The man who has no incentive to earn a larger wage has no desire to work for any more than a competency which will enable him to live and raise a family on the level of the mass of his fellows. There is no desire to keep a clean house in order to be given one of better construction with pleasanter environment.

Much as we may hate aristocratic sentiments, it has been the rise of these which has advanced civilization. The operator would do well to create such a degree of self-respect in his village as will make the better men endeavor to live more seemly lives. The democracy of the mine village is, in a way, to its credit and in a degree has been its undoing.

The foreman, the doctor and the miner often live in houses which can only be distinguished by most careful inspection, and all the residences in a mining town may be inferior in appearance at least to that which would be inhabited by a mechanic in a small town. The wage is sufficient to permit the miner to live in a good house and we have long wondered that he is almost always required to pay a rental of $6 or $8 a month when he is able to pay more and should demand better quarters.

We urge this in no revolutionary spirit, but advocate only a gradual raising of the mining communities by the building of a few houses of a better type, year by year. By renting these, on demand, to the more desirable tenants, a desire would be created throughout the mining camps for a higher standard of living.

SOCIOLOGICAL DEPARTMENT

Welfare Work Among Miners

By Ira D. Shaw*

SYNOPSIS—The miner argues that if welfare work pays the operator, the latter is trading on the pleasures, as well as on the labors, of his employees; if it does not, it is a charitable scheme and demands money, which should be expended in a wage increase. Welfare work is usually unpopular with the miner, unless he feels that he has originated it. That is why the author thinks it should not be fostered by an industrial corporation.

⁂

"Ten years ago the employer of labor thought that, when he had given his employee a fair wage, passable living and working conditions, his full duty as an employer was done. Today every employer of labor feels that he has an obligation toward his employee that mere wages, favorable working conditions, etc., do not discharge. The question is now how to deliver the goods." Such in essence was the remark made a short time ago by the president of one of our largest corporations employing thousands of men in all grades of labor from the most highly skilled down to the least trained. There never was a period in our industrial history when so much welfare work was planned and performed as at present. Many experiments have been made, good, bad and indifferent, but all with the best of motives.

For the purpose of this paper I shall define welfare work as any operation or agency which has for its aim the betterment of any and all conditions so that there may accrue as a result, increased physical, mental and moral efficiency of the individual and eventually of the body politic as well.

Character as the Ultimate Product of Welfare Work

In the coal fields there has been but little done along welfare lines until within the past few years. As a rule the operator has been busy getting out his output at a price that would enable him to meet competition, with little thought of the main factor in production, the human element, for in the last analysis the quantity and quality of the output is going to be determined, not by the kind and number of machines used, but by efficiency and reliability of the human factor, or the real agent of production. This, in its last analysis, comes down to the question of the real character of the employee.

Some of the recent investigations for which our people are getting noted, if not notorious, have brought out that after all the most important factor in all human relationships is character. This fact is just as true in the industrial as in the financial world, and the sooner it is generally recognized and provision made for it the sooner we shall see diminution of strife in the industrial world.

Miner Desires to Spend His Wages Himself

As before stated, many attempts to meet this need for increased efficiency have been made; churches, relief and burial funds, death benefits, educational work, village improvement, gardens, savings banks and many other institutions, good in themselves have been established and their value tried. Some coal companies have invested thousands of dollars in clubhouses for employees, and in some cases confess that the whole scheme is a heart-breaking failure, because the miner has the feeling that every move on the part of the operator to give him something not absolutely needed for daily toil is bound to show up against him on the payroll in some way, though he may not know or understand just how.

This feeling of antagonism between miner and operator is a real condition, and not a theory. I believe it has no adequate foundation, but arises from a misapprehension of motives. However, the feeling exists, and it must be reckoned with in planning welfare work. So far as the writer knows practically all the attempts to better the conditions of the miners have been made either by the initiative of the operator, or at least without any attempt to bring the miner into any vital relationship with its inception, or by some outside agency, such as a church or other social organization or fraternity.

No one who knows the mining industry and the life of the miner denies that he has real needs which at the present time receive very little attention. The commendable agitation for a shorter day and better pay unfortunately does not carry with it a movement which will provide for the occupation of the increased leisure time, and for encouragement to the miner to save a part of his earnings.

The Greatest Danger to Society Is in Misdirected Leisure

No man is likely to become dangerous to society so long as he is working. It is misuse of leisure that in the final analysis works ruin to our laboring men. The man who labors at hard tasks, such as a miner performs, craves something of a stimulating nature when his daily toil is done. The dangerous character of his work adds to this feeling of need for stimulation, as he works under nerve as well as muscle strain, owing to the dangerous nature of his work. The average mining community has no provision for the miner who is in this condition, so one cannot wonder that he takes the most easily procured substitute, alcoholic stimulation, and this gives him temporary relief only, and is sure to bring on detrimental reaction.

In spite of all evidence to the contrary, there are still a few operators who maintain that the miner must have alcoholic stimulation to do his work; yet a study of mine accidents shows that the greater part of them occur just after a holiday, when those who indulge in liquor are coming through the reaction stage, and are not normal physically or mentally. In some communities it is impossible to run the mines on anything like normal output for several days after the men are paid, owing to the mine employees absenting themselves to drink or to recover from their intoxication.

Note—Paper read before the West Virginia Coal Mining Institute, June 25, 1913, at Morgantown, W. Va.

The Mining Camp Provides Only for Toil and Sleep

Study any of our coal fields: What opportunity is there for any man to use his leisure time for recreation? Many communities have absolutely no semblance of any public institution, even a church, no lodge or other social possibilities. In such a community as this what chance is there for a decent man? The forces of evil are always at work, and are reaching after their victims. Naturally, they are most successful where they have no opposition.

The sooner we recognize that man has a three-fold nature and none of these elements are to be ignored in providing for his welfare, the sooner we shall solve the problem of human efficiency. The mental and moral natures must be considered just as important as the physical, and provision must be made for their development as no mere prizefighter can be a real man, though he may look much like one. So no mere drudge, without developed character can be a desirable citizen. The miner of today is just what his surroundings and those who are responsible for his environment have made him. He is no better and no worse than the miner of tomorrow will be under the same circumstances. It follows that the responsibility must fall largely on those who mold his living conditions. But the miner will react upon his surroundings and make them better or worse according to the motive and the spirit of the operator. All the miner needs is opportunity and friendly leadership, and this latter is all-important.

In some cases much money has been spent to provide clubhouses that have been poorly planned. In others there has been no thought or attempt to provide the proper leadership. In still other cases, men have felt that the company was not only commercializing their labor, but also making a profit off their leisure, even though the clubhouse was a losing venture to the company. Should space permit I could mention a number of cases where real attempts have been made to provide for the leisure time of the miner, but the employees have felt very little interest in it for various reasons.

Human Efficiency as an Outcome of Welfare Work

Successful welfare work can never be carried on without competent leadership. It is just as sensible to install the most recent and efficient mining machine, and then expect it to get results by turning it over to be operated by an ignorant foreigner, who knows nothing of machinery, as to expect a clubhouse to be successful without some competent and skilled leadership. Moreover, welfare work should never be regarded as a charity any more than the installation of uptodate machinery. No operator hesitates to engage the best engineer to lay out his mines and the various features of his operation, but the average operator seems to feel that when it comes to the very important subject of human engineering and raising the efficiency of his most vital factor, the most that is desired or needed is some sort of a place, and too often thinks that that place ought to produce revenue for his own pocket.

The miner has a right to resent any attempt to capitalize his leisure hours, and the exercise of this right has made many attempts unsuccessful. There is now, in the West Virginia fields, a clubhouse built at the expense of not less than ten thousand dollars, where there is absolutely no supervision except that exercised by the mine employees, who have no knowledge whatever of the best method of organizing such work. The operator expects the clubhouse to bring an income of one hundred dollars per month. The work has been done with the best of motives and the operator has the best interests of his men at heart, and honestly desires to serve them; but there is that undercurrent among the men which will doubtless make the success of the venture short-lived so far as the miner is concerned. The patronage will probably be limited to the officemen and the higher grade of employees. This, instead of closing up the breach already existing, makes it still wider, for one of the aims of welfare work should be to make the men of all grades feel that they, after all, have common interests and common needs.

The Need for a Sense of Possession

Successful welfare work must be coöperative so that the miner may feel a sense of proprietorship in the enterprise. Instances may be cited where welfare work under company auspices has been tried and failed, but, on turning the work over to the men themselves under trained leadership the success has been conspicuous. In all cases the emphasis is on strong and wise leadership.

Successful welfare work must avoid all appearance of paternalism and patronizing elements. The miner is an independent being, and resents any attempt to discount his independence. He feels abundantly able to take care of himself, and prefers to do it in his own way, even if it is not as well done as under a paternalistic regime.

In welfare work the initiative should lie with the miners rather than the operator. If the miners feel that they are responsible for the inception of welfare work they feel a much greater personal obligation to support it since the operation has come at their request, and not on the suggestion of the operator.

After studying the whole question of welfare work among miners, the Young Men's Christian Association feels that it has a program to suggest to mining operators that will not fail under any fair conditions. It has been working its way among miners for several years without a failure. It succeeds in enlisting practically every man in the operation in its program, and aims to meet all the social and educational needs of the community, and through coöperation with the church helps to meet the spiritual needs. It is not implied, however, that it holds the only solution to the problem, for doubtless the same method would apply under any competent organization.

The program of the Association calls first of all for an adequate building, which would include the machinery for the three-fold development of the individual. The building or clubhouse should contain shower-baths, a reading room, a bowling alley, pool tables, a hall for moving pictures and other entertainments, which hall could also be used for religious meetings, and classrooms for educational work. The entire plant should be in charge of a man trained in organizing this sort of work.

The Association would not feel justified in asking any company to provide such equipment unless at least 60 per cent. of their English-speaking white men pledge themselves to support the work after it had been established. The entire management of the work is vested in a local committee elected by the men themselves and carried on under the leadership of the general secretary. This feature gives the feeling of proprietorship which is vital to the success of the work. The fact that no work is to be done until the men have pledged themselves to its support makes them feel their responsibility for its success.

The welfare work carried on under such circumstances has brought about a complete revolution in many communities. It provides a clean place for recreation and amusement, as well as an incentive for the increase of personal efficiency. In a single instance the amount of liquor brought into a community by express was reduced from over two hundred gallons per month down to less than fifty gallons in less than three years' time. In the meantime gambling practically ceased. The entire community has put on a new aspect, and the change is noticeable even in the very countenance of the residents.

In another instance, a company had established a splendidly equipped welfare building, and maintained it as a company proposition. After being operated about two years, without success, it was turned over to the Association. The first month of the new regime showed a wonderful change. With a comparatively poorly equipped building the receipts more than doubled, while the saloon keeper in the town declared that his sales for the same month decreased something like four hundred dollars.

This clearly indicates that if the miner is given a clean place, under proper leadership, and allowed to feel that he is to a certain extent a proprietor in the enterprise, he will take care of its success. In all these clubhouses there should be a casino for the sale of soft drinks, candy, cigars and light refreshments, if needed. All these things tend to make the place attractive to the men, and bring about a generous response.

Moreover, in many communities a playground can be attached, to which the secretary can give attention. In all cases there should be provision made for any need of the community that the place can supply. The greater the sense of those requirements, the more easily the facilities may be provided. In all cases the success of the work will depend most largely upon the character and training of the person to whom the leadership is intrusted, and this, after all, is the most important feature of all successful productive operation.

⁂

Effect of Belgian Mining Law

Most of the Belgian colliery companies in their annual reports this year, make some reference to the consequences of the law, which, since January, 1912, has limited the miner's day to nine hours. The Charbonnages de Courcelles du Nord, in the Charleroi district, state that their output was about the same as in 1911—450,141 tons, against 449,714 tons—but that it was only thanks to the discovery of a new seam that a reduction was not recorded. The coal, however, was dirtier than formerly, with the result that the cost of washing increased, and new washing installations had to be erected.

At the Gosson-Lagasse Charbonnages, in the Liège district, the new law has involved a rise of 1.53 francs (29½c.) per ton in the cost price, owing to the reduction in the output, combined with loss of effective work by the men, and greater difficulties in recruiting the necessary staff, workers finding it advantageous to seek employment either in the Pas de Calais and Nord districts, where wages are higher, or in other industries not subjected to limitation of the hours of work.

The report of the Charbonnages de la Louvière et Sars Longchamps, in the Centre district, lays stress on the necessity of having larger washing installations, the coal extracted there being dirtier, in consequence of the fact that the miners work with less care than previously in order to gain the same wage in a shorter time. In 1912, the company had to pay to the French Eastern Railways penalties amounting to 27,613 f. ($5329), for 27,257 tons supplied; or 1.013 f. (19½c.) per ton, as compared with 6260 f. ($1208) for 31,412 tons, or only 0.199 f. (about 4c.) per ton in 1911, owing to the dirtier condition of the coal.

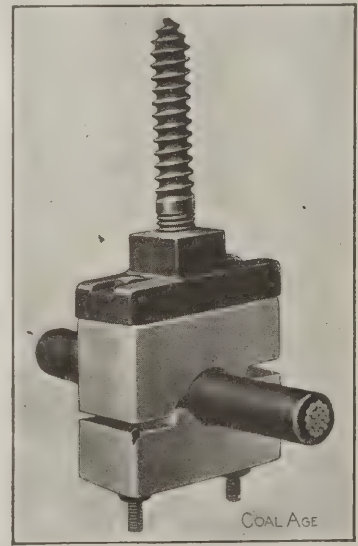
The consequences of the new law have, however, been partially offset by a sensible rise in the selling price of coal.

⁂

A New Cable Hanger

To facilitate the supporting of feeders in mines, a new cable hanger has recently been placed on the market by the Electric Service Supplies Co., of Philadelphia.

Although this device is particularly designed for suspending feeder cables in mines, yet it is adaptable for use in various other locations. It will accommodate a cable from ½ in. to 1 in. in diameter and permit its insertion or removal after the hanger proper has been permanently installed.



THE NEW HANGER

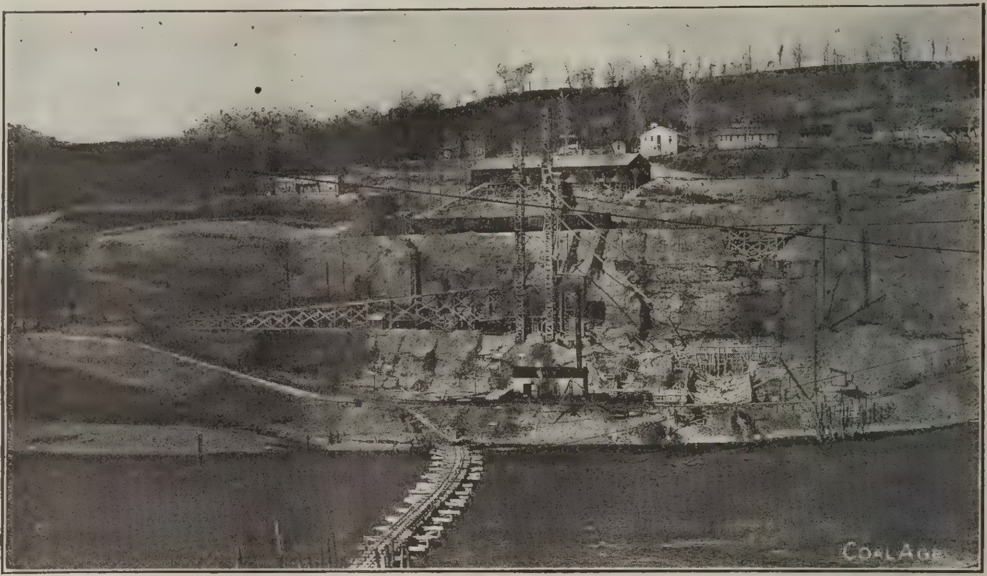
As shown in the illustration, this hanger consists of two porcelain insulators, notched and fitted together to receive the cable and clamp it squarely. These insulators are bolted together, the bolts extending through the cast-iron head which is especially designed to afford easy installation. The clamping surface of the insulators is ribbed to prevent any tendency the cable may have to slip through the clamp and damage the insulation.

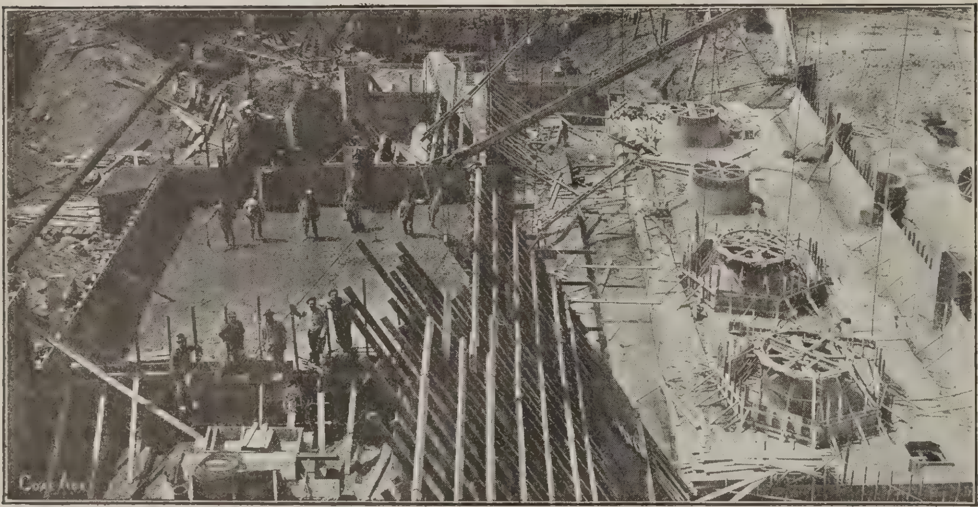
These hangers are ordinarily fitted with lag screws 3 in. long, for use in connection with wooden plugs, but for timber work a special lag screw of the same length is furnished. They may also be supported by special expansion bolts. The hangers are 3¼ in. wide by 4½ in. high, exclusive of the lag screws or expansion bolts. All metal parts are heavily galvanized to effectually withstand the action of rust, and all parts are designed to meet severe service and afford an easy means of supporting heavy cables.

The Cheat Haven Water-Power Development

A Plant Owned by the Hydro-Electric Co. Which Will Furnish Power to Compete with Coal. Visited by West Virginia Coal Mining Institute, June 24

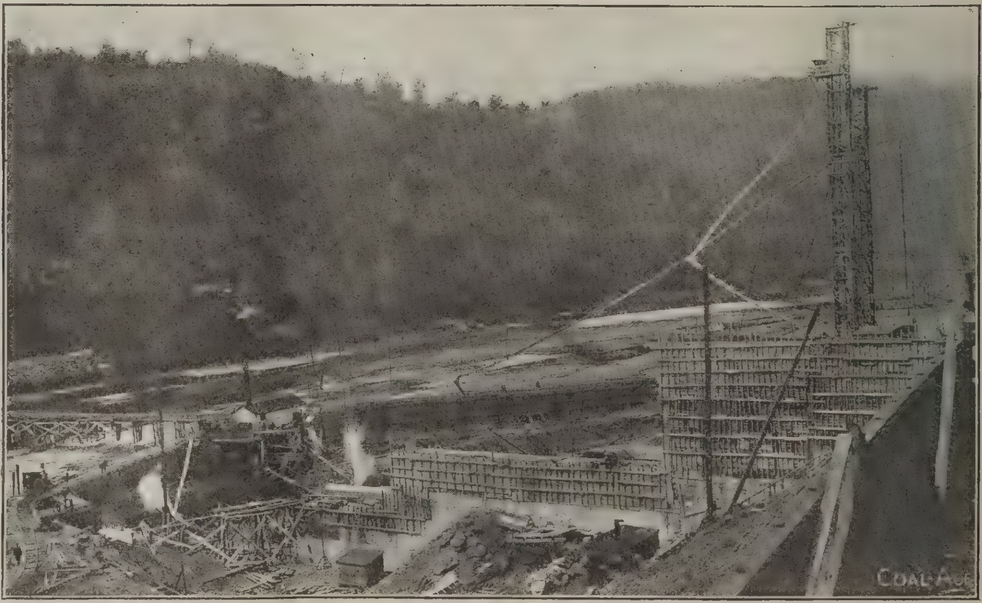
View of the west bank of the river, taken from the opposite side. Shows the T. A. Gillespie Co.'s concrete plant and the Cheat Haven & Bruceton R.R. Cheat River in foreground and at its edge cofferdam enclosing power house and a part of the dam.





View looking down on power house. Shows also bulkhead between power house and bank. One of the forms in the rear is being filled with concrete from a chute. On the right are the upper ends of the draft tubes.

View looking down the Cheat River from the east bank, showing another view of the power house and the towers from which concrete is spouted to the many forms on the left. A construction trestle can be seen crossing the river.



DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 3—In my opinion, it is not safe, under any conditions incident to coal mining, to use mixed lights in a mine known to generate explosive gas regularly or at intervals. I will offer three reasons in support of this opinion:

First, the workmen in the open-light section of the mine are liable to enter the gaseous section with their open lights and cause an explosion.

Second, the workers in the non-gaseous section where open lights are used are liable to encounter or meet an outburst of gas, at any moment, as the working faces advance.

Third, when one section of a mine is compelled to use locked safety lamps, it often creates dissatisfaction among the workmen.

It is a well known fact that few miners care to use locked safety lamps, especially when open lights are in use in portions of the same mine. The foreman often finds it difficult to get men to work in the safety-lamp section under these conditions. He will sometimes take chances and place some of the gassy workings on open lights, in order to get men to work in that section, and to advance the face equally with the open-light section.

I believe that if all mines that are gaseous or liable to encounter gas were worked exclusively with approved locked safety lamps and the miner thoroughly instructed in the use of the same and only permitted explosives were used for blasting and all places examined before a shot is fired, there would be less danger of accident from explosions of gas.

MINE FOREMAN.

Expedite, Penn.

⁂

The Air Current and Mine Explosions

Anyone reading the interesting article contributed by Mr. Verner on the Cincinnati mine explosion cannot but be impressed with the fact that the installation of large modern fans for the ventilation of mines has not reduced the fatalities produced by explosions as we would naturally expect. The opposite of this seems to be the case; that is to say, we are having disastrous explosions in mines where we would least expect them, considering the efficiency of the ventilating machinery installed.

A notable example of this was the Marianna (Penn.) explosion, Nov. 28, 1908. The Marianna was a mine that was equipped with the express purpose of being uptodate in every way and free from danger. Some of the leading mining experts of Europe had examined it about two weeks before the disaster occurred, and gave it as their opinion that the mine was all that had been claimed—a really model mine. The state inspector had just finished his examination of the mine when it exploded.

These facts have given rise to questions similar to the questions raised by Mr. Verner; but seemingly mining men, thus far, have been unable to find out the reason why such uptodate equipment fails to provide the desired immunity from fatal and terrible disasters.

The gases pent up in the coal seam and surrounding strata, under pressure, are given off more freely in proportion as the pressure is reduced. Large exhaust fans have, therefore, evidently much to do with the rate with which gas exudes from the coal and other strata. The reduction of pressure when a powerful exhaust fan is in operation also allows the gas to expand in the gobs where it accumulates in considerable volume because the air current does not reach those places. This difficulty could be overcome, to some extent, by making the fans compressive instead of exhaustive. The compressive system of ventilation produces a greater pressure against the escaping gas than the atmospheric pressure. Then, if the barometer is falling, the pressure in the mine can be increased by increasing the speed of the fan and thereby offset the dangers that arise from atmospheric changes.

On such occasions some superintendents might desire to increase the pressure (water-gage) without increasing the quantity of air passing into the mine per minute. This could be accomplished by means of a regulator placed in the main return airway (blowing system), and which could be arranged to give the same quantity of air with almost any reasonable water gage. Regulators are not generally regarded as an uptodate appliance and should not be used where they can be avoided; but, for the purpose stated, I believe they could be used to advantage.

In the west of Scotland, many of the mines give off large quantities of blackdamp and the officials have some difficulty in keeping the mines in a healthy condition, even when the atmosphere is in a normal condition; and at times of sudden atmospheric changes they have had to shut down, owing to the gas almost filling the mine. At one of the mines, the loss of time from this cause was so great that the officials decided to try a compressive fan, with the result that there was no further trouble from blackdamp. The compressive fan, in this case, was able to regulate the flow of gas regardless of atmospheric changes. Had this mine generated marsh gas and the gobs been full of explosive gas, the flow of gas from the strata and the expansion of gas in the gobs would have been as readily controlled as was the blackdamp.

In the large modern mines of today, the old workings and other places where gas can accumulate are more extensive than in mines formerly. Large abandoned places may be sources of danger from causes that are not suspected. When these places are known to contain explosive gas they are generally walled off and made safe, as a brick wall will keep anyone from entering the place with an open light and causing an explosion. But it should not be expected to absolutely prevent the gas from escaping into the roadway.

It is well known that gas exudes more readily and in greater quantity at a fault or where the strata are broken or disturbed, and this was probably the cause of a greater quantity of gas than usual accumulating at the face of the heading, in the Cincinnati mine, where it was a little later ignited. Another point that should not be overlooked is that, although the mine was free from marsh gas to the extent that open lights were used, the fact that explosive gas was known to be generated in the workings, proves that there must have been a certain small percentage of gas in the air, which with coal dust would make a highly explosive mixture, in mines circulating large quantities of pure air.

Robert McCune.

———, Scotland.

⁂

Waste of Mine Timber

The article on this subject, published in Coal Age, Apr. 26, p. 653, was particularly interesting to me, as my experience firebossing for a number of years has taught me that it is not what is *made* in coal mining as much as what is *saved* in mining operations, that makes the work successful.

The careful miner will consider that every prop, cap piece or tie lost or wasted increases to that extent the cost of the production of coal and makes it more difficult for the operator to pay good wages or to undertake needed improvements in the mine. In other words, waste on the part of the miner only makes the conditions under which he must work more disagreeable and dangerous.

I know from experience that there are thousands of good props and ten times that number of cap pieces lost and destroyed by the neglect and carelessness of the miner, who will order timber brought to his place when he has posts back in the gob that he could use if he would take the trouble to get them. In many cases, much of the blame rests on the men who select the timber and who send in sticks 4 ft. in length, instead of 4 ft. 6 in. as ordered. To avoid the annoyance of such a mistake, some miners will order a 5-ft. prop where a shorter length would do, intending to cut the stick to the proper length, which always means waste.

More care should be exercised by the room boss to see that every miner orders such timber as he can use without undue waste; and that the timber is delivered promptly to the right place by the driver; and that miners do not order more timber than they need and use what they order; and that no timber is left in the gob that can be used again.

In the mine, where I have been employed, it was the custom, as soon as a room was worked out, to send a day man into the place to get out every stick, cap piece, tie and rail that could be removed and used.

John Sutton, Fireboss.

West Terre Haute, Ind.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

PROPERTIES AND BEHAVIOR OF GASES

The symbols, molecular weights, densities and specific gravities of the common mine gases have been given in another place. The properties and behavior of these gases in the mine will be treated here from a practical, rather than a theoretical standpoint.

METHANE

This gas is commonly known as "marsh gas" or "light carbureted hydrogen," it being the lightest of the hydrocarbon gases. It is a colorless, odorless and tasteless gas. It is combustible, burning with a pale-blue flame, in the air or in oxygen. It contains no oxygen and is not, therefore, a supporter of combustion, in the generally accepted meaning of the term. A lamp flame is quickly extinguished by this gas unmixed with air. Mixed with air in certain proportions, the gas becomes explosive, the mixture being known as "firedamp." Marsh gas is not poisonous, but when unmixed with air suffocates by excluding oxygen from the lungs. The diluted gas can be breathed for a long time with no ill effects, except a slight dizziness, which quickly passes away on return to fresh air.

Marsh gas is the most common of the occluded gases of the coal formations. It seldom, if ever, occurs pure, but is mixed in varying proportions with other hydrocarbons (olefiant gas and ethane) and often with nitrogen. These mixed gases greatly modify the character and properties of the pure gas.

Marsh gas issues from the strata into the mine workings where it accumulates in quantity, unless removed by a copious air current. The most gaseous seams are those that are overlaid with a compact rock, slate, or shale that is impervious to gas and not traversed by faults, which would allow the gas to escape. Gas is generated most freely from a virgin seam and from a freshly exposed face of coal. Hence, new workings generate more gas than old workings; because, in the old workings, the gas has mostly drained from the strata and escaped.

Marsh gas diffuses rapidly into the air and other gases, the rate of diffusion depending on the relative densities of the two mediums. The question is often asked, if the diffusion of gas is so rapid how is it possible for a large body of gas to accumulate in a void place in the mine. The reason is that diffusion only takes place at the surface of contact, and is therefore limited, and the gas is being generated faster than it passes away.

Marsh gas being lighter than air tends to accumulate at the roof and at the head of steep pitches and in rise workings. It is found in such places where the air current is not sufficiently strong to sweep away the gas and in other poorly ventilated or abandoned places. Gas can generally be found at the roof or close to the face of the coal in chambers generating gas. It is detected by observing the flame of a safety lamp. If gas is present in sufficient quantity in the air a faint nonluminous cap will appear surmounting the flame of the lamp. The gas also lengthens the flame.

The Coal Age Pocket Book

FIREDAMP

All gases were formerly known to the miner as "damps," which is a word of Dutch or German origin meaning vapor or fumes. Later, as the characters of the different gases became known, they were named according to their several characteristics. The term "firedamp" was applied to any inflammable or explosive mixture of gas and air.

The word firedamp, today, in this country, means any inflammable or explosive mixture of marsh gas and air, with or without other gases. In England, the word is taken to mean any mixture of marsh gas and air without regard to whether or not the mixture was inflammable or explosive, which, however, is not its logical meaning.

When but a small amount of marsh gas is mixed with pure air the gas is so diluted that the mixture is not inflammable. In contact with flame, this small percentage of gas in the air adds to the combustion of the flame and lengthens the flame; but the flame is not propagated throughout the mixture, as the absorption of the heat by the air is too great to maintain the temperature necessary for combustion.

Lower Inflammable Limit—As more gas is added to the air, a point is soon reached where the combustion of the gas develops sufficient heat to raise the temperature of the air to that required to maintain the combustion. When this point is reached the flame causing the ignition is extended or propagated throughout the mixture. In other words, the mixture becomes inflammable, because the combustion is supported in the mixture independent of any other source. The theoretical percentage of gas in the firedamp at this point, as calculated, is slightly above 2 per cent., for dry air or saturated air. The heat absorbed by the water of saturation is so slight in comparison that it can be ignored without appreciable error. There are heat losses, however, that cannot be calculated, which fact raises the lower inflammable limit of pure marsh gas to about 5 per cent.

Effect of Dust and Other Gases—Owing to the fact that marsh gas is rarely, if ever, found pure, but is generally mixed with dust or other gases or both, it is never safe to work with open lights, in air containing more than 1 per cent. of gas, in bituminous mines; or 2½ per cent., in anthracite mines.

Gases are divided into two general classes, in respect to the effect they produce on the inflammability of firedamp. Gases having a lower ignition point than marsh gas, as for example, carbon monoxide, hydrogen sulphide, ethane and olefiant gas, lower the inflammable limit of firedamp, as given above. Fine coal dust floating in the mine air has a similar effect, in proportion as the dust is highly inflammable. On the other hand, extinctive gases such as nitrogen and carbon dioxide raise the limit given above.

In the working of bituminous mines, coal dust is a most dangerous factor, especially when the coal is highly inflammable. In many cases, the finely divided dust produces an explosive atmosphere even when no gas is present. The presence of such dust in the mine air, acted on by the flame of a blownout shot, is certain to cause trouble.

INQUIRIES OF GENERAL INTEREST

Effect of Carbon Dioxide on Flame of Carbide Lamp

What is the effect of carbon dioxide in the mine atmosphere, on the burning of the acetylene lamp?

CARBIDE.

Shenandoah, Penn.

Carbon dioxide (CO_2), being an incombustible gas, acts when present in the atmosphere not only to dilute the air and thus reduce the percentage of oxygen present; but, with the nitrogen of the air, absorbs a considerable proportion of the heat developed by the combustion. The acetylene gas is the combustible and the oxygen of the air the supporter of combustion. The reaction that takes place is as follows:

$$2\,C_2H_2 + 5\,O_2 = 4\,CO_2 + 2\,H_2O$$

The reaction shows that the acetylene flame, like other flames, is dependent on the oxygen of the atmosphere for its combustion; but not necessarily to the same degree as other flames. The acetylene flame, like the hydrogen flame, is more tenacious than either the candle or oil flame. In other words, the acetylene flame will continue to burn in an atmosphere where other flames are extinguished. This fact has been observed in the mine, in places generating blackdamp. Blackdamp is composed largely of a mixture of carbon dioxide, nitrogen and oxygen. The percentage of oxygen in blackdamp is, therefore, much below the normal percentage of oxygen in the atmosphere. Blackdamp, as found in the mine, is an *artificial atmosphere* and generally contains sufficient oxygen to support the burning of the acetylene flame. In such an atmosphere it requires 50 per cent., more or less, of carbon dioxide to extinguish the flame of the acetylene lamp.

When the acetylene lamp, however, is placed under a bell jar and allowed to burn until it is extinguished, the percentage of carbon dioxide in the air within the jar has been found to be 6.3 per cent. This is called a *residual atmosphere,* much of the oxygen of the air having been consumed by the combustion of the flame. In this connection, the article, "The Carbide Lamp and Carbon Dioxide," COAL AGE, Vol. 2, p. 128, will be of interest to those studying the subject.

Experiments were recently made at the U. S. Federal Testing Station, Pittsburgh, to compare the burning of the Taylor acetylene lamp with that of a candle. In these experiments, the candle was first placed under a bell jar and allowed to burn until it was extinguished, the time required being 1 min. 59 sec. The Taylor lamp placed alone under the same bell jar burned 2 min. 2 sec., when it was extinguished. The candle and lamp were then placed together under the same bell jar, the lamp having a small flame. In this case, the candle was extinguished in 47 sec., while the lamp burned 3 min. 9 sec. The same experiment was then performed, the lamp having a large flame. The candle burned 29 sec., and the lamp was extinguished in 1 min. 18 sec.

Fan Ventilation

Kindly explain in COAL AGE for what purpose the Pitot tube is used in fan ventilation.

READER.

Belleville, Ill.

The Pitot tube has been used, in recent years, for determining the velocity of the air current more accurately than can be determined by the use of the anemometer, in making fan tests. The Pitot tube is a simple tube of small bore about ½ in. in diameter, attached to the water-gage tube and used in connection with it, to determine the velocity head of the air current from which the velocity of the current may be calculated.

As is well known, the water-gage tube should be so arranged that the air current will pass its mouth at right angles to the length of the tube; and often a thin plate is fixed to this tube flush with its mouth so as to direct the current of air in a direct line across the mouth of the tube and prevent any tendency of the air either to enter the tube or draw away from the tube. By this arrangement the tube measures only the static pressure of the air current.

The end of the Pitot tube, however, is bent in the direction of the advancing current, so that the full force of the current is directed into the mouth of the tube. When so arranged, this tube measures the entire pressure producing the flow of the air, which corresponds to the sum of the pressure head and the velocity head.

Now, if the first tube is connected with one arm of the water gage, and the second tube with the other arm of the same gage, it is evident that the reading of the water gage will measure the difference of these two pressures, which is the pressure due to the velocity head, expressed in inches of water gage.

The velocity is then calculated from the reading of the water gage, the calculation being based upon the fundamental equation $v = \sqrt{2\,gh}$. It must be remembered, however, that in this equation, v is the velocity in feet per second and h the head of air column in feet, g being the value of the force of gravity (32.16), i the gage, and water being 815 times as heavy as air.

$$v_{ft.\text{-}sec.} = \sqrt{2\,g\,h_{ft.\ air}}$$

$$v_{ft.\text{-}min.} = 60\sqrt{\frac{2 \times 32.16 \times 815\,i}{12}} = 3965\sqrt{i}$$

Or, for any other gage than water, specific gravity $= G$.

$$v_{ft.\text{-}min.} = 3965\sqrt{Gi}$$

The velocity head is a comparatively small reading in a water gage, and, to increase the accuracy of the results, it is advisable to use either alcohol or petroleum instead of water, in the gage. In either case, the specific gravity G of the alcohol or the petroleum should be carefully determined. As an illustration, taking the specific gravity of petroleum as 0.878, a gage reading of $\frac{1}{16}$ in. would indicate a velocity of 928 ft. per min.

EXAMINATION QUESTIONS

Miscellaneous Questions

Answered by Request

Ques.—A shaft 500 ft. deep is full of water; what is the pressure per square inch and per square foot, at the bottom of the shaft, due to the weight of the water?

Ans.—The pressure due to the weight of the water is found as follows:

$$500 \times 62.5 = 31{,}250 \textit{ lb. per sq.ft.}$$
$$500 \times 0.434 = 217 \textit{ lb. per sq.in.}$$

Ques.—(a) How many 3-in. pipes will present a sectional area equal to that of one 12-in. pipe. (b) If all the pipes are of equal length, will this number of 3-in. pipes discharge more or less water, in a given time, than one 12-in. pipe, and why?

Ans.—(a) The sectional areas of these pipes are:

One 12-in. pipe, $0.7854 \times 12^2 = 113.1$ sq.in., nearly.
One 3-in. pipe, $0.7854 \times 3^2 = 7.07$ sq.in., nearly.

The number of 3-in. pipes, therefore, required to give the same sectional area as a single 12-in. pipe is $113.1 \div 7.07 = 16$ pipes.

(b) Approximately, the discharge of a pipe line, for a constant head, varies as the square root of the fifth power of the diameter of the pipe. In other words, the discharge ratio is equal to the square root of the fifth power of the diameter ratio. Indicating the discharge of one 12-in. pipe by G_{12}, and the dischargee for sixteen 3-in. pipes by 16 G_3, the ratio of discharge, in this case, is

$$\frac{G_{12}}{16\,G_3} = \tfrac{1}{16}\sqrt{\left(\frac{12}{3}\right)^5} = \tfrac{1}{16}\sqrt{4^5} = \frac{\sqrt{1024}}{16} = \tfrac{32}{16} = 2$$

This shows that one 12-in. pipe will discharge twice the quantity of water that sixteen 3-in. pipes will discharge, under the same head and for the same condition of the pipes, the length of all the pipes being equal. The reason is that sixteen 3-in. pipes present a very much larger rubbing surface, which increases the friction and decreases the quantity of the flow.

Ques.—What are the essential features to be observed in building and maintaining mine roads, in order to secure the safe, speedy and economical handling of the coal?

Ans.—When laying out a permanent mine-haulage road, it is advisable to straighten the entry as far as practicable by taking off a "skip" on the rib, where the entry has not been driven on line. It is also well to bring the roadway, as far as practicable, to a uniform grade that will favor the movement of the loaded cars. The most economical grade for this purpose is 1½ per cent. When this has been done, the road should be well timbered and drained and the roadway ballasted, especially where motor or rope haulage is employed. The track ties should be spaced an equal distance and not too far apart, so as to provide a good bedding for the rails. Iron rails should be used on all main-haulage roads, and the weight of the iron should be adapted to the weight of the loaded cars and motors. There is no economy in using too light rails. The haulage roads should be of sufficient width to afford a clear passage of not less than 2 ft. on at least one side of the track; but where this is impracticable, refuge holes should be cut in the rib, at short intervals. All roadways should be regularly cleaned at frequent intervals of time.

Ques.—Explain the method of calculating the percentage of gas in an air current.

Ans.—The percentage of gas in mine air is determined by observing the height of the flame cap, in an approved safety lamp exposed to the gas. It has been the custom among firebosses to guess at the height of the flame cap. The best results, in testing, are obtained by the use of a lamp having a free upward circulation of air. The air should enter the lamp at a point below the flame and, ascending, pass out through the gauze chimney. The lamp most commonly used in testing is the unbonneted Davy lamp. When such a lamp is used, burning sperm or cottonseed oil, the percentage of gas (J) may be calculated from the height (h) of the flame cap, in inches, by means of the formula

$$J = \sqrt[3]{36\,h}$$

For example, if the height of the flame cap is ¾ in., $h = 0.75$; and the percentage of the gas, in this case, is

$$J = \sqrt[3]{36 \times 0.75} = \sqrt[3]{27} = 3 \text{ per cent.}$$

It is often difficult to obtain a good average test for gas, in a strong air current. In such a case, it is necessary to shield the lamp from the direct force of the current and obtain a number of readings, in different parts of the airway, in order to secure a good average reading.

Ques.—Assume that a pair of headings, each 5 ft. high and 8 ft. wide, is being driven to the rise, on a grade of 10 per cent., and one of these headings is standing waiting for the crosscut, which is almost through, when the fireboss reports that the idle heading is filled with gas to within a foot of the bottom, at the face. Calculate the quantity of gas in the heading.

Ans.—The thickness of the seam being 5 ft., if the gas is observed 1 ft. from the bottom, at the face, there is $5 - 1 = 4$ ft. of gas, at that point. Then, the rise of the heading being 1 in 10, the distance the gas reaches back from the face is $4 \times 10 = 40$ ft. The section of the heading filled with gas is in the form of a wedge measuring 4 ft. on end and 40 ft. on the base and 8 ft. wide. The volume of this space is $\frac{8 \times 4 \times 40}{2} = 640$ cu.ft.

This method of measuring gas is that commonly employed by firebosses, but is only suggestive of the relative amount of gas present. As a matter of fact, there is no definite gas line above which all is gas and below which all is air. The point at which the fireboss reports gas is the point where he first observed the cap in his Davy lamp, and represents, approximately, 2.5 per cent. of gas. Above this poinut, the percentage of gas increases and below it decreases.

COAL AND COKE NEWS

Harrisburg, Penn.

A bill has been introduced amending the act which provides that wash houses be established at all collieries, when application is made by 20 or more men, and compels the company to erect a suitable place for men to wash and change their clothes after coming out of the mines; the amendment reads that the petition of the men must be complied with 8 weeks after making application. This bill passed the House and is now in hands of the Senate Committee on Mines and Mining.

The McKay bill making it unlawful to discharge into any running stream, any coal, culm, mine refuse or ashes, has been sent to the Governor the second time, for it was recalled a few days ago to be amended, the amendment striking out the word "ashes."

The bill does not apply to water pumped or flowing from any coal mine where the coal, clum and refuse have been removed therefrom, nor does it prevent the discharge of sewage from any public sewer system owned or maintained by any municipality.

The bill carries a fine of $100 for each offense and $50 for each day that the offense is maintained, or imprisonment not exceeding one month, or both at the discretion of the Court.

The purpose of this bill is to eliminate the polluting of streams in the anthracite coal region with culm, etc., which in times of high water washes onto the farmlands lying along the several rivers and creeks, resulting in suits for damages.

On July 1, a hearing will be held by the United States District Court in Philadelphia of the suit brought by J. B. Coryell, trustee in bankruptcy for Dimmick & Co., against a number of officials of coke manufacturing companies of Uniontown, Penn., alleging a conspiracy in restraint of trade.

The men against whom suit is brought, are Isaac W. Seamans., J. P. Brennan, C. E. Lenhart, A. P. Austin, R. W. Fry, Julian Kennedy, J. H. Hoover, G. D. Harrarh, J. W. Abraham, E. H. Abraham, R. W. Gilmore, G. B. Gilmore, L. W. Fogg, W. G. Rock, John Harding, G. D. Howell, J. V. Thompson and Wiley L. Byers. The alleged conspiracy it is charged is a violation of the Sherman anti-trust laws.

Dimmick and Co., before their bankruptcy last March were dealers in coke, having offices in Uniontown, Philadelphia and Cleveland, Ohio and doing a business, it is declared, of about $4,000,000 to $5,000,000 a year. They received most of their coke from ovens at Uniontown, owned and operated by the defendents in the above suit, and had contracts, it is alleged, for long terms with the companies of which these defendents are officials.

The charge is made that a combination was formed not to sell any more coke to Dimmick and Co., and it is alleged that they organized a selling company, called the Consumers Co., and, further, that they raised the price of coke from $1.70 to $4 a ton. Owing to the great increase in price, Dimmick and Co., refused to buy. The Consumers Co. took the coke thus refused by Dimmick & Co. and sold it.

Dimmick & Co., charge that they had contracts to meet, and in order to fulfil them had to buy coke at the greatly increased price. The result, they say, was a loss of $400,000 so that they were forced into bankruptcy. They now seek reparation for their loss, and claim that the sole object of organizing the Consumers Co. was to drive them out of business.

This is commencement month in the anthracite coal fields as well as at the great universities and colleges of the land The boys who receive their diplomas from the various technical schools have in the majority of cases only a vague idea of just what use they will make of their education. On the other hand, the young men ranging in age between 20 and 30 who have passed the examination of the technical schools maintained by the various anthracite companies and the Y. M. C. A., with the coöperation and financial assistance of many of the operators, have an extremely definite idea of what use they will make of their added knowledge.

These are the men who will earn more money because they are better fitted for the many positions in and about the mines for which special training is not only advisable but often necessary. These are the men who will save human lives, since it is the men familiar with such subjects as mine gases, mine ventilation, mine law, mine surveying, electricity and magnetism, mechanics, compressed air and kindred subjects who are best fitted to keep the mine safe and warn the uninstructed and ignorant of the dangers in their way.

These are the men who can save money for the public which must ultimately pay for the increased cost of mining due in some degree to the blunders of an ignorant past. These are they who can raise the standard of living in the anthracite coal fields and the operators are welcoming their awakening to the opportunities of the schools as it makes for better citizenship, more efficient labor and greater contentment.

This does not in any way detract from the value and dignity of our great universities. The students in these technical schools make more definite and immediate use of their opportunities than the average college graduate. The education acquired in the anthracite coal fields is secured in evenings of study after days of labor in the mine, and therefore is valued at its true worth.

In coal mining, as in many other walks of life, a man's efficiency depends largely upon his knowledge of the subject in hand and his ability to use that knowledge to the best possible advantage.

PENNSYLVANIA

Anthracite

Bloomsburg—Judge Evans of the Columbia County Court has granted a preliminary injunction against the Midvalley Coal Co., restraining it from mining coal on Columbia County land, which the Lehigh Valley Coal Co. claims. Back of this action is a controversy for title to a vein of coal which was discovered by Lehigh Valley engineers and is conservatively estimated to be worth $1,500,000. There has been some confusion about the leases to this property and the Lehigh Valley Co. claims that the Midvalley people have disregarded warnings not to mine the coal and have already sunk a tunnel into the property.

Hazleton—The State Railroad Commission has dismissed the complaint filed against the Lehigh Traction Co. demanding that cars be run exclusively for miners between Hazleton and Freeland. In so doing the Commission held that the traffic does not justify special cars since the miners quit work at different hours. The complaint admits that the company has separate compartments in its cars for miners returning from work, but the Commission holds that there is no way to prevent an occasional overflow which brings the miners in contact with other passengers.

Harrisburg—Although Senator Wm. E. Crow, of Fayette County, is quoted as saying that no settlement upon the controversy arising over the Workmen's Compensation Bill is in sight, it has been reported on good authority that a plan which may prove acceptable is being evolved and a final effort will be made to bring about the enactment of the measure.

A bill has been passed relating to the dockage of anthracite coal at the mines on which to compute the earnings of the miners.

Philadelphia—The strike of the Reading car repair men has as yet had no preceptible effect upon the coal tonnage handled by that railroad. The Reading authorities say that as things now stand they can get along with the force as reduced by the strike for a considerable time.

Pottsville—Rumor has it that the Mill Creek Coal Co. contemplates opening the coal measure in the Wolf Creek Valley north of St. Clair. The openings will be made west of or below the new reservoir recently constructed by the Pottsville Water Co., and hence will in no manner injure the quality or lessen the quantity of the supply.

Bituminous

Greensburg—The first-aid contest of the Keystone Coal & Coke Co. for the cup presented by L. B. Huff was won by the Arona team with a score of 99¾. Three teams tied for second place and the prize of $40, the money being divided among Keystone Shaft, Carbon and Saley. The Greensburg team took third place and a prize of $20.

Cairnbrook—At the new operation of the Lackawanna Coal Co. coal is being removed but is stored in cars on the ground, as the Pennsylvania R.R. has not yet completed its extension up Shade Creek. It will possibly be the middle of July before any shipments can be made. It is probable also that the Berwind-White Coal Mining Co. will soon start to operate in this territory and a large tonnage will, therefore, be taken out.

Pittsburgh—Word has just been received in coal and railroad circles here that the Coleman tract of land in the Allegheny Valley just west of Rimersburg, comprising about 9000 acres, has been purchased by a syndicate of Philadelphia capitalists. With the development of this property a new railroad will be built to haul the output, thus bringing heavy coal supplies into the market. About 800 men will be employed in the preliminary work.

Universal—A fire occurred on June 22 which caused damage to the amount of approximately $25,000 and was extinguished only after a bucket brigade of 500 men had fought it for four hours. The fire broke out in the kitchen in the home of Emil Elovich, a Lithuanian, at about two o'clock a.m. The entire family, father, mother and five children, made their escape down a ladder from the second story. The flames spread rapidly from house to house before the town could be awakened.

Bellefonte—During a heavy thunder storm on June 25, the lightning struck one of the rails of the track of a coal mine near Clarence. The current traveled down the rail into the mine, killing one man and injuring three others.

Connellsville—Two unknown men were run down and killed by a coke train on the track of the Davidson ovens near here June 26. Shortly before the accident the men wandered onto the property and told the workmen that they merely wanted to see the coke ovens. It was raining and they climbed on the ovens to dry their clothing. Not being familiar with the making of coke the men did not know that the small coke engine and cars pass over the tops of the ovens.

Active operations in the Greene County portion of the lower Connellsville coke region have been begun. The Portland Coke Co. has 50 of its 100 ovens completed and has begun shipping some coke. The Reliance Coal & Coke Co., which is building 400 ovens just below Brownsville, will begin shipments in a couple of weeks.

WEST VIRGINIA

Charleston, W. Va.—An official call for a strike of miners in the New River coal field was issued June 25, from the local Headquarters of the United Mine Workers of America. This order is to be effective July 1. Several thousand copies of the call for the strike have been ordered printed and will be distributed throughout the district within the next few days. Coal operators in the New River field have asked that these copies be recalled in the hope of reaching some terms which will avoid a strike.

The miners of the Paint and Cabin Creek coal fields plan to enter suits for heavy damages against those responsible for the killing and wounding of miners and members of their families during the recent labor troubles. One of the suits of principal interest will be that of Mrs. Maud Estep, the widow of Susco Estep, the young miner who was killed by a bullet while getting his wife and children to a place of safety. This shooting occurred at Holley Grove on Feb. 7.

Bluefield—It has been learned that a new coal company has been organized and will be in operation within a short time. This company will be known as the Trace Fork Coal Co., and will be located at Mullen. Side-tracks are now being laid. The Pocahontas No. 3 seam will be worked and everything is being rushed for the opening of the new mine.

KENTUCKY

Jenkins—The Consolidation Coal Co., now building a veritable city at Jenkins, has begun work on a $30,000 hospital at that place, which will be the largest institution of the kind in the northeastern section of the entire state. The new hospital will take the place of the temporary building erected there two years ago.

TENNESSEE

Nashville—The Nashville Traffic Bureau is looking for a decision by the Interstate Commerce Commission in the Nashville coal rate case. A decision has been expected in this case for some time and is awaited with much interest. A material reduction is sought in the rates on coal, it being maintained that there is discrimination against Nashville in this commodity.

South Pittsburg—The Rexton coal mines, owned by the Tennessee River Coal Co., are making preparations in order to begin working by the time the coal season begins in the fall.

OHIO

Cincinnati—There are numerous indications of a volume of business this summer and autumn which will exceed in value and tonnage all records that have yet been made. Orders for coal are said to be far beyond those of other years at this season, and the railways, both East and West, will probably be taxed to their utmost in order to meet their requirements.

Crescent—Two mines in the eastern Ohio coal fields went on strike June 24, throwing 600 men out of work. The men employed at Gaylord mine No. 2 struck on account of the refusal of the company to recognize the uniform outside wage agreement, while the exact nature of the trouble arising at the Crescent mine of the Lorain Coal & Dock Co. over which the men quit work has not been ascertained.

Brilliant—The Royal Coal Co., which controls a large acreage south of Brilliant, is shortly to open its mine which was projected several months ago. At that time trouble was met in securing the right of way for the mine siding, and the opening was delayed considerably on that account. Settlement of this difference has been effected, however, and development of the property will be started soon.

ILLINOIS

Benld—Considering output the three mines of the Superior Coal Co. near here are among the largest in the world. Mine No. 1 is averaging 3500 tons daily and on May 23 last hoisted 3808 tons. Mine No. 2 set a new monthly average in April of 4059 tons daily. During May mine No. 3 averaged 4061 tons a day, or 105,507 tons for the month. On June 6 the three mines broke all previous records, hoisting 12,294 tons.

Carlinville—The Superior Coal Co. have returned the options taken some time ago on land southwest of Benld, as it has been decided to postpone the sinking of shaft No. 4 for an indefinite period. The increased tonnage of the present mines and the extension of the road to connect with the mine at Staunton is the reason assigned for this decision.

IOWA

Knoxville—It has long been known that a vein of coal underlies the village of Pleasantville at a depth of between 300 and 400 ft. S. C. Frost has interested capitalists and raised money upon popular subscription for the purpose of prospecting. He has also employed Knoxville prospectors for this work.

NORTH DAKOTA

Minot—According to the latest reports from the Northern Briquetting Co., lignite briquettes will probably be produced in Minot by Sept. 1. The above named company owns 700 acres of lignite coal land near Burlington and is establishing a plant near the crossing of the Great Northern and Soo line tracks. The necessary briquetting machinery has been ordered and it is expected that the plant will have a capacity of at least 75 tons in a working day of 10 hr.

ARKANSAS

Fort Smith—A number of coal miners were reported entombed after an explosion in a mine at Jenny Lind. Ark., 12 miles south of Forth Smith June 24. It is understood that aid was summoned from the mine rescue station at McAlester, Okla.

OKLAHOMA

Venita—A company from McAlester has unloaded a prospecting drill at Blue Jacket and prospecting for coal will be started at once. No attention will be paid to oil or gas, but a prospect hole will be sunk on the west side of the town in the hope of getting a little closer to the railroad. This will be put down to a depth of at least 400 ft.

ARIZONA

Phoenix—The first of a number of petitions to initiate a law excluding all but English-speaking workmen from the mines of Arizona was filed June 21 with the Secretary of State. Petitions are being circulated in every mining camp and it is believed that the necessary 2168 names will be secured to place the measure before the people at the election in 1914.

FOREIGN NEWS

Cardiff, Wales—The strike called by the miners as a protest against non-unionism in the mines narrowed its area a week from its proclamation to the Rhondda Pit of D. Davis & Sons. The men still on strike, numbering 7000, are receiving financial support from the Miners' Federation.

New Hazleton, B. C.—An active campaign of development in the Kitseukla coal field has been undertaken by J. W. Hart and Wm. McDonald. These prospectors staked their claims last summer and say that they have one seam of coking coal 7½ ft. thick, upon which they will do most of their work. Another bed 2½ ft. thick is reported to be anthracite of good quality.

PERSONALS

Ernest Hutton, of Clarksburg, W. Va., has been recently appointed superintendent of the power and mechanical department for the Elkhorn Mining Co.

D. A. Thomas, English coal magnate from Cardiff, Wales, has been recently visiting various coal operations in the Pocahontas and Winding Gulf district of West Virginia.

H. B. Douglas has been appointed acting general manager in charge of the operation of the Clearfield Bituminous Coal Corporation, with headquarters at Clearfield, Penn. This appointment was made on account of the death of A. R. Shillingford, vice-president and general manager of the company.

J. F. Healy, formerly of Elkins, W. Va., has opened a consulting mining engineering office in Room 1201, Union Bldg., Charleston, W. Va., and proposes to make a specialty of reports on coal lands and subjects relating to coal mining for banks, trust companies, and investors generally, as well as other engineering business. Mr. Healy is a graduate of the Pennsylvania State college, with many years experience in mining engineering in Washington, Montana and West Virginia, as well as for years acting as general superintendent and manager of operations. He also acquired an intimate knowledge of the minutia of coal mining as a boy.

OBITUARY

Edward Nelson Saunders, aged 68 years, prominent in the coal industry of the Northwest and interested in several St. Paul financial institutions, recently died at his home in that city. He is survived by a wife, three daughters and one son.

Peter Donaldson, a partner in the firm of James Watson & Co., also President and Managing Director of the Dayton Coal & Iron Co., of Dayton, Tenn., and a heavy stockholder in the latter company, drowned himself June 24 at Kilcreggan, a watering place on the Clyde. The firm of James Watson & Co. suspended payment on June 11 and the Dayton company made a consignment shortly afterward. It is believed that Mr. Donaldson's act was the result of these business reverses.

COAL AND COKE PATENTS

Gas Producer—W. Hammick, Pittsburg, Kan., 1,060,755, May 6, 1913. Filed July 16, 1912. Serial No. 709,751.

Hoisting Bucket—A. Wirsing, Milwaukee, Wis., 1,060,730, May 6, 1913. Filed Dec. 12, 1902. Serial No. 736,260.

Coal Bit Sharpener—A. T. Upton, Mount Vernon, Ill., 1,061,149, May 6, 1913. Filed Aug. 5, 1912. Serial No. 713,424.

Coal Boring Machine—W. J. Hinds, Grant Town, W. Va., 1,060,840, May 6, 1913. Filed June 29, 1912. Serial No. 706,767.

Superheater for Locomotive Boiler—J. Primrose, New York, N. Y., 1,060,360, Apr. 29, 1913. Filed Mar. 9, 1911. Serial No. 613,349.

Apparatus for Superheating Steam—E. H. Foster, New York, N. Y., 1,060,334, Apr. 29, 1913. Filed Sept. 1, 1911. Serial No. 647,141.

Stoker—H. E. Stover, assignor to Baldwin Locomotive Works, Philadelphia, Penn., 1,060,036, Apr. 29, 1913. Filed May 22, 1912. Serial No. 698,904.

CONSTRUCTION NEWS

Whitesburg, Ky.—An Eastern syndicate has just purchased 5000 acres of rich coal land along lower Parr's Fork on the Knott-Letcher border and is planning an early and extensive development of the property.

West Newton, Penn.—The Connellsville Coke & Fuel Co., is pushing work on the erection of an 80 oven coke plant to develop 105 acres of Ligeonier Valley coal recently bought from ex-judge Charles G. Steel and other Greensburg men.

Lisbon, Ohio—Over two thousand acres of valuable coal land lying north of West Point and along the right of way of the Youngstown and Ohio River Railroad Co., will be extensively developed by the Kirk-Dunn Coal Co., of Cleveland, in the near future.

Birmingham, Ala.—The Pratt Consolidated Coal Co. that recently purchased the properties of the Milner Coal Co. of New Castle, is remodeling No. 6 mine, erecting a temporary tipple and preparing to resume the operation of this development in the near future.

Charleston, W. Va.—T. M. McClenahan, of Charleston, W. W. Keefer, of Pittsburgh, and John Sargeant, of Cincinnati, Ohio, will develop coal lands near Charleston, and are installing a plant to produce 2500 tons daily. The initial cost of this installation will be between $250,000 and $300,000.

Washington, D. C.—Work on the new building of the Bureau of Mines in Pittsburgh for which the last congress appropriated $500,000 is expected to be under way soon. W. G. McAdoo, Secretary of the Treasury, has asked Congress for an emergency appropriation of $15,000 to pay for surveying the plot adjoining Schenley Park which the city gave the government in exchange for the Arsenal site in Lawrenceville.

Edinburgh, Scotland—The Udston Coal Co. is now leasee of the three coalfields in East Lothien, Riggenhead, St. Germains, and Penston, covering a space of about three miles in length. The management met recently to consider the question of erecting 200 to 300 workmen's houses, half of them to be at Macmery, and half at Tranent. At Tranent and Elphinstone, which, when completed, will be productive pits in East Lothien, several hundred additional houses will be erected by the company.

Lexington, Ky.—Over $40,000,000 will be spent in the development of the property of the Elkhorn Fuel Co. within the next few months. It is proposed to build three new mining towns; one on Potters' Fork a mile from the main line of the Lexington and Eastern, which will be reached by a branch line, one on Wright's Fork, and one near Neon, the two last named being on the Lexington & Eastern main line.

Orders for millions of feet of lumber have been placed, two large band saw mills and several planing mills will be installed to work up native lumber, and a brick plant of considerable capacity will be built and its output used in constructing the new cities.

NEW INCORPORATIONS

Connellsville, Penn.—The Lake Trade Coal Co. has been organized at Windber with a capitalization of $25,000.

Columbus, Ohio—The Citizens Ice, Coal & Supply Co. has been organized with a capital of $40,000 at Sidney by Milton Bennett and others.

Osceola, Ark.—A charter has been granted to the Gay-Orr Coal & Ice Co., capital stock $25,000. The incorporators are B. F. Gay, W. E. Orr, and B. I. Gay.

Pittsburgh, Penn.—The Milburn Coal and Coke Co. a corporation organized under the laws of the state of West Virginia has discontinued business and dissolved.

London, Ohio—With a capital stock of $50,000 the Davies Block Coal Co. has been organized by W. B. Catching, McCall Fitzgerald, Sam G. Hardin and M. M. Elliott.

Louisville, Ky.—Amended articles of incorporation have been filed with the county clerk changing the name of the firm of Joseph Walton & Co. to the Pittsburgh Coal Co.

Louisville, Ky.—The O'Donnell Coal Co., capitalized at $50,000 has been incorporated. The founders are Joseph O'Donnell, and M. Lanning. The company will do a general coal mining business.

Kittery, Nova Scotia—The Nova Scotia Coal Iron and Railway Co. has been organized with a capital of $500,000 to carry on the business of mining all kinds of minerals. H. Mitchell is president, and H. A. Paul is treasurer.

Nashville, Tenn.—A charter has been issued to the Flat Creek Coal & Coke Co., of Knox county. The concern has a capital of $50,000 and the incorporators are Thomas Pruden, J. C. Gaut, G. N. Hacker, P. H. Smit, and J. M. Meek.

Charleston, W. Va.—The Coöperative Coal Co. of Charleston, has been organized with a capital of $15,000 to deal in coal lands. The incorporators are C. T. Davis, F. W. Johnson, T. E. McCoy, W. H. King and G. V. Rainey, of Charleston.

Wellsburg, W. Va.—The Ohio River Co. of Wellsburg has been organized to mine and deal in coal and other products. The incorporators are B. Cochrane, Elmer Hough, Robert Wheeler, John K. Paullas, and H. A. Stengle, all of Wellsburg.

Manhattan, Kansas—A charter has been granted to the Manhattan Lumber and Coal Co. with a capital stock of $25,000. The incorporators are, I. L. Inskeep, George E. Cragg, Oliver A. Hutchins, George W. Myers, and M. L. Hastings.

Wilmington, Del.—The General Fuel and Power Co. has been organized with a capital stock of $800,000 to operate coal mines, to manufacture ice, cement, gas, etc. The incorporators are H. E. Robinson, J. Jacobs and Harry W. Davis, all of Wilmington.

Wheeling, W. Va.—The Monroefield Coal Co., has been organized in Morgantown to develop coal lands in Monroe County, Ohio. The capital stock is $10,000 and the incorporators are J. Martin, W. J. Snee, M. C. Martin, E. P. Weaver, and B. C. Weaver of Morgantown.

Charleston, W. Va.—The Elma Mining Co. of Charleston has been incorporated to develop coal lands in Fayette County. The capital stock is $50,000 and the incorporators are R. M. Price, R. S. Stillman, Duke W. Hill, A. C. Collins and Buckner Clay, all of Charleston.

Phoenix, Ariz.—A charter has been granted to the Arizona & Mexico Mines Development Co., to mine coal and other minerals. The capital stock is $1,000,000 and the incorporators are, Sam B. Bradner, W. L. Barnum, M. L. Buckley, and Charles F. Hanson all of Phoenix.

St. Louis, Mo.—The City Coal Co. has been recently organized with Wm. W. Shook holding 34 shares, Philip Riley and Joseph Moriarty holding 33 shares each. The purpose of the new company is to do a general coal and ice business, and the capital stock, which is fully paid up, is $10,000.

INDUSTRIAL NEWS

Coshocton, Ohio—During a recent thunder storm a bolt of lightning set fire to the timbers in the air shaft of the Henry Lear mine near here.

Louisville, Ky.—William Martin recently sued the Monongahela River Consolidated Coal & Coke Co. for $1000 damages alleging he was injured while working on a barge belonging to the defendant.

Somerset, Penn.—W. T. Hoblitzell, F. B. Black, and J. M. Black, of Meyersdale, recently disposed of their interests in the Meyersdale Coal Co., the heirs of the late J. R. Stauffer, of Scottdale, acquiring the controlling interests.

Columbus, Ohio—The Athens & Pomeroy Coal & Land Co., has leased its coal land in Meigs County to the Calvin Essex Co., of New Straitsville, and arrangements are now being made to operate upon the leases this summer.

Ashtabula, Ohio—The steamer "Colonel James H. Schoonmaker" left Ashtabula June 21 with the largest cargo of coal ever carried on the lakes. This aggregated 13,712 tons and represented 296 carloads, or a train over two miles long.

Washington, D. C.—The Red Bank Milling Co., of New Bethlehem, Penn., has filed a complaint with the Interstate Commerce Commission against the Allegheny Valley division fo the Pennsylvania Railroad and other carriers, alleging discrimination.

Ehrenfield, Penn.—During a recent storm lightning struck the fan house of the No. 8 mine of the Pennsylvania Coal & Coke Corporation, and the fire that followed completely destroyed the building, the fan and the motor. The loss is estimated at $5000.

Omaha, Neb.—Some twelve or more ice and coal companies recently appeared in police court at the summons of Inspector John Grant Pegg to account for their failure to pay the occupation tax amounting to $1 a year for each team and $3 for the company.

Mason City, Iowa—A deal has recently been completed whereby Thompto & Heiny take over the coal business of the Northwood Mfg. Co. The former concern also purchased the coal sheds belonging to the latter and will have them moved from their present location.

Memphis, Tenn.—The test of burning coke in switch engines to eliminate smoke recently conducted by the Southern Ry. in Memphis, has brought the announcement from the officials of that company that the fuel is unfitted for railroad use. It was found to be a poor steam producer, yet cost nearly four times as much as coal.

Montreal, Canada—The rumor is afloat that the International Coal & Coke Co. is expected to reorganize shortly. It is understood that the bondholders will be called together with the ultimate idea of exchanging the bonds for preferred stock. The company is understood to be in good condition but needs additional working capital.

Indiana, Penn.—Considerable drilling has been done in Indiana County by a real estate company said to be the coal land agents of the Pennsylvania Railroad. About $50,000 was spent in drilling, and large tracks of land in Pine, Brush Valley, Conemaugh, Rayne, Grant and Mahoning Townships were thoroughly tested for coal, but no options have been taken.

Toledo, Ohio—Officials of the Pere Marquette and Ann Arbor railways say that the decison of the Interstate Commerce Commission increasing the rates on coal by way of the translake route of the two railways to Milwaukee, Manitowoc and Kewanee will mean a gain in revenue to these roads of approximately $50,000 per annum to the former and $100,000 per annum to the latter.

Birmingham, Ala.—It is reported in the coal mining circles that local coal operators are negotiating for the purchase of the De Soto Mining Co. which operates the Indio mine in the northern part of Jefferson County near Warrior. The De Soto company owns between 8000 and 9000 acres of valuable coal land and the daily production of the mine now operated is between 250 and 300 tons.

Pittsburgh, Penn.—There is a persistent though quiet inquiry for good coal lands throughout the mining region of western Pennsylvania, and some large purchases are being made. For three tracts totaling 67 acres in Hempfield Township, Westmoreland County, Ex-Senator John M. Jamison recently paid $72,500 , or a little over $1082 per acre. The coal purchased, however, is said to be some of the very best in the country.

Denver, Colo.—Prince Henri Decroy, member of the ruling house of Belgium, Camile Perin, managing director of the Societe Generale, Charbonnages of Brussels and W. J. Van Maanen proprietor of the Gazette, an English financial paper of Belgium, will arrive in Denver shortly to take over 30,000 acres of Routt County coal land and to close the deal entered into by Paris and Belgium bankers for the purchase of $28,000,000 in bonds to finance the Yampa Fuel & Iron Co.

Punxsutawney, Penn.—James A. McClain, cashier of the Spangler First National Bank, has taken an option on the MacHenry coal tract on Little Yellow Creek near Nolo, Indiana County. The field consists of approximately 5000 acres and the option price is stated as $100 per acre. The total amount involved, therefore, will be in the vicinity of one-half million dollars. An investigation will be made and if the coal proves suitable for coking purposes an extensive plant will be constructed.

Pottsville, Penn.—The Philadelphia and Reading Coal & Iron Co. has recently installed a storage battery locomotive at the Glendower Colliery, which gives promise of doing away with approximately 70 per cent. of the mules now used in the underground workings. The motor is somewhat similar to those now in operation. The storage batteries are concealed in a large case beneath the car, and are so arranged that they are capable of hauling long and heavy trips of coal for a period of ten to fifteen hours. At night they will be recharged, and be ready for operation the following day. Inasmuch as it has been necessary to use three or four mules for transporting coal on the long gangways, the company officials believe that a very large per cent. of the number of these animals can be done away with upon the adoption of the new style motor.

COAL TRADE REVIEWS

GENERAL REVIEW

Many of the hard-coal consumers have now definitely closed down for the summer and the trade is dull. However, shippers are still somewhat behind, so that there is no campaigning for orders and domestic grades are all steady. With a slightly curtailed production in July, there will probably be sufficient demand to keep the trade steady. Only the smaller sizes are going into storage, and the outlook is favorable for the first two weeks of the current month.

The Eastern bituminous situation continues firm, with coal moving freely. The strike outlook in West Virginia is becoming acute; the entire output of the Pocahontas field is sold up, while the New River district is working on half capacity or less. There is a briskness in the trade that no one is able to account for, and it is evident that the Southern agencies have more than enough orders, so that there is sure to be a broad market for the Pennsylvania grades. Georges Creek producers are being pushed to meet their contracts and are declining orders in all directions.

A further slight decrease in the manufacturing demand is noticeable in the Pittsburgh district, due to the arrival of midsummer. Prices are firm, with premiums occasionally obtainable on spot orders, while the labor and car shortage are still in evidence and will probably become more acute as the summer advances. The Lake movement is heavy, but somewhat delayed by congestion, due to the lack of adequate motive power. There has been an advance in quotations at some of the outlying districts.

In Ohio there is a heavy domestic demand much earlier than usual. The Lake movement continues excellent all along the line, the shipments from the docks in the Northwest being particularly good. The production is heavy, manufacturing demand large and the steam consumption good, due to the heavy railroad movement. There was a heavy dumping at the Hampton Roads piers during the week, the port being almost congested with vessels awaiting tonnage; the exports were particularly heavy, and indications are that they will continue so throughout the summer. There are rumors in the South of a curtailment in the production of pig iron, which will necessitate the blowing out of a number of furnaces; this is naturally having a depressing effect on the local market.

The Middle Western trade is a trifle stronger in spite of the unusually warm weather; this is due probably to the labor trouble in West Virginia, there being a heavy demand in the local market for the Eastern steam coals and an advance expected shortly. There is also some improvement on the local fuels, the mines working better generally, with the car supply excellent, except in spots; when the car shortage develops later, as is expected when the heavy crop movement starts, it is probable that Eastern shipments will be curtailed, which should bring about an advance on the Western coals.

BOSTON, MASS.

Bituminous—The situation on Pocahontas and New River coals is fast becoming acute. Practically the entire output of Pocahontas is understood to be sold up and shippers of New River are said to be getting out only 40 to 50% of the normal output of that district. As a result prices are likely to go higher for spot coal, $3.15 having been paid within a week f.o.b. Norfolk for an emergency shipment. Reports of a suspension through the Chesapeake & Ohio districts are received here with more or less concern, according to individual points of view, but the belief is that with all the Southern agencies abundantly suplied with orders there is sure to be a broad market for the Pennsylvania output. There are a number of fair-sized buyers that have yet to cover on their fall and winter requirements, and there can be no question now that prices will be firm for the balance of the year. The Georges Creek district is being pushed to keep up with the contract business in hand, and sales agents are declining orders in every direction.

The demand is strong for all the better grade Pennsylvania coals, and there are rumors that the shippers are not accepting orders now except for prompt delivery. Prices are firmer from week to week on all brands, and just now there is some hurried buying in the effort to get coal forward before the Gettysburg anniversary celebration, which is expected to work practically an embargo against coal movement in Pennsylvania. All-rail, the market shows signs of steady improvement.

Anthracite shippers are still somewhat behind on their orders. New England, however, is only fairly well supplied, and the prospect is with probably a slightly curtailed output in July there will be enough business to keep the demand steady through the summer months. There is no campaigning for orders on the part of the companies, and practically all schedules for domestic sizes are accepted subject to delay. The steam sizes are also in strong request, particularly for delivery on Long Island Sound.

Current wholesale prices on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.10@1.45	$1.30@1.65	$1.67@1.77	
Philadelphia*	2.35@2.70	2.55@2.90	2.92@3.02	
New York*	2.65@3.00	2.85@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.15
Providence†				3.88@4.00
Boston†				4.00@4.10

*F.o.b. †On cars.

PHILADELPHIA, PENN.

There is much lethargy manifested in the anthracite market in this vicinity. The usually hot weather, and the fact that at this season of the year, many of the homes of the large coal users are closed, has made the local market rather dull, and this condition of affairs is not likely to improve for some time. There was a slight improvement at the end of the month of June, such as is always manifested, due to many of the dealers desiring to get a car or two of coal before the advance, but this business soon ends. The only feature to the market is the tidewater business, which still continues good. It is understood that this trade looks favorable for the first two weeks in July, and perhaps longer. The talk of partial suspension of mining is likely to become a fact in the present month. The mines were closed over the fourth of July, and this may be but the commencement of a period of curtailed mining, which is not unusual at this season. Many of the large operators state that outside of the small sizes little coal is going into stock, but it is the New England market and the large consignments to the Lakes for trans-shipment to the Northwest, which is making this possible. Any cessation of the demand from these directions, is likely to cause storage of prepared sizes.

The bituminous market has slightly recovered from its relapse of last week. Conditions, according to various inquiries, nearly all point to a period of prosperity for sellers of this product, although it must be said that many of the trade look rather for substantial tonnages, than any marked inflation in prices.

NEW YORK

Bituminous—The local soft-coal companies anticipated a dull period during July and August, as is usually the case, but such has not materialized as yet, and indications are that it will not. Stocks at tide water are smaller than usual, inquiries are coming in good, and there is not much coal around. The demand on contract is particularly heavy. In the stock market things are rather quiet, with few sales being made, but nevertheless there is a strong, healthy undertone, and prices are firm in every particular. There are rumors in the local market that Pocahontas has sold during the week at Hampton Roads at $3.50.

The labor situation in West Virginia continues to be the predominating feature in the local soft-coal situation. Should the miners effect a curtailment in production there to the extent they claim they will, the situation will be grave. The market at the present time does not need any strike to improve it. Car supply on the Pennsylvania R.R. has been a trifle uncertain, but entirely satisfactory; on the New York Central the supply has been fully up to requirements. Labor shortage still continues throughout the mining regions.

We quote the New York market unchanged, but strong and firm as ever.

Anthracite—The last week witnessed an active mine movement among consumers endeavoring to land their stock at the 30c. discount, which expired July 1. As a result, there was a temporary, but abnormal, activity. On the whole, however, the trade is in a strong position, and promises to recede but little over the dull summer period. Producers were looking forward to a depressed market over July and August, but the trade is developing an unexpected strength. There is, however, a good, healthy undercurrent through the market, and while insufficient orders will necessitate some shutdowns during the next two months, it is not expected that this will be of serious proportions.

The hard-coal companies do not report any serious shortage of labor, and seem to be somewhat better off in this respect than the bituminous operators. Stove coal still continues the shortest in supply, with pea and buckwheat the longest; a number of companies report that they are stocking these sizes heavily.

The New York market is quotable on about the following basis:

		Individual		
	Circular	Lehigh	Scranton	Schuylkill
Broken	$5.00	$4.45@$4.65	$4.50@$4.70	$4.45@$4.65
Egg	5.25	4.80@ 4.90	4.85@ 4.95	4.80@ 4.90
Stove	5.25	4.90	4.95	4.90 .....
Chestnut	5.50	5.05@ 5.15	5.10@ 5.20	5.05@ 5.15
Pea	3.50	3.25@ 3.45	3.30@ 3.50	3.25@ 3.45
Buckwheat	2.75	2.10@ 2.45	2.50@ 2.75	2.10@ 2.45
Rice	2.25	1.75@ 1.95	2.25	1.75@ 1.95
Barley	1.75	1.30@ 1.70	1.75	1.30@ 1.70

PITTSBURGH, PENN.

Bituminous—There has been a slight further decrease in manufacturing demand for coal, due merely to the arrival of midsummer. The Lake movement is heavy, and mines in the district are operating at practically as high a percentage of capacity as at any time for years. Prices are firmly maintained, with a disposition to ask premiums on prompt lots of 5@10c. a ton. Prompt slack, however, is quotable at 60@70c. Car supply is fairly good, but there are delays in transit, and a congestion is feared later which would result in a definite shortage. Most of the roads are clearly short of motive power. We quote regular prices unchanged as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The Geologic Survey reports the total production of beehive coke in the United States last year at 32,868,345 tons, and the "Connellsville Courier" had previously reported the Connellsville production at 20,000,000 tons, which would indicate that the Connellsville output comprised 61% of the total beehive output of the country, a slight gain in the proportion as compared with five years or ten years ago. On account of the rapid increase in byproduct coke, the proportion of total coke output is not increased. Last year byproduct coke constituted 25 per cent. of the total coke output, showing a great gain in proportion, and with new byproduct plants starting this year, a further important increase in the proportion is certain for this year and next. There is no prospect that the Connellsville region will adopt the byproduct process, as this should naturally be practiced where the coke is consumed, but within a few years the Connellsville region will probably be a large shipper of coal to byproduct plants. At present it labors under a handicap in freights, which average 15c. a ton higher than from the Pittsburgh district, but this condition is likely to be remedied.

The deadlock between Connellsville operators and furnacemen over contracts for furnace coke for second half has not been broken, the operators continuing to insist upon $2.50, while the furnacemen regard this price as entirely too high in view of the pig-iron market. The operators say they are now making the coke price, and it is up to furnacemen to make pig-iron prices to correspond. A partial bridging of the deadlock has occurred by the operators selling several furnacemen July coke at $2.50, thus postponing the necessity of such furnaces to close contracts. In Pittsburgh coke circles, it is thought these sales were with a guarantee, for the prompt market, while firmer, is hardly quotable above $2.25, and $2.50 for July coke thus looks out of line. Demand for foundry coke is moderately good, with prices firm. We quote: Prompt furnace, $2.25; contract furnace, $2.50 asked; prompt foundry, $2.85@3; contract foundry, $2.75@3, per ton at ovens, with a few operations asking $3.25 on contract foundry coke.

BALTIMORE, MD.

Interest in Baltimore trade circles during the week centered in the strike call for July 1 in the New River District of West Virginia, for if there is a serious tie-up in these particular fields it will mean that local operators will be rushed with orders to supplant the supply of New River coal, of which consumers in the West and in New England have been large users. Whenever there is a shortage of New River coal, the consumers look to the local market for their supply.

Even the issuance of the order has had an effect on coal-trade conditions in Baltimore. The market is firm as far as prices are concerned, and fuel is moving freely. Line business is also good. The salesmen who returned to the city during the week reported first-class business.

Anthracite business is light on account of the prevailing warm weather.

Some idea of the activity in the movement of coal may be gleaned from the report of the coal tonnage of the Baltimore and Ohio R.R. for May, 2,995,812 tons being moved as compared with 2,786,580 tons in 1912, an increase of 209,232 tons. The coke tonnage for the month was 432,898 tons, as against 439,631 tons for last year, a slight decrease.

The coke market is weak, and the demand light, the output being about equal to the demand.

BUFFALO, N. Y.

The end of June is when bituminous coal ought to be about as dull as at any time of the year, yet Buffalo jobbers are finding it so difficult to get a supply of Youghiogheny coal that nobody dares to take an order unless the fuel is actually in sight. This means a briskness in the entire trade that nobody can account for. There is considerable slackness in coke, but coal is so scarce that the consumer does not dare to allow his supply to run down.

There is much the same condition of things reportetd from Canada. At one time the competition from Nova Scotia coal extended well west of Montreal and was very sharp, but is now hardly worth mentioning. There is but one complaint of the Canadian trade. There is in many sections a land boom that has tied up money badly. If this speculation turns out well, business generally will not suffer.

The scarcity of both miners and cars grows worse. The eagerness to get a good output causes coal men to take special note of anything that will reduce the production. Accidents often appear to be many, but the loafing of the men and the failure of the car supply, is a constant source of complaint. The worst of it is that as the fall approaches there is prospect of the shortage increasing.

There is no weakening of prices for bituminous coal, jobbers insisting on an advance of all quotations except slack, the list running up to $2.90 for Pittsburgh lump, $2.75 for three-quarter, $2.65 for mine-run and $2.15 for slack. The demand for the latter has been quiet of late, though it is improving somewhat. Allegheny Valley coal is about 25c. below Pittsburgh. Coke is as quiet as ever, the furnace men trying hard to break the market. Quotations remain on the basis of $4.85 for best Connellsville foundry.

In the anthracite trade there is also some complaint of car shortage. Shipping agents are eager to keep the Lake movement up. It has been heavy right along, but the idea is that more coal should be laid down on the Upper-Lake docks than ever before. There is no improvement in the local anthracite market and the all-rail trade is also quiet. It is impossible to stimulate the buying of coal in warm weather for winter consumption. At the same time the agents of independent anthracite mines are active and claim to have secured a better supply than ever before.

The week's shipment of anthracite to the Lake trade was 164,000 tons. The coal still goes to the leading ports chiefly, but there were 11 ports in the list, showing an increase of activity in that direction. Just now Fort William, on the Canadian side of Lake Superior, is a large receiver.

COLUMBUS, OHIO

With a good demand for steam tonnage and the lake trade ruling strong, the coal business has been strong in every respect. One of the best features is the increased demand for domestic grades, which is somewhat earlier than usual. This shows that dealers are trying to place their orders before the expected advance, which will be brought about by a prospective car shortage and other conditions.

The lake traffic is still one of the most active departments of the trade. The docks of the Northwest are in fairly good shape and no congestion of consequence is reported. The movement from all of the Ohio fields is steady, and chartering of bottoms is going on actively. The Toledo docks of the Hocking Valley Ry. Co. during the week ending June 27 loaded 113,000 tons. The present season is expected to be a record breaker insofar as the lake trade is concerned.

The domestic trade in every part of the country which looks to Ohio for its fuel supply is active. Dealers' stocks, depleted by the recent floods, are being replenished and consumers are placing their orders earlier than usual. Threshing, which will be at hand soon, is expected to produce a demand in rural districts. There is also some activity in school and other public contracts.

The steam trade is still active, although it is being placed in the background by the domestic and lake branches of the business. Railroads are requiring a large tonnage for freight movement. Many factories are having a good run of orders, and as a result their fuel requirements are large. Most of the steam contracts for the coming year have been closed, although some railroad contracts are still unawarded.

The output from Ohio mines during the week was large under the circumstances. In the Hocking Valley, where the car shortage is least noticed, the output is about 90 per cent. of the average, and the same proportion prevails in many of the strictly domestic fields. In eastern Ohio, where the car shortage is the most pronounced, the output is estimated at 60 per cent. In the Pomeroy Bend district there has been a considerable increase in the production during the past few weeks.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump........	$1.55		$1.60	$1.55
¾ inch................	1.40	$1.20	1.40	1.35
Nut..................	1.25		1.25	
Mine-run.............	1.20	1.10	1.15	1.15
Nut, pea and slack....	0.65		0.70	0.65
Coarse slack..........	0.55	0.70	0.60	0.55

HAMPTON ROADS, VA.

The past week has been a busy one at Hampton Roads, and while the dumpings at all piers have been heavy, it is believed that these at Lamberts Point will more than equal the combined dumpings of Newport News and Sewalls Point. From the beginning to the end of the week, berths at Lamberts Point have been kept filled and the anchorage off the piers blockaded with vessels awaiting their turn.

It is expected that the June dumpings over Lamberts Point piers will show a decided increase over May figures. This is especially true as regards export coal, as heavy shipments to foreign ports have been moving from these piers daily. All through the month of June shipments of export coal have been heavy from all Hampton Roads piers, and it looks as if the foreign demand will continue well on into July.

The labor situation in the New River fields is growing worse daily and is causing much uneasiness. Rumors that the miners will walk out July 1 are reaching tidewater, and suppliers are holding such coal as they may have on hand or in transit and decline to name any prices for coal for early delivery.

The heavy dumpings at Hampton Roads have greatly reduced the number of cars in the various railroad yards, and as the shipments from the mines during the past week have been anything but heavy, the coming week will find less coal on hand for the week's dumpings than there has been for months, with considerable tonnage in the stream waiting for cargo.

BIRMINGHAM, ALA.

There are rumors that several pig-iron furnaces are to be closed down in the near future. As is generally known, the pig-iron market has been declining rapidly for several months, and some sales during the current week were reported as low as $10 per ton f.o.b. cars Birmingham for No. 2 Foundry, which price is below the cost of production of less favorably located furnaces.

Any reduction in the consumption of either coal or coke at this season of the year is bound to have a depressing effect, and would somewhat overthrow the optimism which has prevailed for some time as to the summer prospects of the local coal industry.

The foundry-coke market has not been affected sentimentally or otherwise, and the prices prevailing at this time on Alabama product are higher than for many years past at this particular season. Current quotations, with only limited tonnages offering, are from $3.75 to $4.50 per net ton f.o.b. cars local ovens.

LOUISVILLE, KY.

Coal men, as well as the rest of humanity, expect warm weather in June and July; but it has been a good many years since the country as a whole has known such a June as that which has just passed into history. That the torrid weather which prevailed has had its effect upon the coal market can hardly be doubted. Of course, nothing like an active demand for spot coal for immediate use can be expected during the summer months under any circumstances. Just now, however, it seems that even the majority of the industrial consumers who usually buy at this time, have shut down on their coal supply, and are running on sawdust and other plant refuse.

An important market has been developed in the Northwest, and it goes without saying that the whole district will reap the benefit of the introduction of Kentucky coal into the Middle West, and that within a few years. There appears to be a great and growing demand all through that section for a high-grade bituminous coal, and this demand eastern Kentucky is in a splendid position to fill.

Prices for July delivery are quoted at $1.65@$1.70 for block, $1.60 for block and lump, and $1.40@1.45 for round. June deliveries are very much behind, however, with a large volume of orders still unfilled. There is some fear of a mild car shortage, which would throw deliveries still further behind, but at present the movement is about as rapid as the production of the coal.

KNOXVILLE, TENN.

The coal operators in the Kentucky-Tennessee field are in exceptionally fine spirits, owing to the good condition of the market for this time of the year. It is the prevailing opinion that, for this season of the year, the market has never been in a more satisfactory state. While there has been a slight decrease in the demand for the finer grades of steam coal, there has been an equal increase in the demand for domestic. The result is that the demand for 3-in. steam, nut and slack, which was abnormal some time ago, is now about normal. Prices on 3-in. steam are about the same as 30 days ago, while nut and slack are selling from 5c. to 10c. less.

Considering the season, the larger grades of steam coal are strong—prices running from 5c. to 15c. higher than last year's prices. During the past 30 days, a shortage of cars has been felt, and operators predict that this fall will see a serious situation with stiffening effect upon prices. Many operators are sold up to Sept. 1, and few desire to make quotations, now, for later shipments, as they believe a strengthening market will develop early in the fall.

DETROIT, MICH

Bituminous—The soft-coal market is a trifle stiffer this week, notwithstanding unusually high temperatures prevailing locally. This firmness is attributed to the strike situation in West Virginia, where it is rumored 15,000 men will shortly lay down their tools. At the present moment, the coarser grades are in the greatest demand, slack coal being in good supply on track; mine-run is more plentiful than screened coal, but it is not probable that this condition will prevail long. Both Ohio and West Virginia lump and three-quarter have been steadily recovering from a slight slump experienced a short time ago, and are now nearly back to circular. Contract business at the present time is not brisk, but any further alarming news from the strike zone will cause the buyers to fall into line rapidly.

The local market is quotable on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	....	....	....	$2.25	$2.00
Egg...........	1.65	....	....	....	....	2.25	2.00
Steam lump....	1.35	....	....	....	....	....	....
¾-in. lump......	1.20	$1.20	$1.20	$1.10	$1.10	....	....
Mine-run.......	1.10	1.10	1.05	0.90	0.90	1.50	....
Slack..........	0.75	0.75	0.50	0.60	0.60	Open	....

Anthracite—The hard-coal market is firm, with circular prices being strongly held; the only exception to this rule is on pea coal, which has sold at slightly under the circular. This was due to a concentration of the demand from consumers on the larger domestic sizes, leaving pea to accumulate. Egg and stove are the strongest grades, and seem to be in heavy demand, with nut fair, while the steam sizes are inclined to be inactive.

Coke—The spot market for coke continues unsettled, with the demand limited. There has been a slight decline on Connellsville foundry coke, some of this now being offered on contract at $2.75, with more than $3 being seldom asked. Prompt foundry coke is not so easy, being affected by the labor shortage at the local ovens; the minimum on good grades is about $2.85. Semet Solvay is quoted at $3 on all sizes, with gas house, $2.85, f.o.b. ovens.

INDIANAPOLIS

There is some improvement in conditions at Indiana mines, reports showing they are working better than half time. Prices remain at the midsummer level. The wheat harvest is on, and while the acreage is short, the yield is good, and a total crop of not less than 30,000,000 bu. is expected. This looks big compared to the 10,000,000 bu. last year when most of the crop was winter-killed. The oat crop is poor, but is offset by the wheat crop. The corn crop is progressing finely, in a big acreage.

Coal dealers report the situation satisfactory, and say general trade and industrial conditions are beginning to reflect the confidence inspired by the crops. Operators say there has been a slight letting up in the demand for Eastern coals. The season started off with a rush, following the anthracite shortage of the winter. The call for hard coal and Pocahontas was so insistent as to interfere seriously with the Eastern bituminous demand; and some May orders for the latter are not yet filled. A peculiar feature is the plentifulness of chestnut, which has been hard to get for several seasons, and in which there was a practical famine last winter. Nobody seems to know what makes this grade so easily obtainable this year. Notwithstanding all this, the official railroad report shows over 60,000 idle cars, but it appears probable that few, if any, of these are coal cars. The supply of cars at Indiana mines is ample, but there is some trouble on the Chesapeake & Ohio, particularly the Big Sandy branch, and on the Baltimore & Ohio. Some wholesalers are pessimistic enough to predict a car shortage this fall as bad as any in the history of the roads.

CHICAGO

There is a heavy demand at the present time in the Chicago market for Eastern steam coal and an increase in prices is anticipated. Producers of a large number of Western coals report that a comparatively small volume of business is being transacted.

Local dealers express the opinion that a car shortage will develop within the next few months on account of the crop movement and that a curtailment in the supply of Eastern coal will be followed by a large number of buying orders for Western fuel. Prices for spot mine-run are quoted all the way from $1.40@1.50. Both lump and egg coal are selling at from $2@2.25 a ton on the spot market. The market for Hocking coal is active, and an advance in prices of 5c. a ton was effective July 1. The amount of anthracite coal shipped into this territory is increasing and prices remain firm. An increase to $1.50 a ton in the price of Franklin County lump and egg coal went into effect last Tuesday. Low-grade screenings command from 80@85c., while prices for better grades range from 85@90c. The coke trade continues to be active.

Prevailing prices are:

	Springfield	Franklin Co.	Clinton	W. Va.

Coke—Connellsville and Wise County, $5.25@5.50; byproduct, egg and stove, $4.85; byproduct nut, $4.75@4.85; gas house, $4.50@4.60.

ST. LOUIS, MO.

There has been little change in the trade conditions in St. Louis in the past two or three weeks. It was expected a few weeks ago that business would become good about July 1, but indications now are that coal will drag until after July 15 or possibly the beginning of August.

It is a hard mater to make the trade realize that there is a car shortage staring them in the face, and that at least half a dozen mines are in the hands of receivers who will not operate them, so that when the demand for coal becomes general there will be an actual shortage.

Selling below cost is still general in the Standard field, while Carterville is picking up. There is practically no smokeless for this market, and indications are that very little of this coal will come in here for the balance of the season. Coke is also a drug on the market at the present time, and anthracite is being thrown in here in a volume so great as to overcome the demand for it, with the result that it is nearly always under demurrage on the east side.

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.80@0.85
3-in. lump	....	....	....	....
6-in. lump	$1.15 @ 1.25	....	....	0.85@0.90

No. 5 washed nut	1.00 @ 1.05	....	....	....

St. Louis prices on July anthracite are: Chestnut, $7.25; stove and egg, $7; grate, $6.75; smokeless lump and egg are $4.65; byproduct coke, $5.10, and gas-house coke, $4.85.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a comparative statement of the coal and coke movement over this road for May and the first five months of this year and last year:

	May 1913	May 1912	5 Months 1913	5 Months 1912
Coal	2,995,812	2,786,580	13,604,039	12,557,130
Coke	434,898	439,631	2,050,968	1,860,883
Total	3,430,710	3,226,211	15,655,007	14,418,013

FOREIGN MARKETS

GREAT BRITAIN

June 20—Coal-market conditions are without material changes. As regards prompt coal, the inquiry for all descriptions is slow, while the tendency in prices is still unsteady. Very few transactions have been recorded recently for forward delivery, the ideas of buyers and sellers showing too much disparity.

Quotations are approximately as follows:

Best Welsh steam	$4.68@4.92	Best Monmouthshires	$4.20@4.38
Best seconds	4.44@4.56	Seconds	4.03@4.14
Seconds	4.20@4.32	Best Cardiff smalls	2.40@2.52
Best dry coals	4.44@4.56	Seconds	2.28@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

COAL SECURITIES

The following table gives the range of various active coal securities during the week ending June 28:

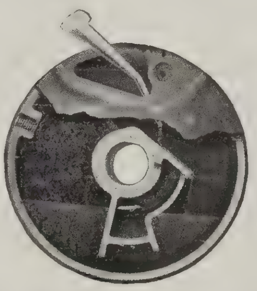
The Lubricating System

on Baldwin-Westinghouse Mine Locomotives reduces wear to a minimum

The frame is so designed that the journals, and the motor armature and axle bearings are easily reached for thorough lubrication.

The lubricating system of the motor, as shown in the illustration, is a distinctive feature of Baldwin-Westinghouse Mine Locomotive Motors. A large pocket is provided for the waste which comes in contact with the shaft through openings in the housings and the bearings. The oil is poured into a separate reservoir and is absorbed by the waste. All grit and dirt in the oil is thus filtered out and only clean oil reaches the shaft. The depth of oil in the reservoir can be easily gauged. An overflow opening in the armature oilwell prevents flooding the bearing. The axle bearings are oiled in a similar manner.



This system, with specially designed bearings for long life in service, has been adopted as standard after years of investigation.

Full information regarding these locomotives upon request.

The Story Of The Shortstop

The Weekly Ad-Talk Page

Suppose a shortstop is a cracker-jack at handling batted balls yet throws wild to first. Suppose he has developed a natural aptitude till he can take care of everything, bounders or grounders, that come anywhere between second and third, and yet, after he has speared the sphere, can't put it—one time out of a hundred—within ten feet of the first sacker's mitt. What good is his fielding to a team?

Picking up the ball is important, but the most important thing of all is getting it to first—*quick*. A man who foozled half the grounders that shot his direction, but *did* get the other half to the initial station, would be a better fielding asset on the team than said brilliant fielder but rotten thrower.

So in many things. To do a thing with infinite pains and then *throw it away* by ignorance or misjudgment or carelessness is the worst kind of inefficiency.

To prepare an advertisement with great trouble and cost, and then virtually toss it away by placing it wrongly is as sheer vicious waste as tossing the actual cash away. What's the use of hiring a copy-writer to study the special features of your machine or whatnot; of having him write about it interestingly and arrestingly; of having an artist devise a drawing illustrating its use; or having a photograph of it in actual service; of combining the whole into an expensively made advertisement—and then inserting that advertisement in the wrong medium?

Yet some advertisers do this—and they are men who, in other respects, are hard-headed, canny, conservative, economical, foreseeing.

Why do they do it? God knows, we say. Yet it is simply for failing to recognize that little principle of the shortstop—*of getting the ball to first*—a principle they readily would understand were it put to them in such graphic metaphor.

Now there are two kinds of papers where a man selling a particular kind of mechanical equipment, for instance, may advertise his goods:

The *general* paper and the *special* paper.

The general paper is *always* right for *everything*. Everybody reads it—and *those readers interested* in the particular kind of machine this man is making will read his story when it's there. But the waste is stupendous. If the paper have 1,000,000 readers there may be, out of that number, 1000 for whom the selling talk about this machine will possess interest. The other 999,000 inevitably pass it by—just as they pass by an ad for Bent's Crackers, if they have no teeth.

That's the first element of waste. The second is that when you put your selling argument on a special machine into that general magazine you pay *for the privilege of talking to that whole million*. That costs you as much for every half inch of space as you would pay for a whole page in the special magazine. It's none of the general magazine's business if you haven't the story that will appeal to even a plurality of its whole million. Against the inquiries coming out of that 1000 *possible* answerers, must be charged the whole cost of that million-circulationed piece of space.

The *special* paper—like Coal Age—appeals to and is read by a special class. It is the *business* paper of that special class. When a man buys a page in Coal Age to talk to you he pays to speak to 12,000 men, practically *every one of whom* is directly interested in the advertisements placed here.

People don't advertise tubs in Coal Age or razors, or hammocks, or socks or textile machinery. They don't advertise general stuff nor do they advertise stuff that belongs to *another special* class. They voice selling arguments about material and equipment in the coal mining and coke manufacturing field. Everything that pertains to that field bears a direct grip on the eyes and mind of you, the Coal Age reader.

Or let us sum the whole thing up in our metaphor of the shortstop:

Everything advertised in Coal Age must belong to Coal Age field. The copy itself (if it be good forceful copy, is the *ball fielded—and the paper puts it to first*.

Instead of making a put-out possible only once in a thousand times, like the general magazine, Coal Age makes one *possible every time*. The worst the advertiser has to contend with is a fielder's choice.

In other words, the circulation of Coal Age is practically wasteless. That's why Selling Arguments placed in Coal Age or any other wasteless-circulation technical paper bring so large a return *in proportion* to their cost!

COAL AGE

Vol. 4 NEW YORK, JULY 12, 1913 No. 2

Did you ever hear of an accident something like this?—

A miner leaves his working face before shooting time, expecting his "buddy" to fire all of the shots. The "buddy" follows instructions, but unfortunately is so severely injured by a windy shot that he is not able to make his way out. After suffering all night he is discovered by the fireboss and eventually reaches the company hospital.

Of course you have. What's the remedy?

Install a gate house at the manway entrance, so arranged that every man must pass it going in and out of the mine, the gateman hands each employee a brass check as he goes in. These checks are kept on a board inside the gatehouse and in easy reach of the gateman. The men keep their brass checks through the day so that every blank space on the numbered check board indicates a man underground. On coming out of the mine each man must hand his brass check to the gateman, who hangs it on the board. Thus, when all the men are out, the board is filled. If there are blank numbers on the board it is known that men are still in the mine.

The gateman keeps two side records. One is a book showing the hour each man went in and came out; the other is a set of cards on which is shown the home address, occupation and working place of each employee. If at 6 p.m. the board shows Jack Thomas still inside without the mine foreman's permission, a rescue party is sent to his working place, as indicated on the gateman's record card: In several instances where this system was employed the man was found seriously injured. In one case several men threatened by damp were reached just in time.

If the man cannot be found in the mine, the card shows where he lives and a messenger is sent there. It may be found that he got by the gatehouse without leaving his brass check; a suitable fine will jog his memory for the future.

The cost of operating such a checking plan is small. A competent gateman can be secured for $50.00 per month, and the night watchman can do the night checking. The mine foreman can tell every afternoon when all of his men are safely out of the mine. In case of fire or explosion in one section of the workings, the location of every man in danger would be easily obtainable by means of telephone connection with the gatehouse, so that help could be furnished to those most in need.

Then, too, think of the value of the gatehouse records for timekeeping purposes. Generally speaking, this alone will nearly pay for the checking. Under this plan, also, it is impossible for a foreman to turn in a shift for a man not in the mine.

If you have never tried a checking system, *start one today*. If you have a better plan than the one outlined above, tell us about it.

Ash- and Coal-Handling Equipments

By Henry J. Edsall

SYNOPSIS—The kind of equipment that should be installed in any power plant for the purpose of handling coal and ashes, is dependent upon the size of the plant and the service rendered. The various types of equipment are discussed in this article and the power plants for which they are adapted.

⁂

In planning coal storage for a power-plant supply, there are quite a number of factors to be considered, among which are the following:

1. Daily coal consumption.
2. Kind of coal used.
3. How coal is received.
4. Regularity of coal supply.
5. Advantages in purchasing to be gained by storage facilities.
6. Amount of primary storage advisable.

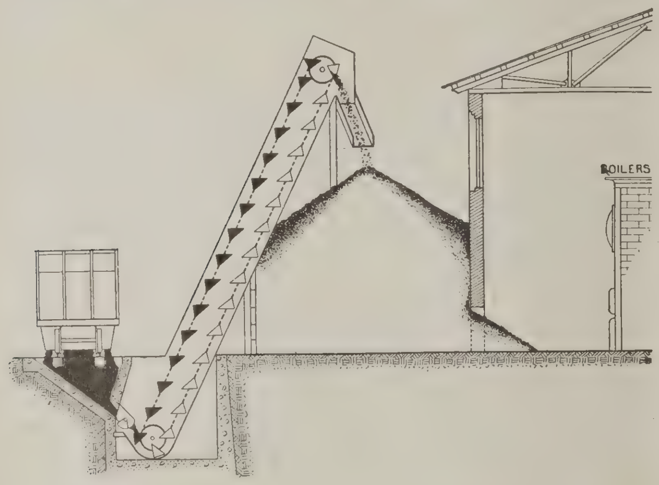

Fig. 1. Bucket-Elevator Arrangement for Unloading Coal Car

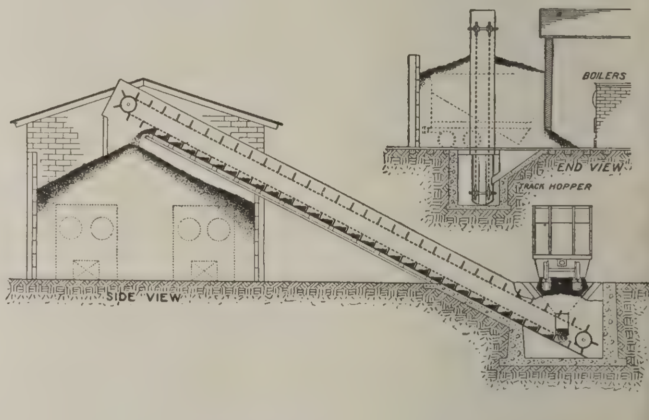

Fig. 2. Arrangement for Unloading by a Conveyor

7. Amount of secondary or reserve storage advisable.
8. Advisability of mechanical method of handling ashes.
9. Method of firing or feeding coal to furnaces.
10. Advisability of crushing coal, and to what extent.
11. Relation of railroad track or wharf to boiler room.
12. Space available for bins in boiler room, or adjacent thereto.
13. Space available for outside reserve storage.
14. Advisability of housing this reserve storage.

On the daily coal consumption depends largely the amount of investment justified. A large investment for handling a small amount per day is obviously not justifiable. For handling a large amount per day, however, there is frequently a choice of several possibilities, and the problem is to pick out the equipment which will give the best return on the investment with due consideration given to cost of labor, power, maintenance, depreciation and interest on the investment. In many cases there are other considerations of importance, such as the importance of a large storage as insurance against a shutdown, more favorable prices to be obtained by purchasing coal at certain seasons, irregularity of winter supply, dependability of machinery versus dependability of the human element in keeping the plant going, additional efficiency to be obtained in boiler furnaces by proper crushing of coal and proper feeding to mechanical stokers and so on.

Small Plants

The small plant naturally comes in for first consideration. Where there are only one or two boilers of moderate size, one man can do the firing and wheel out the ashes. If the coal is placed within easy reach on the boiler-room floor, one man should be able to look after 400 or 500 rated horsepower of boilers. This will depend somewhat on the number of boilers which go to make up this total, as it is, of course, much easier for a fireman to handle one 500-hp. boiler of the three- or four-door type than two wide and low boilers of 250 hp. each. In any case a fireman should be able to handle 1500 to 2000 lb. of coal per hour. The coal supply for a boiler room of this size is frequently brought in carts or wagons and dumped on the boiler-room floor. If the supply is regular, for instance, from a dealer with a good supply in his own yard, it is unlikely that any coal-handling equipment is justifiable. If, however, the coal is received by rail with a siding run in along the side of the boiler room there is the necessity of unloading the coal from the cars. Shoveling coal over the side of modern coal cars is expensive and almost always requires other labor than the boiler-room force. In such cases, therefore, it is usually justifiable to provide some method of unloading the cars as they are designed to be unloaded, that is, through the bottom doors. In most cases the first thought is to build a trestle or elevated siding for the cars, or to drop the boiler-room floor down below the ground level and make a vault for the coal under the track. Both of these methods are, as a rule, a mistake. A low trestle means distributing the coal along a considerable length so that the fireman has to go farther for it, and this outside wheeling of coal is especially objectionable in winter. If the trestle is built of wood, it means considerable expense in first cost, and a high maintenance cost with the increasing prices of lumber. If it is built of more permanent materials, or built higher, it is still more expensive in first cost.

---

*Engineer with Link-Belt Co., Philadelphia, Penn.

If the boiler-room floor is dropped below the ground level and vaults built, these are quite expensive for the amount of storage obtained, and there is still the necessity of considerable wheeling of coal. It also increases the difficulty of handling ashes as it is necessary to get them up out of the boiler room and either wheel them away or load them onto carts or cars.

Use of Conveyors Best

The simplest and best way, ordinarily, is to build a bulkhead or fence so as to form a coal bin just outside the boiler-room wall and use a simple chain and bucket elevator or flight conveyor to unload the cars and deliver the coal to the bin. By making doors or openings in the boiler-room wall, the coal can then be allowed to flow through to the floor in front of the boilers within easy reach of the firemen. The machinery for such an elevator or conveyor will usually cost between $500 and $1000, depending on the length required and the size of buckets or flights, and the labor and power cost for unloading the coal from cars and delivering to a bin, will usually amount to less than two cents per ton. The maintenance cost for both the bin and machinery equipment is very low. Equipments of this type are illustrated in Figs. 1 and 2. Where it is desirable to make the bin longer for a longer row of boilers, it is best to use a chain and bucket elevator at one end, and a horizontal flight conveyor over the bin for distributing the coal lengthwise, as shown in Fig. 3.

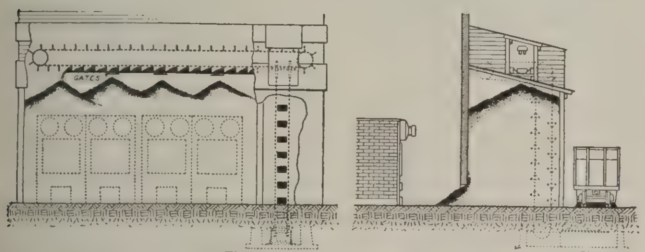

Fig. 3. Bucket Elevator and Horizontal Conveyor to Distribute Coal

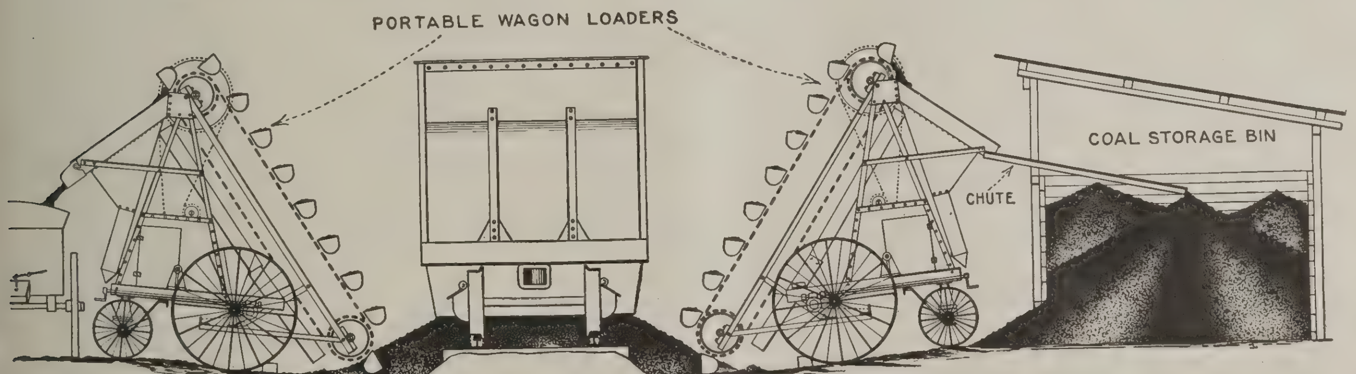

Fig. 5. Use of Wagon Loaders for Stocking or Loading Coal

Sometimes it is necessary to unload the coal from cars at a distance from the boiler room, or, perhaps, there are two or three boiler rooms that have to be supplied. Fig. 4 shows a simple chain and bucket elevator for unloading the cars and storing the coal on the ground, and a portable wagon loader for taking it from the ground storage and loading it into carts or small industrial cars. The cost of the elevator and the cost of operating it would be about the same as the one described above, and a wagon loader equipped with a motor can be purchased for about $700. They will load coal at the rate of about 60 tons per hour with one or two men to help the coal to the foot of the machine. Fig. 5 shows the possibility of using a wagon loader for unloading bottom-dump railroad cars and delivering to carts or industrial cars or to low bins or ground storage.

Simple Unloading from Boats

Where coal is unloaded from boats in small quantities, the simplest and cheapest rig is a mast and gaff with a single-drum hoist to handle a tub which is filled by dipping and shoveling. The tub delivers direct to ground storage or to an automatic or hand-pushed car on a small railway for distribution over a greater area. Such an equipment is shown in Fig. 6. For picking this coal up from the ground a wagon loader will show a good saving if the quantity handled is not too small. For a boat-unloading equipment of somewhat larger capacity, a mast and gaff with a double-drum hoist operating a self-filling clam-shell buckets is frequently used, but for an outfit of this handling capacity, a locomotive crane is much more flexible and satisfactory for operating the clam-shell bucket. This is described later on.

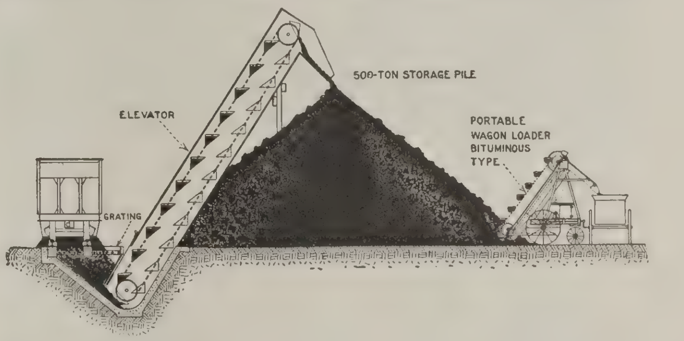

Fig. 4. Reloading from Ground Storage with Wagon Loader

As a boiler room increases in size, the amount of coal and ashes to be handled is increased, and either more men have to be used, or the facilities for handling have to be improved. When the amounts to be handled get to be too much for one man firing by hand, there is the possibility of reducing the labor by using mechanical stokers and feeding the coal to them automatically from an overhead bin. Besides the saving in labor there is the additional efficiency to be obtained by the use of mechani-

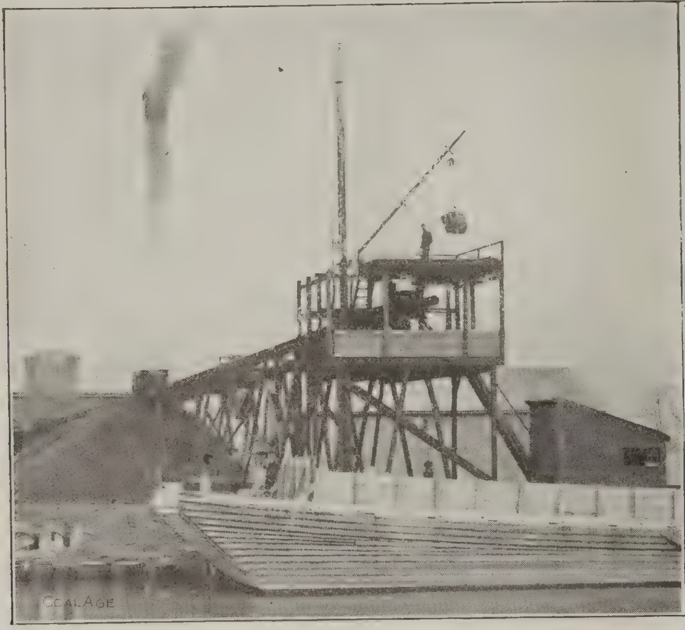

Fig. 6. Unloading Coal from Boats with Mast and Gaff

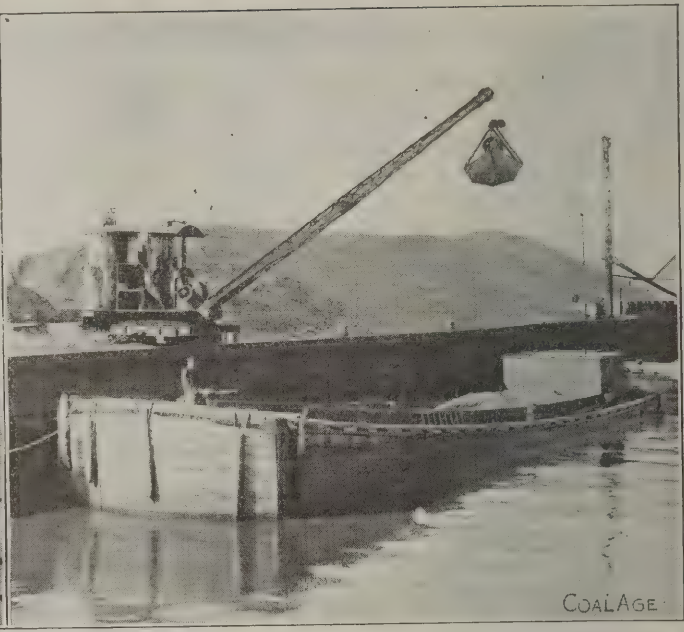

Fig. 7. Unloading Boats with Locomotive Crane and Clamshell Bucket

cal stokers. With such an arrangement one man is ordinarily able to look after about three times as much total horsepower of boilers as when firing by hand; that is, he could look after about 1200 or 1500 rated horsepower comfortably. This, of course, would depend on the number of boilers and the type of stokers, but one fireman should be able to handle from 4000 to even as high as 8000 lb. of coal per hour when it is delivered by gravity to the stoker hoppers. While some of the plants equipped in this way are comparatively small, there is more or less of a similarity between them, and they can, for purposes of description, all be classed as larger power plants.

Larger Power Plants

In figuring the saving to be obtained by reducing the number of men in a larger power plant, if we figure the cost of a man as $12 per week, or $624 per year, the saving of one man should justify the investment of at least $3120, or five times the amount saved, that is, there should be a saving each year of 20 per cent. of the investment to pay for maintenance, depreciation and interest and a certain percentage in addition. There are usually other advantages to be gained besides these, such as a neat and ship-shape boiler room that tends toward higher efficiency, more contented men and less danger of strike trouble,

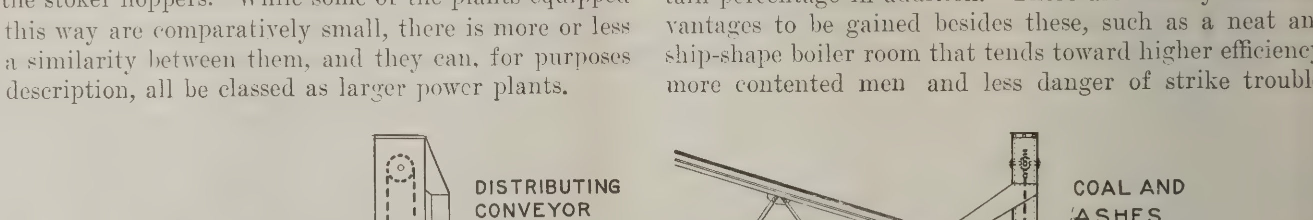

Fig. 8. The Same Elevator Handling Coal and Ashes

larger storage facilities, better efficiency from the furnaces, etc.

For overhead bin storage in a boiler room, a suspension type of steel bunker is usually the cheapest in first cost, and these will discharge a large portion of the coal without any manual labor and last for a long time. They can either be supported on columns resting on concrete piers, or if it is a new boiler room, the roof trusses can be designed with sufficient strength to carry the bin. Sometimes the bin is supported partly or entirely on the boiler-room walls, or on the boiler-room walls and walls around the boilers. In any case the bin must be placed high enough to give ample slope for the chutes to the stokers and not to interfere with cleaning or removing boiler tubes, and there must be room over the bin for the conveyor for filling it.

As with the bin outside the boiler-room wall, there is sometimes the possibility of using a single elevator of the chain and bucket type with divided spout for distributing the coal in the bin. Where the bin is very short, however, it is better to use a horizontal distributing conveyor placed high enough to fill the bin to maximum capacity, that is, with the coal piled up above the top and the sides of the bin at the natural slope for the kind of coal used.

Elevating to Overhead Bins

Fig. 8 shows an elevator and conveyor arrangement for handling coal, and in this case the same elevator handles the ashes. A steel Berquist bin was located in the boiler room with spouts to the stokers and, in order to increase the storage, an additional bin was built in a room directly above and openings cut in the floor to allow the coal to go through to the Berquist bin underneath. In place of building an elevated storage bin for ashes, the ashes are stored in a ground bin formed by four brick walls, and when it is desired to load them to a railroad car, they are fed back to the foot of the elevator, reëlevated and delivered, by means of a chute, direct to the car. The ground storage bin is, of course, much cheaper to build than an elevated bin, and the reëlevating adds only about 2½ cents per ton for power and labor, to the ashes-handling cost. While with mechanical stokers it is usually necessary to crush the coal fairly small, in this case the crusher was omitted and a grating with 5¾x6¾-in. openings was placed over the track hopper so that any lumps too large to pass through the grating have to be broken by an attendant. This means some additional labor, but even with this handicap a large steel car of soft coal containing about 50 tons of run-of-mine soft coal can be unloaded in about 3½ hr. with one man in the car and one man outside at the grating to break the large lumps.

There are two boilers in the boiler room aggregating a rated horsepower of 764. One day man and one night man look after the boilers, and have an easy job of it, and the boilers show a high efficiency.

(*This article will be concluded next week.*)

⁂

The Coal Production of Utah

The production of coal in Utah in 1912 reached the record figure of 3,016,149 short tons, valued at $5,046,451, an increase, according to E. W. Parker, of the U. S. Geological Survey, of 502,974 tons over the output for 1911. The known workable areas in this state aggregate more than 8,000,000 acres. The largest and, commercially, the most important coal field is that of the great Uinta Basin, which lies parallel with and along the south side of the Uinta Mountains.

This field extends from Crested Butte, about one-third of the way across Colorado on the east to the western part of Carbon and Emery counties, Utah, on the west. This basin underlies large portions of Uinta, Wasatch and Carbon counties, its southern border being in Grand and Emery counties. The principal mining operations are carried on in Carbon County, more than 85 per cent. of the state's production coming from that locality.

Although by far the larger part of Utah's production is mined by hand, the efficiency record of the miners averages with the highest among the states. In 1912, the average production per man employed was 906 tons, while, in 1911, the average was 821 tons.

The reports to the U. S. Bureau of Mines show that there were 18 fatal accidents in the coal mines of Utah, in 1912, being four more than in 1911, but none of which were due to explosions of gas or dust.

⁂

Virginia's Coal Production in 1912

According to figures compiled by E. W. Parker, of the U. S. Geological Survey, in coöperation with the Geological Survey of the state of Virginia, that state, in 1912, produced 7,846,683 short tons of coal, valued at $7,518,576.

The figures given above are a gain over the preceding year of 981,971 tons in quantity, and $1,263,772 in value. Over 75 per cent. of the total increase was made in Wise County, whose production, in 1912, amounted to 4,500,174 short tons; or a gain over the preceding year of 745,114 tons, equaling nearly 20 per cent.

The coal areas of Virginia, which have produced or now are producing coal, belong to the Atlantic Coast region and include the Richmond Basin and the Appalachian region. The latter comprises a number of separate areas extending across the western part of the state. The Richmond Basin is the only area of free-burning coal located immediately adjacent to the Atlantic seaboard. The first coal mined in the United States was from this area, mines having been opened and worked as early as 1750.

Virginia makes a somewhat unfavorable comparison with the other states of the Appalachian region in the quantity and percentage of coal shot off the solid. In 1912, of the total production of the state, 3,741,533 tons, or 47.7 per cent., was "mined" by the powder. This was an increase for the year of approximately 12 per cent. in coal so produced. On the other hand, the percentage of machine-mined coal increased from 27.2 per cent. to 40.85 per cent.

As the percentage of coal shot off the solid in Virginia is high, so is the death rate. In 1912, there were 75 fatal accidents, of which 67 were underground and eight on the surface. Thirty-three of the deaths inside the mines were due to falls of roof, 10 to explosions or burns of gas, 10 to premature blasts, or similar accidents, and nine to mine cars and locomotives.

⁂

It is claimed as a result of British coal-dust experiments that the extent of an explosion will not necessarily be limited by keeping certain underground zones free from coaldust. The pioneer blast which precedes the actual flame of the explosion is sufficient to stir up enough coaldust to provide the necessary combustible material.

Prevention of Accidents in Coal Mines

By John McNeil

SYNOPSIS—An abstract of a paper delivered at the second meeting of the Rocky Mountain Coal Mining Institute, in which the practice of blasting off the solid and legislation requiring payment on the run-of-mine basis is condemned.

⁂

As early as 1835 Great Britain appointed a Royal Commission of talented men possessing special knowledge in the conduct of coal mining, as well as eminent authorities in science, to examine into the subject of mine accidents. Since that time there has been a succession of such commissions at frequent intervals in all countries wherever coal has been mined. These commissions have applied themselves faithfully to the cause entrusted to their care, but, unhappily, there still remains a direful toll of mortalities and injuries.

The most prolific cause of accidents is from falls of roof and coal and, approximately, 50 per cent. of the fatalities are due to this cause alone. The greatest number of accidents occur at the working face, due to the neglect of the miners to stand props promptly upon the first evidence of bad roof. While the miner must necessarily be responsible, to a large degree, for the safety at the face of his working place, yet the mine superintendent and boss have direct supervision over him, and it is their especial duty to prevent carelessness, whenever cognizant of it.

In late years a large number of workmen, more or less inexperienced in mining, and unable to speak or understand the English language, have entered the mines, so that it is all the more essential that a vigilant watch be kept throughout the chambers and thorough discipline employed. It is not enough for the mine boss to tell the miner that his roof is poor and then to leave the place, but he must remain until the work he has ordered, has been done and obedience has been obtained.

Now I have been a pitboss myself and have not infrequently received notice from the superintendent that the cost of coal the month before was too high, and that a better showing for the present month would be expected. In turn, the superintendent would show me a letter he had received upon the subject from the general manager. So our anxieties in the matter were mutual, and faithful to our superior officer, we did our best to reduce the cost.

Hard To Watch the Miner

Working under such high pressure, I had, as boss, but little time to keep a vigilant watch over Tom, Victor or Mike. My attention, under the circumstances, was more closely directed to the mule drivers, the cagers, the dumpers and the box-car loaders, so as to increase the output and lower the cost.

To have engaged an assistant for the purpose of watching the faces, would have seemingly increased the cost, but just that very thing should have been done. When I now read the mining laws demanding that the mining boss visit and examine carefully all working places daily, or every other day as the case may be, I know from experience the physical impossibility of his doing so in a very extensive coal mine, and yet there is the most urgent necessity of doing it.

I talk from experience when I say that probably in no other direction in the mining of coal can accidents be minimized more readily and completely than by keeping a vigilant and eternal watch on the miners in close proximity to the working face; and in the absence of the mine boss, there should be an experienced inspector clothed with authority to examine the roof, not only by ocular observation, but by sounding the top, in a careful and practical manner with a pick. His orders should be absolutely obeyed.

Explosive Character of Dust

The explosive character of coal dust is now universally acknowledged, and for many years systematic experiments have been carried on in Great Britain and other foreign countries, with the object of finding some means of preventing or mitigating the disastrous effects of colliery explosions.

During the past few years our Federal Government has made a searching inquiry into the causes of all recent mine explosions and established a testing station at Pittsburgh that is now under the supervision of the Bureau of Mines, and has published a number of bulletins of great interest on coal-dust experiments. Such research at home and abroad has shown conclusively that coal dust is a great source of danger, especially in the presence of firedamp.

Tests at Experiment Station

Certain tests at the Station have shown that finely pulverized coal dust (200 mesh) caused an explosion where there was only 0.032 oz. of it suspended in each cubic foot of air, or 1 lb. in 500 cu.ft. of air. It has also been determined that to burn completely 0.12 oz. of such dust would take all the oxygen in a cubic foot of air and the combustion of 1 lb. will take all the oxygen in 133 cu.ft. of air.

If a ray of sunshine could possibly penetrate the chambers of a dusty coal mine, we would be astonished to see the densely charged atmosphere around us, but in the gloom of the mine we are seemingly not cognizant of the latent dangers that lurk in the air. Custom makes one feel at ease. The surroundings are the same as they were yesterday; but in such an atmosphere, we are not safe if we tolerate heavy blastings with common black powder, or even permissible powder, for that matter, for all at times spread flame.

Whenever at such a mine I feel the vibration of a windy shot, I am grateful for my deliverance, and the more I see and learn, the more I feel that we often step on the very brink of disaster with frequent and heavy shot firing.

Explosion in a Tipple

In this connection I will relate a peculiar explosion which occurred on the 18th of October, 1897, at the tipple of a coal mine belonging to the Colorado Fuel & Iron Co., at Crested Butte, Colo., under the following conditions:

Note—Abstract of paper read before the Rocky Mountain Coal Mining Institute, Salt Lake City, Utah, June 12, 1913.

The mine entrance is situated on the side of a mountain and the coal is run to the tipple over a tramway about 1200 ft. long on a grade of from 5 to 20 per cent. In some manner a loaded trip of cars got over the "knuckle" without the rope being attached. The cars remained on the track and passed through the tipple shed at a fearful rate. The commotion of this passing body raised a dense cloud of coal dust in the shed and an explosion occurred simultaneously. Clouds of dense smoke and flame extended 35 ft. above the crown of the building and in a few moments the structure had taken fire in several places.

Two men employed in dumping the coal, seeing the runaway cars coming, made their escape, as they supposed, from flying timbers, but notwithstanding, both were severely burned and considerable damage was done to the building.

The only accountable source of the fire was from a stove in the weigh house. There were no inflammable materials stored in any part of the building, neither were the pit cars oiled there. The explosion, of course, was due entirely to coal dust ignited by the fire of the stove.

Happily, but few of our Western mines generate firedamp, but those that do are all the more susceptible to an explosion, when coal dust is present in suspension in the air, or deposited on the roof, sides or floors so as to intensify the consequences greatly, should a gas explosion occur. In a number of our best regulated mines there are water-sprinkling systems to moisten the coal dust and saturate the air. There are also other appliances that humidify currents of air upon entering the intake air course, such as radiators, steam injectors and mechanical water sprayers. Also some of us sprinkle adobe dust over the sides, roof and floor of the haulageways.

While we greatly appreciate the value of these admirable precautions, yet, if we, at the same time, permit heavy shooting and blasting coal off the solid with highly inflammable black powder, which is the most prolific cause of coal-mine explosions, it would appear very much as if we were straining at a gnat and swallowing a camel.

Sea Sand Taken into Mines

Upon visiting some very extensive coal mines in England some four years ago, I noticed great quantities of sea sand being taken into the mines, which was spread liberally over all permanent haulageways, almost giving them an appearance of stone when compared with our entries. As their cars, unlike most of ours, are of the closed-box doorless type, they do not strew coal dust along the haulage roads.

But in addition to all such precautions, Great Britain, unlike us, strikes at the root of the greatest evil by absolutely prohibiting shooting off the solid, and not only is the coal seam undermined, but sheared as well, and where wedges, plug and feather, hydraulic cartridges, or other devices can thrust down the coal, the use of explosives is eliminated entirely. When powder is resorted to in blasting coal, it is used in light charges, the machine and pick being used as much as possible, in order to bring down the explosive charge to a minimum.

It is estimated that a little over one-half pound of explosive is used on an average to each shot fired in British mines, though the amount varies in different districts. In the Newcastle district, England, 4,508,290 lb. of explosives were used in firing 8,608,850 shots.

We have no data to draw a definite comparison with the Newcastle statements, but from experience and knowledge of the conditions, in this respect, throughout the coal mines of Utah, Wyoming, New Mexico and Colorado, I think you will all agree that our shots will average 1½ lb. of explosives. Remember it is of average conditions I speak.

Comparison of Death Rates

The British death rate in coal-mine fatalities per 1000 persons employed, ranges from 1.25 to 1.36 for a number of years. The fatal accident rate per 1000 employees in the United States, taken as an average from 1866 to 1908 is 3.10. The number of lives lost per 1000 employees in Utah, Wyoming, New Mexico and Colorado, taken on an average for a number of years, is 9.04.

We must frankly admit that the death rate has greatly increased in our mines during the last decade, but in the past 12 months, we have shown a marked improvement, and I know just how earnestly all of you are watching and working for a continuance of this good work. Now, as members of the Rocky Mountain Coal Mining Institute, I would recommend that we, as a body, exert our energy toward securing by law the abolishment of that dangerous practice of blasting coal from the solid; and let us demonstrate before our legislatures, by overwhelming evidence, that the enactment of the "run-of-mine" basis granted a license which may have been the cause of grave disasters. I am well aware that as the years go by, the prevailing custom of undermining and shearing the coal by pick mining is gradually but surely becoming a lost art in this Western country. The use of powder is so much less arduous for the miner in comparison to hand mining, and therefore the miners take a risk and strenuously oppose any change to either pick or machine mining.

To be successful in lessening the recurrence of disasters, we must install sufficient undermining and shearing machines to cut the coal and reduce the use of powder to a minimum; and the explosive that is used must be the safest product which we can obtain. Blasting operations being practically unavoidable in coal mining, we should, after reducing the shot charges to a minimum, adopt the best firing regulations practicable. The method of performing the blasting by shot firers with electrical appliances after all the workmen have left the mines, is a valuable precaution; but better still is the system of wiring the numerous shots in one circuit and firing the same by an electric current from the surface, when no one is in the mine, especially in those mines where firedamp is given off. Accumulations of coal dust should be removed as much as possible from the vicinity of blasts and all shots should be tamped with incombustible material.

In this connection, I will quote from an article in the *Transactions* of the Manchester Geological Society of England, Vol. 18:

"This is an account of some experiments made in Germany in the Saar coal field in October, 1893. The gallery was constructed on the surface, 167 ft. in length, of elliptical cross-section (5½x4½ ft.) with a cross-gallery to represent the actual state of the colliery level.

One end was closed with masonry, in which cast-iron canons were placed, having bores the size of the holes generally used for blasting in the mines.

A Series of Experiments

Firedamp was conducted in pipes from a "blower" in the mine. The following experiments were made with one-half charges of powder:

First: tamped with clay, the length of the flame was nearly 10 ft.

Second: tamped with coal dust; the length of the flame was 26 ft. Neither firedamp nor coal dust were in the gallery during these experiments.

Third: tamped with clay; the gallery being strewn 131 ft. in length with nongaseous coal dust; the length of the flame was 18 ft.

Fourth: similar to No. 3, but tamped with coal dust; the length of the flame was 31 ft.

Fifth: tamped with clay; coal dust in No. 3 being replaced by the dust from Pluto colliery in Westphalia; length of the flame was 190 ft., with a heavy detonation and much afterdamp.

Sixth: a repetition of No. 5 without the addition of fresh dust, with almost identical results.

Seventh: tamped with clay; without coal dust and fired in air containing five per cent. firedamp; the flame was 36 ft.

Eighth: similar to No. 7 with 65½ ft. of the gallery strewn with coal dust from the Pluto colliery; the length of the flame was 170 ft., with very severe detonation and strong development of afterdamp."

Mine fires sometimes originate in a way that leaves no doubt as to the source of their origin, but a mystery remains as to how they became ignited. Therefore, precautions should be taken to minimize them as far as possible. Lumber cabins, seats, cupboards and boxes should be done away. Underground stables should be made fireproof, and only incandescent lights should be used in them. All cotton waste and other oily substances should be put in an iron keg reserved for that purpose and should be removed frequently from the mines. Overcast air-bridges and all permanent stoppings should be constructed of concrete or other fireproof material. Manways for the miners to travel to and fro from their working places should be maintained and men should be kept off the branch and main haulageways as far as is possible, in order to lessen the risk of accidents by mine cars.

Injurious Effect of Bad Air

We have recorded the prominent causes of accidents, but we have yet to record the injurious effect on the general health of coal miners, caused by breathing stagnant or impure air, vitiated by powder smoke, finely ground coal dust and the presence of carbonic acid gas, better known as blackdamp. C. E. Foster, a late British inspector of mines, makes the statement "that there are quite as many miners killed prematurely from breathing impure air and carbonic acid gas, as there are from inflammable gas.

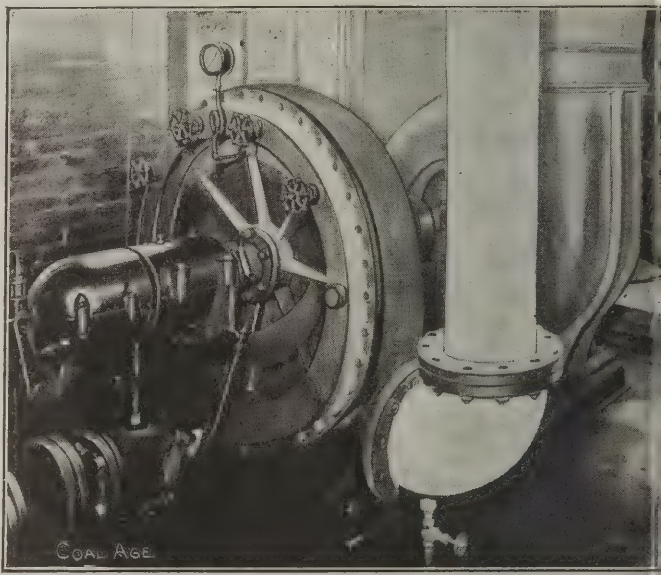
Therefore, a large ventilating current at the intake and the outlet of a mine is a good thing, but the ventilation will be bad, nevertheless, if the air currents are not continuously distributed and carefully conducted to the room faces where the miners are at work.

A Rugged Blower Unit

In the production of water gas, whether for purpose of power or illumination, the blower unit plays an important part. As it is constantly called upon for sever service, its reliability is responsible for the continuou and satisfactory operation of the plant.

At the works of the Lynn Gas & Electric Co., there i an interesting installation of a turbo-blower. This i shown in the accompanying photograph. The set consist of a Sturtevant, type 5 steam turbine, direct-connecte to a No. 9 gas blower of the same manufacture, and i used to blow the gas generators.

The turbine is operated intermittently, being starte and stopped by a chain which is attached to a quick-opening valve. This subjects both turbine and blower to sudden and severe variations in load and speed, which are a constant test of reliability and rugged construction.



Blower Direct-Connected to Steam Turbine

This set, which has been in constant operation ever since January, 1912, and has received practically no attention except for oiling, has never given the slightest trouble in any way, in spite of the fact that it is called upon to undergo the severe service outlined above, for 15 hours every day.

⁂

The Production of Coal in Michigan During 1912

The production of coal in Michigan in 1912, according to E. W. Parker, of the U. S. Geological Survey, amounted to 1,206,230 short tons, valued at $2,399,451. Compared with 1,476,074 tons, valued at $2,791,461 in 1911.

Of the total production in 1912, more than half (635,560 tons) was mined by machines, of which 125 were in use. Of the remainder, 433,222 tons were reported as shot off the solid, and 120,637 tons as mined by hand.

The number of men employed in the coal mines of Michigan in 1912 was 3133, a decrease from 3323 men in 1911, and the average number of working days decreased from 218 to 183.

Don'ts for Inside Employees

By Anthony Barrett*

SYNOPSIS—A concise statement of essential precautions for coal miners, based on long observation and experience in anthracite mines.

⁂

1. Don't pass the firebosses' station without first seeing the fireboss.

2. When the fireboss notifies you there is gas in your breast, don't go up in it until the gas is removed.

3. Don't start to work at the face before examining and seeing that it is safe.

4. Always cut your fuse off the roll before you put the cap on it, then tighten the cap with a crimper. Never use your teeth as it is a dangerous practice.

5. Don't push the charge in the hole with a drill. Use a wooden tamping stick.

6. Don't light your squib with your mining lamp when using black powder. Use a piece of touch paper.

7. Don't neglect to place your prop as soon as you have room. It is too late after you are injured.

8. Don't neglect your brattice. Put it up as soon as you have room to build.

9. Don't stay and work in your breast if the top is working. Leave and go for the fireboss and tell him about it.

10. Don't leave your breast at quitting time before you examine to see if it is all right. There may be a feeder of gas burning.

11. Don't fire a hole when driving a heading to another breast before you have told the party on the other side about it. Always get an answer when you rap to him.

12. Don't go into old workings. There may be gas there of which you are not aware.

13. Examine your safety lamp before going down the shaft. If you find any fault with it, show it to the foreman or fireboss.

Rules for Gangway Miners

1. If you are using fore-poles, don't take the cut out before putting in the poles. You may get hurt.

2. Don't use black powder and dynamite in the same holes. It is dangerous.

3. Don't let the laborer work at the face when you are not there.

4. Don't leave the colliery if there is any gas in the gangway or chute before you tell the foreman or fireboss about it.

Rules for Drivers

1. Don't beat your mules with a club or piece of lagging. Carry a whip and use your best judgment when to use it.

2. Don't form the habit of shouting at your team. They may become excited and turn the wrong way, causing an accident.

3. Don't ride on cars in a gangway where the timber is low. Walk alongside of your team.

4. Don't pass, when going in, a lagging or plank that is lying on the gangway, it may trip you when coming out, thereby causing an accident. Stop when you see it and place it out of the way.

5. Don't fail to report to the loader boss or repairman if you find a bad joint in the road. By so doing, you may avoid and prevent an accident to yourself and others.

6. Don't slide your foot on the rail or sit on the bumper of the car. Many good drivers are in the cemetery from these causes.

7. Don't allow any person to ride on your loaded trip.

Rules for Loaders

1. Don't uncouple your car while it is in motion. Have the driver stop first.

2. Don't go up in the breast when you want to load. Rap on the battery for the miner.

3. Don't ride on loaded mine cars.

4. Don't clean off the rail with your hands. Use a shovel.

5. Don't pick up a piece of coal before you have examined to see if it is shattered. When shattered lift it up to your waist and let it drop on the platform, then you can shovel it into the car. Shattered coal may break in your hands while loading it into the car, thereby causing injury.

6. Don't forget to report to the fireboss when the gangway timber is crushing.

7. Don't unload timber and sheet iron on the gangway. Put it on the platform.

Rules for Loader Bosses and Repairmen

1. Don't walk along the gangway in the morning as though you were outside of the mines. Examine the road and top as you go. If you see anything wrong report it at once to the fireboss. If there are any laggings or plank lying on the gangway, place them on the platform, or some place where they will not cause an accident.

2. Don't be careless about erecting a battery. Make it air-tight.

3. Don't unload plank along the gangway. Put it up in the chute.

4. Don't allow any person to ride on the locomotive except those in authority. Allow no one to ride on a loaded trip.

Rules for Door Boys

1. When trip is on inside stay on the inside. When on outside stay on the outside of your door.

2. Don't let the door stand open longer than is necessary.

3. Never leave the door at quitting time until all the drivers are out.

4. Don't bring books or papers to read while at work as you may get interested in reading them and forget the door, causing an accident.

5. Don't go to sleep at your door.

These are simple rules which, if practiced, may be the means of preventing injury and possible loss of life.

How To Reduce Falls from Roof and Sides

By D. J. Griffiths

SYNOPSIS—This is a paper which was delivered at the June meeting of the Rocky Mountain Coal Mining Institute and provoked a good deal of discussion, as attacking any method of systematic timbering.

⁂

Beyond doubt it is practically impossible to eliminate all chances of accidents from falls. Mother Earth is not going to give up her treasures without some sacrificing on our part.

This particular question ranks among the important subjects connected with coal mining, and has been given less attention as a factor of life and limb destroyer than any other cause. The single fatalities which happen, create very little attention, nevertheless, when counted up at the end of the year, they outnumbered the unfortunate ones that are mowed down on the wholesale by mine explosions.

Firedamp and coal dust were often considered as the greatest evils in coal mining. All records, however, prove this conclusion to be wrong; the second annual report of the Bureau of Mines, gives the loss of life caused by falls of coal and roof in 1910 as 1310 and in 1911, as 1321.

The reports of Pennsylvania Mine Inspectors for a period of 33 years, show that 59.38 per cent. of all the accidents underground was caused by falls of roof and coal. Also, the Bureau of Mines shows in their last issue on fatalities that accidents from falls of roof and coal killed more men than any other two causes combined, and that they account for more than half of the deaths underground.

It seems we are getting too accustomed, taking too many things for granted, running too many risks, trusting too much for the best and preparing too little for the worst. We must remove the cause then the effects will cease. However, I can see that a better day is here.

The main damaging factors underground are falls of roof and sides. Bad roof is tender and lacks the adhesive qualities to sustain its own weight over comparatively small areas. A roof of any character which is frequently penetrated by well defined slips and cleats, is characterized as treacherous roof. The carelessness of men has been one of the main causes of most of the accidents in mining as well as in any other industries.

Three Grades of Miners

Miners can be classified into three distinct grades, to wit: The experienced and careful, the experienced and reckless, and the unexperienced. The accidents with which the first class usually meet, occur through the carelessness of their coworkers as well as through accidents which are termed unforeseen, such as falling roof between timbers, and between the timbers and the face of the coal. This may have previously given evidence of being absolutely sound and safe, but be released by invisible slips or by sudden outburst of occluded gases in large quantities, as we term big blowers or feeders, or by a sudden squeeze and seismic movement. The competent but careless or unenergetic miner takes too many chances under threatening pieces of roof and sides and the coal at the face, neglecting to timber or pull down roof as the conditions demand. The unexperienced most of the time put up the timber in the wrong places. Owing to the scarcity of skilled miners, the mines of the West employ annually hundreds of men who are far from being familiar with all phases of danger, and therefore are not watchful.

There are causes that make or transform safe roof into dangerous roof. First: Poor or inadequate ventilation causes the roof and sides to disintegrate, while decomposition of timber is noticeably hastened in the presence of highly contaminated air. The men become depressed and indifferent, losing alertness, quickness and ambition. In a sluggish atmosphere the men cannot see the same as if the air is good. J. S. Haldane and T. L. Llewelyn, British Experts on Mining, have recently made experiments to determine the degree to which lamps are dimmed by the presence of impurities in the air. The results show that every diminution of one per cent. in the oxygen present, lowered the illumination power of a safety lamp, burning colza oil and paraffin 3.5 per cent, and I assume that it also affects the hearing of men to a certain degree. Therefore, in as much as poor ventilation is a factor of so much importance in damaging property and crippling life in all directions, it is one of our chief duties to see that the volume of air is sufficient and see that it is as nearly perfect in quality as practicable, and that the air is properly conducted through the various parts of the workings. Secondly, lack of sufficient pillars for support renders the roof unsafe. The pillars should safely bear the load; small pillars permit squeezes at the face and on the haulage roads, so causing the roof to fall, and many deaths are a result.

Blasting Off the Solid

Blasting off the solid is injurious to the roof. The expansion of the powder is upward as well as downward and sideways. The flying coal knocks out the props and sometimes breaks them in two, allowing the roof to fall or giving it an opportunity to become released. The resetting of displaced timber is hazardous work. In southern Colorado, the coal is undermined so that the danger from flying coal has been practically eliminated.

I am pleased to say that the motto of the majority of the companies, today, is Safety First.

The miner is better taken care of today than ever before. The fireboss makes a thorough inspection of the roof and ascertains as well that the place is perfectly free from firedamp and blackdamp, and adequately ventilated. The pitboss visits the working places every day, and frequently the superintendent enters the place. It is becoming common for companies to have inspectors, who devote all their time to the health and safety of the underground employees, and further, we have more state inspectors than before.

In the mining world there is at present a controversy over the methods of timbering. Some believe in systematic timbering, where there is a maximum for the distance between each prop. The idea looks good on the surface but when carefully analyzed, it falls short. In the first place, it would create a tendency on the part of the miners to timber their places according to the specified rules, losing sight of the importance of putting the timber where they would be most serviceable. Moreover, it would make the officials neglectful of sounding the roof, as they would see the place thickly timbered and the law complied with. A system cannot be applied that can be of any benefit, where conditions vary in every foot of advance in a room, entry, pillar and cross-cut. In my opinion, mine timbers should be set in such a manner that they will give the greatest degree of safety. Conditions of the roof govern where and how many timbers, and what kind of timbering is needed. The trouble is not the failure to use sufficient timber, but to place them where they are needed. It is necessary to sound the roof often and place timber according to the sound.

---

*Note—Abstract of paper read before the Rocky Mountain Coal Mining Institute, Salt Lake City, Utah, June 12, 1913.

How can a method of systematic timbering prevent a pot hole, a trough-shaped rock, and various other shapes of rocks surrounded by slips, from falling? There can be no set rule for placing props. The people that advocate systematic timbering, must believe that all the miners are inexperienced, and that the company officials never visit the miners' places. Firebosses, pitbosses and company inspectors visit the places every day and other officials occasionally. I am afraid by compelling men to timber according to fixed rules, the standard of safe timbering would be lowered. Such an attempted remedy would create a larger number of accidents.

Eight years ago the British Inspectors of Mines instituted inquiries to ascertain whether the earth trembling had any effect upon falls of roof and sides in the mines. They appear to have taken this course, because the adoption of the new special rules to secure the roof did not reduce the number of falls; falls of roof and sides continued to be as disastrous a source of accidents as in the presystematic days.

Systematic Better Than No Timbering

I take it for granted that someone will say that systematic timbering has reduced the fatalities in some sections of the country. In answer to that, I will say, yes. But why? Because previous to that very little attention had been given to the men and the roof, so that any kind of a system would naturally help matters in those particular sections. We cannot have a set rule to hold the roof any more than we can establish a rule to fight a fire in a mine where practically all the coal had been extracted. It would be a good move in the right direction to see that all the miners and timbermen are equipped with axes and saws in perfect condition. If the tools are not in perfect condition, they will postpone timbering. Every post should be set with a cap-piece, which should be in thickness the width of the prop and a little wider than the width of the prop. Under great pressure the cap-piece is liable to split the prop if it is not covering the whole end.

And further, I advocate a good electric lamp; one that has illuminating power to expose the joints of the slips and breaks.

The M-O-I. and Kokoal Dealers' Convention

By A. T. Shurick

SYNOPSIS—A description of one of the most important conventions of coal dealers that has ever yet been held. About 700 members of both societies were present. A number of important papers were presented and considerable discussion was devoted to the relationship between the coal industry and the railroads.

⁂

The joint convention of the Michigan-Ohio-Indiana Coal Dealers Association and the Order of Kokoal, at Cedar Point, Ohio, on June 17, 18 and 19, brought together one of the largest and most representative assemblages of coal dealers and wholesalers that has ever met. These are the two most powerful organizations of their kind in the country, and this was the second occasion on which they have met in joint convention. Add to this propitious weather conditions, an ideal place of meeting and all the requisites were at hand to assure an excellent attendance.

The Kokoal's Annual Meeting

Members and guests of the two associations began registering at the Breakers Hotel at Cedar Point on the morning of June 17. Cedar Point is about three miles by water from Sandusky, and the Breakers Hotel, which was the headquarters, proved all that could be desired; it was not yet opened up actively for the summer trade and the coal men had it practically for themselves.

The Kokoal meeting, which was scheduled to take place in the morning, was not held till 2:30 p.m., due to the nonarrival of members until that time. The meeting was called to order by Imperial Modoc Coleman who introduced Vice-President Ballard, of the M-O-I.; the latter extended a hearty welcome to the Kokoal members which was appropriately responded to by Past Imperial Modoc A. M. Hull, of the Kokoals.

Following this, Imperial Pictor Lester read the secretary's and treasurer's annual report. In this he commended the work of the Birmingham Breaker in general, in the highest terms, and W. C. Adams, of that breaker in particular, following with remarks on a number of the other more successful breakers. Mr. Lester regretted that in order to obviate the possibility of a deficit the sum of $300 had been donated by a number of companies who indorsed the principles and work being done by the order.

Imperial Modoc Coleman's paper was then read. His address was confined almost entirely to the weakened condition of the society's membership. The records showed that only about 50 per cent. of the members had their dues paid up and in addition to this he deplored the inactivity on the part of the local breakers. He stated that he had attempted to strengthen the order's financial position by the opening of a new membership designated as associate members. The initiation fee was to be $5 each and he had hoped to secure some 2000 members but had only succeeded in getting about 70.

Mr. Coleman said that he now favored cleaning out all the "Dead timber" from the society's membership and making a new start. He is also of the opinion that all members should be affiliated with some local breaker and that the latter be held responsible for the collection of all dues of its members. On the question of initiation of new members he thought that the present system was becoming rather old and should be brought uptodate. He concluded his remarks with an expression of his sincere appreciation of all the assistance given him by the members, press, etc.

Mr. Adams, of the Birmingham Breaker, then made a short talk on rejuvenating the organization. He quite pertinently pointed out that there was no other industry in the world producing such a staple product as coal and yet so loosely organized as the coal dealers were; and in his opinion there was no other organization that could be established on so high a plane were a reasonable effort made. He ascribed the success of the Birmingham Breaker to the concerted action, coöperation and close interests of the individual members and concluded by stating that the coal men should be impressed with the advantages to be obtained by organization.

The session was concluded by the Imperial Modoc appointing a committee on resolutions and another on constitution and bylaws which were to report on Thursday.

In the evening one of the most enjoyable koruskations ever held was given by the Birmingham Breaker at which eight new members were initiated into the order. Complimentary cigars from the Minneapolis delegates were distributed to all who attended the evening meeting.

At the end of the first day 431 members and guests of the two societies were registered

The Official Badge

The M-O-I. Meeting on Wednesday

The annual meeting of the Michigan-Ohio-Indiana Coal Association was held in Convention Hall at 10:10 a.m., on June 18, President Lake presiding. The opening address was made by President Ryan, of the Cedar Point Resort Co., who extended a hearty welcome to the visitors on behalf of his company. Mr. Lake responded with a few appropriate remarks, and was followed by G. A. Ballard, chairman of the executive committee who made a short talk on the organization of the convention.

President Lake's annual address was then given. He stated that he had not expected to be present because of a serious illness and had not therefore prepared a formal paper, but he delivered one of the most interesting talks of the session, confining his attention mostly to the association and its work. He found that this was growing quite rapidly and he now considered it one of the most powerful in the country. Evidence of this fact was clearly shown in the recognition accorded the association by the large transportation companies, there being nine representatives of these latter present at the meeting; it was obvious that they were awakening to the necessity of working in closer harmony with the coal men and also to the importance of their organization. It was only within the last few years that shippers had been able to recover for losses in transit and this was a result that he had long predicted, and it was gratifying to him that his prediction had proved true.

The next evil of this character to be corrected, is the car-service rules. Railroads carefully specify that they are not liable for "acts of Providence," but, on the other hand, the coal man must fulfill his agreement regardless; it is a poor rule that does not work both ways and he believed that the association should push this issue aggressively. However, he was of the opinion that when the transportation companies become better acquainted with the coal men and more familiar with their troubles that a better understanding would prevail and such difficulties easily adjusted.

Concerning the Retail Prices of Coal

On the question of the retail selling prices of coal, about which there has been much unfavorable comment in the press of the country, Mr. Lake stated that this was entirely unjustified and unfair. He said that the dealer could not handle coal under average year around condition for less than 70c. per ton, and in view of the fact that New York retail prices are from $1.50 to $2 per ton above the wholesale, this seems to be a modest estimate. Some dealers might believe they could do better on this price, but unless they kept accurate accounts and made full allowance for depreciation and other charges they were not in a position to determine this and should be careful about selling low. He then cited conditions in other industries, such as the drygoods, for instance, where a profit of 20 to 25 per cent. was demanded; this is much more than the dealer expects.

He concluded by extending his sincere personal thanks to J. A. Ballard and the committee for the efficient and able way in which they had handled the meeting.

The treasurer's report was then read and this was followed by the secretary's report. During the past year there were 248 claims filed against the railroads, of which 23 were declined, 101 collected and 124 still pending; the total amount involved was $4547.80, of which $2056.60 was collected. The total membership is 1790, of which 192 were taken on during the year and 63 dropped out for different reasons. Cash on hand to the middle of June was $436.60 as compared with $456.78 at the same time last year.

Following this the papers of members were read in the order given herewith:

"Coal the Essential." By Frederick W. Saward, of the *Coal Trade Journal*, New York.

"Anthracite Conditions—Your Troubles and Ours." By D. F. Williams, Scranton, Penn.

"Coöperation as between the Coal Man and the Railroad." By J. B. Nessle, general coal and ore agent of the New York Central Line, Pittsburgh, Penn.

"Value of Railroad Claim Department." By H. B. Wolf, Marion, Ind.

"Result of Coöperation as between Shipper and Dealer." By W. J. Hamilton, Columbus, Ohio.

A committee of nine (three from each state) on nominations was then appointed and instructed to report later, and the president concluded with the statement that this had been one of the most interesting sessions the association had ever held.

The Boat Ride in the Afternoon

In the afternoon the members and guests of both societies had an enjoyable sail on the steamer "G. A. Boeckling." The steamer left at 2:45 p.m. and crossed the bay to the Sandusky shore, passing by the B. & O. R.R. coal docks. These are equipped with two loading derricks and under them are the bins of Bert Smith, a local dealer. After touching at Sandusky, the steamer proceeded down the shore line past the Big Four R.R. docks and on down to the Short Line (Pennsylvania R.R.) piers.

At this point the operation of picking up entire railroad cars and dumping them into the vessel's hold was witnessed; the freighter "A. B. Stewart," of about 10,000 tons capacity, was being loaded at the rate of about one railroad car every two minutes. From here the steamer turned out to Johnson's Island, at which point all the rock is obtained for the breakwaters both at Sandusky and Cleveland; scows were being loaded by derricks at the piers there.

The return trip was made by Sandusky and hence into Cedar Point again. During the entire journey a one-man, spectacled, colored orchestra ably assisted by Mr. Draggins and others rendered excellent selections on the stern of the boat.

The Concluding Day

The final meeting of the Michigan, Ohio, Indiana Association was called to order in the Convention Hall on June 19 with a small attendance present. The first business was the report of the committee on nominations, which was read and adopted, the officers for the new year being as follows:

President—H. H. Deam, of Bluffton, Ind.

Vice-President—James A. Ballard, of Detroit, Mich.

Treasurer—W. A. Gipson, of Upper Sandusky, Ohio.

Directors—Robert Lake, of Jackson, Mich., to succeed George T. Calvert; W. G. Voegele, of Mansfield, Ohio, reelected; J. W. Landrum, of Terre Haute, Ind., to succeed H. H. Deam, and H. B. Wolf, of Marion, Ind., reelected.

The new president was installed, appropriate addresses being made by both him and retiring President Lake. Talks on the following subjects were then given mostly in an informal manner:

"Looking Things Square in the Face." By Benjamin F. Cobb, Monon Bldg., Chicago.

"Value of Sociability in Business." By D. W. Sherry, Connersville, Ind.

"The Value of Gaining Public Confidence." By H. P. Gaukler, Pontiac, Mich.

"Credits." By H. W. Kelly, Angola, Ind.

"Preparing Your Selling Talk." By C. H. Enderlin, Chillicothe, Ohio.

The meeting was concluded with the adoption of a resolution extending a hearty vote of thanks to the Cedar Point Resort Co. and others for the many courtesies and unfailing attention which had been accorded the members of both societies during the meeting.

In the afternoon the concluding meeting of the Order of Kokoals was held, at which the annual election of officers took place, the result being as follows:

Imperial Modoc—James A. Ballard, sales manager Semet-Solvay Co., Detroit, Mich.

Imperial Baron—W. C. Adams, sales manager Alabama Fuel & Iron Co., Birmingham, Ala.

Imperial Baronel—A. J. Moorshead, president Madison Coal Corporation, St. Louis, Mo.

Imperial Baronet—George W. Edmonds, George B. Newton Coal Co., Philadelphia, Penn.

Imperial Pictor—R. S. Jones, Berwind Fuel Co., Minneapolis, Minn.

Imperial Mazumer—E. V. Sidell, retail coal merchant, Poughkeepsie, N. Y.

Imperial Gazook—Daniel Howard, Central Fairmount Coal Co., Clarksburg, W. Va.

Imperial Pit Boss—John A. George, president Indianapolis Coal Co., Indianapolis, Ind.

Imperial Acolyte—F. C. Atwill, Atwill-Makemson Coal & Coke Co., Chicago.

Imperial Swatta—G. T. Rider, Scanlon Coal Co., Louisville, Ky.

Imperial Spotta—Pratt Thompson, Lehigh Coal & Navigation Co., Hartford, Conn.

The Exhibits

F. S. Converse, of Binghamton, N. Y., manufacturer of coal-handling tools and machinery, had one of the largest exhibitions at the convention, showing a line of chutes, screens, bags, baggers, etc.

One of his products which attracted considerable attention was the Converse Portable Rotary Screen for rescreening coal. The screen is cylindrical in shape and covered with wire screen of different mesh set on a frame and fed by a hopper; the whole equipment is on wheels so that it is readily moved about. The object of the device is to eliminate what commonly requires three distinct operations when screening the coal over a yard screen.

The exhibit of the *Domdoff & Joyce Co.,* of Cincinnati, Ohio, attracted considerable attention, owing to the large variety of cokes and coals displayed. The company was represented by Charles A. Sargeant, secretary, and W. H. Underwood.

The New York Coal Co., Columbus, Ohio, operating eight mines in the Hocking Valley district in the Nos. 6 and 7 veins, was also an exhibitor, displaying Manhattan washed coal. They claim to have the largest coal-washing plant in the East; it has a daily capacity of 1500 tons of washed coal. The coal on display was the various sizes used by retail dealers. They also showed photographs of the washer plant, revolving screens and cars loaded with Manhattan and Knickerbocker rescreened lump.

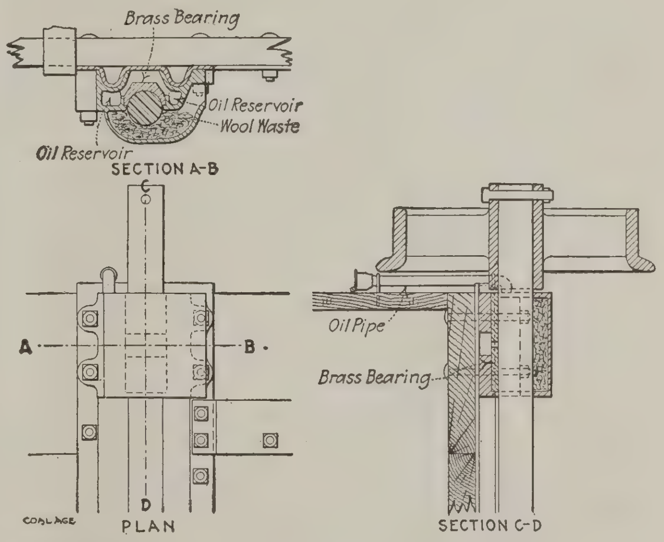
The Gifford Wood Co., of Chicago, exhibited a working model of a retail coal-yard pocket which was one of the most interesting features there. The model was in operation much of the time and proved of interest to the visitors. In addition to this, they had different sizes of gravity-discharge buckets and steel-roller chains with special self-adjusting attachments.

The Hunter W. Finch Co. had a unique exhibit in the shape of a block of Dixie Diamond Block coal from old Kentucky and to the dealer who came nearest guessing the weight of this block, a car load of the same coal was to be given free. The company was also distributing lapel watch chains and a handy little bullet pencil.

A Substantial Journal Box

Although the railroads have for many years employed brass bearings in waste-packed journal boxes on practically all of their rolling stock, the mining industry has been slow indeed to follow their example. Lately, however, the Helmick Foundry-Machine Co., of Fairmont, W. Va., have perfected a journal box of this kind. This device is illustrated herewith, and embodies several features not ordinarily found in mine-car construction.

As may be clearly seen in the drawing, this journal box is waste packed, and consequently self-oiling. The waste, furthermore, is easily accessible, so that the packing may be readily stirred up or renewed without removal of the axles or wheels. Oil may be easily and quickly introduced into the waste receptacle by means of the cups and pipes fastened to the side of the car and extending above the flange of the wheel.



The New Journal Box and Pressed Corrugated Base

The top of the journal box is grooved to fit a corrugated axle base pressed from steel plate. This stiffens the bottom of the car considerably, thereby tending to prevent the axle from bending to a great extent. Heavy bolts extending entirely through the bottom of the car hold the journal box and plate securely in place. This arrangement makes an extremely strong and rigid axle base.

The axles proper are of cold-rolled steel without collars, and can be removed without taking the journal box from the car bottom. One wheel is made tight upon the axle, while the other is loose, thus allowing the car to pass around the sharp curves frequently employed in mines with a minimum of draw bar pull. The whole device is simple, compact and strong, and well adapted to the hard knocks and severe conditions invariably encountered in underground transportation.

Some Notes on Railroad Claims

By H. B. Wolf* and J. B. Nessle†

SYNOPSIS—Some comments on the difficulties the dealer is liable to encounter collecting damages for coal lost in transit. The railroads are prone to take a rather obstinate position in such matters and unless the shipper is able to bring some pressure to bear, his claim will usually receive scant attention. On the other hand, shippers frequently file such inadequate claims that the roads find it impossible to take action; in fact, they claim to be eagerly seeking reasons why claims should be allowed. Both sides of the question are presented.

⁂

By H. B. Wolf

I have never been able to satisfy myself why a coal dealer should have any use for a railroad claims department. I believe he should buy coal f.o.b. destination and let the other fellow stand the shortage or fight it out with the railroads. The producer has always told us to accept what was in the car or make the railroads pay for whatever shortage there might be. I wish to say to the retailers that this is one of the biggest leaks in our business and should be given the same attention as the delivery and collection of a ton of coal to our customers. When we give this leak the attention it should have, the railroads will protect our coal while entrusted to them and our shortage will be less, our money more, collections for short weights will be much easier and payments by railroads more prompt.

The roads doing business in these three states are now taking notice of the retail coal dealers, and while at the writing of this paper I do not know what our secretary's report will contain as to results obtained by the association railroad claims department, I am sure that it will be a surprise to many of us. (See page 50.)

Some Collections Made

Last year I determined to know something of the shortage of coal consigned to our company. I ordered some railroad claim blanks of our secretary and served notice to the railroads entering our city to weigh all cars consigned to us unless otherwise ordered.

Owing to one excuse or another by the railroads we failed to get 202 cars weighed at all but we did manage to get 159 cars weighed. Ninety-six of these overweighed or underweighed less than 1000 lb., 63 cars fell short over 1000 lb., and it is of these 63 I wish to speak. These cars were from almost all coal-shipping districts and contained all kinds of coal from $8.66 anthracite to Indiana mine-run. The total shortage was an even 100 tons, amounting to $369.55, or an average shortage of 3348 lb., amounting to $5.86 per car.

The first lot of claims we sent to the railroad, but as all the satisfaction we got was a card notice, stating the number of claim, we soon changed and sent all our claims to the association, and through them we have been able to collect a great many that otherwise would not have received much attention. We have many claims still pending, but we are so confident that they are just and that we will get them that they were listed on our inventory May 1, as an asset at their face value. It takes time to collect these claims, and if you do not get action on them as soon as you wish, do not give them up but make the railroad pay that which it owes you.

After filing your claim you will probably receive a letter reading as follows:

> Beg to advise claim so and so is herewith returned to you for your withdrawal, as investigation has developed the fact that the car did not meet with any rough handling or theft while on the rails of this company or its connections.

In other words, the railroad will accept this car and issue a bill of lading, showing contents and amount, and on arrival at destination again weigh the car and issue a way bill showing a shortage over their own agent's signature. Then because they cannot find where the shortage occurred, they expect you to believe there was no shortage.

I do not wish to leave the impression that all roads are alike on the question of settling short-weight claims. Our experience has been varied with the four roads entering our city. One road, whose chief revenue comes from carrying coal, had a car of coke it had hauled from the ovens, a distance of 40 miles. I ordered the car over to another road for delivery to one of our yards, and also ordered this latter road to weigh the car, for which they charged $1. It was short 2000 lb., amounting to $3.35. I filed bill for this amount plus the $1 that had been charged by the other road for weighing, and the whole claim was allowed.

By J. B. Nessle

No industrial or railway-traffic man claiming Pittsburgh as his home can hear the word coöperation mentioned in any discussion without swelling up a bit, and if at all possible to do so he finds an opportunity to speak of the Traffic Club of Pittsburgh. This organization, founded some ten years ago, is made up of representatives of the principal industrial organizations and railway-traffic officers whose business interests are located within what is known as the Pittsburgh district. The watchword, object and practice of this organization is coöperation as between industrial interests and railroads first, last and all the time, and it is with a feeling of great pride on the part of members of this organization that they point to the records made in the Pittsburgh district in the adjustment of the many questions that come up from time to time as between railroad and industrial representatives which are amicably settled without recourse to commissions or the courts.

The Value of Organization

This organization has brought the railroad representatives and the shippers of the Pittsburgh district in a close personal relationship with each other. Instead of each trying to find a way to embarrass the other, they are today and for some time have been devoting their energies in an effort to harmonize any differences that may exist and coöperate to the fullest extent.

People wonder and ask the question, why is it that the Pittsburgh shippers are not down at Harrisburg advocat-

---

Note—Abstract of papers read before the M. O. I. Coal Association at Cedar Point, Ohio, June 18, 1913.

*J. G. Wolf & Sons, Marion, Ind.

†General coal and coke agent, N. Y. Central Lines West.

ing and insisting upon the passage of an air-tight public-service law and the establishment of a public-service commission? The answer is that through the application of the principle advocated by the Traffic Club, insofar as the steam railways and shippers are concerned, a public-service commission is not necessary in order to secure and protect the rights of either interest.

There is absolutely no community anywhere approaching the size of the Pittsburgh district where so few complaints before state or interstate commissions are filed by the shippers against the railroads. We have a way of settling these things out of court; largely through the spirit and influence of coöperations as advocated by the Traffic Club.

With a membership scattered over three or more states your organization and the railroad cannot, of course, get as close together as we do in Pittsburgh, but it is quite apparent to me that the association certainly appears to have adopted coöperation as its watchword. If we are to judge from the manner in which the officers of this organization are endeavoring to handle the questions arising from time to time and attend to the disputes that are brought to their attention by members as against the carriers, there is absolutely no doubt that the vast army of coal dealers throughout the country and the railways are going to be brought closer together, and to a better and clearer understanding of each other's troubles and requirements.

Railroads have been blamed for lack of interest, desire to shift responsibility and actual refusal to pay legitimate claims. As a matter of fact, the entire trouble and responsibility for the failure to receive prompt action for adjustment of claims is often due to the claimant himself, in that he has not supplied any evidence whatsoever which would enable the railroads to even locate the shipments in question. Your officers are endeavoring to correct all this, and I wish to assure you that in the railway claim offices this effort is most thoroughly appreciated.

Coal dealers have the idea that a railroad claim office is created for the purpose of finding excuses, evasive language and reasons why a claim should not be paid, without the slightest regards to its merits. It is possible that in the past there may have been some grounds at least for this suspicion, but I feel quite safe in saying at this time that instead of finding a way not to pay claims, they are today bending every effort to find a way to settle all legitimate claims promptly. In other words, we want to find a way to pay your claims at the earliest possible moment.

The Railroads Require Help

Another instance in which your association is coöperating with the railroads is the advice they are giving us from time to time where your members report pilferage. A number of these cases have been reported to me by the secretary and the information has been welcome, since it has given us an opportunity to so police the points mentioned as to eliminate entirely the losses. You all realize, I am sure, that it is absolutely impossible for railroads to carry a detective on each car of coal, or to police the entire line of their road in such a manner as to absolutely prevent the possibility of someone getting on and throwing off coal from cars in transit. But we can and will prevent this wherever possible to do so, and when your members notify the carriers that at a certain place systematic stealage is being practiced, you are doing the railroads and the coal trade a positive service.

Another thing the officers of your association are doing through advice from members is calling attention to the railroads where they find the agents engaging in the coal business to the detriment of the legitimate dealer in the town in which the agent is located. The carriers welcome this information, since they are not always able to check up on this sort of business, and it enables them to at once break up the practice. It is hardly necessary for me to assure you at this time, insofar as the lines I represent are concerned, and I believe this to be true of practically all of the railroads in the territory, that we are absolutely opposed to our agents engaging in coal or any other business to the detriment of the legitimate shippers located on our lines.

Your organization is one that can accomplish a great deal for the coal dealers and at the same time in many ways help the railroads, and I feel confident in predicting that, notwithstanding all that may have happened in the past, we may reasonably expect the "dead past to bury its dead" and find the representatives of the coal trade and the railroads, like the lion and the lamb of old, lying down peacefully together.

⁂

A Comparison of Fatal Accidents

The following is a comparison of the fatality rates of the H. C. Frick Coke Co., with those of Scotland, South Wales, and Great Britain. These figures were given at the recent meeting of the Coal Mining Institute of America.

DEATHS PER MILLION TONS PRODUCED

	1910	1911	1912
Scotland	5.06	4.12	3.50
South Wales	5.60	5.67	6.53
All Britain	6.54	4.47	4.52
H. C. Frick Coke Co.	1.99	1.72	1.88
TONS OF COAL PRODUCED PER DEATH			
Scotland	197,600	242,000	285,000
Scuth Wales	150,700	176,100	153,000
All Britain	137,100	243,500	248,000
H. C. Frick Coke Co.	502,049	578,151	531,328
DEATHS BY FALLS PER MILLION TONS MINED			
Scotland	2.10	1.76	1.86
South Wales	3.18	3.20	2.79
All Britain	2.36	2.33	2.03
H. C. Frick Coke Co.	0.97	0.90	0.70
DEATHS BY CARS PER MILLION TONS MINED			
Scotland	0.68	0.84	....
South Wales	1.68	1.47	....
All Britain	1.02	0.98	0.87
H. C. Frick Coke Co.	0.79	0.41	0.91

The H. C. Frick Coke Co. produces twice as much coal per death as the bituminous region of Pennsylvania, Ohio and Illinois, three times as much as West Virginia and South Wales and twice as much as the whole of the United States.

Figures for Scotland, South Wales and Great Britain were taken from the "Blue Book," published by the British Government. Figures for Pennsylvania, Ohio, Illinois and West Virginia were taken from the year book, published by the mining department of those states. Figures for the United States were taken from Technical Paper No. 48, United States Bureau of Mines "Coal-Mine Accidents in the United States."

⁂

To preserve iron from rust, immerse it for a few minutes in a solution of blue vitriol, then, in a solution of hyposulphite of soda, acidulated with hydrochloric acid. This gives a blue-black coating which is affected by neither air nor water.

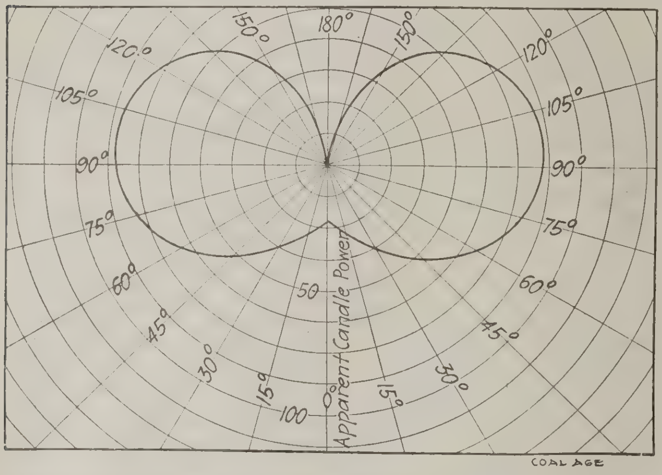
Selection of Portable Electric Mine Lamps

By H. H. Clark*

SYNOPSIS—The purchaser of a portable electric mine lamp will consider not only its safety but the cost of maintaining it, its weight and the candlepower. In considering the latter, due weight should be given to the manner in which it is evaluated, that is, whether the average or the "head-on" intensity of light is considered and whether the lamp has or has not a reflector.

⁂

Portable electric lamps first of all should be safe; that is, they should not be capable of igniting gas and should not be so poorly constructed that a man will be left in darkness, due to failure of any part of the lamp equipment. The lamp should give the proper amount of light for from 10 to 12 hours on one charge of the battery. The lamp equipment should be as light as possible so that the burden of carrying it and working with it may be reduced to a minimum. Some of these qualities are more or less apparent after a brief examination. There are other qualities that are not so easily determined and I will mention a few of them.



Showing How the Intensity of Light from a Lamp Bulb Varies

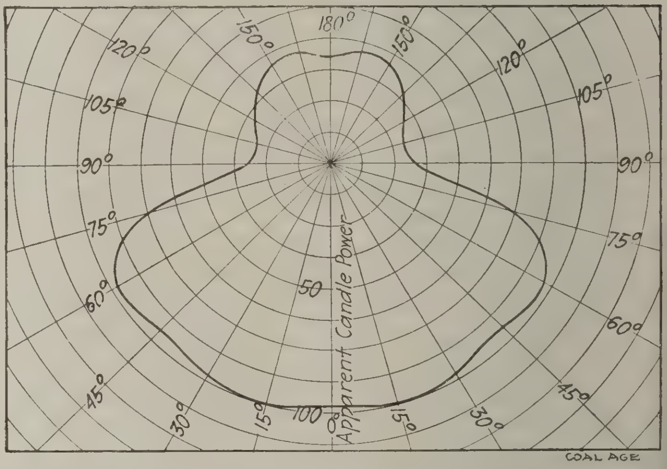
Lamp Upkeep

It is important that the cost of repairs and upkeep of portable electric lamps should be reduced to a minimum. Nor must the interruptions of service, due to equipments getting out of order, be overlooked. The principal item of upkeep is the expense of replacing the lamp bulbs which have been burned out. The life of these is, therefore, an important consideration. The manufacture of miniature lamp bulbs does not seem to be thoroughly standardized in this country. Those which the bureau has examined have varied a great deal in their characteristics. These bulbs cost from 17 up to over 40c. and it may be supposed that the higher-priced lamps are more durable, but I cannot give any definite information as to their relative life, although tests are now under way to determine this fact.

The candlepower that these bulbs will give is not a fixed quantity, as it varies with the voltage at which the lamps are burned. If a lamp designed for two-volt service is burned at less than two volts it gives a considerably decreased candlepower and has a considerably longer life. If, on the other hand, it is burned at 2¼ volts its candlepower would be largely increased and its life proportionately shortened. It is not always a good sign to see a lamp bulb glowing with extreme brilliancy, because it may mean that it is being burned at too high a voltage and may last but a few hours under such conditions.

Candlepower Ratings

Up to the present time, so far as I know, no standard candlepower rating of portable electric lamps has been adopted. Different meanings may be given to the word "candlepower" as applied to portable electric lamps. If a man speaks of his lamp as giving five candlepower he may refer to the intensity of light given by the lamp bulb, or to the intensity of the lamp when used in connection with its reflector. In either case he may refer to the candlepower measured at one point or to the average of measurements at several points. The true candlepower of the lamp is, of course, the average candlepower that it gives over its illuminating range. Some lamps if measured from a point directly in front of their reflector will give from 5 to 10 times the candlepower that they would give if the intensity of light were measured from a point 30 deg. on either side. An effect of this sort is, of course, to be expected, but the statement as to how the candlepower is measured should always be made, because two lamps that really give the same amount of light give widely different candlepowers when measured "head-on."



The Same Light with Its Intensity Modified by a Reflector

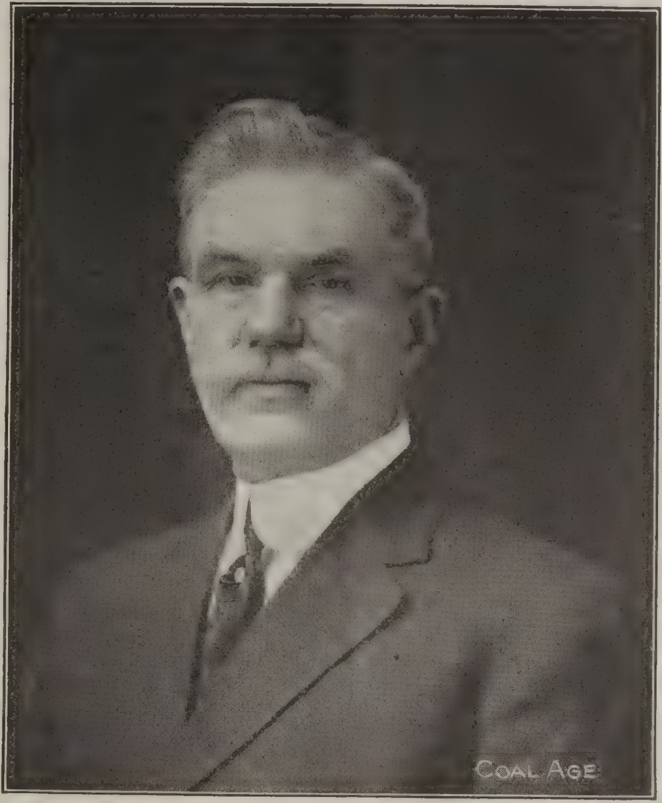
As an illustration: Two lamps give the same amount of light, but the "head-on" candlepower of one is more than 12 times that of the other, and the average candlepower of one is nearly seven times that of the other.

---

*Electrical engineer, U. S. Bureau of Mines, Pittsburgh, Penn.

Note—Article read before the Coal Mining Institute of America at the summer session, June 16, 1913. The illustrations accompanying this article are added in order to exhibit how the light of a lamp varies with the point of measurement. The figures are taken from a catalog of the Luceo Reflectors.—Ed.

WHO'S WHO—IN COAL MINING



Thomas K. Adams

There are probably few mining men of eminence, whose life record shows more clearly what a true ambition, supplemented by a strong purposeful determination to rise to a sphere of usefulness, can do to achieve success, than the following simple, unsophisticated sketch of the career of of Thomas K. Adams, who is at present the oldest, in service, of the mine inspectors of Pennsylvania.

Born in 1849, near Edinburgh, Scotland, and left fatherless in six months (when the father died, leaving the mother with six children), Thomas entered school at five years of age. His early education was all included between the ages of five and eleven years, when he was taken from school (1860) and put to work in the mines of the Midlothian district, where he continued working 13 hr. each day, until 16 years of age. During all these five years of work in the mines of Midlothian, the boy attended night school regularly. Few can understand but those who have had a similar experience what it meant for a boy of tender years to work 13 hr. of the day and study at night to gain the education he so much coveted.

At the age of 16 years (1865), Mr. Adams came to this country and at once entered the mines of Mercer County, Penn., where he worked as a miner, doing all kinds of practical work. At that time, there was no law n Pennsylvania requiring that a miner should serve two years, in the mines of the state, before he could mine coal on his own responsibility.

Seeking constantly for betterment, and to secure experience and information, Mr. Adams worked for six months in the anthracite mines of Pennsylvania, and ollowed this with six months of toil in the mines at McAlester, Oklahoma, then Indian Territory. Then came a change. Having saved some money as a miner, Mr. Adams entered the Edinboro State Normal School of Erie County, Penn., and continued to attend that institution during four full terms. It was here that he received a good English education. Following this, he taught for a short time, as a regular teacher, in the ommon schools of Mercer County, Penn., to which place he had returned.

It was not long, however, before his ambition for mining again asserted itself. While still a young man, Mr. Adams took an active part in the affairs of the Miners' Local Union and was soon appointed to the position of secretary of that organization. His duties as secretary of the Miners' Union led him into active participation in the work of securing the appointment of a mine commission, which was the first appointed (1874) in Pennsylvania. As a member of that commission, he performed excellent service in the formulation of a bituminous-mine code, which was afterward (1877) made the bituminous mining law of Pennsylvania.

In the meantime, Mr. Adams had reëntered the mine, working as a miner, thereby adding to that fund of practical information and experience which, in later years, placed him in the foremost rank of practical mining men. It was while working in the mines of Mercer County that Mr. Adams (1881) went to Pittsburgh to take the first examination for mine inspector ever held in Pennsylvania. He passed this examination successfully, receiving a rank of 95 per cent., and was immediately appointed and commissioned to act as mine inspector, by Gov. Hoyt. Mr. Adams rereceived this appointment May 15, 1881, and has continued to hold the position of mine inspector from that time, having just been recommissioned for another term.

Four years later, in 1885, and again, in 1893, Mr. Adams was appointed a member of commissions to revise the bituminous mining law, being selected chairman of the last named commission.

As a student of mining, Thomas Adams has few equals. While engaged in the numerous activities incident to the office of mine inspector, he continued his studies of mining, in correspondence and other schools; and added largely to his fund of information by the constant reading of mining books and papers. He did not confine his reading, however, to mining subjects, but devoted many spare moments to the reading of standard works of the best English authors. Mr. Adams has, by industry and frugality, collected a fine library, comprising many of the standard works on history, philosophy, theology, sciences and general literature.

Mr. Adams has thus, from the age of 11 years, supported himself and gained an enviable reputation for sobriety, industry and practical knowledge. He is a total abstainer from alcoholic beverages and the use of tobacco in any form. He has always shown an active interest in labor movements, being especially desirous for the betterment of all classes. He served as the local and district secretary of the Miners' and Laborers' Benevolent Association, and was master workman of the Knights of Labor at the time when labor officials gave their time and efforts without remuneration.

Mr. Adams is a republican in politics, a churchman of the United Presbyterian faith, and a school director in his own town. He is, this year, the retiring president of the Mine Inspector's Institute, U. S. A., of which organization he is a charter member. He states that he is satisfied to have done his best with what he modestly styled "a limited capacity."

Our Front Cover This Week

The upper illustration on the front cover of Coal Age this week shows the 400,000-ton bituminous coal-storage equipment built by the Link-Belt Co. for the Berwind Fuel Co., Superior, Wis. The equipment consists of four traversing bridge-tramways, two revolving locomotive cranes and three movable screening towers.

Each bridge has a span of 295 ft. and an overall length of 506 ft. Two of the bridges are equipped with three-ton buckets, and two with four-ton buckets. All motions of the bridge and bucket are controlled by one operator from either of two fixed-control stations.

Run-of-mine bituminous coal is unloaded from vessels and delivered either to storage, or through reloading hoppers on front tower of tramway direct to box or open cars for reshipment. Transfer from stock pile to cars is accomplished by similar bucket delivery to the reloading hoppers.

When sized coal shipments are desired, coal is taken from vessels or stock pile by tramway buckets to movable screening towers, which may be likened to traveling tipples.

Slack coal, screened from the sized coal shipments, is discharged into open-top cars or conveyed to slack-storage pile, from which the cranes or tramways deliver to movable screening towers for box-car shipment as needed.

The revolving locomotive cranes travel on a track of 10-ft. gage and are arranged to operate 54-cu.ft. buckets at a maximum radius of 45 feet.

Run-of-mine storage is also tributary to the cranes for delivery to cars through the hoppers on the movable screening towers as required.

Delivery to box-cars is facilitated in all cases by traveling box-car-loading machines.

The entire plant is of the most modern construction, and is operated by alternating-current motors.

The lower illustration on the front cover shows a general view of the largest anthracite coal-storage plant in the world, built by the Link-Belt Co., of Philadelphia, for the Philadelphia & Reading Coal & Iron Co., at Abrams, Penn.

The immense tonnage of this plant is divided into eight piles—four on each side of a central railway system—each pile having a capacity of 60,000 tons. The guaranteed performance of the equipment is 1800 tons per day of 10 hr. for each of the incline conveyors, or a total stocking-out capacity of 14,400 tons per day.

For replacing the coal into cars, each of the reloading conveyors has a capacity of 2500 tons, making the total reloading capacity of the plant 10,000 tons per day of ten hours.

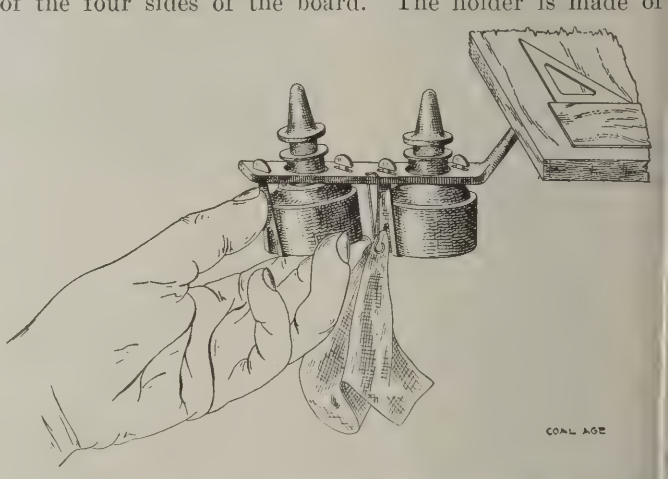
This is the well known Dodge system of coal storage and is the most successful application of engineering practice to the storing of anthracite coal.

As usually arranged for open-air storage, two trimming machines and one reloading machine between them constitute a group. A storage plant comprises a number of these groups which may be of equal or varied capacities. It is, therefore, capable of extension by the addition of one or any number of groups.

"The Dodge System" is also adapted to storage under cover, and to modifications of the open-air storage, in which the trimming machine may be stationary or movable, and the reloading machine a traversing instead of a pivoted conveyor.

A New Bottle Holder

The device illustrated below is a safe and convenient bottle holder for attachment to the underside of a drafting board. When not in use it can be swung out of the way for which purpose a pivot screw is provided. It does not interfere with the use of a tee-square on any of the four sides of the board. The holder is made of steel, ribbed to give strength and coated with black enamel. The bottles are easily inserted and removed and when fastened into place cannot be upset. A holder for a wiping rag is part of the device. The appliance is made by Eugene Dietzgen Co., 218 East Twenty-third St., New York City.



Device for Holding Bottles of Ink

⁂

The December number of The Otto Cycle contains the following table showing the loss of power in gas engines at different altitudes above sea level, expressed in percentage of the power at sea level:

Altitude, feet	Loss in rated horsepower per cent.
1,000	3.55
2,000	6.95
3,000	10.25
4,000	13.45
5,000	16.35
6,000	19.45
7,000	22.35
8,000	25.15
9,000	27.85
10,000	30.45
11,000	32.95
12,000	35.35

EDITORIALS

The Man Who Speaks

There is no merit in taciturnity, in hiding all one's emotions and traveling before the world in a disguise. The successful man is a mixer who has fewest secrets from his working men. The kindly word was the source of all the friendly feeling between capital and labor in the early days and no tricky sociological device can replace it now.

The foreigner needs that word of welcome no less than the native-born. It is our duty to melt the refractory material of southern Europe in the effulgent crucible of our kindness. If we have not learned the loneliness of the alien in a strange land, we have failed to estimate the mainspring of his discontent and of his deplorable penchant for intoxicating liquors.

That place he calls home, you may call a hovel; those folk joys he cherishes may appear to you ignorant follies, but he clings to them nevertheless; the murk of the mining town may not disgust you who have not reveled in the skies of the Mediterranean, but as he recalls the latter, he sings enraptured those plaintive songs of the homeland with a voice which makes the hills ring again. And when he is at his work with his mind ill at ease, a little word of welcome in his own tongue meets with his glad response. "*Buon' giorno*" or "*Buona sera*," pronounced in his vernacular "bon jawn" or "bon-ah sarah," will lighten the morning and the evening of the Italian's discontent.

The foreigner is looking for sympathy and comprehension. Those who have been urged to partake of beer and home-brewed wine by an overurgent Italian host will readily bear witness to the fact that if the stranger long remains a disgruntled alien it is because we have failed to return with a smile the advances he has made to secure our good will, when his heart was aching for the sights and the friends of his homeland.

⁂

The New Mining Law of Colorado

For some time past the mining interests in Colorado have been wrestling with the question of revising the old mining law, which had become well-nigh obsolete, owing to the great development of the coal-mining industry in that state.

It was in November, 1910, that Gov. Shafroth appointed a commission to inquire into the condition of the coal mines, the causes of the many recent serious mine accidents, and to suggest remedial legislation. The commission consisted of Doctor Alderson, president of the State School of Mines; Doctor Ekeley, professor of chemistry, and R. D. George, professor of geology, both of the University of Colorado, the latter being also state geologist; and James Dalrymple, state inspector of coal mines.

The need of a new mining law in Colorado had been recognized for some time, but was emphasized by the recent occurrence of two serious mine explosions; namely, the Starkville explosion, Oct. 8, 1910; and the explosion at Delagua, Nov. 8, 1910; the former costing 56 and the latter 79 lives. The work of the commission extended over a period of two years and has resulted in giving to Colorado a practically new mining code.

Under the new law, a board of examiners is to be chosen, each four years, beginning 1913. Sec. 5 of the new law reads as follows:

> Section 5. Within 30 days after the passage of this act the governor shall notify one judge of each of three judicial districts in which coal mines are operated to make appointments as follows: Two of said judges shall each appoint one reputable coal miner of known experience and practice at the time, from his judicial district. The third judge shall appoint one reputable coal-mine owner, manager or other mine official, and the governor shall appoint a coal-mining engineer of like repute, experience and practice at the time, who shall constitute, together with the chief inspector of coal mines, a board of five examiners, who shall hold office until the third Tuesday of January, 1917. The duty of the examining board so appointed shall be to examine candidates for the position of chief inspector, deputy inspector and mine officials and perform such other duties as are provided for in this act. Provided, when examinations are held to examine candidates for the position of chief or deputy inspectors, the chief inspector shall not act as a member of the examining board, but the other four members of the examining board herein provided for shall select the fifth member to act instead of the chief inspector.
>
> In the year 1917, on or before the third Tuesday of January, and every fourth year thereafter, a new board of examiners shall be appointed as herein provided. The appointment of members on the board of examiners shall be made from the said judicial districts in regular rotational order. Vacancies shall be filled in the same manner.

The section above quoted is unique in respect to the method outlined therein for the selection of the examining board, which board is charged with the duties of examining all candidates for the offices of chief and deputy mine inspectors, company mine examiners, mine foremen, assistant mine foremen and firebosses.

The law provides (Sec. 40) that the board "shall meet at places selected by them, immediately after the taking effect of this act and every two years thereafter, or oftener if necessary." While the new law does not seemingly compel the employment of shotfirers, a clause of the same section reads as follows:

> Shotfirers shall pass an examination to be given by the chief inspector or deputy inspector on occasions when either of these officials shall be present at the mine where the applicant for the position of shotfirer is employed: Provided, that when there is no certificated shotfirer at any mine employing shotfirers, the mine foreman and fireboss may examine any applicant as to his fitness to fill the position of shotfirer, and, having been satisfied of such fitness, may employ him in that capacity until the next visit of the chief or deputy inspector.

As will be observed from the reading of Sec. 5, in the examination of candidates for the office of chief inspector, the incumbent of that office cannot act as a member of the examining board. In that case, the remaining four members are authorized to select a fifth person to act in place of the chief inspector, on the board. The law, however, does not specify, as it should, the qualifications of the person to be so chosen for this place.

The law provides (Sec. 10) that the examining board shall certify to the governor the names and grades of all successful candidates; and (Sec. 11) that, from this list, the governor shall select and appoint as chief inspector of coal mines, "the applicant best qualified for the duties of that office." The wording of this section makes it possible for the governor to appoint the applicant "best qualified" for the position, according to his own judgment and regardless of the rating the applicant received in the examination.

The law further provides (Sec. 12) that the chief inspector shall select his own deputy inspectors from the list of successful candidates. As provided in Sec. 13 a certified list of candidates holds good for five years from the date of certification. There is required (Sec. 16) a rating of 85 per cent. for the office of chief inspector of coal mines, and 75 per cent. for deputy inspector of coal mines.

The law requires (Sec. 17) that each candidate for inspector be a citizen of the United States and of the state of Colorado, of temperate habits, good repute and personal integrity, 30 years of age, and have an experience of 12 years in working coal mines in the United States, at least eight years of which shall be in Colorado and three years immediately preceding his examination. In addition, candidates for chief inspector must show executive ability that would enable them to advise, direct and control the inspection staff. Sec. 41 limits the time of examination of candidates for office other than mine inspectors to 15 days for each two years.

It is to be regretted that Sec. 18 of the law compels the examining board to provide candidates with the mathematical formulas required in the answering of any question given by the board. Instead of giving the formula to be used, the candidate should be given a textbook and required to find his own formula, which would demonstrate his ability to work out such a question without other aid than that afforded by the textbook with which he is or should be familiar, and which he invariably uses in daily practice as a workman uses his tools.

Coal Age has always claimed and still holds that candidates for any practical official position in mining should be granted, in examination, the use of any textbooks with which he is familiar and which he commonly uses in solving technical questions, in daily mine practice, in the office, or at home. The object of the examination should be to show a man's ability to work out such technical questions as the examining board see fit to ask, under the same conditions with which he is surrounded in daily practice.

Examiners should not require candidates to memorize formulas, constants and other data, which they themselves obtain by reference to textbooks. Neither should examiners give a formula in connection with the question asked, as this is a decided help to the candidate and in no way proves his ability to work out the question independently. There are many candidates who could readily answer the question when the formula is given, but who could not find the correct formula in a textbook, and these men have not the ability that should be required to pass the examination.

We do not advocate that textbooks should be used in *all* the sessions of an examination, but only in one or two sessions in which technical questions only should be asked.

Common-Sense Precautions

On page 45 of this issue, Anthony Barrett, an inside foreman employed by the Philadelphia & Reading Coal & Iron Co., has given a series of "Don'ts" which are worthy the attention of all mining men who are employed underground or who oversee those who work in the mines.

There is no doubt but that other experienced mine officials could supply additional precautions which would make this set of rules still more complete in the amount of ground covered. We, therefore, ask that Coal Age readers write us, suggesting further precautions which we can embody in a final set of rules, to be distributed broadcast among mining companies.

⁂

The Pennsylvania State Tax on Anthracite Coal

The new law recently signed by Governor Tener, providing for a tax on all the hard coal mined in the state of Pennsylvania is now in effect, and the large operators will immediately put out a new circular to which this extra cost will be added.

The law provides, in brief, a tax of 2½ per cent. of the value at the mine of all the coal produced. On the basis of the September circular, the maximum quotations on anthracite, the increase on the prepared sizes will amount to between 8¾c. and 10⅜c. per ton On the steam grades the increase will be from 3¾c. to 6¼c. per ton. These increases are to be added to the regular circular by all the large companies, effective July 1. How outlying states will regard the proposition of carrying Pennsylvania's taxes remains to be seen.

⁂

Simultaneous Coal Conventions

During the week beginning July 16, four of the editors of Coal Age were compelled to be away at the same time, attending different coal meetings. The territory covered extended from Alabama to Lake Erie and as far west as Utah, and even though we were compelled to leave the stenographers and the "printer's devil" to get out the paper, we would not have complained had we felt the situation was properly handled. Such is not the case, however. Not only was it a physical impossibility for us to attend all of the meetings but it was also impracticable to devote sufficient space to them.

This latter is probably the most serious feature of all; scarcely any of the coal societies have sufficient means to provide for the publication of the different papers and discussions which take place, and so they are compelled to rely upon the coal press of the country. The coal journals, as a rule, appreciate the high value of these papers and are eager to publish them, but such matter cannot be delayed and must be printed immediately.

Nor are we alone in this complaint. Machinery houses have petitioned the order of Kokoal to request the different state associations to so arrange their dates in the future that demonstrators may cover the ground thoroughly and as economically as possible. Complaints are also general from coal men of all kinds. It is, therefore, to be sincerely hoped that some concerted action will be taken in this respect and that next year will not witness such an absurd congestion of meetings.

SOCIOLOGICAL DEPARTMENT

Sanitation in Mining Towns

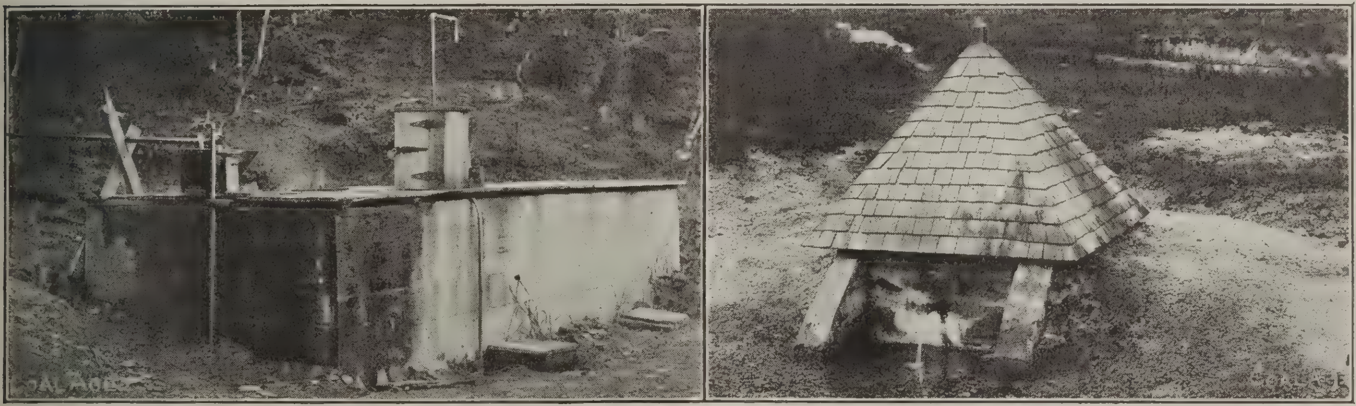
By J. H. White*

SYNOPSIS—Controlled entirely by the operator, with an income absolutely assured, so long as the mines work, the mining town can be made and kept sanitary if the ideal is borne in mind and the necessary expenditures made.

⁂

The U. S. Bureau of Mines has recently incorporated a new section within its organization which is known as the Mine Sanitary Engineering Section, the function of which is to improve sanitary conditions in and about mines.

Perhaps the reason why sanitary improvements are neglected and why people hesitate to spend money on them is because it is difficult to get an accurate measure of the returns on the investment. It is unfortunate that the results are not more tangible. You can install a meter and readily discover the slippage in a pump, or you can put an indicator on the steam chest of the engine and get a graphic presentation of the waste, and the prony brake on the pulleys will measure the loss due to friction, but you cannot calibrate humanity. We do possess an imperfect method, viz., vital statistics, but they are difficult and expensive to obtain, are subject to gross misinterpretation, and even when their story is told in the most graphic way they fail to drive the lesson home. Even epidemics arouse only local interest. The simple practice of learning from the experience of others is theoretical rather than real.



Septic Tank at Edgewater, Ala., Mines — Protected Spring at Ishkooda, Ala.

Tennessee Coal, Iron & Railroad Co.

The Characteristics of the Mining Town

The characteristics of a typical mining town are:

1. Company ownership, the streets, lots, houses, stores, churches, schools, hospitals and the public utilities, such as the water supply and lighting system, are frequently owned and controlled by the operator of the mine. 2. The completion of the town at the time of its inception; it is a "made-to-order" product and is only occasionally the result of growth and development extending over a period of years. 3. The absence of permanency; the life of the average mining town is 20 or 25 years and the idea of abandonment at some time in the future is manifest. Modern mining towns are now being constructed with a longer life in view. 4. The pronounced similarity and sameness of the occupations of all the people residing in the town. 5. The absence of local self-government. 6. The dual capacity of landlord and employer vested in the same party.

These conditions affect the following fundamental sanitary problems, among others:

1. Housing. 2. Water supply and disposal of waste. 3. The establishment and enforcement of sanitary rules and regulations.

As the mining town does not grow but is built at a single stroke, the valuable lessons learned by the "try-out" method and the profit gained by previous mistakes do not exert their powerful influence, so that the errors existing in one house exist in all. If one house is not properly lighted, all will be dark; if a few houses are placed too closely together, all houses will be similarly spaced; if there is congestion in one section, there will be congestion throughout; if one privy is unsanitary, all the privies will be the same. Of course, one could have learned from the experiences of other mining towns already built, but this information was perhaps not readily available and local conditions modify each case.

I believe you can see that the uniformity of occupation of the tenants has its effect upon the housing situation. While no two human beings are the same, none of us can deny that similar means of livelihood have marked effects upon our practices, habits, recreations and dress. This in a way simplifies the housing problem as it eliminates the variety of conditions and conveniences to be provided.

Note—Abstract of address before the senior sanitary engineers, University of Pittsburgh, Pittsburgh, Penn., May 20, 1913. The photographs accompanying this article were kindly furnished by the Tennessee Coal, Iron & R.R. Co. to "Coal Age."

*Sanitary engineer, U. S. Bureau of Mines, Pittsburgh, Penn.

Company Town a Reflection of Operator's Ideals

Company ownership is the most important factor entering into housing conditions. Every house reflects the standard which the operator wishes maintained; comparisons, variations and graduations are absent. It is difficult to stimulate personal pride among the inhabitants and no friendly rivalry exists. However, if improvements are introduced they are far-reaching, and the tone of the entire town is raised, so that one house does not point the finger of scorn at its neighbor. As the employer is also the landlord, the payment of rent is compulsory and the importance of an assured income should be given due weight.

In discussing the water-supply situation it must be kept in mind that the town site is generally determined by the location of the mine shaft which in turn is established by such factors as topographic conditions, formation of coal, economic transportation and similar commercial considerations. The necessity and importance of a satisfactory domestic water supply for the people who were to get out the coal was probably not given much consideration in the past; it is hoped that more thought will be given to this phase of mine development in the future. In some places the men are carried daily to the mine in work trains or by interurban tramroads, and numerous difficulties are thus avoided. In studying conditions with a view of introducing a public water supply into a town the cost of improvements and the age of the town must be carefully balanced. Another factor which may complicate the problem is the relatively large industrial consumption of water compared with the demands for domestic use. This may mean an extra large filter plant to purify all water (both domestic and industrial) or the installation of separate pumping and distribution systems. The possibility of piping water from a neighboring town may furnish a solution at certain places and its feasibility should always be investigated.

Protection of Individual Wells

In many mining towns the domestic water supply is from individual wells, and while this system is far from perfection, it can be brought up to a safe standard. The usual indictment against the system is the susceptibility of the wells to infection, and on account of the inconvenience of drawing water an insufficient amount will be used for household and personal cleanliness. The danger of infection may be minimized by abolishing the unsanitary privies and conditions around a dug well may be improved by lining it with terra-cotta pipe, placing a water-tight covering of concrete over the top and installing a pump.

The nature of the soil plays an important part in the safety of the well, sandy soil furnishing a natural protection. In a limestone region pollution may come from points many miles away, which makes the potential danger of the well in such measures great. In such cases the distribution of drinking water in bottles throughout the town may be necessary, the well water being used for cooking and washing purposes only. The inconveniences due to the difficulty of getting water from the wells may be eliminated by establishing bath houses at the mine shaft so that the men may wash upon coming out of the mine. These bath and change houses are being widely introduced; in a few states they are required by law. A public laundry is a great convenience for the women; lugging in several tubs of water preliminary to doing a week's washing is a severe burden. Bath houses in or near the schools for the women and children are almost necessary accessories to the perfect well system. Wholesome and safe drinking water is essential to existence; its supply is one of the gravest responsibilities accompanying company ownership.

Sanitary Sewerage

There are few mining towns with sanitary sewer systems and some of the statements already made explain their absence. Such a system presupposes a public water supply for flushing purposes, and all that has been said about the difficulties of obtaining water bear indirectly upon the sewerage question. In the second place, the approximate location of the town site is determined by the mine shaft and the topography must be accepted as it is. This is generally rough and hilly and a single gravity system of sewers is almost impossible as the cost of leveling off the hills and grading the streets is prohibitive.

Moore's Spring Pumping Station at the Mines of the T. C., I. & R.R. Co.

Moreover, a suitable stream to take the discharge of the sewers may not be near at hand; and the necessity of installing a sewage-disposal plant looms up. Besides these difficulties the expense of making house connections, installing plumbing fixtures and keeping these in repair means a large expenditure. In the construction of new towns, some of these objections could be avoided by a more careful selection of the town site and arranging streets so that they follow contours. In some cases, also, the experiment has been tried of building the outhouses or privies over the sewers and having a single automatic flush which serves for a number of houses. This obviates expensive plumbing fixtures and cuts down the extravagant use of water.

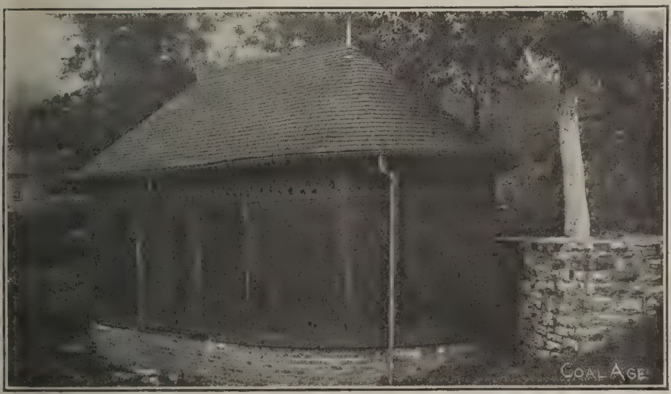
The Dry Closet

At its very best the dry closet is not an institution to be proud of, and one would hesitate to estimate the sickness and loss of life caused by these neglected filth spots that abound in most every mining town.

A privy is sanitary when there are: (1) No nuisances surrounding it. (2) No possibility of ground pollution or infection of water supply. (3) No possibility of the spreading of germs by flies or other insects or animals.

The ground pollution and water infection is eliminated by the water-tight receptacle, but it is difficult to shut out flies. Methods used are darkening the vault, covering each deposit with sand, clay or ashes, placing a strong deodorant in the cans, or possibly partly filling the cans with water so as to cause an immersion of the stools. It is seldom possible to depend on fly-tight construction.

The sanitary collection and disposal of night soil is another important feature and one which has not been satisfactorily solved. It is almost impossible and practically uneconomical to destroy this material by fire. Disinfection by a liquid is not efficient because of the impermeability of the solid matter and the nauseating work of bringing about a thorough mixture by stirring. Burying in the ground is not without its drawbacks because of the pollution of water supplies and because in the development of the fly larvæ, disease germs may be brought up from several feet under the surface. One method which is being tried is placing this material in a septic tank and promoting liquefaction of the solid matters by various agencies in the tank and then applying a liquid disinfectant to the effluent. This method is being tried out by one of the large mining companies of Alabama.



Moore's Spring, Concreted, Bricked and Housed, T. C., I. & R.R. Co.

The collection of garbage, trash and waste of all kinds offers no special difficulties. There is a surprisingly small amount of this and the hens, hogs and dogs usually consume it.

The establishment and enforcement of health laws and regulations in mining towns vary markedly from those in other places. Company ownership expedites the legislation and simplifies the enforcement. The official sanitary inspector is in absolute control and he need be retained, however, only as long as he does his work satisfactorily. It is not necessary for him to cater to any particular parties or show any favoritism or partisanship, as his job does not depend upon his popularity. The dual capacity of landlord and employer commands obedience to the laws as their violation may be punished by discharge and eviction from the town. On account of similarity of occupations the regulations will affect all the inhabitants with the same severity and one class is not discommoded for the benefit of another—as, for instance, in a city where stable regulations and permits bring neighbors into conflicts.

On the Operator Depends the Condition of the Mining Town

These are the advantages that mining towns possess, but the drawback lies in the fact that the initiative in maintaining sanitary and clean conditions throughout the mining town rests entirely with the operator. Indifference on his part may give rise to deplorable sanitary conditions. The residents have no official voice in the government of the town and unofficial aggressiveness is seldom exerted because the total absence of property rights breeds irresponsibility and carelessness. Most of them are blissfully ignorant of the dangers of unsanitary surroundings, and when they protest it is the inconvenience rather than the dangers that bestir them.

Pump at Bayview, a Mining Camp of T. C., I. & R.R. Co., Now under Construction

⁂

Company Schools at Gary, W. Va.

J. F. Drummond, of Huntington, W. Va., has been engaged in starting schools for workingmen at Gary, W. Va. There are night schools at all the mines of the United States Coal and Coke Co., and these schools educated on an average 25 men each. The education is not occupational, but is designed to teach the men to speak, read and write the English language. Text books are lent by the company to the pupils. They can buy them, if they so desire, but unless they spend money in this way, attendance at school is absolutely without expense to those availing themselves of the instruction.

INQUIRIES OF GENERAL INTEREST

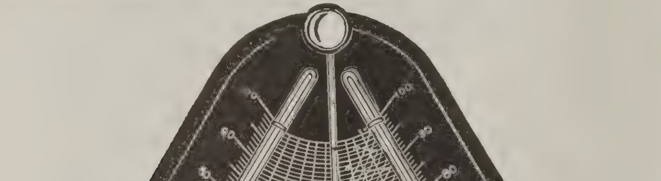
A Humidity Chart

Will you kindly state if there is a chart for determining the percentage of humidity in the air directly, without calculation; and also explain the method of calculating the percentage of humidity from the readings of the dry- and wet-bulb thermometers?

J. S. Watson.

Baxter, W. Va.

In reply to this inquiry, we would say that the only chart of which we have any knowledge is that known as the "hygrodeik chart," prepared some years ago from corrected tables of the U. S. Weather Bureau. The chart has since been used in connection with the hygrodeik instrument shown in the accompanying figure, and designed by the Taylor Instrument Co., Rochester, N. Y.



The Hygrodeik

The operation of the instrument is exceedingly simple. A pointer, or index finger, is arranged to slide up and down on a movable arm. First, the arm is swung to the left and the pointer moved to correspond to the temperature of the wet-bulb thermometer, which, in this case, is 60 deg. F. The arm is then swung to the right until the pointer intersects the curved line terminating in the reading of the dry-bulb thermometer, which, in this case, is 70 deg. F. The lower extremity of the swinging arm then points to the relative humidity of the air, which is read, in percentage, from the lower scale of the chart and is, in this case, 55 per cent.

The lines that curve downward to the right show both the weight of moisture in the air and the dew point or temperature at which that moisture would fully saturate the air. In the present case (wet bulb, 60°; dry bulb, 70° F.) the dew point is 52 deg. F., and the amount of moisture present in the air 4.4 grains per cubic foot. This amount of moisture would fully saturate the air at 52 deg., but gives only 55 per cent., humidity at 70 deg. F.

The principle of the hygrometer is generally well understood. The two thermometers are identical, with the exception that the wet-bulb thermometer, shown on the left, is covered with a fine silk or cotton sack, terminating in a wick, which dips into the small water vessel shown below. The water is drawn up through the wick by capillary attraction and keeps the sack moist. The evaporation of the water from the sack increases with the dryness of the atmosphere. The evaporation is most rapid in a perfectly dry atmosphere and ceases altogether when the air is fully saturated with moisture.

The principle involved is that the evaporation of the water causes an absorption of heat, which cools the wet bulb and reduces the reading of this thermometer. The reading of the dry-bulb thermometer indicates the actual temperature of the air.

The Calculation of Relative Humidity

In order to calculate the relative humidity of the atmosphere from the readings of the dry- and wet-bulb thermometers, it is necessary, first, to obtain from a table, the tension of aqueous vapor, expressed in inches of mercury, for each of the temperatures indicated. Then, divide the difference of the readings of the dry- and wet-bulb thermometers by 88, for all temperatures of the air above 32 deg. F. (For temperatures below 32 deg. F., divide the difference of the readings by 96.) Multiply the result by the observed barometric pressure divided by 30. Subtract this last result from the tension of the aqueous vapor at the lower temperature (wet bulb), and divide the remainder by the tension of the aqueous vapor at the higher temperature (dry bulb). The quotient thus obtained will be the relative humidity of the air expressed as a decimal.

Calling the dry- and wet-bulb readings (Fahr.) t_d and t_w, respectively, the corresponding tensions of the aqueous vapor expressed in inches of mercury P_d and P_w, and the barometric pressure B, the relative humidity of the atmosphere (H) is expressed by the formula:

$$H = \frac{P_w - \frac{B}{30}\left(\frac{t_d - t_w}{88}\right)}{P_d}$$

Making the calculation for the above readings, since $P_d = 0.7335$; and $P_w = 0.5183$, assuming a barometric pressure $B = 30$ in., the humidity of the air is

$$H = \frac{0.5183 - \frac{30}{30}\left(\frac{70 - 60}{88}\right)}{0.7335} = 0.55, \textit{ or } 55 \textit{ per cent.}$$

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 4—That the discussion of the question of the use of mixed lights in coal mining is one of great interest to both miners and officials alike, cannot be doubted. The question, however, will appeal differently to men working under different conditions, as they will view it, each, from a different standpoint. A discussion of the question, nevertheless, will develop many practical points that will be of benefit to all classes and help to safeguard human life and property in and about the mines.

In deep coal mines, where the coal is giving off large quantities of gas, there is no question but that safety lamps should be used exclusively, for the reason that a slight accident or derangement of the ventilating system would soon reduce the mine air to a point where it would be highly explosive; and such an occurrence would not be anticipated in time to avert an accident. In working mines of less depth, or generating less gas, however, it is not generally considered necessary to use safety lamps, especially if the ventilation in the mine is good and there is but a small percentage of gas in the return current.

In the class of mines last mentioned, it frequently occurs that a single heading or an isolated working place that has been driven up a considerable distance, becomes difficult to ventilate; and the lamp may show a slight cap in a cavity of the roof or close to the face of the coal. In working such a place, it would be agreed quite generally that safety lamps should be used. It does not seem necessary, however, that a whole section of the mine should be put on safety lamps, because one or two working places in it require their use. In my opinion, it s out of all reason to demand that such a section shall be worked exclusively on safety lamps. It must be remembered that both miners and mine laborers are more liable o injury where safety lamps are used than where they re allowed to use open lights; provided, of course, that he conditions are such as to make open lights safe.

In closing, permit me to say that I believe it is a detriment to all concerned to oblige the use of safety lamps hroughout a section where the conditions requiring their se are not general; or, in any case where their use can e avoided with reasonable safety.

W. J.

Ladysmith, B. C., Canada.

Letter No. 5—I do not consider it good practice to use mixed lights in a mine that is making gas in sufficient uantity to render an explosion possible. This conclu- on, I believe, is justified from the fact that all persons, oremen, company hands and miners alike are careless nd forgetful, or absent-minded, as the case may be. Many instances can be given that demonstrate the truth of this fact.

Suppose, for example, that gas is reported in one or ore chambers on a gangway, in a certain mine, and a bratticeman is sent in to remove the danger. He will generally take a safety lamp and a naked light with him; and, setting his naked light down on the bottom rock in the intake, he proceeds to erect a brattice for the purpose of driving the gas from the face of the pitch. Everything goes well until some unforeseen occurrence drives the gas down on the open light, and there is an explosion in which the bratticeman is badly burned and sometimes others suffer with him.

I recall several small explosions that occurred in about this way. In one case, I was driving a mule and running cars to make up the trip. It was our custom to use naked lights to a certain point; but it was necessary to use safety lamps when gathering the cars for the trip. When the trip was made up ready to run to the foot of the shaft, we would put our naked lights on our heads, so as to be ready to sprag the trip. It frequently happened that we would forget we had a light on our head and step back past the danger point. In this manner, I had two mules burned and was myself nearly suffocated with the afterdamp. The night driver and several others were badly burned, in this way, at the same place.

In another instance, I recall, the mine officials were watching the removal of a body of gas. About an hour later, when it was supposed that all the gas had been driven out and the place was safe, a man was badly burned. In this case, also, mixed lights were used.

When we consider that these and similar accidents are happening frequently, we are forced to conclude that, although it is more convenient to work with an open light than with a safety lamp, yet for the good of all concerned, the use of open lights should be prohibited in a mine generating gas in sufficient quantity to cause an explosion.

A mine laid out and equipped in the best manner possible and having an efficient system of ventilation is not exempt from danger, even when safety lamps are used, if a few men are allowed to carry open lights. A moment's absent-mindedness or the carelessness of a single man with an open light may be the innocent cause of untold suffering; and to avoid this, no mixed lights should be used in any mine generating gas in dangerous quantity.

A Miner.

Scranton, Penn.

⁂

Safety Lamp and the Eyesight

I do not think it wise to allow Mr. Sutton's letter on the effect of safety lamps on the eyesight, Coal Age, June 28, p. 1008, to pass without comment. The letter as it stands is liable to mislead many persons who are not better informed. I may say, at the outset, that I have known miners who have had over 30 years' experience with safety lamps and whose eyesight was not apparently affected in the least degree. This, however, does not warrant the conclusion that the continued use of such lamps **does not affect** the eyesight of others.

Anyone who doubts the harmful effect of safety lamps on some eyes should visit a mining locality where safety lamps have been used almost exclusively for a number of years. In such a locality, it will soon appear to an unprejudiced mind that the disease known as "nystagmus" is uncommonly prevalent. That its cause is directly traceable to the continuous use of the safety lamp has been claimed by eminent oculists (COAL AGE, Vol. 1, p. 1215). The observant visitor, in such localities, will notice that many whom they meet, habitually tilt their heads backward in order to obtain a better vision of objects or to enable them to recognize persons better. The reason for this is that the disease produces a rapid oscillation in the eyeball that blurs the sight. The effect is more noticeable at twilight when a person so affected has greater difficulty to recognize objects clearly, than at midday.

As showing the generally defective eyesight of firebosses I may quote an item from COAL AGE, Vol. 1, p. 352, which reads as follows:

> The necessity of periodical medical examination of the eyes of firebosses is shown by the results of such examinations conducted at the Globe colliery, Wales, England. After a disastrous explosion caused by shortfiring in a gassy chamber, it was found there was 3 to 3½ per cent. of firedamp present, which was not detected by the fireboss because of his defective eyesight: the examinations clearly showed that out of 41 firebosses inspected by a government inspector, 31 were found to have defective eyesight.

This is truly a large percentage of defective eyes, among men who were charged with the duty of examining the safety lamps of miners and detecting gas by observing the scarcely visible flame cap in a lamp. The peculiar conditions to which the eyes of all firebosses are exposed have convinced me that the continued use of the safety lamp is not without injury to the eyes of a large class of miners.

I am not writing this for the purpose of condemning the use of safety lamps. In many mines, the use of safeties is a necessary evil and will continue as such until something is found to take its place. Even where electric lamps are used a safety lamp must be employed to test the air. I think that everyone using safety lamps should know that the use of the lamp is liable to affect his eyesight, in time, so that he can use every precaution to avoid this danger. Having this knowledge, the careful miner will hang his lamp where its light will not fall directly on his eyes. He will also avoid the bad practice of holding the lamp in his teeth while driving a wedge or doing similar work. Not only are the eyes exposed to the fumes of the lamp when so held, but its position causes a squint.

W. L. MORGAN,
Mine Inspector, 8th District.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

ESTIMATION OF COAL LANDS

It is common to estimate the value of coal land on a basis of the weight of coal underlying an acre. To determine this with any degree of accuracy, the land must first be thoroughly prospected with a diamond core drill to determine the average thickness of the seam.

The burning or coking quality of the coal can only be determined by actual practical test when the coal is mined, although the core samples taken from the drill holes enable a fair judgment to be formed in respect to the probable value of the underlying coal.

The records of the prospect holes must also show the condition and character of the various strata overlying and underlying the coal, the thickness and inclination of the seams, the amount of water that may be expected when sinking shaft or slope, the position and general direction of any fault lines that may be present and other data of interest in mining.

A common rule for estimating the ton-acre value of a level seam of coal, allowing about one-third for screenings and waste was formerly,

Anthracite, 100 tons per inch-acre;
Bituminous, 1000 tons per foot-acre.

Owing, however, to improved methods of mining, and to changes in the relative amount and value of the screenings, these rules are practically obsolete. The present custom is to calculate the cubic contents of the seam, and the corresponding weight of coal, knowing its specific gravity. The following table has been computed for anthracite coal of 1.5 specific gravity.

TABLE I - TONS OF COAL UNDER ONE ACRE OF SURFACE
Calculated for a Specific Gravity of 1.50 or 93.7 lb. per cubic foot

INCHES	LONG TONS	ONE FT.	TWO FT.	THREE FT.	FOUR FT.	FIVE FT.	SIX FT.	SEVEN FT.	EIGHT FT.	NINE FT.	TEN FT.

10.0	1519.10	3342.10	5165.10	6988.10	8811.10	10634.10	12457.10	14280.10	16103.10	17926.10	19749.10
11.0	1671.01	3494.01	5317.01	7140.01	8963.01	10786.01	12609.01	14432.01	16255.01	18078.01	19901.01

The top horizontal column of TABLE I, gives the thickness of coal seam up to ten feet. The extreme left-hand column shows inches. For example: to find the number of tons of coal in a 10-acre tract, where the seam has a thickness of 2 ft. 6 in. run down the 2 ft. column until opposite 6 in. and you will find 4557.46 Multiply by 10 and the result is 45,574.60 long tons

To find the weight in long tons for a coal of any specific gravity other than 1.5 it is only necessary to multiply the figures shown in these tables by the ratio of the given specific gravity to 1.50

For Example: The weight of coal underlying a 10-acre tract, when the seam is flat, 2 ft. 6 in. thick, and the specific gravity of the coal 1.30 (Bituminous) is $\frac{1.30}{1.50} \times 45{,}574.6 = 39{,}498$ *lg. tons*

On a pitch of 60 deg. this seam would contain double this amount or practically 79,000 long tons

Expressed in short tons, these amounts should be $\frac{2240}{2000} = 1.12$, *or say* $\frac{1}{8}$ *greater.*

COAL AGE

For inclined seams, it is necessary to divide the values in this table by the cosine of the angle of inclination of the seam.

The Coal Age Pocket Book

To Calculate the Lower Inflammable Limit—In order to calculate the proportion of gas (methane) and air when the firedamp mixture first becomes inflammable, it must be assumed that all the heat generated by the combustion of the gas is absorbed by the products of the combustion and the remaining unburned air. Owing, however, to there being a certain amount of heat lost by radiation or otherwise that cannot be estimated or accounted for, the calculated inflammable limit will only approach the actual, to the extent that the conditions are fully realized in the calculation. The process is as follows:

The weight of oxygen necessary to burn 1 lb. CH_4 is shown by the relative weights of these gases in the reaction:

$$CH_4 + 2\,O_2 = CO_2 + 2\,H_2O$$

	CH_4	$2\,O_2$	CO_2	$2\,H_2O$
Molecular weights,	16	64	44	36
Relative weights,	1	4	2¾	2¼

But oxygen forms 23 per cent., by weight, of the air, the remaining 77 per cent. being practically all nitrogen. The weight of nitrogen concerned in burning 1 lb. CH_4 in air is then calculated as follows:

$$23 : 77 :: 4 : N$$

and

$$N = \frac{77 \times 4}{23} = 13.39 \text{ lb.}$$

From a table giving the heat of combustion of differen substances, it is found that 1 lb. CH_4, burned in air or oxygen gives out 23,513 heat units (B.t.u.). The temperature of ignition of this gas (CH_4) is 1200° F.

Now, since the specific heat of a substance is the hea (B.t.u.) absorbed by 1 lb. of that substance, during a rise o 1 deg. F. in its temperature, the heat absorbed by the products of combustion of 1 lb. CH_4, for each degree rise in temperature, is found by multiplying the specific heat of each of the products, including the nitrogen of the air, by the relative weight of each product, respectively. The total heat i then found by multiplying that result by the number of degrees rise in temperature; and adding the latent heat in th steam or water vapor, as follows:

The specific heats of the several products of combustion referred to water as unity (1), are carbon dioxide, 0.2163 nitrogen, 0.2438; water vapor, 0.4805; and air, 0.2374. Th latent heat of the water vapor (steam) or the heat absorbe when 1 lb. H_2O becomes steam at 212° F. is 966 B.t.u. Th heat absorbed by the products of combustion, for a rise o 1200 — 32 = 1168° F., is therefore

Carbon dioxide,	0.2163 × 2.75 × 1168 =	694.7264	
Nitrogen,	0.2438 × 13.39 × 1168 =	3812.9360	4507.6624 B.t.u.
Water,	1.0000 × 2.25 × 180 =	405.0000	
Latent heat,	966.0000 × 2.25 =	2173.5000	
Water vapor,	0.4805 × 2.25 × 988 =	1068.1515	3646.6515 B.t.u.
Total heat absorbed by products	....		8154.3139 B.t.u.

EXAMINATION QUESTIONS

British Columbia, First-Class Candidates, May 27, 1913

(*Selected Questions*)

Ques.—(a) State the conditions under which mine explosions are most frequently produced. (b) In what way do various kinds of coal dust influence the character of an explosion?

Ans.—(a) Mine explosions most frequently occur in a dry and dusty mine generating gas in small quantities, so that it is not considered necessary to use safety lamps except in a few places in the mine where the gas is more troublesome than elsewhere. Under these circumstances, a good ventilating current is commonly maintained in quantities that is deemed sufficient to make the working places safe.

Too much reliance is often placed on the proper arrangement of brattices and the enforcement of mine regulations with respect to gas, dust and lamps. A brief derangement of the ventilating current from any cause, or an unexpected fall of roof in an unused chamber where gas has accumulated, or the failure on the part of any workman to comply with the regulations, or the carelessness or absent-mindedness of an employee may cause the ignition of gas and produce disaster.

(b) The degree of inflammability of coal dust and its fineness increases both the liability to explosion and the energy developed when the dust is ignited by a flame of sufficient volume and intensity. The suspension of the fine dust in the air current or in the atmosphere of the mine workings renders it more susceptible to ignition. The dust of soft coal, bituminous or semibituminous, is generally more inflammable than that of harder coal. The dust of anthracite coal is not inflammable under ordinary conditions, but may add to and intensify what would otherwise be only a gas explosion.

Ques.—If the specific gravity of marsh gas is 0.559, what will 100 cu.ft. of this gas weigh, at a temperature of 60 deg. F., barometer 30 in.?

Ans.—The weight of this gas is calculated thus:

$$W = 100 \times 0.559 \frac{1.3273 \times 30}{460 + 60} = 4.28 \ lb.$$

Ques.—Explain the law of diffusion of gases and its effect on their behavior in mines. Give rule and example, showing how to find the comparative velocity of the diffusion of the different gases.

Ans.—The molecules of all gases and air are in a state of constant vibration. The amplitude of the vibration or the distance through which the molecules vibrate depends largely on the density of the gas. When two gases, or a gas and air of different densities are in contact, the vibratory motion of the molecules at the plane of contact is not equal for the two mediums; and, as a result, there is a constant progression of the molecules of one of the gases into those of the other, causing them to mix or intermingle. The action is called "diffusion" and is very rapid. The effect of the diffusion of gases, in mines, is to cause them to mix with the air and with each other, in varying proportions.

The velocity, or rate of diffusion, of air and gases into each other varies inversely as the square root of their densities. For example, calling the density or specific gravity of air 1 and that of methane or marsh gas (CH_4) 0.559, the ratio of their velocities of diffusion is

$$\frac{V_{air}}{V_{gas}} = \sqrt{\frac{0.559}{1}} = \frac{0.7476}{1}; \ or, \ say \ \tfrac{3}{4}$$

This shows that in the diffusion of marsh gas into air, the relative velocities of the air and the gas are as 3:4. That is to say, for every three volumes of air passing into the gas, there are four volumes of gas passing into the air.

Ques.—(a) How many cubic feet of air should be mixed with 1 cu.ft. of firedamp to render it harmless? (b) What percentage of firedamp is the most dangerous?

Ans.—(a) The proportion of gas and air that may be considered as the safe limit will depend primarily on the nature of the gas or gases present, the quantity, fineness, and inflammability of the dust suspended in the air; and the character of the coal, size of openings and method of working. In the working of bituminous coal, under ordinary mining conditions, there should be from 100 to 150 cu.ft. of air for every cubic foot of explosive gas. In the working of anthracite coal, under ordinary mining conditions, from 40 to 65 cu.ft. of air for every cubic foot of explosive gas is sufficient to render the mine air safe for working.

(b) When marsh gas (CH_4) is present in any proportion in excess of the upper or higher explosive or inflammable limit, the mixture may be considered as more dangerous than where the proportion of gas to air is less. The reason for this is that any addition of air, which is liable to occur at any time or place in the operation of the mine, may render the mixture highly explosive. The less dangerous mixtures are those in which the proportion of gas to air is less than that required for the maximum explosive force, or one volume of gas to 9.57 volumes of air. In this case, any addition of air renders the mixture less explosive.

Ques.—In a mine giving off 2500 cu.ft. of marsh gas per minute, the volume of air entering the intake opening is 4,500,000 cu.ft. per hr.; what is the percentage of gas in the return current? Would you consider this percentage of gas dangerous?

Ans.—In this case, the volume of air passing is 4,500,000 ÷ 60 = 75,000 cu.ft. per min. Assuming there is no increase of the volume of air on the return, due to a rise of temperature or a fall of ventilating pressure, the volume of the return current is 75,000 + 2500 = 77,500 cu.ft. per min. The percentage of gas in the return current, under many conditions, would be dangerous; it is

$$\frac{2500 \times 100}{77,500} = 2.3 \ per \ cent.$$

COAL AND COKE NEWS

Harrisburg, Penn.

The Kline bill which provides for the coöperation of the state of Pennsylvania in the establishment of a Mining Experiment Station for investigations with a view of better safeguarding the lives of miners and greater efficiency in the mining and mineral industries and making an appropriation for the same has passed both houses of the legislature and is now in the hands of the governor for his signature.

The bill gives the governor the authority to appoint a commission of three, one of whom shall be the dean of the school of mines of the Pennsylvania State College, one the chief of the Department of Mines of Pennsylvania and one a practical miner. It shall be the duty of the Commission to coöperate with the director or other representative of the U. S. Bureau of Mines in the establishment in the state of Pennsylvania of a mining experiment station for the purpose of conducting investigations and making tests to better safeguard the lives of miners and to bring about greater efficiency in the mining and mineral industries. The members of the commission are to serve without compensation, but their actual expenses are to be paid.

For the prosecution of this work the sum of $50,000 or as much thereof as may be necessary is appropriated.

The Commission is to submit to the governor as he may require reports giving the results of its work and shall arrange for the prompt transmission to the Department of Mines and to the Topographic and Geological Survey of the state copies of all reports, circulars, bulletins and other publications issued from time to time embodying the results of the tests and investigations conducted.

PENNSYLVANIA

Anthracite

Lykens—A. F. Hanna announces that he has discovered a new vein of coal in Broad Mountain after drilling 60 ft.

Hazleton—The abandoned workings on the outskirts of West Hazleton, which were formerly owned by James G. Harvey, are to be reopened. The projectors are the Nazareth Coal Co., a subsidiary of a cement company of the same name. Arrangements are now being made to sink a shaft.

Pottsville—Concerted antagonism of the legal advisers of the big coal companies to the enforcement of the bill placing a tax on anthracite is expected in the near future. The coal company officials claim that this measure is special legislation and has other unconstitutional features which will cause the higher courts to nullify the statute.

Lansford—The Lehigh Coal & Navigation Co. has offered to continue the wages of any of its employees who may enlist in the National Guard during such time as they are absent on duty and has also set aside a fund to encourage enlistments.

Wilkes-Barre—Eighteen hundred men went on strike July 1 at the Stanton colliery of the Lehigh & Wilkes-Barre Coal Co., when a number of employees reported without their Union buttons and failed to bring their dues to the locals of the miners' organization.

Brockton—On July 15, at 1:30 p.m., William S. Leib will sell at public auction in Brockton, Schuylkill County, Penn., the lease given and executed by Benjamin Smith Lyman and Frank Lyman to the Schuylkill-Lehigh Coal Co., dated Apr. 18, 1911; also the lease given and executed by the Philadelphia & Reading Coal & Iron Co., to the Schuylkill-Lehigh Coal Co., dated Apr. 18, 1911, together with the locomotives, steel and wood cars, hoisting engines, boilers, mine fans, jigs, coal breaker, machinery, tools, and all other personal property of the said Schuylkill-Lehigh Coal Co. now in the possession of the said receiver. This sale will be made subject to the mortgage given and executed by the Schuylkill-Lehigh Coal Co. to the Newark Trust Co. dated Oct. 17, 1911.

Bituminous

Clearfield—The Pennsylvania Supreme Court has sustained the Clearfield County Court in what are known as the discrimination cases brought by coal operators to recover damages from the Pennsylvania R.R. Co., on account of illegal favoritism shown to competitors of the complaining operators in matters of coal car distribution. Verdicts against the railroad company were recorded in large aggregate amounts.

Kaylor—With new officers in charge, financial assistance assured and no debts, the property of the Great Lakes Coal Co. will hereafter be known as the North Penn Coal Co. The Great Lakes Coal Co. was bought at foreclosure sale last month by a committee representing the bond holders, practically all of whom have deposited their certificates. The property owned includes 20,000 acres of coal land in Butler and Armstrong counties, on which there are four mines one of which is being operated on a six months' lease.

New Bethlehem—A deal whereby the Pine Run Coal Co., of New Bethlehem, takes over the Cobaugh collieries property has been consummated, and the Pine Run Co. will begin at once to rebuild the railroad from Hawthorne and develop three mines on their property. The new territory has several cannel coal seams and three beds of soft coal already opened, all of which are on the Armstrong county side of Red Bank.

Cookport—Property owners in and about Cookport have, within the past few days, received notices of the acceptance of options taken some time ago. With these notices it is known for the first time definitely who the real purchaser is. The money is being paid out by the Manor Real Estate & Trust Co., which has opened offices in Indiana.

Connellsville—A mine fall, which caused the surface to drop nearly 4 ft., not only cut off the gas supply of Connellsville for more than an hour on July 1, but temporarily crippled the Possum Run branch of the Pennsylvania R.R. The fall occurred in the Limestone Hill neighborhood at about 4 o'clock in the afternoon. Both the Davidson and Trotter workings are in this vicinity, and the main pipe line of the Fayette County Gas Co. from the West Virginia field was broken, cutting off the town's supply.

Indiana—While celebrating the nation's birthday by exploding dynamite caps in a shanty in which was stored 175 sticks of dynamite, two miners, both of whom recently became naturalized, were instantly killed at McIntyre when the dynamite exploded. Both men were Austrians employed by the Coal Run Mine Co., and were celebrating their naturalization and the Fourth of July at the expense of the company.

WEST VIRGINIA

Beckley—B. T. Phillips and L. C. Lilly have leased the Worley mine from the Raleigh Coal Co., and will shortly be ready for the operation of the same. This mine was formerly operated by M. G. Quesenberry, but has for some time been idle.

Parkersburg—After ten years' contest in various tribunals, the Supreme Court has awarded Edward Grinnell, a mining engineer, between $100,000 and $200,000 as his net share of the proceeds of a sale of 60,000 acres of coal land in West Virginia.

Fayetteville—Following the purchase of the Manufacturers and Consumers Coal Co. lease at Fayette, by his agent, D. A. Thomas, the Welsh coal magnate, has been in Fayette county and gone over many of the properties on which these agents hold option. It is understood that several of these options may be closed within the next few days or weeks. It is also stated that additional options have been taken and cash forfeits put up to some of the Fayette operators.

Charleston—Civil actions which total $40,000 will be claimed from the Paint Creek Collieries Co. by miners who were evicted from their homes on that company's property, under the term of what the miners call "the yellow dog contract." It is alleged that the evictions were made without due process of law and that the household effects of the miners were damaged when they were "dumped" on the ground.

An agreement has been reached between the New River miners and operators, and a strike thus avoided. By the terms of this contract, the miners are to have the privilege of organization, to receive semi-monthly pay, have a check weighman, have the privilege of dealing at independent stores, and work a nine-hour day. A conciliation board composed of two miners and two operators who choose a fifth party to act as umpire, has been agreed upon and no Baldwin-Feltz guards are to be employed but such employees are to be replaced by a limited number of mine watchmen. Furthermore, all miners discharged for union activities may return to work and shall not be discriminated against.

KENTUCKY

Pineville—W. T. Caton, Edward Dunkin and Lester Lock, members of a first aid team of the Continental Coal Corporation, have each received from Major Chas. Lynch, U. S. A., a letter and check for heroic work in saving the life of Thaddeus Idol, a fellow workman in the mine. These prizes were the award of the American Red Cross Society and came from a donation made by former President Taft for the benefit of coal miners showing the greatest proficiency in first aid work. The men named are the first to receive a prize for actual first aid, in a mine in Kentucky. Teams from this company have won prizes in contests at Lexington and Pineville, and it would seem that they are equally efficient when the real emergency for which they are trained comes in the course of their everyday work.

The Elk Coal Co., operating on Greasy Creek, near Pineville, has leased its properties to the Corum-Parker Coal Co., of Pineville, which was recently organized for the purpose of taking over and operating the mines.

OHIO

Columbus—The first meeting of the Ohio Mining Commission appointed by Governor Cox to investigate the conditions surrounding the payment for coal mined in Ohio will be held in the State Chamber soon. An effort will be made to have the operators and miners state their side of the case and it will then be determined what trips will be necessary to gather information by the commission. It is expected that every mining district in the state will be visited.

Martinsburg—The Fairpoint Coal & Coke Co. owned by Wheeling parties, has leased its mine at Fairpoint to the Forest City Coal Co., which is operating a mine at Barnesville. F. L. Head, general manager of the Forest City Co., is now in charge of the Fairpoint property and is said to be planning improvements that will result in an increased production which means an increase in the number of employees.

Lancaster—Four Pittsburgh capitalists have secured a lease from the Zanesville Coal Co. on a 22-acre tract near the No. 3 mine in Perry County.

INDIANA

Petersburg—It is announced that Rootzell & Mackey, of Evansville, will reopen the Hartwell coal mines in the vicinity of Petersburg. For many years these mines were the largest in the vicinity, employing 300 to 400 men, and the new owners hope to bring them to their former productiveness.

Representatives of the Vandalia Coal Co. have been taking leases on hundreds of acres of coal land southwest of this city on a line with the projected route from Bicknell to Evansville. Five thousand acres near Wheatland has been leased to the American Coal Co. said to be closely affiliated with the former firm.

Jasonville—A sample of coal from the farm of Julius Marvel has been tested by Edward Barrett, state geologist and pronounced a good grade of cannel coal. A survey will be made of the deposits.

Linton—A new shaft will be sunk at once one mile north of this city by a mining company headed by John Tempelton, of Terre Haute.

ILLINOIS

Duquoin—On July 1 a fire originating the coal chutes of the Paradise Coal Co., spanning the Illinois Central tracks, completely destroyed the company's buildings in the vicinity of the shaft mouth. An alarm was immediately sounded to the 300 or 400 miners below ground and the hoisting engineer, Charles Mathias, stood by his engine in spite of the intense heat until he had hoisted every man out of the mine. By this time his hands were blistered and his hair and eyebrows singed. At last accounts, although still alive, he was in a critical condition. Five other employees were seriously injured, but it is believed that they will recover. The estimated damages were $50,000. The upper works will be rebuilt at once, the entire loss being covered by insurance.

Marion—The Illinois Hocking Washed Coal Co. took the bankruptcy act on account of the fire which is still burning in the mine it had leased from the Carterville District Coal Co. J. C. Mitchell, cashier at the First National Bank of Marion, was appointed receiver. It is understood that some of the former officers and stockholders have organized another company known as the General Fuel and Power Co. to take over and handle the business formerly conducted by the Illinois Hocking Co.

Zeigler—The Interstate Commerce Commission has ruled that the allowance or division of rates which the Chicago, Zeigler & Gulf has been receiving from the Iron Mountain, Burlington and Illinois Central roads is unjust, discriminatory and unduly prejudiced against other coal mines served by the respondent. This is a case where the mining company owns about a mile of switching tracks connecting its mines with the three above mentioned railroads. These switching tracks are incorporated as Chicago, Zeigler & Gulf, and the mining company, since its incorporation, has been receiving a switching charge and other privileges which other mining companies have not been able to secure.

Hallidayboro—The Hallidayboro mine, which shut down May 1, will resume operations before the 15th of July. The mine is to be repaired and as soon as the repairs are complete, operation will begin. Nearly 300 men will be employed.

IOWA

Des Moines—Johnson Bros. mines near Clayworks will soon be running on electricity furnished by the Central Electrical Co. The Norwood White Coal Co., of Des Moines, have also let a contract to the same electrical company for the partial electrification of mines Nos. 4 and 9 near Yadres.

Prescott—Work at the prospect pit near here was stopped recently when a depth of 140 ft. was reached without finding coal. People who have examined the rocks in and near this pit have the opinion that a fault has been struck. Some are in favor of raising more money and drifting a few feet upon either side of the hole in the hope of reaching the coal.

ARKANSAS

Clarksville—All the mines in the Spadra anthracite coalfield were supposed to be in operation July 1. During the last season this field mined 90 per cent. more coal than the season preceding, and all indications point to a big run this year.

OKLAHOMA

Adamson—The Union Coal Co. has commenced opening mine No. 6 located one mile east of here, which, when completed, will be the largest in the Adamson territory. This company is building a large water reservoir, and a hundred houses to be occupied by the miners will be constructed in a few months.

WASHINGTON

Seattle—A struggle of almost a year to obtain from the Denny-Renton Co., better wages and conditions, as well as recognition of the union has recently resulted in a victory for the United Mine Workers. The above named company has leased its mine to the Pacific Coast Coal Co., which has been operating under a contract with the miners' organization in its several mines in this state. This lease is understood to be a withdrawal of opposition to the miners' organization on the part of the Denny-Renton Co.

FOREIGN NEWS

Brussels, Belgium—It has been announced by the Belgian Coke Syndicate that a reduction of 2 francs (39c.) per ton to all consumers who purchase during the rest of the current year will be made on coke July 1. This decision, upon the part of the manufacturers, is probably due to the comparatively poor condition of the iron market and to the stronger competition of German independent coke makers.

Vancouver, B. C.—Declaring that they have been induced under false pretensions to leave their native land, about 50 English coal miners have taken their case before Sir Wilfred Laurier, of Ottawa, asking that he request the Canadian Parliament to make an investigation. The men left England with the promise of better wages and also the assurance that there was no labor trouble ahead. Upon their arrival in Canada, they learned that the men in these collieries were on a strike, and many of them are absolutely destitute. The coal operators have evidently been put to a large expense with no apparent reward for their efforts.

Lima, Peru—Pressure is being brought to bear upon the Government in the hope of securing a subvention sufficiently large to make possible the extension of the railroad from Sayan to the Oyon coalfield. It is understood that the Government is willing to bind itself to a certain amount of financial aid to a railroad or other private enterprise providing such company develops a stated tonnage of coal. This fuel would have to be mined at a price that would enable successful competition with foreign coal in the open markets on the Peruvian and Chilean coast. With the increasing use of fuel oil in the nitrate fields of Chile and the uncertainty of being able to compete with American coal after the Panama Canal is in operation, it is certain that great difficulties will be experienced in getting capital to invest at Oyon. On the other hand, it is claimed that the Peruvian navy must have a coaling station in the north of the republic and with the completion of the line to Oyon, plenty of coal could be furnished at Huacho. Regardless of the question of coal, it is said that a railroad to Goyllarisquisga would be a paying institution, as it would furnish a more direct outlet for the Cerro de Pasco production and would develop a rich territory.

PERSONALS

Fletcher W. Cunningham, of Charleroi, has succeeded Richard Maze as mine inspector of the 20th Bituminous District of Pennsylvania, with headquarters at Somerset.

Ramie S. Curtiss has been made manager of the offices of the Morgan Run Coal Co., which have been opened in the Boyd Building at Coshocton, Ohio, and are a branch of the Cleveland offices of the same company.

F. V. Nedden, of London, has recently taken a position as engineer in charge of the centrifugal pump department with the Goulds Manufacturing Co., of Seneca Falls, N. Y. Mr. Nedden has had a large and varied experience principally in Germany.

D. C. Botting, chief of the Washington state Coal Mine Inspection Department, has resigned and accepted a better position with the Government. He will take charge of the practical mining operations in the Matanuska coal fields of Alaska. His expedition will take out 800 tons of coal and test it upon a battleship.

A. S. Biesecker, who has been connected with the electrical department of the Delaware, Lackawanna & Western R.R. for the past eight years has accepted a position as electrical engineer for the Scranton Electric Construction Co. He will be succeeded by E. J. Powell, who, for some time past, has been his assistant.

Wm. B. Crawford has resigned as chief engineer of the Carter Coal Co. operating in West Virginia and Kentucky and will organize a firm of consulting and contracting engineers with headquarters in Bluefield, W. Va., and Chicago, Ill. The new firm will act as consulting engineers for several of the large coal corporations and will also do a general business as consulting engineers along civil, mining, mechanical and electrical lines.

W. L. Schmick, general manager of the Consbolidated Coal Co., of St. Louis has resigned his position to accept a similar place with the Big Muddy Coal & Iron Co. It is understood that W. J. Jenkins, president of the Western Coal & Mining Co., will assume Mr. Schmick's duties with the Consolidated Coal Co. The Big Muddy Coal & Iron Co. is closely affiliated with the Gould interests which control the Western Coal & Mining Co., and the Consolidated Coal Co.

CONSTRUCTION NEWS

Pomeroy, Ohio—At an approximate cost of $25,000 the Peacock Coal Co. has awarded a contract to the Roberts & Shaffer Co. for the building of a large steel tipple. In this structure the Marcus screen and picking conveyors will be employed.

Big Four, W. Va.—The Lake Superior Coal Co., successors to the Dixon-Pocahontas Coal Co., has a large force of carpenters at work erecting tenement houses for the miners. This operation is located near Big Four, just east of Welch.

Bluefield, W. Va.—Two miles of street car line connecting the towns of Northfork and Keystone, are said to be under construction. This is believed to be the first link of the long proposed electric railway between Bluefield and Welch.

Connellsville, Penn.—The Juniata Coal Co., of Bens Creek, is making a new opening near the old mine and building a tramroad to deliver the coal to the railway. More surface has been leased preparatory to increasing the operations to a large scale.

Steubenville, Ohio—The Steubenville Coal & Mining Co. expects to have a new tipple in operation by the first of September. The structure will be of steel and will mechanically screen and grade all coal as it is dumped from a platform above the shaft.

Piedmont, W. Va.—The Consolidation Coal Co. is reopening the old Consolidation mine. A modern outfit for hauling, dumping and trackage is being installed. The branch railway, abandoned over thirty years ago, will be rebuilt. There are a number of coal beds still undeveloped within easy reach of three openings.

Grafton, W. Va.—S. A. Shackelford, Son & Co. have recently closed a contract with the Winona Coal & Coke Co., situated at Coffman, for the construction of 12 five-room dwelling houses. These will be two stories high and will be built in a row facing the railroad on a piece of level land just north of the old coke ovens and west of the present tipple.

Keeferton, W. Va.—The Roberts & Shaffer Co. have just closed a contract with W. W. Keefer, president of the Pittsburgh Terminal Railway and Coal Co., also of the Milburn Coal & Coke Co., for the building of a large steel tipple at Keeferton. The cost of this structure will be about $30,000, and it will be equipped with the new Marcus combination screen and picking conveyor.

Joplin, Mo.—The Moka Coal Co. has commenced the stripping of the dirt and rock from a 160-acre tract of coal land near Mulberry. Prospecting has shown that it will be necessary to go to a depth of from 18 to 30 ft. to remove the coal. The railroad company will not be able to have a track built before the middle of July, but the coal company will proceed to uncover the coal and prepare it for shipment by that time.

Whitesburg, Ky.—It is reported that fine progress is being made on the Beaver Creek branch of the Chesapeake & Ohio R.R., from the mouth of Beaver to Steel's Creek, 22 miles distant. Hundreds of men and teams are employed on the work, and double shifts are being used. The Baltimore & Ohio is making preparations for the construction of its branch line in the same vicinity and will probably begin active work in a short time.

Whitesburg, Ky.—The Kentucky Coal & Timber Co., of which T. S. McGrath, of Chicago is the head, is taking steps to make good its recent announcement that it will develop its 30,000-acre holdings in Leslie, Perry and Letcher counties. Locations are being selected convenient to the railroad and grades prepared for the necessary sidings and switches. It will not be long before the company is ready to get out coal as the amount of construction work necessary is relatively small.

Wilkes-Barre, Penn.—The Delaware, Lackawanna and Western R.R. Co. are pushing the work on the elevated road to carry the coal from the Peach Orchard tract which is situated on the east side of the Susquehanna River to the Pettebone Colliery which is on the west side of the river.

From the Pettebone breaker an elevated track about 2000 ft. long and supported by 112 concrete piers and steel bents will connect with the old abandoned Wilkes-Barre and Eastern trestle (now owned by the Erie R.R. Co.) which crosses the river. The average height of the new trestle will be about 35 to 40 ft.

NEW INCORPORATIONS

Kansas City, Mo.—The Grey-Bryan Coal Co. has increased its capital from $10,000 to $30,000.

Indianapolis, Ind.—The Deep Vein Coal Co. of Terre Haute, has issued $25,000 additional preferred stock.

Baltimore, Md.—The Hagan Coal & Coke Co., of Bristol, Va., has incorporated with a capital stock of $100,000.

Indianapolis, Ind.—The Riverside Coal Co. has been incorporated here with a capital of $10,000 by J. L. Hogan, F. G. Owen and F. Hollingsworth.

Louisville, Ky.—The Nebo Coal Co., of Louisville, has been organized with a capital stock of $250,000. The company will handle properties in western Kentucky.

Briggs, Okla.—A charter has been granted to the Sequichie Mining Co. with a capital stock of $1000. The incorporators are Geo. Pidgeon, Chas. Young and Coleman Dick.

Hazard, Ky.—The Ross-Petrey Coal Co. has been organ- zed with a capital stock of $5000. The incorporators are lexander Ross, Lewis E. Petrey and W. J. Combs.

Wilmington, Del.—The Day Lumber and Coal Co. has been ncorporated with a capital of $1,000,000. The incorporators re S. E .Robertson, D. J. Jacobs, H. W. Davis, all of Wil- nington.

Harrisburg, Penn.—The Dominion Coal Co. has been or- anized at Pittsburgh, with a capital stock of $30,000. The ncorporators are R. C. Mosten, B. A. Height, Herman F. Lin- enbrink and R. S. McLean.

Little Rock, Ark.—The West Spadra Coal Co. has been ranted a charter. The capital stock is $25,000, of which 4000 has been subscribed. The incorporators are R. D. unlap, E. W. Dunlap, C. Langford and W. R. Eustice.

Connellsville, Penn.—A charter of incorporation has been ecured for the Rices' Landing Coal & Coke Co. by J. H. rice, Jr., C. C. Morrison and T. W. Stephens, all of Pitts- urgh. The company will formally take over the property ately owned by the Dillworth Coal Co. at Rices' Landing.

Dover, Del.—Articles of incorporation were filed June 27 r the Yankee Development Co. of Pittsburgh, to acquire ineral lands of all kinds and prepare the same for market. he capital stock is $100,000 and the incorporators are W. J. ammond, Thos. G. Shields and C. M. Patterson; all of Pitts- urgh, Penn.

Charleston, W. Va.—The Middle Fork Coal and Land Co. as been organized with a capital of $20,000, principal office Elkins and chief works in Randolph County, Middle Fork istrict. The incorporators are Howard Sutherland, Effie H. utherland, J. F. Strader, Beryl H. Strader, all of Elkins, umboldt Yokum and Hattie M. Yokum, of Beverly.

INDUSTRIAL NEWS

Petersburg, Ind.—The Evansville Utilities Co. is prepar- g to furnish electricity to the Ayrshire mine, south of this ty, for lighting and to operate the mining motors.

Sprankle's Mills, Penn.—The Knoxdale Coal Co. has leased veral farms in this vicinity and expects to begin testing the nd in the near future. The upper Freeport vein is being ught.

Morgantown, W. Va.—Coke is being shipped from the Po- nd Coke Co.'s plant on Dunkard creek. Forty of the one ndred ovens which have been completed are now in op- ation.

Bluefield, W. Va.—E. T. Boswell, president of the Big Vein al Co., is going over some undeveloped coal land near chland, Va., with the view of opening up a new opera- n in the Red Ash vein.

Pittsburgh, Penn.—It has been estimated that in the ighborhood of six thousand carloads of coal have been uled over the Pittsburgh division of the Pennsylvania R.R. ery day during the month of June.

New Orleans, La.—A contract for the supply of coal for government dredges working in Southwest Pass, has en awarded the Monongahela River Consolidated Coal and ke Co. The first delivery will be 12,000 tons.

Greensburg, Penn.—H. C. Davis, of Wilkinsburg, has sed a number of unused coke ovens at the Boyer plant in Pleasant Township, and will develop a small tract of l acquired some time ago from the R. K. Hissem in- ests.

Spokane, Wash.—Judge George Turner, of Spokane, has d his coal railroad in Montana to J. H. Gardiner, of Clark unty, Washington, for $50,000. The road is 13 miles long connects with the Northern Pacific tracks at the town of estnut.

Buffalo, N. Y.—The coal chutes and warehouses of the ples Coal Co., at Williamsville, near Buffalo, burned July nvolving a loss of $10,000. About 200 tons of coal, mostly hracite, were partially destroyed. The cause of the fire unknown.

Philadelphia, Penn.—The Eastern Coal Dock Co., recently arded a contract to the Belmont Iron Works for a one- ry steel machine shop to be erected on the east side Delaware Ave. south of Porter St. The cost will be ap- ximately $1275.

Toledo, Ohio—Railroad companies are warning coal ship- s of the necessity for shipping as early as possible in er to avoid a car shortage later. Indications are that traffic will be heavy during the fall and that the car supply will be taxed to its utmost.

Wheeling, W. Va.—It is reported that a $250,000 coal land deal has been made in Belmont County and that the Huffman & Rice interests of Waynesburg, Penn., are the purchasers. The coal land is reported to have been sold at an average price of approximately $30 per acre.

Bedford, Ind.—Fire recently destroyed the coal chutes of the Monon R.R., together with a large quantity of coal and two steel and two wooden coal cars. The loss of the chutes alone was $2500, wholly covered by insurance, the total loss reaching $8000. The origin of the fire is unknown.

Pittsburgh, Penn.—The Epping-Carpenter Pump Co. has recently placed contracts for doubling the capacity of its extensive foundry. One of this company's recent orders is for a compound pot-valve wood lined pump for the H. C. Frick Coke Co. This pump is built to handle 3500 gal. of water per minute.

Washington, D. C.—An American consular officer in France has transmitted the name of a large manufacturer of creosote oil and similar products, who desires to get in communication with American manufacturers of pitch for coal briquettes and who is willing and able to maintain a permanent export trade in this line.

Harrisburg, Penn.—The Hamburg Vitrified Brick Co. of Hamburg has complained to the Pennsylvania State Railroad Commission that the Reading Railroad Co. has a rate of 90 cents a ton on coal from Landingville and Auburn to Hamburg where the Pennsylvania Railroad Co. charges but 50 cents for practically the same haul.

Rio de Janeiro, Brazil—The American consul general at Rio de Janeire reports that the Estrado de Ferro Central do Brazil, the largest Brazilian government railway, has purchased 40,000 tons of American coal by tender through a local firm and it is reported that a steamship company will use 20,000 tons of American coal to bunker steamers calling at this port.

New Orleans, La.—Owing to the closing of the government locks in the Tombigbee River for slight repairs, the opening of the regular coal carrying barge service to the Alabama fields has been delayed. Two more power barges for this trade are nearing completion. Each is fitted with two 150-hp. gas-driven engines, and a small 7-hp. auxiliary engine for starting. The gas producer is of the improved type, generating the gas only as needed.

Detroit, Mich.—The southern division of the Detroit, Toledo and Ironton R.R. was sold at public auction at Delray by E. S. Vorheis recently. Otto T. Bannard and M. M. Buckner acted on behalf of the purchasing committee and bought the road for $1,650,000. The Ohio division of the same road was recently sold at Springfield to parties said to represent the first-mortgage bond holders. The bonded indebtedness of the road amounts to about $14,000,000.

Pittsburgh, Penn.—The sanitation of mines and mining camps throughout the United States is to be made the subject of an exhaustive study by the U. S. Bureau of Mines, and the first work in this direction is to be done from the different stations. J. H. White has been placed in charge of this new department and has become identified with the general offices of the Bureau of Mines here. For years he was with the Tennessee Coal & Iron Co. and has made sanitation a specialty.

Hazleton, Penn.—A. Pardee & Co., operators of the Cranberry and Crystal Ridge collieries, which employ about 1000 hands, locked out their employees on July 5. There had been strike talk among the men for the previous two weeks and the mines are now at a standstill.

Nearly 3000 mine workers are on strike in the Hazleton regions. At Audenreid No. 4 colliery of the Lehigh and Wilkes-Barre Coal Co. the breaker boys struck over dissatisfaction due to wages, tying up the whole colliery. The breaker boys at the Black Ridge mine of the Hazle Mountain Coal Co. have also gone on strike on account of a cut in their wages.

Pittsburgh, Penn.—A receiver for the Monongahela River Consolidated Coal & Coke Co., a $30,000,000 corpration, has been asked for by Alexander Dempser, its former president, in a bill in equity, filed in Common Pleas Court, June 30, against the Monongahela River Co., the Pittsburgh Coal Co. of New Jersey, the Pittsburgh Coal Co. of Pennsylvania and the Union Trust Co. of Pittsburgh, trustee. The Court is also asked to set aside an election of directors for the Monongahela Co., held last January, and to grant an injunction restraining the Pittsburgh Coal Co. of New Jersey from controlling the Monongahela River Co. Dempster is the only individual holding Monongahela River Coal & Coke Co. stock.

COAL TRADE REVIEWS

GENERAL REVIEW

The most interesting development in the national hard coal market for some time was the recent announcement of the new Pennsylvania state tax on anthracite. What the effects of this will be are problematical. The operators have, of course, been forced to shift the burden onto the public, and whether the outside states will object to sharing a portion of the Pennsylvania taxation remains to be seen. Aside from this, the trade is quiet and moderately dull, but there is a fair amount of business on hand for July.

The Eastern bituminous market has weakened slightly, under the influence of the strike settlement in the New River field. It is now easy to buy at circular prices, in the New England states, but on the other hand there is no shading and quotations are being firmly maintained; there is some slight tendency to sag on the lower grades only. It is believed by some that the soft coal market will ease off into the customary summer dullness, but on the other hand the West Virginia trouble was not of sufficient proportions to have materially affected the situation in any event. Buyers who expected to obtain their coal cheap through the summer are still being disappointed, there being little prompt tonnage available, even in the lower grades.

Mines in the Pittsburgh district are still operating up to a high rate, the demand on contract continuing heavy and a fair amount of business being done in the prompt market. There does not seem to be any possibility of a slump, while on the other hand there are good prospects for a further advance, should there be the slightest provocation for same. Many producers are refusing absolutely to enter into further contracts.

In Ohio, the only disturbing feature is the car shortage, which is tending to curtail production; the output last week was also restricted by the holiday. Most of the producers have announced an advance of ten cents in the circular and there is an increased domestic demand for stocking, while the lake movement to the Northwest is still heavy. Tonnage at the Hampton Roads piers has accumulated fast and vessels are compelled to wait almost indefinitely for cargoes; some high spot prices are being paid at rare intervals, in order to clear vessels. In fact, the demand there has seldom ever been so heavy. Shipments from the Pocohontas field are about normal but there has been a heavy decrease from the New River district; men are returning to work in this latter field, but it will be some time before the full production is restored.

Requests for future shipments in the Middle West are now generally being refused by operators, who fear that they are not going to have sufficient coal in the fall. While the market generally is showing a tendency to tighten somewhat, the situation is in some respects uncertain. Indications generally are for an improvement, but buyers claim that the dealers are all overbought and the operators oversold. The opening of the big Keokuk Dam has displaced a large tonnage of Middle Western steam coal.

BOSTON, MASS.

Bituminous—All anxiety over labor troubles in Pocahontas and New River is now apparently a thing of the past. While a suspension was effective through most parts of the New River field July 1, yet all the reports were coupled with assurances that the operators would grant concessions enough to make any prolonged strike unlikely. It is now expected that the threatened "flurry" will slope off into a spell of midsummer dullness such as this market usually goes through at this season.

Mining of anything like the normal output will hardly begin, however, until about July 10 or 15, and meanwhile the loading at Hampton Roads will be slow. Tonnage accumulated fast the last fortnight and at this writing not only barges and sailing vessels but steamers as well have been detained three and four times as long as usual. For spot coal, high prices are still being paid to clear vessels but the volume of such business is small and now with the absence of strike talk it will probably amount to little, if indeed there is any at all. There is still a quantity of coal to be bought in New England and the outlook is that for a month or so anyway it will be easy from the buyer's standpoint to cover on Southern coals on the $2.85 f.o.b. basis. The contract figure is expected to be firmly maintained, however, and the New England trade is pretty sure to be steady the balance of the season.

On Georges Creek and the Pennsylvania grades there is little that is new. The better coals from Somerset and Cambria Counties are holding strong in price but inferior grades have sagged off a little. Just as a broader market was opening for Pennsylvania coals and the trade was getting to the point of buying with not so much regard to quality the news came from New River and the demand from this territory has swung back to more nearly normal. The market all-rail is without special change. Sales agents have been cautious about selling ahead, but they have taken care of current business at not more than 5@10c. over the figures set for yearly contracts. Just at present it is a kind of mark-time situation.

Anthracite—The big news this week is the announced intention of the anthracite companies to charge on their invoices the Pennsylvania state tax of 2½% of the market value of coal at the mines under the law which went into effect June 27, and so make dealers, and ultimately the consumer, pay the tax beginning July 1. It amounts to an extra advance in July of 8¾c. on stove and egg and 9c. plus on chestnut and it remains to be seen how it will be received by the trade. Meanwhile there is ample business in sight for July and unless there are still other unusual features the market is likely to maintain its present condition throughout the month. Stove size seems in a little better supply than earlier in the season.

Current wholesale prices on bituminous rule about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.05@1.45	$1.35@1.65	$1.67@1.77	
Philadelphia*	2.30@2.70	2.60@2.90	2.92@3.02	
New York*	2.60@3.00	2.90@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.00
Providence†				3.90@4.00
Boston†				4.00@4.15

*F.o.b. †On cars.

NEW YORK

Bituminous—The holiday toward the close of last week caused a suspension of about two days at the mines, some operations even being affected for the last three working days of the week. As a result, there has been a further tightening in the soft-coal market, although it is temporary in this case and will probably be relieved shortly.

Stocks at tidewater continues about normal, the same as they have been for some time. Occasional contracts are still being made; it has been difficult to convince many of the consumers, who refused flatly to concede the increased quotations demanded by the operators, that such was justified.

It is doubtful if the labor agreement in the New River Field will have any effect on the local situation. The trouble has not become of sufficient proportions to be felt in the market, and because of the labor scarcity it will be some time before the production becomes very large. The car supply on the Pennsylvania R.R. is still short, while that on the New York Central likewise continues good. We continue to quote the New York soft-coal market unchanged on the following basis:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.65@2.70; good grades of Pennsylvania, $2.75@2.80; best Miller Pennsylvania, $3.05@3.15; George's Creek, $3.25@3.30.

Anthracite—The most interesting feature in the hard-coal market during the week was the announcement of a 2½ per cent. state tax on all the anthracite produced in Pennsylvania, which amount, most of the leading hard-coal companies have already stated they will add to the regular circular price. The effects of the change, if any, have not developed at this writing. As usual, the burden has been shifted along until it rests on the public's shoulders, and it now remains to be seen whether outside states propose to carry a share of the Pennsylvania state tax.

While the trade generally, so far this year, has been somewhat above the average, it is now clear that the customary summer lethargy is beginning to develop. Orders are becoming scarcer so that a general restriction in production throughout the mining regions is taking place. None of the sizes can be said to be in particular demand, but stove coal approaches this condition the nearest.

The market promises to be quiet from now on through the remainder of the summer, but indications point to a heavy demand the coming fall. We quote the New York market on the following basis:

	Circular	Individual		
		Lehigh	Scranton	Schuylkill
Broken	$5.00	$4.45@$4.65	$4.50@$4.70	$4.45@$4.65
Egg	5.25	4.80@ 4.90	4.85@ 4.95	4.80@ 4.90
Stove	5.25	4.90	4.95	4.90 .....
Chestnut	5.50	5.05@ 5.15	5.10@ 5.20	5.05@ 5.15
Pea	3.50	3.25@ 3.45	3.30@ 3.50	3.25@ 3.45
Buckwheat	2.75	2.10@ 2.45	2.50@ 2.75	2.10@ 2.45
Rice	2.25	1.75@ 1.95	2.25	1.75@ 1.95
Barley	1.75	1.30@ 1.70	1.75	1.30@ 1.70

PHILADELPHIA, PENN.

The anthracite coal trade in this vicinity is commencing to show marked signs of the summer influence. The dealers are not only bemoaning the lack of trade, but are also confronted with an additional problem in the shape of the new state tax, which imposes a levy of 2½% on the market value of the coal at the mines. This will undoubtedly be saddled on the consumer. There have been considerable comments on this act, and the majority of the Pennsylvania press seem to feel that it is uncalled for as well as unjust. The operators generally are handling the tax in a way of their own, that is, by adding it as a separate item to the invoices for the coal, simply passing the charge that will be imposed upon them on to the dealers, who will undoubtedly add it on to the retail price.

Beginning the first full week of July, it is understood that many of the large operators will commence curtailing operations. While up to the present time the market has been absorbing practically all of the prepared sizes, the outlook now is such that it was probably deemed advisable to institute partial suspensions. The work at the mines will probably be limited to four days a week, which it is felt will be sufficient to meet the requirements of the trade for the next two months or longer.

Outside of stove, there is no active demand for any particular size. Individual operators are now offering their output of egg and chestnut at considerably less than the socalled circular prices and the steam sizes are a drug in the market, the only movement being on contracts already entered. The Tidewater business to the New England market still continues in a fairly active condition, but the demand from this direction is slowly but surely growing less as the summer season advances.

Encouraging reports still continue to emanate from the bituminous market. Conditions in the West and Northwest have resulted in a marked strengthening of this branch of the trade, and a stiffening in prices. Contractors who are still holding out for better figures are buying on the open market now for their current needs at advances over the figures at which they could have secured their season's supply. Altogether the trade looks good from this standpoint, and confirms the prediction made months ago, that the summer would see a much improved condition of affairs as far as bituminous is concerned, and indications are that it will continue so until the fall demand opens up.

PITTSBURGH, PENN.

Bituminous—There is no material change in the situation. Mines continue to operate at a high rate, barring last week's nterruption through the holiday, while demand is good on contract, and there is a fair demand for prompt lots. Some additional contracts for coal have been made, for delivery up to Apr. 1. Despite the fact that slack always sells off in he summer, some of these contracts have been for slack at the full price of 90c., which prevails without question outside the lake-shipping season. There is little of this grade offered at special prices, except that on the Pan Handle there are a few operators selling prompt at 70@75c. in small lots. We quote regular prices as follows, with premiums sometimes paid on prompt lots: Slack, 90c.; nut and slack, $1.05; nut, 1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., steam, $1.50; 1¼-n. domestic, $1.55 per ton at mine, Pittsburgh district.

Connellsville Coke—The operators have traversed most f the distance, apparently toward winning the long contest or $2.50 for furnac coke for second half. Buyers having contracts expiring June 30, involving about 175,000 tons a month, continued to hold aloof until within the past few ays when operators sold for July only at the $2.50 price, to the extent of about 90,000 tons; by far the major part of this tonnage was sold by a group of operators who had definitely announced their adherence to a $2.50 price. Last Saturday there was urgent inquiry for spot-furnace coke, and some buyers seemed ready to pay up to $3, but little was secured. Afterward they changed their attitude and declared they would run their furnaces slow, or bank altogether, rather than pay a fancy price. This week the market is extremely quiet on the surface, there being practically no inquiry. Consumers not yet covered are probably conferring together and hoping to break the market by keeping out entirely. The operators, on the other hand, consider their contest practically won, and expect the remaining consumers eventually to come into the market and pay $2.50. Most of the sales made for July were guaranteed against the sellers' declines, which, instead of proving a weakness seems to have strengthened the operators' position. Production last week was light on account of the holiday, practically two days being lost, and coke shipments are light. We quote: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $2.75@3; contract foundry, $2.75@3, per ton at ovens.

BALTIMORE, MD.

With no possibilities now of a strike in West Virginia, the trade has settled down to a summer basis, but considerably better than a year ago, when contracts were being made at from 10c. to 25c. off what is demanded at present. Except for slack, which has recently taken another slump down to around 55@60c., very little coal, even of the least desirable grades, can be had on a mine basis of less than 90@95 cents.

While there is now no rush for fuel, there is enough demand to continue a healthy warm-weather market. Quite a number of small manufactories throughout the state that have been purchasing in the open market have recently come under cover for either short- or long-term contracts. Many concerns that had hoped to go through the summer buying at the low figures which prevailed for spot fuels last summer, have been sadly disappointed, and are now contracting at less advantage than if they had done so early in the spring.

The coal record at this port the month of June was rather remarkable, 25 large steamships being loaded in the export trade. The tonnage ran to 110,000 tons, an increase of approximately 22,000 over the previous month, and the largest single month in the history of the port.

The first of July ushered in a real dull period for the anthracite dealers. During April, May and June the low circular resulted in considerable purchasing for delivery during that time. The rail movement both from the anthracite and bituminous fields has been good; while there has been some spasmodic complaint from some regions, especially in the West Virginia gas-coal districts for movement to the Northwest, the main situation has been easy.

BUFFALO, N. Y.

The bituminous coal market has seldom ever been as active at the end of June as this year, and all members of the trade are searching for a reason to expect a falling off before long. On the contrary, however, all indications point to a still stronger market by September, and perhaps sooner; the reason for this is that the consumption is so heavy, while the production cannot possibly be urged to a higher point. Operators and shippers are doing their utmost to get more coal, but the miners are indifferent. They are not very numerous and do not care to work full time during this period of the year.

It is said that there is not a car anywhere in the country under demurrage if the holder is at all up to his business; equipment is none too plenty, and it is felt that with a little larger output the supply would run short. If crops are as large as they promise to be, and the consumption holds up the outlook for the fall is serious. For this reason there is a general refusal on the part of sellers to make any more contracts unless they can get full going prices, and some of them do not dare to contract even on that basis.

There is every prospect of a further advance in bituminous prices as soon as the smallest farther reason for it appears. Some shippers are calling present figures too low, but the trade generally is satisfied with $2.90 for Pittsburgh select lump, $2.75 for three-quarter, $2.65 for mine-run and $2.15 for slack, although the latter is hardly as strong as the sizes. Allegheny Valley prices are strong at about 25c. lower than Pittsburgh. There is no stir in coke, as consumers still think it too high for the rest of the market. Quotations are $4.75 for best Connellsville foundry.

Anthracite is quiet except with the jobber with independent mines behind him. He is always on the watch to make sure that they do not get away from him, as they have done in former years. There is not much danger of it now, for the consumer is not going to buy much till cool weather is here with a reminder of the return of winter. At the same time the lake shippers are making every effort to crowd coal Westward. Shipments by lake for the week were 136,000 tons, the total for June being 642,110 tons and for the season, 1,785,574 tons. With the late start last season, on account of mining suspension, the amount was only 551,693 tons to July 1.

COLUMBUS, OHIO

The interposition of a holiday on Friday of last week, which was followed by a partial holiday on Saturday, curtailed production in all of the mining districts of the state. But notwithstanding that fact the output has been good and the tone of the market satisfactory in every respect. All mining concerns announced new circulars for July 1 which makes an advance of about 10c. per ton.

One of the best factors of the trade is the activity displayed in domestic grades. Retailers are placing orders both for immediate delivery and shipment later in the month. They believe that the stocking up period will arrive sooner than usual and want to be prepared for the demand when it appears. Dealers stocks are not heavy in any territory tributary to Ohio and the approach of the threshing season also has a stimulating effect upon the trade. The docks of the Northwest are taking the coal as fast as it comes to them and no congestion of consequence is reported. Boats are still being chartered for the latter part of the season.

Production in Ohio fields was interfered with by the two holidays of the week and also by a growing car shortage, particularly in eastern Ohio. Notwithstanding these conditions the output in the Hocking Valley is estimated at 85 per cent. of the average and in the Pomeroy Bend field about 75 per cent. In eastern Ohio the output is about 70 per cent. of the average, considerable trouble from lack of cars being reported from this latter district.

Iron and steel plants are taking a good tonnage despite the usual dullness which overtakes manufacturing during the summer months. Factories show no disposition to stock up to guard against a shortage but this will probably come later in the season. The only disturbing factor noted by coal men is the possibility of a car shortage which is expected to be more acute this year than ever before.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump........	$1.60		$1.60	$1.60
¾ inch..............	1.45	$1.20	1.40	1.40
Nut................	1.25		1.35	
Mine-run............	1.25	1.10	1.15	1.20
Nut, pea and slack....	0.65		0.65	0.65
Coarse slack..........	0.55	0.65	0.50	0.55

TOLEDO, OHIO

The coal business in Toledo is unusually strong for this season of the year. Lake shipping began early and would have been still sooner but for a shortage of coal at the docks due to the fact that so much was required to make up the deficit caused by the Ohio floods.

The present season gives every evidence of proving a banner year in coal shipments, but the next one will be even much better for the Toledo docks. The new $2,000,000 Hocking Valley docks will be completed and open for use next June and Toledo will hold the enviable position of being the first port in the world so far as coal and ore is concerned, being equipped with more loading machinery than any port on the lakes. The enormous Lake Shore track and yard improvements being made here at an expense of $3,000,000 will also have considerable effect on the coal market. The lake this season is considerably higher than usual, which is, of course, of benefit to coal and ore shippers and will result in much heavier loading than is possible when the water is lower.

The coal movement, according to the figures at the Customs office here, show that the shipments at this port for this season amount to 2,165,802 tons as against 1,762,139 tons for the same period in 1912, an increase of 403,653 tons. The general demand for coal has been extraordinary throughout the season and is strong from every source for both steam and domestic fuels. The call is coming from all sections of the state and orders for present and thirty-day delivery are coming in freely. The traffic situation here is highly satisfactory thus far and no congestion has been noted. Prices have been holding firm and there have been no concessions from the list. Quotations on the local market follow:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump....	$2.25	$1.50	$2.50	$1.75	$2.50	$1.35	$1.35
Egg	2.25		2.50	1.50	2.50		
Nut	1.80	1.15	2.25	1.50	2.50		
¾ lump...........		1.35				1.20	1.20
Mine-run	1.50	1.15				1.10	1.10
Slack		0.45				0.65	

HAMPTON ROADS, VA.

While the dumpings at Hampton Roads during the week have been fairly good as a whole, Lamberts Point alone has probably handled more coal than both Sewalls Point and Newport News. The demand has seldom ever been so heavy at this port while shipments are only about normal from the Pocahontas District with a considerable decrease in the output from the New River fields. The strikes in the latter district are causing considerable uneasiness among buyers and shippers and while it is reported that the men were to return to work about July 7, it will take some time to get a normal quantity of coal to tidewater.

Considerable tonnage is in the stream at Sewalls Point awaiting coal and vessels are experiencing some delay at Newport News as well. There is also a large fleet anchored off Lamberts Point; some of the boats are awaiting turn at the docks and others are short of cargo. Suppliers are practically all short of coal but such few as have any on hand will not quote a price as they are holding off to take care of contract vessels which are expected at any moment.

Coal shipments over Hampton Roads piers for the month of June were heavy although they did not come up to the dumpings for May. During June there was dumped over the Lamberts Point piers 476,122 tons, at Sewalls Point 254,758 and at Newport News piers 263,231 tons, a total of 994,111 tons.

LOUISVILLE, KY.

The long continued spell of hot weather appears to be having a depressing effect upon the coal market. Campaigning for orders for the winter business should now be well under way, but the unusually warm weather has taken all the snap out of the trade, and it is difficult to do business. The holidays over the Fourth of July did not have any effect on the situation, as producers were more than willing to close down, because of the difficulty in disposing of tonnages.

The orders for screenings still continue light, with production far in excess of the demand; steam consumption generally throughout the state is light. The circular prices for July delivery are being maintained, with only occasional discounts being offered on screenings at some of the large distributing centers; these are for the most part being well maintained in spite of the over-supply.

INDIANAPOLIS, IND.

Local dealers have increased anthracite prices 25c. a ton, and Pocahontas 50c., the former following the various smaller monthly advances made at the mines. One of the largest retailers says it is the first time for many years that he has not been able to name prices for coal to be delivered to his customers in the fall. Dealers can get some spot-shipment coal from the smokeless field but cannot make any contracts for deferred shipment. Under such circumstances they are not able to say what future quotations on Pocahontas will be or whether they will have much coal on hand when the winter buying opens in the fall. In Indiana and other states conditions and prices have not changed.

DETROIT, MICH.

Bituminous—Business in this vicinity continues good for this period of the year, especially on domestic coal there being plenty of orders for the current month, and some being placed ahead into August; Pocahontas is particularly strong. Most of the local dealers appear to be well sold up on this latter coal, and there are rumors that some have received more than the regular circular price. The Lake movement remains active, and there is some indication of a car shortage, although it has not reached serious proportions as yet. The local soft coal market is quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.60	....	....	....	....	$2.00	$2.0
Egg...........	1.60	....	....	....	....	2.00	2.0
Steam lump....	1.50	....	....	....	....	....	...
¾-in. lump......	1.25	$1.25	$1.10	$1.15	$1.10	....	...
Mine-run.......	1.10	1.10	1.10	1.10	0.90	1.50	...
Slack..........	0.85	0.85	0.45	0.50	0.60	....	...

CHICAGO

The Chicago market has been influenced by the possibility of a general strike in the West Virginia district and as a result there was a shortage in smokeless coal. At the start of the coal year efforts were made to place the price of this fuel at $4.25 but during last week, some of the more prominent dealers fixed the spot price for wagon delivery at $4.60.

The jobbing interests claim that instead of an increase in price there will be a decrease because operators are over-sold and consumers over-bought. They back these statements up with the fact that shipments to the lake districts are 25 per cent. above what they usually are at this period. The market is said to be tightening up slightly on other grades of coal owing to heavier harvest and mid-summer storage buying but prices remain the same. Anthracite seems to be now taking the place of smokeless owing to the shortage of the latter. The situation is just the reverse of what is was last year

Prevailing prices are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$1.97@2.07	$2.55	$2.27	
Egg		2.55		$3.94@4.20
Steam lump	1.82@1.87		2.07	
Mine-run	1.77@1.82	$2.20@2.30	1.87	3.30
Screenings	1.62@1.67	1.90@1.95	$1.62@1.67	

Coke—Connellsville and Wise County, $5.25@5.50; byproduct egg and stove, $4.85; byproduct nut, $4.75@4.85; gas house, $4.50@4.60.

ST. LOUIS, MO.

There is no change in market conditions so far this month, although indications a few weeks ago were that the first of the month would see a general increase in prices; however, this is bound to come within the next week or two on the Standard coals and possibly on Carterville. Standard is still being sold below the cost of production, and on the first of the month St. Louis received the first electricity from the Keokuk Dam. It is estimated that this has, up to the present time, already displaced between fifty and seventy-five cars per day of screenings, which have been used at the different power houses of the United Railways Co. and the Union Electric Light & Power Company.

Coke still remains firm with indications of a slight advance and a fairly good demand.

The prevailing circular is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.80
3-in. lump	....	....	....	....
6-in. lump	$1.15 @ 1.30	....	....	0.90
Lump and egg	....	$2.10	$1.30	....
No. 1 nut	1.15 @ 1.30	....	1.15	0.90
Screenings	0.85 @ 0.90	....	....	0.80
Mine-run	1.05 @ 1.15	....	....	0.75
No. 1 washed nut	1.50	....	....	....
No. 2 washed nut	1.35	....	....	....
No. 3 washed nut	1.30	....	....	....
No. 4 washed nut	1.20	....	....	....
No. 5 washed nut	1.00	....	....	....

St. Louis prices on July anthracite are: Chestnut, $7.25; stove and egg, $7; grate, $6.75; smokeless lump and egg are $4.65; byproduct coke, $5.10, and gas-house coke, $4.85.

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY

Total shipments of coal over this road for May of the urrent year were 318,720 tons as compared with 311,247 tons or the same month last year. For the five months to May 1 of the current year, the shipments were 1,897,003 tons as ompared with 1,406,847 tons for the same period last year.

IMPORTS AND EXPORTS

The following is a preliminary statement of the coal imorts and exports in the United States for May and the leven months ending May 31.

Imports—Bituminous imports for May of the current year ere 97,993 tons as compared with 132,959 tons for the same onth last year. For the eleven months ending May 31 of he current year, bituminous imports were 1,487,498 tons as ompared with 1,167,147 tons for the same month last year, nd 1,685,049 tons during 1911.

Exports—Exports for May of the current year were 2,09,215 tons as compared with 1,504,233 tons for the same onth last year. For the eleven months ending May 31, otal exports of coal for the current year were 18,396,346 ons as compared with 16,026,491 tons for the same period ast year and 13,333,726 tons in 1911.

COAL MOVEMENT

The following is a summary of the movement of coal and oke over 13 principal railroads during April and the first four months of this year in comparison to last year, in short tons:

Classes and Railroads	April 1912	April 1913	4 Months Ending April 1912	4 Months Ending April 1913
Anthracite:				
B. & O. (a)	10,902	123,602	582,656	557,994
C. & O. (a)	3,215	2,176	14,442	4,343
Erie (c)	122,725	753,072	2,302,666	2,711,120
Penna. (a-c)	290,865	930,592	3,579,602	3,674,096
Virginia (a-b)	....	45	....	356
Total 5 roads	427,707	1,809,467	6,479,366	6,947,909
Bituminous:				
B. & O. (a)	2,297,135	2,660,702	11,058,713	11,191,866
B. R. & P. (a-b)	401,581	661,519	2,701,410	2,955,146
B. & Susq. (a-b)	22,269	152,537	490,368	602,601
C. & O. (a)	1,609,054	964,104	5,915,640	4,925,334

(a) Includes coal from connecting lines. (b) Includes Company's coal. (c) Does not include company coal hauled free. * Includes company coal for fueling.

FOREIGN MARKETS

GREAT BRITAIN

June 27—The demand for all kinds of coal is more active. and prices have a firmer tendency.

Quotations are as follows:

Best Welsh steam	$4.68@4.92	Best Monmouthshires	$4.20@4.26
Best seconds	4.44@4.56	Seconds	4.03@4.14
Seconds	4.20@4.32	Best Cardiff smalls	2.52@2.58
Best dry coals	4.44@4.56	Seconds	2.28@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

The "Iron and Coal Trades Review" makes the following statement in its editorial columns under date of June 13:

> There can be no doubt that the demand for coal has been taxing the resources of the principal producing countries of the world, with the exception, perhaps, of the United States, and the result has been a general advance in prices. In the United Kingdom many circumstances have combined to accentuate this movement, including the new burdens of industrial legislation which have to be borne by the coal-mining industry, increased wages, the irregular working of the miners, difficulties in Wales over the non-Unionist question, and the strikes in Belgium and Silesia. Average f.o.b. prices at British ports are now more than 25c. per ton higher than they were a year ago, and in the inland market collieries are asking advances of from 25c. to 50c. per ton on all contract renewals, according to the class and quality of coal in question. As compared with 1911, a minimum advance of 75c. per ton is being obtained, and in many cases it is considerably more.

SPANISH IMPORTS

Coal imports into Spain for the four months to Apr. 30 of the current year were 949,199 metric tons, as compared with 664,733 tons for the same period last year. Coke imports for this period of the current year were 125,304 tons as compared with 137,150 tons for the same period last year.

GERMANY

Coal production of the German Empire for the first four months of this year and last year was as follows:

	1912.	1913.
Coal	56,083,431	63,379,455
Lignite	26,769,972	28,176,021
Coke	9,061,330	10,660,315
Coal briquettes	1,629,265	1,937,511
Lignite briquettes	6,226,447	6,866,452

FINANCIAL DEPARTMENT

The Elk Horn Fuel Co.

The newly organized Elk Horn Fuel Co. has issued the following statement concerning the 5%, 5-year convertible gold notes they are now offering:

The issue of these notes is limited to $4,000,000. They are dated May 1, 1913, mature May 1, 1918, but are subject to redemption at the option of the company (in whole, or in part by lot) on any interest day upon sixty days' notice at 105 and accrued interest. The notes are in denominations of $1000 and $500, may be registered as to principal, and are in coupon form with interest payable May 1 and Nov. 1.

Both principal and interest are payable at the office of the Guaranty Trust Co. of New York, without any deduction for any tax or taxes which the company may be required to pay thereon or deduct therefrom; the 0.004 state tax in Pennsylvania will be refunded as provided in the mortgage. At the option of the holder, the notes may be converted at their face value at any time after Nov. 1, 1913, and until Feb. 1, 1918; or if before the latter date they are called for redemption, then up to and including the thirtieth day preceding the date fixed for redemption (but in no event after Feb. 1, 1918) into shares of the capital stock of the Consolidation Coal Co. at $105 per share of $100 par value, with a cash adjustment for fractional shares and of interest and dividends.

Organization and Capitalization—The Elk Horn Fuel Co. is incorporated under the laws of the state of West Virginia, and is capitalized as follows:

5% cumulative preferred stock	$7,000,000
Common stock	19,000,000
First mortgage 5-year 5% convertible notes (closed issue)	4,000,000
Total	$30,000,000

all of which are outstanding.

The books of the company show a surplus of over $1,000,000 applicable to the payment of interest and dividends, of which over $500,000 is in cash.

Property and Security—The notes are a direct obligation of the company and are secured by a mortgage dated May 1, 1913, to the Guaranty Trust Co. of New York, which is a first lien on the following properties and on all property hereafter acquired by the Elk Horn Fuel Co., subject, however, to purchase money liens thereon:

(a) Direct first mortgage on 199,479.09 acres of land, in fee, and mineral rights of which 184,829.09 acres are in the Elkhorn region in eastern Kentucky, practically all of which lies in what is known as "The Elkhorn Coking Coal Field"; and 14,650 acres in Randolph and Upshur Counties, West Virginia (known as the Rich Mountain properties), now under operation.

(b) Upon 15,758 shares of the capital stock of the Beaver Creek Consolidated Coal Co., out of a total authorized and outstanding issue of 55,150 shares. This company owns, free from all liens and encumbrances, approximately 50,000 acres of land in fee or mineral and mineral rights, in "The Elkhorn Coking Coal Field." These lands and mineral rights are subject to an option in favor of the Elk Horn Fuel Co., under the terms of which the latter has the right to purchase all of these lands and mining rights at $60 per acre, at any time prior to Apr. 30, 1918, free of taxes or other expenses in the meantime.

(c) Upon 12,000 shares, being the entire issue of the capital stock of the Mineral Fuel Co., owning 4500 acres in "The Elkhorn Coking Coal Field." This company has an outstanding bond issue of $1,200,000, of which $800,000, or the proceeds thereof, are reserved for development purposes upon its property; this is an operating company.

(d) Forty-four thousand shares of the par value of $4,400,000 stock of the Consolidation Coal Co., at present market value of about $4,400,000, paying dividends at the rate of 6% per annum.

In addition to the foregoing properties, which are subject to the mortgage, the Elk Horn Fuel Co. also owns 1800 shares of a total outstanding issue of 1936 shares of the Tennis Coal Coal Co., which owns approximately 49,200 acres of land in fee or mineral and mineral rights in the counties of Leslie, Perry, Harlan and Knott, Kentucky; these lands represent a market value of over $700,000.

Revenue—The income of the company for the first year of its operation is estimated at $303,000. This includes $264,000 dividends at the rate of 6% per annum on Consolidation Coal Co. stock, pledged as part security for the notes, and in addition earnings which will accrue to this company from the Mineral Fuel Co., the Rich Mountain properties, and certain leases now in force upon other properties of the company subject to the mortgage.

Except as to the property of the Mineral Fuel Co., which will be operated by it the present plan of the Elk Horn Fuel Co. is to lease its property to reputable lessees, instead of operating itself: thus obviating the necessity of providing for large capital expenditures, which direct operation by the company itself would entail. Applications are already in hand, and negotiations in progress for leases, on terms advantageous to the company, and as railway construction is now under way, no difficulty will be encountered in securing leases upon satisfactory terms and profitable basis.

There will be procured for the Elk Horn Fuel Co., leases to responsible operators, satisfactory to the trustee of the mortgage, covering not less than 20,000 acres of coal land out of a total of 200,000 acres, requiring a minimum annual production of not less than 2,000,000 net tons and a minimum royalty of 10c. per ton, beginning not later than Apr. 1, 1915; thus providing an additional income to the Elk Horn Fuel Co., from operation of not less than $200,000 per annum from Apr. 1, 1915, to the maturity of the notes. There will, however, be considerable income from these leases during the year of 1914.

The Consolidation Coal Co.—This company is one of the largest and most important producers of bituminous coal in the United States. It owns and operates approximately 300,000 acres of coal lands in Maryland, Pennsylvania, West Virginia and Kentucky, and last year produced more than 10,000,000 tons. It is now producing at the rate of upward of 12,000,000 tons per annum, and last year earned over 10% on its outstanding $25,000,000 of stock. The company was incorporated in 1864 and has been paying dividends for 26 years, and at the rate of 6% since 1905. It has offices and direct selling connections in New York, Boston, Portsmouth, Philadelphia, Baltimore, Washington, Cincinnati, Louisville, Detroit, Cleveland, Chicago, London and Genoa, with well established connections in Mexico and Canada.

The Consolidation Coal Co. owns a majority of the stock of Metropolitan Coal Co. of Massachusetts, which sells about a million tons of coal annually in Boston. It also owns a majority of the stock of the Northwestern Fuel Co., of Wisconsin, which company has extensive docking and handling facilities on the Great Lakes, and distributes more than three million tons of coal annually. The Consolidation company operates its own fleet of barges, tugs and steamers on the Atlantic coast, and successfully exports its coal to Europe, Africa and South America.

Management—The company is managed by men of long experience in the successful development and operation of coal properties, and its officers and directors are heavily interested in the property.

COAL SECURITIES

No Important Dividends were announced during the week.

* * *

The Monongahela River Consolidated Coal & Coke Co.—A receivership for this company has been demanded by Ex-President Dempster, who owns 8481 shares of the common stock and 100 shares of the preferred. The company's equipment is valued at $5,000,000. It is alleged that the company consummated a contract with the United States Steel Corporation to furnish coal for a period of 25 years at less than cost and also that it sold to the H. C. Frick Co. 8500 acres of coal land at $88.50 per acre when same was worth not less than $1000 per acre, and in addition, threw in lands worth $300,000.

Westinghouse 200 H. P. Motor Direct-Connected to Centrifugal Mine Pump.
Pump Capacity, 600 G. P. M., Head 800 Ft.

Reliable Pump Service

Lower maintenance expense, greater compactness, greater flexibility as to location, elimination of steam pipes, greater ease of control, and the ability to operate with practically no attendance, are some of the important advantages gained by driving your pumps with

Westinghouse Motors

Westinghouse motors for mine pumps are especially designed for this work. They are extremely simple in construction, and will operate satisfactorily under the severest conditions. The bearings have a larger area than the needs of the service require and will wear for years.

The lubrication is automatic and the bearing surfaces are always flooded with oil whenever the motor is in operation. Full information on request.

VOLUME 4 JULY 19, 1913 NUMBER 3

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

Foreword: *Page* 75
Some pertinent remarks concerning the relation of employer to employee, and vice versa. Duties of each class are briefly outlined, and a general policy of goodwill and forbearance is advocated. COAL AGE, Vol. 4.

***Ash- and Coal-Handling Equipments:** *Pages* 76-79
Although the pivoted bucket carrier is higher in first cost, the operating and maintenance charges are so low that this style of conveyor shows the best results through a long period of service. For storage, a "Dodge" system is best for sized anthracite, and a locomotive crane or a traveling-bridge tramway is best for run-of-mine bituminous. The second and concluding article on the subject. Henry J. Edsall. COAL AGE, Vol. 4.

***A Universal Blow Torch:** *Page* 79

***The History of the Gasoline Mine Motor:** *Pages* 80-82
The gasoline mine motor was designed to fill particular needs of the coal industry. The author shows what these are and gives a description of the early attempts to produce a locomotive to meet the requirements. An article next week will answer some of the objections hitherto brought against the gasoline motor. R. O. Hodges. COAL AGE, Vol. 4.

***Lining the Flush Pipe:** *Pages* 82-83
In flushing granular material into the worked-out sections of mines, unprotected pipes soon fail through the abrasive action of the material handled. Experiments with various pipe linings are here described and the results given. COAL AGE, Vol. 4.

***The Economical Use of Anthracite:** *Pages* 84-87
A detailed analysis of the various costs of the different grades of anthracite coal. Also a study of the economies to be effected by using mixtures of the different sizes. It has been found that operating costs at large plants can be materially reduced by this means without any appreciable loss in efficiency. Reginald Trautschold. COAL AGE, Vol. 4.

***A New Illuminated Steel Sign:** *Page* 87

Our British Coal-Mining Letter: *Page* 88
Comparison of triple-expansion engines with turbines; the coefficient of volumetric efficiency; hoisting-engine controllers. COAL AGE, Vol. 4.

Snapshots in Coal Mining: *Page* 89
Miscellaneous views of surface and underground equipment gathered from all parts of the world.

The Mine Explosion: *Pages* 90-91
Some verses founded on an incident of the coal-mine explosion at Hanna, Wyo., June 30, 1903. D. G. Thomas. COAL AGE, Vol. 4.

Recent Judicial Decisions Affecting Coal Trade: *Page* 92

Producing And Selling

The Weekly Ad-Talk Page

R. O. Eastman, of the Kellogg Toasted Corn Flake Co., Battle Creek, Mich., recently had this to say about the cost of selling:

"Our magazine advertising cost last year about two-thirds of a cent a package. If we are to include our sampling and display, cost of salesmen, etc., which in a sense are just as much 'cost of advertising' as the money we spent with the magazines, the figure might possibly be raised to two cents a package or even more.

"But there is an important fact to be taken into consideration and that is *that it costs more to sell almost any kind of merchandise than it does to produce it.* The farmer gets 35 or 40 cents a bushel for his potatoes, the consumer probably pays from 80 cents to a dollar—the difference between what the farmer got and what the consumer paid was the cost of selling. There is a great hue and cry being raised about this cost being exorbitant and about 'eliminating the middleman,' but there are a number of middlemen in this transaction and all of the Government commissions and political economists that have been on the job have thus far failed to discover the particular middleman who could be conveniently eliminated. Reduced to first principles, it is very plain that whether any of these middlemen receive an exorbitant price for their services or not, they are doing the work cheaper than the farmer could do it himself, for if he had to take his crop of potatoes and deliver them himself to each of his ultimate consumers, the potatoes would just about be worth their weight in gold.

"The 'cost of advertising' is merely one of the items of the cost of selling, and it is the cheapest method that a large producer can employ to sell his goods. Advertising is a wonderful force, the economics of which are not yet clearly understood. It has created entirely new channels of merchandising. It has made it possible for the manufacturer to carry his story—his selling argument—direct to the consumer and thus eliminate in actual selling of the goods, as distinguished from distribution, all middlemen. The national advertiser, who advertises judiciously, sells his goods before they are made by creating the consumer demand. His own sales force, so termed, the jobber and the retailer, cannot then be considered as merchants but as distributors whose function is not to create a demand but to supply a demand already created.

"There are two classes of goods really, those that are made first and sold afterwards according to the old order of things, and those that are sold first and made afterwards, of which our own product is a typical example. We create the demand by advertising and have the means of determining with reasonable accuracy the exact volume of that demand so that we may gage our production accordingly. The result is that we produce only sufficient quantity of goods to supply the normal demand which results in a constant fresh stock. We have no warehouse, our goods go direct from our ovens into our cars, and neither we nor our jobbers, nor our retailers have to take any risk of overproduction with the disastrous results of overstocks and spoiled goods. These are the risks which always attend the production of goods which are 'made first and sold afterwards' and in the very nature of things the public—the consumer—pays for all these risks.

"If the question, 'Who pays for the advertising?' comes up for consideration, we need only point out that some six years ago we were making a package one-third smaller and selling it for fifteen cents. To-day, after spending two or three million dollars in advertising the product, we are selling a package fifty per cent. larger than the original package at a third less, or if you will figure it out, giving the consumer just twice as much for his money. Who pays for the advertising? One big advertiser says, 'Mr. Overhead Expense pays for the advertising,' and this is largely true. Perhaps a better answer is that advertising pays for itself. It is merely the intelligent use of a cheaper and more effective means of selling and the consumer gets the benefit."

COAL AGE

Vol. 4 NEW YORK, JULY 19, 1913 No. 3

Mr. Mine Owner and Mr. Mine Manager.

Do you give your employees all to which they are justly entitled? By this is not meant the actual dollars and cents they draw on payday, but do you give them value received for the rent they pay? Are their houses shacks built from mill culls, without paint, without a fence, without a garden or yard, without any sanitation, with a leaky roof and a chimney that will not draw? Or are your houses neat little cottages, painted, with a fence, a garden, a bath and water?

Perhaps you say that the average miner will not appreciate the little cottage, and that the bathtub would soon become the storage place for all kinds of rubbish. Perhaps in a way you are right, but if you can elevate the average miner to the point of appreciating his home, with its pleasant surroundings, you will surely find that you have a better employee; and as you raise the standard of life for one miner, you have thereby raised the standard of your camp.

Do you make 50 per cent. profit in the company store, or are you satisfied with 10? Are you like the mine manager who remarked—"We will do all right his year, as we are getting the coal on the railroad ars for the same money at which it is sold, and we can declare a good dividend from the profits of the store nd the rents." The houses of this company were mere shacks, yet they rented for $5 per month per room; the nearest competitor of the company store was four miles away over practically impassable wagon ads.

Do your employees respect you as an individual, or ecause you are the boss? Are you and your men roud of your camp and mine? Do you put dollars, safety first? As the mine owner or manager, you e a personage in your community and this gives ou many privileges, as well as many duties. Do you use the privileges? Do you recognize your duties?

r. Employee:—

Do you give the company full value for your pay? o you aid them to the best of your ability? Do u obey all rules and regulations that are made for ur safety? Do you appreciate the trim little cottage, with its garden and bright surroundings? Do you help the company to make the camp and the mine the best in the field?

Are you loyal to the company? Do you protect its interests? Do you ever try to aid its owners even though this means a little extra work for you? Or do you scheme to get a 15-min. delay in reaching the parting with your loads, so you will not have to make the last trip? Do you kill time when the boss is not around, or do you work at the same rate as when he is standing over you?

Do you only look forward to payday, and the sound of the whistle, or are you proud of your work and anxious and willing to earn your pay? Do you save the extra spikes and bolts, or do you throw them away because there are plenty more in the supply house? Do you bring out the extra timber, or do you hide it behind the gob?

Have you always been square in your dealings with the company? Or, are you like this miner: He had an entry under contract; it was in low coal and the rock was paid for at $2 per yd. The bank boss left his paint at the mouth of the entry and did not put up any yardage stamp; the next month the entryman devoted all his time to pushing his rooms while he only drove the entry 8 ft. A new bank boss came on, and when he measured up the yardage he used the last stamp of the previous boss and gave the entryman 69 ft. Did the miner correct this mistake? No sir, he took the $46 with a grin, and as an excuse said—"It was the company's fault, and anyway they have beat me out of more than that in the store."

To Both Employer and Employee:—

It is probable that ideal relations between you two will never be fully realized. However, is it not possible to better the conditions that now exist? The company by taking more interest in the individual will cause him to realize that his efforts are appreciated, while the employee on his part can be more loyal to the company, and by carefully obeying its rules can help preserve the employer's property. Let us revert to first principles—"Do unto others as you would be done by," instead of doing others before they do you

Ash- and Coal-Handling Equipments

By Henry J. Edsall*

SYNOPSIS—Although the pivoted bucket carrier is higher in first cost, the operating and maintenance charges are so low that this style of conveyor shows the best results through a long period of service. For storage, a "Dodge" system is best for sized anthracite, and a locomotive crane or a traveling-bridge tramway is best for run-of-mine bituminous. The second and concluding article on the subject.

⁂

A coal-handling equipment supplied with a pivoted bucket carrier system is, of course, designed only for a small plant. As a rule, a first-class pivoted bucket carrier for handling both the coal and ashes is the simplest and best arrangement, and works out to be the cheapest in the end. While it may be somewhat more expensive in first cost, the operating and maintenance costs are so low and there are so few delays that run into expense so quickly, that the carrier shows the best results when followed through a long period of service. There is, however, a great difference in pivoted bucket carriers, as there is in all machinery, and to get good results, it is necessary to select a carrier that is carefully designed and one in which the materials and construction are of the best.

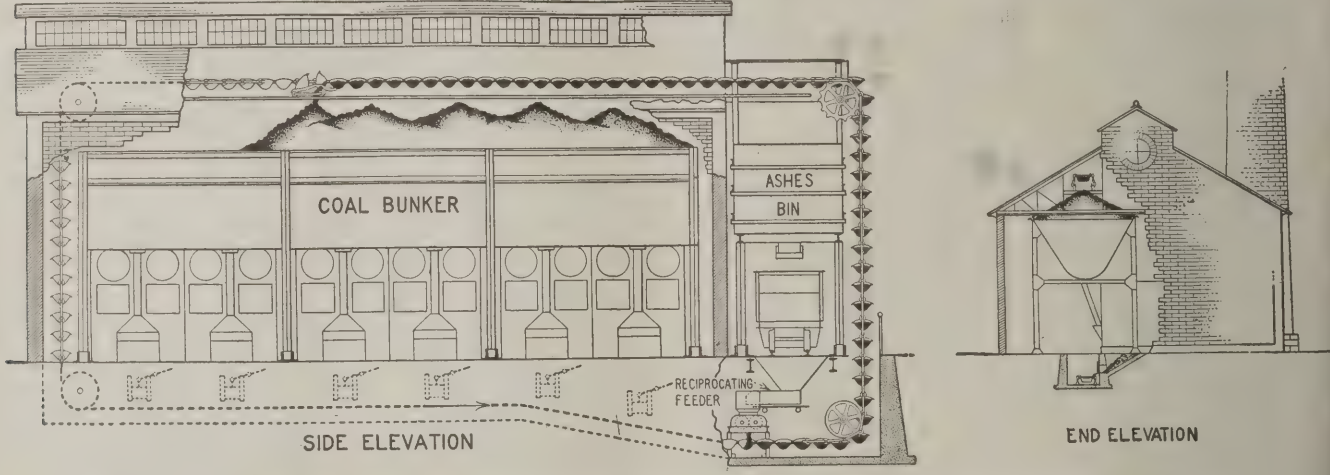

Fig. 1. Boiler Room Equipped with Conveyor Handling Coal and Ashes Fig. 2.

Figs. 1 and 2 show a boiler room equipped with mechanical stokers and overhead coal and ash bins and with a pivoted bucket carrier for handling the coal and ashes. The coal is fed from the track hopper to a crusher by means of a reciprocating feeder. After passing through the crusher it goes directly into the carrier buckets which elevate it and convey it to the bin where a movable dumper can be set to dump the coal from the buckets at any point. The coal then feeds by gravity from the bin through the stoker spouts to the mechanical stokers. The ashes go into hoppers underneath the furnaces and are then fed by gravity or raked out into the carrier buckets, which take them up and deliver them to the ashes bin for discharging to railroad cars or carts.

Fig. 7 shows a bin in a boiler room with spouts direct to stokers, and Fig. 4 shows a bin with a traveling weighing hopper underneath so that the coal can be weighed before it is delivered to the stokers. Fig. 5 shows an elevated ashes bin built with concrete columns and floor, brick walls, and corrugated-iron roof. This makes a practically permanent construction, whereas a steel bin is subject to more or less corrosion from the sulphuric acid formed by the action of the water used in quenching the ashes. This corrosive action is also quite serious where steel is used for the buckets and chain in the carrier. Malleable iron, however, is much less subject to corrosion and stands up remarkably well, and by using case-hardened steel pins and bushings with large bearing surfaces at the chain joints and large well oiled rollers, a very durable carrier can be obtained.

Comparison between Belts and Elevators

The earlier carriers for handling coal and ashes, like first designs in most kinds of machinery, were not very satisfactory because the ashes and acid quenching-water cut and corroded them so rapidly. This has prejudiced many people against handling coal and ashes in one carrier, and as a result, separate systems for each are very popular with many engineers. This means two systems to install, operate and maintain, and the cost for each of these three items is usually higher than with the best modern carriers. The coal handling usually consists of a chain and bucket elevator or inclined flight conveyor or belt conveyor for elevating the coal, and a flight or belt conveyor for distributing. For ordinary capacities, flight conveyors are cheaper to install and, contrary to the ideas of many engineers, cheaper to maintain than belt conveyors. Distributing with a flight conveyor also requires only simple slide gates, whereas the belt conveyor requires the more expensive tripper and a track for it to run on. For long conveyors or very large capacities, the belts show a considerable saving in power and, on account of the higher speed, the handling capacity is much higher for a similar width. For moderate lengths and capacities, however, the saving in power is a very small item, and, as stated before, the flight conveyor is cheaper in first cost and cheaper to maintain. There is also some danger with a belt conveyor of having the belt badly torn by a sharp piece of steel or other foreign substance in the coal. When his happens, it is expensive, as the belt itself forms the principal item of cost in a belt conveyor.

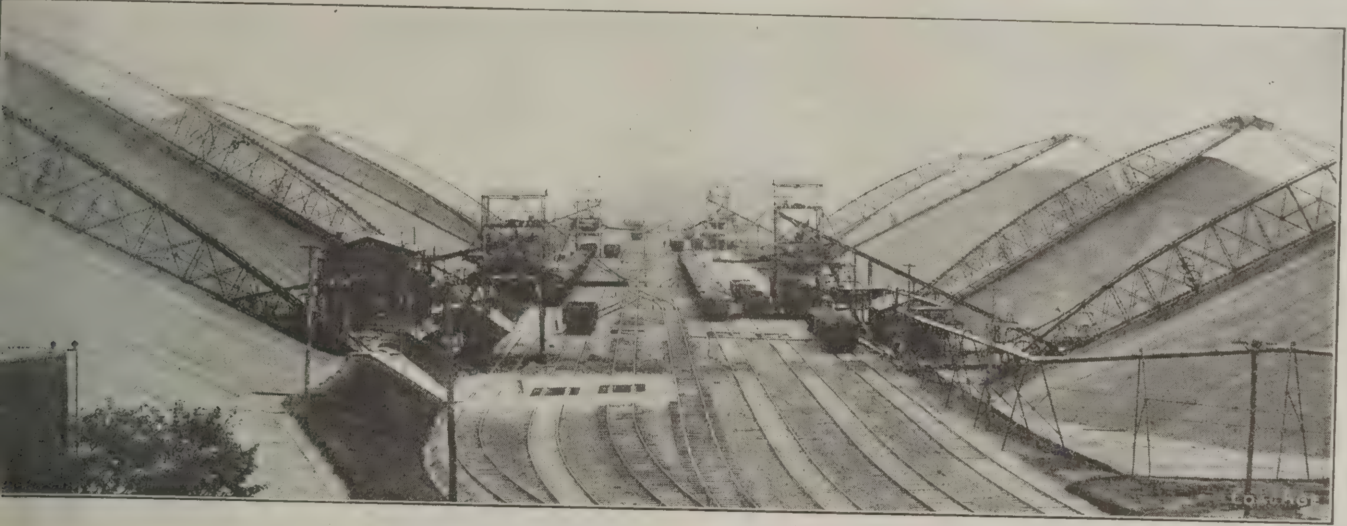

Fig. 3. A Large Storage Plant Using the Dodge System

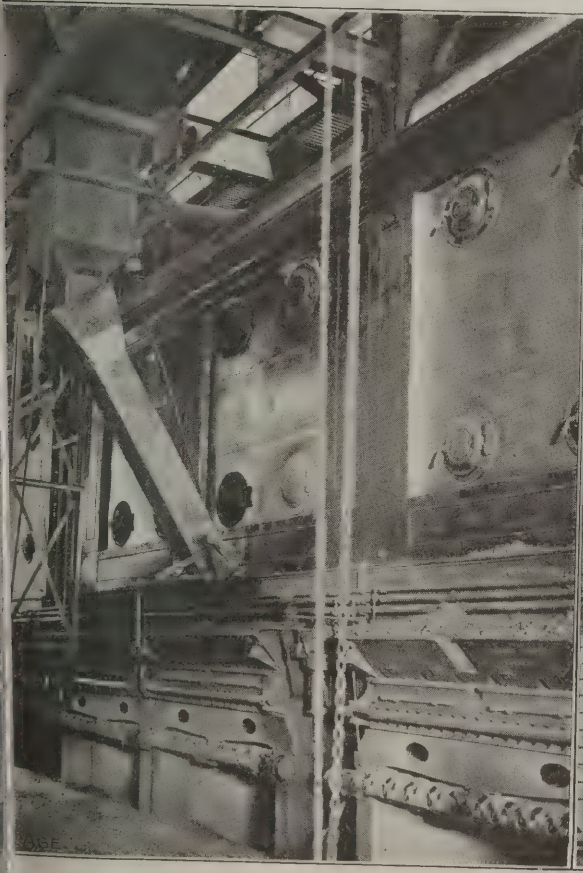

4. Traveling Weighing Hopper Delivering Coal to Stokers

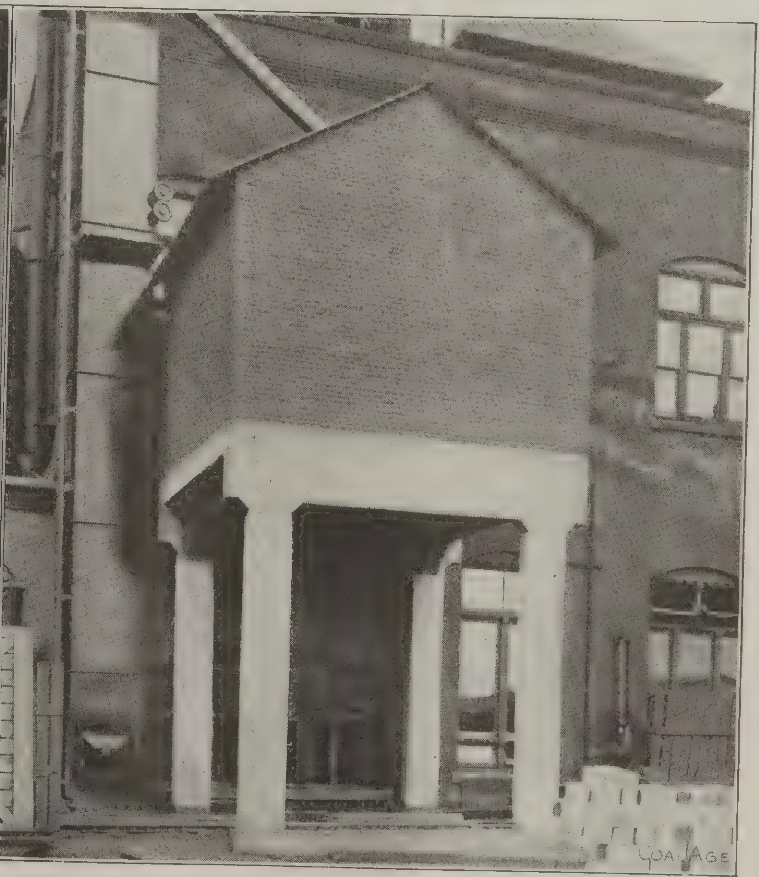

Fig. 5. Elevated Brick Ash Bin Built Outside of Main Plant

For handling ashes in a small plant, the usual equipment is a wheelbarrow or industrial car for moving them ontally, and a chain and bucket elevator or skip and hoist for elevating them. They can be either de- d to an overhead bin for gravity loading to wagons rs, or delivered direct to the wagons or cars, or to a d storage pile. The vertical chain and bucket ele- is a satisfactory type of machine for moderate ca- ies and moderate heights, if properly designed and constructed, but for large capacities or greater lifts, the skip hoist shows a lower maintenance cost. A pivoted bucket carrier will, of course, do the horizontal conveying and also the elevating with one machine, and will do this with a minimum amount of repairs, but the first cost is too great for small plants. Another type of conveyor that has proved economical for conveying ashes horizontally, or at an incline, is a block chain conveyor. This type of machine consists of a block chain, 8 or 12 in. wide, that slides along and pushes the ashes forward in a cast-iron trough. The only wearing parts are the chain, wheels, trough and return guides. The trough and return guides can be made quite thick so that they will wear for a long time, and the chain and wheels can be renewed without great expense even if they do not last for such a great length of time.

Pneumatic System for Handling Ashes

Recently, pneumatic systems have been developed for handling ashes and have even been used for handling both coal and ashes. One of the heaviest items of expense with such a system is the power cost, for a great deal of power is required in any blowing system. In handling a small amount of ashes per day, this is not a serious matter, but where a large amount of coal and considerable ashes also are to be handled, it becomes quite an important factor. It is also necessary to feed them slowly and regularly, and the coal or ashes must be quite dry or they will stick in the pipes. In feeding ashes they are usually raked out to openings in the floor, or fed from hoppers underneath the boilers, and the operation is much slower than with a pivoted bucket carrier that ordinarily handles 40 or 50 tons per hour or more. The pneumatic system therefore requires not only a larger motor, but a longer period of operation to handle the same amount of material. Where a pivoted bucket carrier would require a 7½-hp. motor for operation, a pneumatic system would require about a 40- or 50-hp. motor. This means much higher cost of operation. The principal claim for pneumatic systems is low maintenance costs, but this does not seem to be borne out by actual results. Certain parts wear out quite rapidly, especially the pipe elbows at bends, even though special steel wearing faces are provided. In handling coal there is also trouble caused by its being pulverized by striking the bends at high velocity, and this causes it to fall through the grates and work badly in the furnaces, thereby reducing the efficiency.

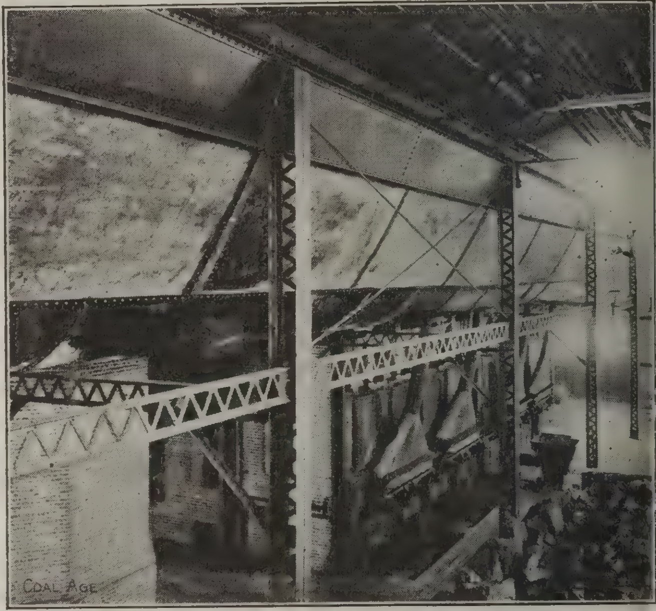

Fig. 7. Overhead Bin for Mechanical Stokers

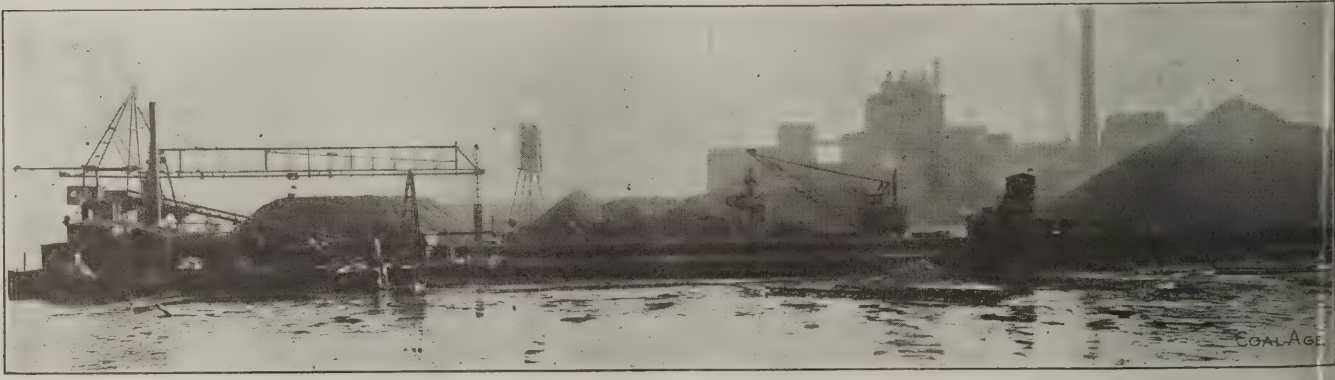

Fig. 6. A Coal-Storage Plant Using Three Types of Equipment

In very large power houses, electric ash cars are sometimes run in under the ash hoppers below the furnaces and the ashes delivered to them to be taken out and elevated to an overhead bin or disposed of in some other manner.

Reserve Coal Storage

Reserve storage plants are sometimes placed adjacent to a boiler room so that the coal can be reclaimed by mechanical means and delivered to a bin in the boiler room, or under the boiler-room floor. In other cases the storage plant is placed at some distance from the boiler room and the coal transferred by cars or other means. Attention has already been called to the scheme of using a simple chain and bucket elevator, inclined flight conveyor, or elevator and conveyor for unloading the cars, and piling on the ground and also to the use of the tub hoist or clamshell-bucket hoist for unloading boats, and the automatic or cable railway for distributing in a ground storage pile. A more flexible arrangement is a locomotive crane equipped with a clamshell bucket. With such a machine operating on a track on the wharf, coal can be taken from the boat and piled in a long pile directly back of the track, or it can be handled from the boat or the storage pile to a car or cars which can be pushed with the crane to the boiler room, and then handled with a conveyor equipment, or in some cases the coal can be delivered direct to a conveyor system, whic extends down to the wharf. In many cases locomoti cranes can also be used to advantage for handling ashe from pits or a pile on the ground to cars or carts. In man instances locomotive cranes are used to transfer coal fro boats either to a storage pile along the wharf, or to a ho per which feeds an inclined flight conveyor extending t the boiler room. An 8-ton car is also used for handlin the coal from the pile to the conveyor when taking from some distance from the conveyor-feeding hoppe

The Dodge System of Storing Coal

For very large reserve storage plants, the "Dodg system is usually by far the best for sized anthracite co and for run-of-mine soft coal either a locomotive cra with a long boom or a rotating or traveling bridge tramway.

The "Dodge" system has two inclined trusses attached together at the peak and having a flight conveyor running up one of them. The coal is fed from the railroad cars through a track hopper to the inclined conveyor which piles it on the ground in a conical pile of usually from 30,000 to 60,000 tons. Two of these piles and a reloader form a unit. The reloader is a flight conveyor which swings around on circular tracks at the ground level so as to cover practically all the area of the two conical coal piles. This reloader is swung against the side of the pile so that the flights can get hold of the coal and push it back and up an incline to the railroad cars. At the plant shown in Fig. 3, 14,400 tons of coal can be handled from the cars to the pile, and 10,000 tons back again from the pile to the cars in 10 hours, at a total cost of less than three cents per ton.

In storing soft coal it is necessary to spread it out over a large area and pile it not over 20 or 25 ft. deep on account of the danger of spontaneous combustion. A clamshell bucket traveling back and forth on a bridge tramway will form a pile over the whole area covered by the bridge, and the bucket can be used for handling to the pile or taking out of storage. If the bridge revolves around a central pivot point, it forms a circular pile, or rather two semicircular piles, for it is necessary to leave a cut through the center for the railroad cars to reach the central unloading pit. If the bridge travels engthwise, a rectangular pile is formed. The trolleys hat run back and forth on the bridge and carry the uckets, are either operated by wire ropes from one end f the bridge, or else the trolley has its own motor and the perator rides along with it in a cab. The first arrangenent usually works out best, unless the length of the ridge is too great for satisfactory control and operation.

A large-radius locomotive crane can be used to form ircular piles similar to the revolving bridge tramway, r it can be used for almost any shape of pile which fits nto the conditions. It is the most flexible and cheapst machine in first cost, and by extending the tracks for t to run on, the amount of storage obtainable can be xtended indefinitely. A 100-ft. radius crane with a fiveon bucket will handle over 200 tons per hour with ease.

Fig. 6 shows a modern reserve storage plant belongng to a large electric company. In this plant the "Dodge" ystem for storing anthracite is used and there are also locomotive crane and a bridge tramway for loading and nloading soft coal, three types being shown.

⁂

Miner Receives $37,500

What is said to be the largest verdict ever given in a ersonal-injury case in the United States Circuit Court as handed down by Judge Chalfield, in New York, rently, when Stanislaw Yensavage, a miner, was awarded 37,500 for injuries suffered while in the employ of the ehigh Coal Co., at Shenandoah, Penn.

On June 10, 1911, Yensavage was working as a helper the company's mines. While carrying percussion caps s oil lamp ignited one of them. An explosion followed, using the loss of both eyes, his right arm and all but e index finger and thumb on his left hand. He was in e hospital five months. He sued for $50,000. The jury as out only three minutes.

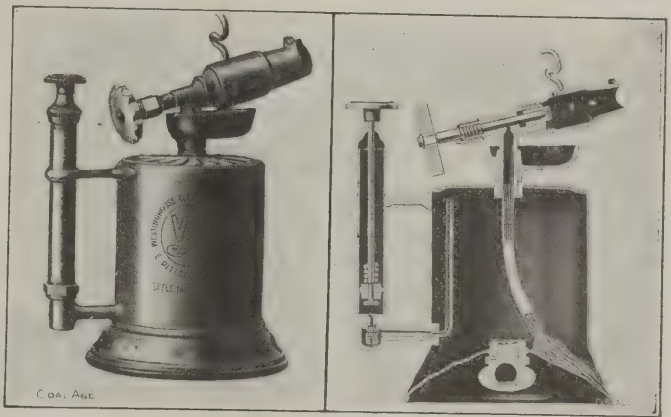
A Universal Blow Torch

A new gasoline blow torch has recently been placed on the market by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Penn., which embodies a number of novel features and improvements. These, it is claimed, adapt the instrument for all conditions of service and it is, therefore, called a "Universal" blow torch.

The burner is made particularly heavy so that it will retain its heat and keep the torch burning in cold or windy weather. The drip cup is made especially deep so that it will start operation under bad weather conditions. These features, however, do not detract from the use of the tool for indoor work.

Another feature of the torch is the self-cleaning burner valve. The needle at the end of the valve stem cleans the hole automatically when the handle is turned. The valve seat need, therefore, never be injured by picking at the opening to clean it. The valve seat, furthermore, is a separate replaceable plug.

The handle of the valve is of fiber and does not get hot nor does it need a long valve stem for cooling as does one made of iron. On the other hand, it will not crack, loosen and come off as does a wooden handle nor does it char or burn.



General and Sectional View of Universal Torch

The tank, it is claimed, is of the heaviest gage brass ever used for such a purpose and is reinforced with an extra corrugated brass disk covering the entire inner surface of the tank pot. This insures the receptacle keeping its shape under rough handling.

The pump valve works in a cylindrical guide which assures perfect seating. It can be taken down and any part replaced separately.

COMING SOCIETY MEETINGS

Alabama Coal Operators' Association—This association will hold its annual meeting at Pine Tank, on July 26.

American Institute of Mining Engineers—This institute holds its next annual meeting at Butte, Mont., on Aug. 18 to 21, inclusive. Bradley Stoughton, 29 W. 39th St., New York City, is secretary.

National Conservation Exposition—Miners' Field Day, to be held under the auspices of the Tennessee Mine Foremens Association, with the coöperation of the Bureau of Mines and the American Red Cross, on Sept. 20, at Knoxville, Tenn.

The History of the Gasoline Mine Motor

By R. O. Hodges*

SYNOPSIS—The gasoline mine motor was designed to fill particular needs of the coal industry. The author shows what these are and gives a description of the early attempts to produce a locomotive to meet the requirements. An article next week will answer some of the objections hitherto brought against the gasoline motor.

⁂

There are many places today where the mule still furnishes the most economical form of haulage. The original investment is not large; the system possesses great flexibility, and is, perhaps, more widely understood than any other. I have often been astonished at the ability shown by the mine mule to haul, for short distances, enormous loads, over any kind of track, despite improper treatment. But the mine mule's average pace is not greatly in excess of three miles per hour, and the mileage which he can cover in the course of a day is decidedly limited. The mule is also constantly liable to injury and is a menace to everyone in the mine.

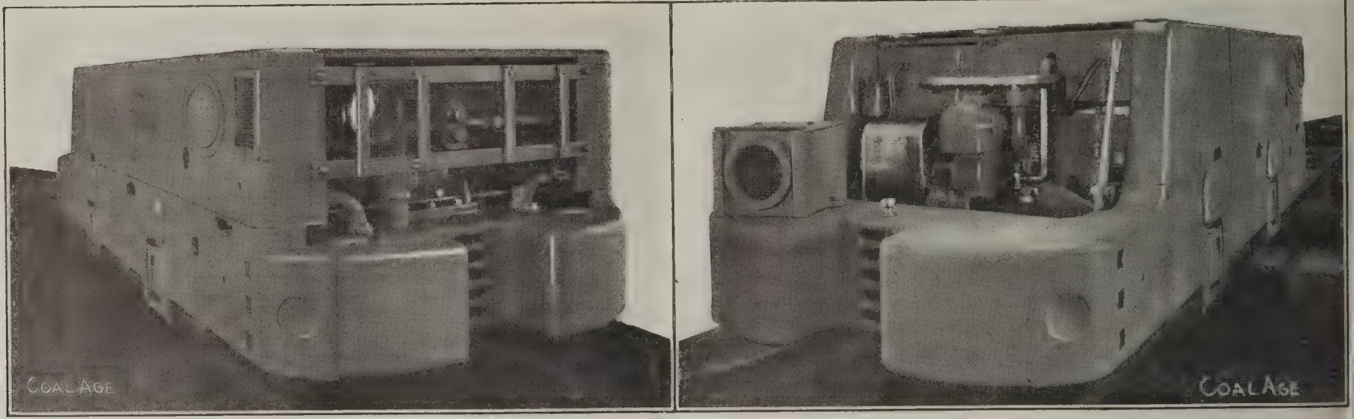
Steam Locomotives

Underground steam locomotives were much in vogue at one time in the anthracite region, and also to some extent in Virginia and West Virginia. They were also used to some extent in Europe. They could not be used without a tremendous amount of ventilation in the entry through which they worked, both on account of the steam which made the heading hot and the lights obscure and because of the immense volume of smoke and the incompleteness of the combustion. The large quantity of carbon monoxide and carbon dioxide given off by the combustion of a ton of coal, readily explains why the mining departments in most of the states have strenuously objected to steam locomotives being introduced into mines, although for cheapness of running and flexibility they leave nothing to be desired.

Compressed-Air Haulage

Compressed air holds a field today, from which I believe it will never be displaced. In deep and gassy mines, compressed-air must of necessity always be the preferred haulage. It operates entirely without sparks or flame of any kind and instead of detracting from the ventilation, it adds to the air-current a perceptible quota of clean and cool air. On the other hand, compressed-air motors are exceedingly bulky and require wide and high entries in which to operate. Their flexibility is strictly limited by the fact that they can, comparatively speaking, proceed but a short distance away from the charging station. The first cost of the compressed-air haulage plant is equal to, or probably in excess of the first cost of an electric installation.

While it is perfectly true that the efficiency of a compressed-air plant can be made nearly, if not quite, equal to the efficiency of the electric plant, mining conditions are such that this efficiency is rarely, if ever, realized, and as at present installed, it is probably the most expensive in fuel of any system of mechanical haulage. The difficulties in keeping pipe lines absolutely tight when the air pressure is 1000 lb. are very great. Unless pipe lines, the piston rings in compressors, and pistons in the air motors are kept in excellent condition, the air which has cost so much coal to compress will escape in abnormal quantities.



Front and Rear Views of Whitcomb Gasoline Locomotive

The Electric Motor

I once saw a statement, made by Mr. Edison, I think, in regard to electricity, which I believe largely accounts for its popularity in many lines. He stated that to produce mechanical power with an electrical current only one single, simple, rotating member was necessary. This is strictly true, and mechanically considered the electric motor is the simplest machine of which we know. There is nothing needed except one drum with its windings rotating at a greater or less speed between the poles of two or more magnets, and we only have to introduce some gearing of the simplest possible form between this rotating drum and the wheels of a mine motor to obtain the power necessary to pull the mine cars. Mechanically there is nothing to get out of order, and as long as we can keep electricity passing and nothing burns out, the motor is bound to keep on pulling coal.

---

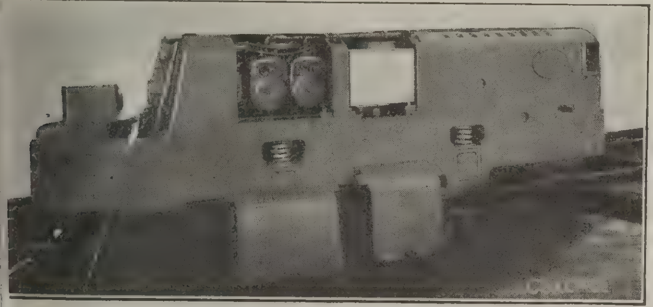
*Mechanical engineer, Geo. D. Whitcomb Co., Rochelle, Ill.

Note—Article read before West Virginia Coal Mining Institute, June 24, 1913, at Morgantown, W. Va.

It is a little hard to criticize a system of haulage which has proved, by long experience, to be such a monumental success, but it is not without its disadvantages. Methane is lighter than air, and a trolley wheel moving along a conductor is about the most perfect means for the ignition of gas. If we could get one-half as good a spark or flame in the cylinders of our motors as is obtained from the ordinary mine trolley, what few ignition troubles we have would entirely cease. These sparks from the trolley wire seem to me to exclude the electric motor from any place in which there is the least danger of gas being present in explosive quantities.

Excessive Starting Torque

Some years ago I was frequently in the granite quarries of New England and I noted numerous attempts made o install electricity as a hoisting power on the large dericks by which the stones were lifted. The system never vas a success for this one reason: In starting the big locks of stone out of their beds it was necessary to put a train on the rope and then loosen the rock with wedges nd crowbars until finally it would break away and swing ut. The electric motor, if it cannot move, must either low a fuse or else burn up. Much the same difficulty found in its application to mining conditions. If it over-loaded, it gets very hot and either blows a fuse or rns out; and as you all doubtless know, when the elecc motor is finally burned out, it is an expensive job put it in condition for further service.



de View with Doors Removed for Inspection of Engine and Refilling of Gasoline Tank

Large First Cost of Electric Haulage

The initial investment for a properly installed elec- plant is heavy. Not only the electric motor, but trolley l feeder wires have to be furnished and erected at no ll cost. Moreover the rails have to be bonded to carry return current. All these items are by no means to be pised. The cost of preparing track for electric use is erally more than for any other systems, as in addition trolley wire, rail bonding, etc., the track itself has to carefully lined up with the conductor if the trolley o be kept on the wire. Also in mines with a bad roof cost of erecting and maintaining trolley hangers is siderable. I have not spoken of the initial expense nstalling an electric plant, of the necessity for dyna-, engines and boilers but these are a very real part of expense of an electric installation and even if the tricity is used for cutting coal we must not forget that rtain proportionate part of the expense of the power it must be borne by the electric motors which are ving their current from it.

Besides the danger of explosion from the ignition of combustible gas there is the danger of electric shock. We can reduce the voltage to a point where shocks while disagreeable are not dangerous or we can so protect the bare wires that there is little possibility that men passing to and fro underneath them will be shocked. Either means adds enormously to the original cost of installation.

The same objection applies to both electricity and compressed air, that the theoretical efficiency of the system is high but electricity is even more apt to leak than air. Mining conditions make an absolute prevention of these leakages almost prohibitive in expense. The ordinary mine operator therefore satisfies himself that the leakages cannot be avoided and gets an efficiency which is far below that theoretically obtained.

Early History of Gasoline Mine Motors

So far as I have been able to discover, the gasoline mine motor was in general use in Europe before it was even considered in this country, its development on that continent being nearly coincident with the evolution of the automobile. The motors had single or twin cylinders of low power and speed. They were not to be compared for a moment with the motors which have been developed on this side of the water. Yet, even under these conditions, they furnished what was considered the most economical means of haulage.

In this country some motors were built in Chicago and probably in St. Louis also, some seven or eight years ago; and I have heard a rumor that motors were built in Pennsylvania about the same time. The Geo. D. Whitcomb Co. also built a motor about the year 1900, which a year ago was still running. Besides these, I believe one or two other companies built motors for use in mines at quite an early date. The St. Louis motors were built by a concern which was unfamiliar with mining conditions. They consisted essentially of a slow-speed, single-cylinder, stationary type of engine, mounted on a mine car. The firm built about a dozen of them, shipped them out to the mines in the adjacent territory and they were all promptly returned, as they cost more money in repairs than the value of the coal they hauled.

The Mascoutah Experiment

We built one motor for a firm operating in Illinois. It was placed at first in a mine in which the grades were so excessive that the motor could not pull itself over them at all. This motor was slightly changed and shipped to the Kolb Coal Co., Mascoutah, Ill., and so far as we know is still in running condition and at work. This coal company now operates four of our motors of later model. The motor at Mascoutah had extremely light work to do so it kept on running despite its faults and we thought we had the whole problem of gasoline-motor haulage solved then and there. It was not until we built one or two more motors that we discovered that the work to which the machine was put had so much to do with its durability.

The company which I represent was originally formed to manufacture and sell the Harrison mining machines, which were the original compressed-air punchers. We have, therefore, been familiar with mining conditions for a great many years, and it seemed to us, about eight or ten years ago, that the gasoline mine motor offered us a field for increasing our business and would also put a check on the increasing use of electric mining machines. Many companies were installing electricity for coal cutting at that time simply because of the convenience which it offered as a means of haulage. Therefore, we started to build gasoline mine motors so as to give those who wished to use compressed-air punchers a suitable method of haulage.

Need of Great Strength

As I have said, the first motor which we built and sent to Illinois was put on such light work that we heard nothing from it. The second motor was sent down into Kentucky, I believe, and was an eight-ton machine. It was expected to haul about 800 tons of coal over a rolling grade some 2500 to 3000 ft. long; and except for the increase in size, we built this motor very much as we had erected the one we placed in Illinois. In other words, we took an automobile engine, transmission and clutches and put them on a frame and fully expected that the combination would haul coal. And it did most successfully, so long as we could make it stay together.

I have no record of the number of times this motor was rebuilt, but I do know that for three or four years about all I heard from the factory in regard to the gasoline motor was that it was being rebuilt. The owners of the mine showed exemplary patience, but at last even this was finally exhausted, and our motor was thrown out. In the meantime, however, we had tried many different engines, from the lightest to the heaviest type, from the automobile motor to that constructed for heavy marin work; from the cheap engines to the most expensive. W had experimented with many different forms of clutche and gears made in all shapes and of all materials, an at last we felt sure that we knew in the main what fea tures would work and could avoid those devices whic were unsuited.

The next motor that we built was sent down to th Roane Iron Co. at Rockwood, Tenn. In this machine w incorporated an enormous factor of safety, which we ha found necessary from our experience with the Kentuck motor. It was on this particular machine that we evolve the clutch which has since proved so successful. We use an engine of our own design made extremely heavy an of high-grade material, with the idea that we might po sibly get an engine that would hold together. Up to th time we had been driving direct from the transmission the front axle with gears and chaining back from t front to the rear axle, and the unequal strain from t gear-drive caused us endless trouble through broke axles. This machine was rebuilt and given the mode transmission and chain drive and ceased to give an trouble. The second machine which we sent into th mine had the chain drive, the present form of clutch, an of transmission, and it gave success from the first. was practically of the same design as we are using toda We have changed some of the smaller features and ha brought out other sizes of the same motor, but in t main, our later motors have been like the second loc motive installed in the Roane mines.

⁂

Lining the Flush Pipe

SYNOPSIS—In flushing granular material into the worked-out sections of mines, unprotected pipes soon fail through the abrasive action of the material handled. Experiments with various pipe linings are here described and the results given.

⁂

There seems to be no question but that flushing, or hydraulic stowage, in the worked-out portions of a mine is the best means of preventing surface subsidence. This method, however, involves many difficulties and considerable expense.

One of the chief sources of annoyance in this operation is the destructive action of both water and material handled upon the flush pipes. This, of course, varies with the nature of the filling, some substances being much more rapid in their action than others. Any material, however, that is fit to form an adequate filling will cut out an iron or steel pipeline in a surprisingly short time.

In order to overcome the corroding and abrasive action of the liquid and material handled, various pipe linings have been tried with more or less success. Wood has been, and is still used to a considerable extent for this purpose. This material, however, requires frequent renewal, and is, therefore, rather expensive for the service rendered. One or two installations have been made recently with cement-lined pipe, but these have been in service for so short a time, that no accurate conclusions may be drawn.

The Germans have, perhaps, had more experience along this line than any other people engaged in coal mining. In the Westphalian district, along the lower waters of the Rhine, the coal measures which are encountered at a co siderable depth are covered by strata which are decide soft and yielding. The surface, moreover, is comparati ly level and low so that any considerable subsidence wou render the land subject to inundation.

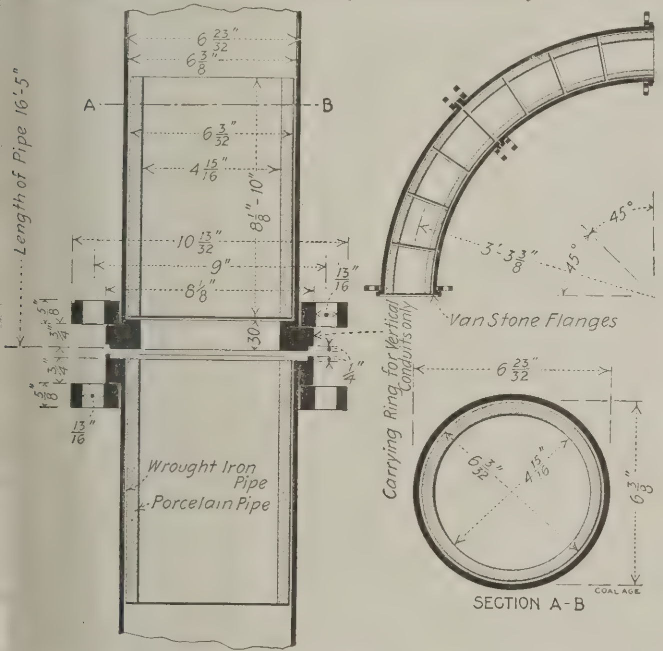
Extra precautions must, therefore, be observed to p vent, so far as possible, any settlement whatever of t surface. Careful experiment has shown that where ha packing is employed in the old workings, a surface su sidence equal to 40 per cent. of the thickness of the se may be expected, while with hydraulic stowage the grou only settles about 10 per cent. of the same thickness.

Due to its geographical location and the severe restr tions imposed by the mining authorities, the Gewerksch Deutscher Kaiser was one of the first German mines adopt hydraulic stowage upon a large scale. The st age material used was pulverized slag from the blast f naces of which about 2000 tons was available daily. periment showed that wrought-iron or steel pipe 5 m (approximately $\frac{3}{16}$ in.) in thickness wore through af 16,000 tons of this material had been passed. Even turning the tubes three times, each turn being for o third of a revolution, only 48,000 tons could be hand before the failure of the pipe. In some instances, tubes failed before the third turning could be acc plished, and much interruption of work was thus casioned.

To overcome this rapid wear and consequent expe a series of experiments were undertaken by the min engineer, Peter Mommertz. These tests were dire toward finding a practical lining for the pipes w would be more durable than the ordinary wrought iron. From these experiments it was ascertained that porcelain, glass and earthenware were more durable than either wrought or cast iron or steel. As these were laboratory experiments only, and might, therefore, prove deceptive, tests were begun upon a more comprehensive scale.

A number of pipes were accordingly lined with these different materials and put to work conveying the packing material underground. After 47,000 tons of material had been passed through the pipes, those of unlined wrought iron were worn out. Those lined with cast iron showed an abrasion of approximately ½ in.; those lined with glass showed a wear equivalent to from $\frac{1}{16}$ to slightly over ⅛ in., while the porcelain-lined pipes showed no wear at all, the linings being merely polished at the joints.

Experiments conducted on wood-lined pipes using fir, pitch pine and oak, under similar conditions to those above described, were entirely unsatisfactory. At the rst inspection of such pipes, the lining was found to ave entirely disappeared. It was believed that a part f the lining wore through, giving the flowing water a ance to loosen up and carry away the remainder.



ection of Pipe Showing the Lining on Straight Length and a Curve

The iron or steel pipes used in these experiments were rdinarily 5 m. (approximately 16 ft.) long. The porce-in linings, however, were made up in short lengths, ever exceeding 1 m. These linings were firmly held in ace in the manner shown in the accompanying illustra-on. The short lengths of the lining pipes also make em easy of transportation in the ordinary mine car.

One of the principal difficulties encountered with the rcelain linings was the presence of elbows in the pipes. his may be overcome in one of two ways: First, making e bend of long radius, so that the solid material carried es not come sharply in contact with the lining. This so reduces the friction, due to the bend. Second, a ting can be made which is similar in principle to the dinary dead end T. This contains a pocket which fills with the material carried and forms as a "buffer" for e sand to impinge upon.

So satisfactory has been the use of these linings, that they are now employed throughout the entire flushing system of this mine and are giving results in everyday operation which are vastly superior to those afforded by anything else. They have also been introduced extensively in Belgium, France and other regions of Germany. It has been found, furthermore, that on lengths of horizontal pipe a complete lining is unnecessary, as a half or slightly less than half lining will answer all purposes.

Although hydraulic stowage and the disposal of mine refuse is a serious problem at many American collieries, this particular pipe lining has never been tried. The American patents are controlled by the Rhineland Machine Works Co., of 140 West Forty-second St., New York. This company informs us that one firm of American operators has manifested great interest in this invention and contemplates giving it a practical test at no very remote date. This will be watched with great interest by all American mining men.

⁂

Death of Baird Snyder

When an automobile in which they were riding got beyond the control of the chauffeur and plunged over a 75-ft. embankment at Scott's Hill, near Wapwallopen, at 4 o'clock, July 8, Baird Snyder, Jr., of Pottsville, and C. S. Shindle, of Tamaqua, were fatally injured. Mr. Shindle lived only a few minutes and Mr. Snyder died next morning at the Wapwallopen Hotel without regaining consciousness. Mr. Snyder was the president of the Locust Mountain Coal Co., and former general superintendent of the Lehigh Coal & Navigation Co. He was also vice-president of the Hirsch Electric Mine Lamp Co.

The men were on their way from Hazleton to Berwick. Somewhere near Briggsville they got on the wrong road, reaching Scott's Hill, where the fatal accident occurred. The chauffeur, failing to notice a sharp turn about half way down the hill, let the car run rapidly. Sighting the turn when it was too late, he threw on the emergency brake and reversed his engines. The momentum of the car resulted in the stripping of the entire rear gearing and the automobile plunged over the embankment into the ravine below. Snyder was thrown clear of the car. He failed to regain consciousness and died next morning.

Shindle was caught beneath the tonneau and was crushed to death. One of his eyes was torn and every bone in his body broken. It was necessary to use block and tackle to free his body from the wreckage. Lyman, the chauffeur, was found on the mountainside tearing his hair out by the roots and crying convulsively. He is a young man about 19 years of age and comes from New York City. Two of his fingers were torn off.

⁂

International Exposition of Safety and Sanitation

The First International Exposition of Safety and Sanitation ever held in America will take place in New York City, Dec. 11-20, 1913, under the auspices of the American Museum of Safety.

All branches of safety and sanitation work will be represented. Exhibits from foreign countries will by a special act of Congress be admitted free. Much work of like kind has been done abroad, and there are 21 museums of safety in Europe; these will all contribute to the exhibit.

The Economical Use of Anthracite

By Reginald Trautschold*

SYNOPSIS—A detailed analysis of the various costs of the different grades of anthracite coal. Also a study of the economies to be effected by using mixtures of the different sizes. It has been found that operating costs at large plants can be materially reduced by this means without any appreciable loss in efficiency.

⁂

Necessity for husbanding the anthracite-coal deposits of the country has led to many tests and experiments to ascertain the economic value of low-grade coals and has thereby given considerable publicity to the matter of "the rational use of low-grade fuels." These are steps in the right direction, but it would seem that a more important consideration is "the rational use of *lower*-grade fuels." This does not mean that the low-grade fuels should not be utilized as much as possible and that every effort should not be made to perfect grates upon which to burn rice, barley, culm, etc., economically, nor that progress in perfecting the gas producer for operation on these comparatively poor fuels, is not of the utmost importance.

Economies Effected by Mixtures

All such efforts, tending toward the conservation of our fuel deposits, should be strenuously pushed; but of even greater importance (owing to the thousands of power plants which operate on specific grades of coal and which will probably continue to be so operated for years), is the rational use of *lower*-grade fuels. That is, the use of mixtures of standard sizes rather than confining ordinary consumption to some one specific size. For instance, a plant designed to operate on pea coal can, nine times out of ten, burn a mixture of pea and buckwheat as efficiently and with considerable profit to the owner of the plant. Naturally, what is true of anthracite coal is equally true of bituminous coal and other fuels, but the limited scope of this article necessitates confining the discussion to the use of anthracite—which coal is also better standardized as to sizes and heating values, etc.

Considering anthracite coal and its use only from an economic standpoint, it is true that coal from various mines differ in heat-generating value. This has led to the forming of certain companies that sell coal on a B.t.u. basis, instead of entirely by weight. While all mines do not produce coal of equal heating value, nevertheless good anthracite does not vary so much in this respect as to prohibit a fairly accurate average being arrived at as typical of this kind of fuel.

Furthermore, in the standard preparation of anthracite for the market, the amount of slate, bone and other foreign material that may be contained in any standard grade of coal is specified and this allowable proportion of foreign material—reducing the heating value of the coal—increases as the size of the coal decreases. Anthracite coal may then be considered in units of heating value even more logically than by weight. A million B.t.u. may, therefore, be taken as the unit of measure and the economic value of the various sizes of coal based on such classification, the weight of coal containing such heating value growing greater, as the size becomes smaller.

An Analysis of the Cost of Coal

Three distinct charges can be usually credited to the cost of coal at the power house, first, the price of coal at the mines, second, the transportation or freight charge, and third, a burden consisting of the retail dealers' profit, or the cost of transferring the coal from its railroad or barge terminal to the power house. The present average price (April, 1913) of anthracite coal at the mines, at tidewater, New York, and the average price of the coal delivered at the power house (all expressd in cents per million B.t.u. heating value of coal), is graphically depicted in the accompanying chart.

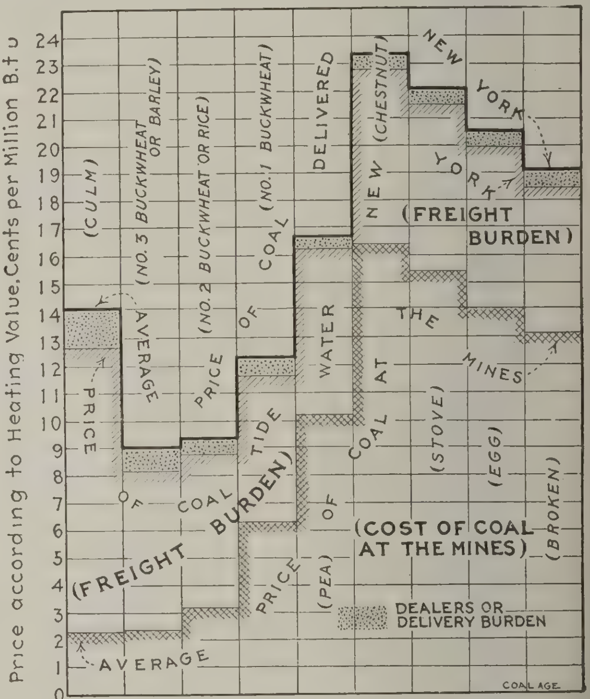


Chart I. Cost Burdens on Coal at New York

The price of coal at the mines varies as would be expected, the prepared sizes, from broken down to pea, increasing as the size of coal decreases, while the price of the washery sizes, from pea down to culm decreases as the sizes of the coal becomes less. The freight burden, on the other hand, is very nearly constant for all sizes of coal, if heating value is made the basis of consideration, though decreasing in rate per ton below pea and being constant (per ton) for the prepared sizes of anthracite. The burden of delivery or dealers' profit, being based entirely on weight, increases as the heating value of the coal decreases; that is, the poorer coal carries a proportionally greater burden.

The conditions governing the economic value of coal at present prices then varies considerably with the location of the power house. At the mines, the most economic fuel, provided it could be efficiently consumed, is culm although its present economic value as a fuel is very little better than that of buckwheat No. 3. At tidewater, New

---

*Consulting and contracting engineer, 22 East 10th St., New York City.

York, or delivered New York, culm (provided again it could be economically used) would not be as economical as the much richer fuel, buckwheat No. 1; buckwheat No. 3 is here the most economic anthracite fuel where it can be efficiently burned, but when delivery charges, etc., are taken into consideration, there is little difference between rice, buckwheat No. 2 and barley, buckwheat No. 3.

In fact, changing from the use of the more expensive coal to barley would probably show very little or no saving in the cost of fuel at a New York power house, owing to the greater labor charge, expenses for special rates, increased quantity of ashes to be disposed of, etc., hat would be necessary when operating on the less effiient, though cheaper fuel. In any locality, chestnut is he most expensive fuel among the anthracite coals, and or this reason is principally confined to special uses and omestic consumption. This is also true of stove and egg.

Broken coal is likewise limited to special uses, the prin-iple one of which is the coaling of locomotives. Here he wisdom of the railroads is well illustrated for the uestion of freight is much less a burden to them than o the public. Hence, the economic fuel for a locomotive s also the economic fuel of the mines. At the mines, roken anthracite is relatively about as cheap as pea, nd when the severe conditions under which a locomotive ust operate are taken into consideration—conditions far ore adverse than those existing in any power house— is probably the most economic grade of anthracite coal they could use. Egg, stove and chestnut are too expensive for general use by locomotives, but pea is used with relative economy. The smaller coals are unsuitable for locomotive use unless briquetted, but briquettes of low-grade anthracites, with and without the addition of some bituminous coal, are being successfully used on many locomotives. In fact, certain manufacturers of briquettes turn their entire output over to the railroads.

Mixtures Should Be More Generally Adopted

The best use of the small sizes of anthracite coal would then seem to be in the stationary power house. The advent of the gas producer has made possible the most economic use of these grades of smaller sizes of anthracite. Even culm has been used as fuel in gas producers in Germany since 1903, 2.2 lb. being consumed per horsepower-hour. In this country, though the use of gas producers is rapidly increasing, the general use of coal for the generation of steam in power houses still continues, and the main consideration is, therefore, its most economic use for this purpose. However, the use of coal as fuel, whether burned on grates or used in the generation of a power gas in producers is, of course, directly dependent upon its heating value.

Its economic use provided that the various sizes of coal can be burned or reduced with equal efficiency, is then dependent upon the price paid per heat value and not upon the price per ton of coal. This has naturally led to the almost universal practice of using only the small sizes

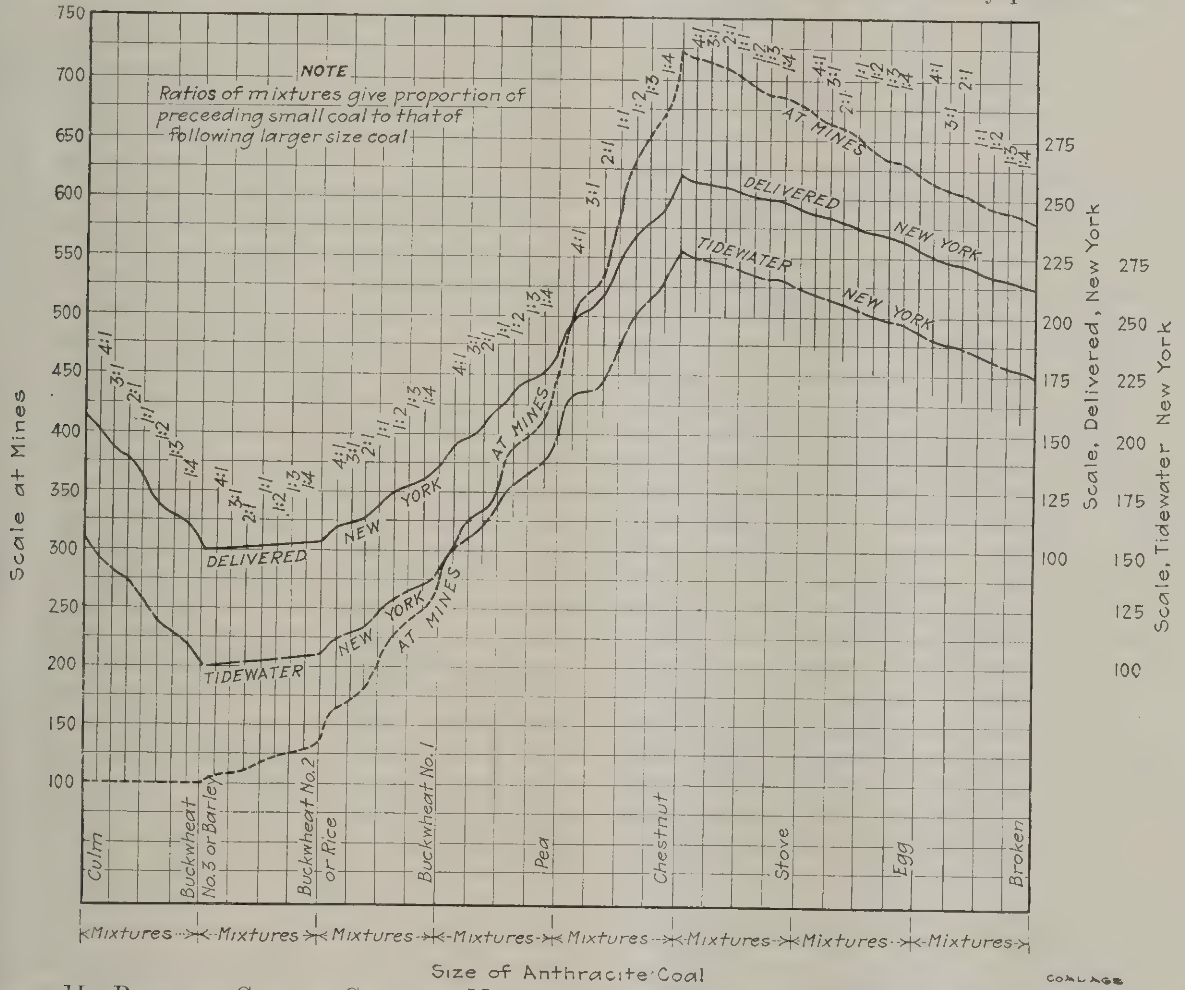

Chart II. Relative Cost of Coal per Million B.T.U. Expressed in Percentage of Most Economic Fuel of anthracite in the power house, and to the building of grates, etc., for the accommodation of specific sizes of coal. The manufacturers of furnaces having done much toward increasing the use of small standard sizes of anthracite, it devolves upon the power-house owner to develop this still further by the use of *lower*-grade fuels. This can be accomplished by using mixtures of standard sizes of coal and gradually remodeling the plant and adapting it to use lower and lower grades.

This is realized at many efficiently managed plants, for the use of mixtures of standard sizes of coal is becoming steadily more general. There are many more plants, however, where the exclusive use of the particular sizes of coal for which their grates were originally built, still continues. Every such plant is not only wasteful of one of the nation's greatest and most valuable natural resources, but is paying much more than necessary for fuel—an economic blunder that can ill be afforded in this day of keen competition and corresponding necessity of waste elimination.

A plant operating on pea coal could probably be operated, with no changes, on a certain mixture of pea and buckwheat No. 1, the proportion of the latter being less than that of the larger coal; or a plant operating on buckwheat No. 1 could be operated with probably greater economy and quite as conveniently if a certain quantity of rice or buckwheat No. 2 was mixed with the regular fuel.

Furthermore, as the grates in any furnace have to be renewed from time to time, advantage might be taken of this fact to substitute a little finer grate with each renewal, so that a larger and larger proportion of the finer coal could be burned efficiently. Each increase in the proportion of the finer coal contained in the fuel fired would mean a reduction in the amount of the fuel bills. A point would undoubtedly be reached in every plant where increased difficulties of burning the fuel fed to the grates, the expense of accessories that might be necessary, etc., would limit the fineness of the coal that could be efficiently used in that particular plant; but in nearly every instance this limiting size of coal or mixture of coals would be less than that used in present practice. Such gradual alteration in the grade of coal used in any plant can be accomplished with no immediate expense and probably with an appreciable gain in economy from the very start.

Based on the assumption that the various standard sizes of anthracite coal can be used with equal efficiency, likewise mixtures of two sizes of coal, Table I gives the average price of the various sizes and mixtures at the present time (April, 1913,) per million B.t.u. heating value of coal at the mines, at tidewater, New York, and delivered New York. Chart II graphically illustrates the relative economic value, as heating mediums, of the various coals and mixtures in percentages of the most economic coal at each of the three points.

As an example of the advantage to be obtained by mixing coals of two standard sizes, a plant ordinarily operating on straight pea coal may be considered. Taking the cost of fuel per heating value of pea as unity, an addition of 20 per cent. of buckwheat No. 1 to the regular fuel would mean a reduction in the fuel bill of nearly 5¼ per cent. The quantity of buckwheat No. 1 added must, of course, be sufficient to replace the actual heating value of the coal it replaces. A mixture of half pea and half buckwheat No. 1—proportions in heating value of the two coals—would show a saving of nearly 13¼ per cent., while the substitution of straight buckwheat No. 1 for the pea would show a reduction of approximately 26½ per cent. in the cost of fuel necessary for developing the same power. These changes in fuel would have to be gradual, of course, and it might never be feasible to substitute straight buckwheat No. 1 as the regular fuel for the plant; still a considerable saving in the cost of fuel could probably be arrived at, and the most economic grade ascertained, by a gradual substitution of a poorer mixture for the regular pea fuel.

SAVINGS EFFECTED

The above savings could not actually be fully realized, it is true, on account of the increases in the amount of coal that would have to be handled, the ashes to be disposed of, and perhaps a slight increase in the labor item, but quite appreciable economies in fuel consumption could be made and this item constitutes from 60 to 90 per cent. of the total cost of power in a steam plant. A saving of but 5 per cent. on 60 per cent. of the cost of power would probably mean a net saving of anywhere from $500 to $1500 per year in a 500-hp. plant.

The development of gas producers has now reached a point where such generators can be economically and efficiently operated on the lowest grades of anthracite, and, unquestionably, the time is not far distant when the general use of anthracite fuel will be much more rational and economic than it is today. The broken coal may still be used, to some extent at least, for locomotive fuel, but even here the lower grades of anthracite will be used more extensively—in the form of briquettes.

The prepared sizes of anthracite will then be used almost entirely for special purposes; pea for domestic heating, etc.; the power house will be operated exclusively on the smaller sizes of anthracite, down to rice or even down to a mixture of rice and barley; mixtures of barley and culm and eventually straight culm will be used as fuel for gas producers, thus realizing the full benefit of "the rational use of the *lower* grades of fuel," as they refer to anthracite coal.

Conservation of the nation's anthracite coal deposits, a question that is rapidly becoming of paramount importance, would thus be taken care of by affecting the purses of the coal-consuming public, the only practical solution of the anthracite-coal question. And this can be done with profit to all, without reducing the revenues of the coal carriers—in fact, increasing the volume of transportation—and to a considerable profit to the mine owners by providing a market for much coal that is now comparatively worthless or of little value.

TABLE I. AVERAGE PRICE OF ANTHRACITE COALS, PER MILLION B.T.U.—APRIL, 1913

Note:—First number refers to proportion of grade coal under heading; second number refers to proportion of next larger grade coal. Proportions according to heating value of coals.

⁂

New Element Causes Trouble

The activities of the Industrial Workers of the World in some parts of the anthracite coal regions of northeast-rn Pennsylvania are giving rise to some difficult situa-ions. The I. W. W. has been trying to organize in that section in competition with the United Mine Workers of America for some time past. It is said that it hopes ultimately to absorb the latter organization.

The appointment of local grievance committees, agreed o at the conferences between the mine workers and the operators last year, has proved fruitful of more local strikes than any other cause. One reason for this is hat there is just enough of the foreign element (chiefly Italians, Poles and Slavs, who are more easily cajoled by the promises of the I. W. W.) to have a member of hat organization on many of the grievance committees.

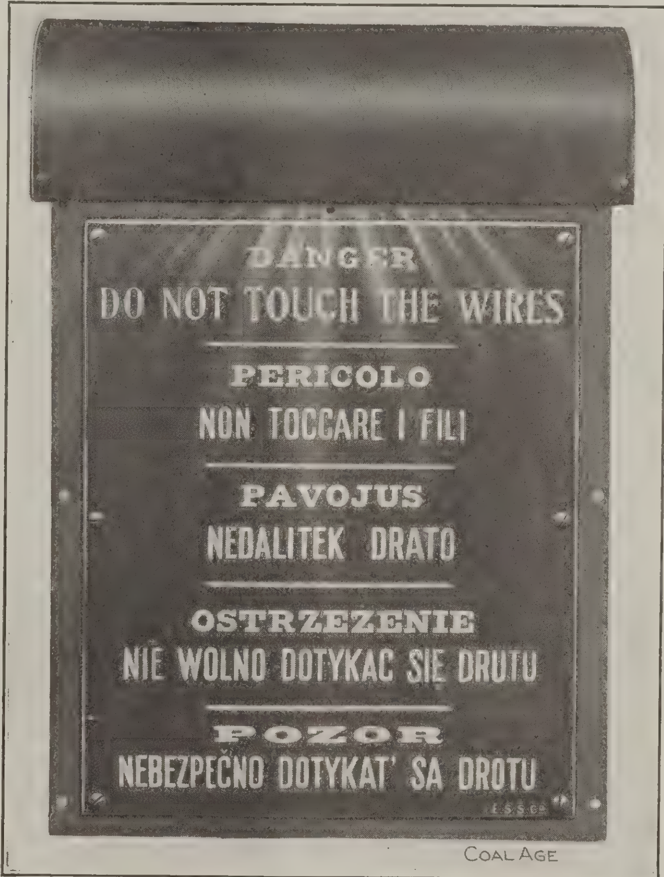
These members find it easy to tell miners, even those who had not thought of presenting any grievances, that hey are suffering abuses. If they tell a miner that he s working in a difficult place, that his is a bad spot and he ought to be getting more money for his coal, he is more than ready to believe them. Many of the local trikes are "button strikes"—efforts on the part of the United Mine Workers to increase their membership—but he presence of the I. W. W. agitators accounts for a fair proportion of the labor troubles.

A New Illuminated Steel Sign

To fulfill the demand for safety appliances and to conform with the many "Safety First" campaigns carried on by railway, mining and power companies, the Electric Service Supplies Co. has placed on the market a new type of illuminated sign like that shown in the accompanying illustration.

These signs consist of a steel frame joined at the top in the shape of a hood under which is placed a weatherproof socket for one incandescent lamp. The hood is given a coat of aluminum paint on the inside and acts as a reflector as well as a protection to the light bulb.

Standard enamel steel signs are attached to this frame by means of six machine screws, the standard size of the sign proper being 10x12 in.



Illuminated Danger Sign in Five Languages

These signs may read in several different languages like the one shown herewith, which portrays the message in English, Italian, Lithuanian, Polish and Slovak. They may be fitted with weatherproof condulets or bushings to protect the leading-in wires which enter the end of the hood, and to insure the proper operation of the sign after a maximum of rough usage.

They are used effectively in mines, power plants and along railways or at any point where human life is endangered by exposed electric wires, switches or third rails. In mines where an illuminated sign is essential they are used extensively to warn the workman of the danger of gases, falling timbers and electric wires. For railway companies their use at stations and cross-overs to inform the public of possible danger is fully recommended.

Our British Coal-Mining Letter

SYNOPSIS—Experiences in the British mercantile marine show that the mining industry of America has saved several steps in the direction of economy by not adopting triple-expansion (or similar) engines but by exchanging noncondensing reciprocators for steam turbines with a condensed exhaust. The "coefficient of volumetric efficiency" in air compression is not really an efficiency factor. Controllers do not produce undesirable strains on hoisting machinery.

⁂

At a meeting of the North-East Coast Institution of Engineers and Shipbuilders, at Newcastle, Eng., C. W. Cairns presented the results of a comparative trial between a cargo steamer fitted with geared turbines and one equipped with triple-expansion engines. The vessels were almost identical in essential characteristics for the purpose of the trial. Instructions had been given that the revolutions of the screw in each case should be as nearly as possible 62 to 63 per min. and that the vessels should be kept within signaling distance of one another. During the journey, the weather freshened, and a strong head wind and sea were encountered; therefore the revolutions were allowed to remain at from 60 to 62, the horsepower under such circumstances when running at 63 r.p.m. being excessive and abnormal.

The coal used during a continuous run of 36 hr. was measured. Owing to the heavy sea no extremely favorable figures were obtained for coal consumption per i.hp. Mr. Cairns declared that it was not safe to accept claims sometimes made that triple-expansion machinery could perform its daily work with from 1.2 to 1.5 lb. of coal per i.hp. The coal used per day by the two ships with triple-expansion engines was 32.7 tons and by that with a geared turbine set 27.8 tons. Thus the turbine showed an economy of 15 per cent. over the triple-expansion engines. Looking at the result from the opposite point of view, the triple-expansion engine demands 17.6 per cent. more fuel than the turbine set.

Air Measurement for Compressors

During discussion of a paper before the Midland Institute of Mining, Civil and Mechanical Engineers on the generation and use of compressed air for mining, P. O. Davis said that when tests with compressors are published the means by which the air is measured should be definitely stated. The result obtained is usually termed a "coefficient of volumetric efficiency." This is a rather misleading term, because it does not truly represent the efficiency of the compressor, and may rise to over 100 per cent. Perhaps the term "delivery coefficient" would meet the requirements better. People are apt to take it for granted that "volumetric efficiency" represents a ratio of work put in to work taken out, which, of course, is obviously not what is intended. This delivery coefficient cannot be accepted as correct unless actual measurements are made of the air delivered and are compared with those shown by the indicator diagram. There are several ways of measuring the air actually delivered. One is to pump out all the receivers. Another valuable method used for turbo-compressors is to force the air through an orifice, measuring the pressure before and after.

Measuring volumetric efficiency from the indicator diagram does not take into consideration the rise in temperature of the air in passing into the cylinder, which may be large, although not shown on the diagram. If the air is warmed up in passing through the inlet ports the temperature inside the cylinder is higher than that of the atmosphere. This increased temperature increases the volume of the air received and makes it appear that there has been a proportionate waste of air. In addition to the increase of temperature caused by warming, there is another loss caused by mixing the incoming air with air that has reëxpanded from the clearance spaces, and any additional high-pressure air which may have leaked past the piston rings or delivery valves.

Hoisting-Engine Controllers

The paper by James Black (see Coal Age, Vol. III, page 453) aroused much interest among Scottish engineers. Even in cases where the hoisting engine is given full steam to within about four revolutions from the end of the hoist when raising the normal load, he considers that complete control is desirable, as the speed which a cage loaded with men will attain, when it reaches that point with full steam on the engine, will be dangerous.

The opinion prevails that the greater the engine speed when the controlling gear comes into operation, the greater are the stresses set up in the machinery. Mr. Black considers this idea is entirely wrong, and says the rate of retardation varies directly as the acting force (the force producing retardation), and inversely as the moving mass, but it is entirely independent of its velocity. In other words, with a given braking force and a given cage load the rate of retardation is a constant, no matter what the engine speed may be when the controlling gear comes into operation.

The kinetic energy possessed by the moving mass varies as the square of the engine speed, and, consequently, when the controlling gear comes into operation the distance traveled by the cage before coming to rest also varies as the square of the speed of the engine. From this Mr. Black considers it is obvious that the stresses set up in the machinery when the controlling gear comes into operation are entirely independent of the engine speed. To show to what extent the Rosehall controller prevents "underwinding," he stated that three hen's eggs were placed on the cage in the bottom of a car. The hoisting engineer was then told to drop the cage in the pit bottom with the greatest speed which the controller would permit. He failed to break an egg, and could only slightly crack one and sometimes two of the shells.

Primeval Erosion of Coal Beds

Professor Kendall, of the University of Leeds, declares that "washes" or washouts in the coal measures are frequent in Yorkshire. The relation of "washes" to "faults" is such that it seems highly probable that either one might have been the cause of the other, or that both arose from a common cause. It is evident that faulting was taking place during the whole of the deposition of the coal beds, as it was indeed during the whole of the carboniferous era. Change of level has been shown to interfere with the normal formation of coal, whether the measures were raised or depressed.

During recent strike trouble, camp was under martial law.

The Mine Explosion

By D. G. Thomas

Founded on an incident of the coal-mine explosion at Hanna, Wyo., June 30, 1903.

Ye lovers of the earth and sky,
The air and warm sunshine;
Give heed while I relate a tale
About a deep coal mine;
How death upon a sheet of flame
Rode madly through the pit,
And in his ire consumed with fire
The men who toil'd in it.

Two brothers from a distant land,
Two brothers fond and dear,
Had come from merry England's shores
To live and labor here;
Their wives—two handsome new made brides—
Came with them o'er the foam
To aid and bless with love's caress
The founding of a home.

They settled in a mountain camp
Where nature long had frowned.
So desolate the hills and plains
So barren was the ground
That not a tree nor e'en a flower
Could find a place to grow;
For shifting sand rolled o'er the land
Like winter's drifting snow.

These brothers were inured to work
From childhood in a mine,
Where ever-present dangers lurk
To frustrate man's design;
Where hardship left upon the brow
Its ugly mark of care,
Where all was blight and gloom and night
To those that labored there.

Their names—well, never mind their names—
We called them Bob and Joe;
As such we knew them in the mine,
As such we'll ever know.
When numbers are engulfed in death
By sheets of livid flame,
We note the sum of those o'ercome
And not so much the name.

Poor Mary from her childhood hour
Had known the keenest strife,
And happiness had only come
To her as Bob's sweet wife.
When he was close, her dark-brown eyes
Beamed forth her loving pride,
But when away, the neighbors say
She feared lest woe betide.

She'd talk to them about the mine,
About the deadly damp,
That ever waits to touch the flame
On some poor collier's lamp,
Then burning madly rush along
The channels underground,
Until its breath had stilled in death
All living souls it found.

And talking thus the tears would flow
Like rain adown each cheek,
Convulsive sobs would shake her frame
Till she could scarcely speak.
The neighbors noting well her grief
Declared with tearful sigh
If death should rob her life of Bob
She, too, would surely die.

But Joe's wife was a different lass,
Light hearted all day long;
No sadness seemed to cloud her sky
Nor mar sweet Nellie's song;
She'd laugh at Mary's gloomy moods,
Then say with playful wit:
"It's time enough to cross the bridge
When we have come to it."

Love plays queer pranks with women's hearts,
So masterful his skill,
That smiles and tears and hopes and fears
He causes at his will;
Poor Mary's tears her love bespoke,
For Bob they'd ever flow;
While Nellie's song the whole day long
Spoke equally for Joe.

The men worked on from day to day
Down in that dark, deep pit;
With pick and drill they'd toil until
The hour would come to quit.
Though weary, yet a cheerfulness
Remained to bless their lives
For, would not they in love's sweet way
Be greeted by their wives?

And would not Mary's eyes be wet,
Her tears of gladness flow,
And would not Nellie's joyful song
Give happiness to Joe?
A bath, and after that a meal—
The collier's main repast—
Would drive away the cares of day
Like chaff before a blast.

One morning in the month of June
  The sky was bright and clear,
The whistle sent its dismal sound
  To workmen far and near;
The miners heeding duty's call
  Bade loved ones fond goodbye,
But not a sign came from the mine
  To tell them death was nigh.

The gasmen in their morning round
  Had been from place to place:
Had marked with chalk the day and date
  Upon each working face;
Then out they went to meet the men
  Who waited there in line
To hear them say the word, ere they
  Went down into the mine.

The colliers one by one approached,
  Approached, but dared not pass
The spot where stood those cautious men
  Who watched the deadly gas,
And asked: "How is my place today?"
  A watchman then replied,
"'Tis safe and sound, no gas was found,
  All, all is safe inside."

And thus assured that all was well,
  They entered that black hole,
And every man at once began
  To blast and load his coal.
The engines groaned and shrieked and hissed,
  The trips arose and fell,
The busy hum of rope and drum
  Said all was safe and well.

The wives, engaged in wonted tasks,
  Pursued them with a will;
The little children laughed and played
  Most happily, until—
A shock as of an earthquake came
  With fearful, loud portent;
Then from the mine came forth a sign
  Which told them what it meant.

A terror such as fear provokes
  Held all in its embrace;
A ghastly pallor spread its tinge
  On every person's face.
They saw the angry smoke and flame
  Leap upward from the slope.
And in its glare they felt despair
  Rush in and stifle hope.

Oh! God! it is an awful sight;
  Grim ruin everywhere!
Since this much we can plainly see,
  What must it be down there?

What has become of those brave men
  At work deep underground,
Who stood in line here at the mine,
  When all was safe and sound.

At last the spell that held them all
  Relaxed its fearful hold,
The frenzied women madly rushed
  To where the flames had rolled,
And peering in that dark abyss
  They yet could see a flare,
As though Death sought each open spot
  To see if life were there.

In horror and in wild dismay
  They gathered round that hole,
Imploring God to spare his rod
  And save the collier's soul.
Poor Mary, foremost at the scene
  Wept bitterly and long;
But Nellie's face we could not trace
  Among the widowed throng.

Week after week brave volunteers
  Undaunted by dismay,
Toil'd ceaselessly to find the men
  Who died below that day,
But wreck and ruin filled the mine;
  Obstructions high and wide
Like demons lay to bar the way
  And keep the dead inside.

While Mary lingered near the mine,
  The picture of despair,
Sweet Nellie, broken-hearted, stayed
  At home, quite helpless there;
She knew no face, she heard no voice;
  But plaintively and low
She tried to coo a love song to
  Bring back her dear, dead Joe.

The evening Bob and Joe were found,
  A figure wan and white,
Like lily fair was lying there
  Upon her cot that night.
The stars were vying with the moon
  In lighting heaven's dome,
When through the door an angel bore
  Her gentle spirit home.

The hillside graves have long been filled
  Bob sleeps in one alone,
And zephyrs sigh in passing by
  With many a plaintive moan;
And Mary wandered far away,
  Just where I do not know:
Still neighbors tell how poor, sweet Nell
  Sleeps in the grave with Joe.

Recent Judicial Decisions Affecting The Coal Trade

By A. L. H. Street

Liability for Demurrage Charges—Carload shipments of coal destined to a pier were subject to demurrage charges while standing in yards at the place of destination, though not actually on the pier, awaiting the convenience of the consignee or the arrival of the vessel into which the coal was to be reloaded; the leaving of the coal in the yards not having prejudiced the consignee in any way. (Virginia Supreme Court of Appeals, Bank of Norfolk vs. Norfolk & Western Railway Co., 78 Southeastern Reporter 568.)

Salaries of Corporate Officers—A reëlected officer of a corporation is entitled to salary at the rate previously paid him, if nothing is said about the amount of his compensation in reëlecting him. (New York Supreme Court, First Appellate Division; Eicks vs. Wittemann Company; 142 New York Supplement 190.)

Authority of Agents—Where a business is conducted by the owner's agent, he has implied power to do whatever the nature and needs of the business require, and his employer is bound by such acts. The rights of third persons dealing in good faith with an agent within the apparent scope of his authority are unaffected by secret limitations placed on his authority by the employer. (Alabama Court of Appeals, Wooten vs. Federal Discount Company, 62 Southern Reporter 263.)

⁂

Elastic Corrugated Piping

Recently a process of manufacturing corrugated pipe has been patented, by which either standard, wrought-iron or steel tubes can be corrugated by the Maciejewski process, as it is known. According to the pressure and size required, small- and medium-sized tubes are made from ordinary steel tubing. For large diameters, lap-welded and re-rolled tubes are used, says *Power* of June 10, 1913. The corrugations are made by a method of pressing the material together, a special patented machine being employed. The process shortens the tubes as the corrugations are pressed into them at equal distances apart, but without decreasing the original inside diameter and the thickness remains uniform and is the same as in the original tube. During the process of corrugating any defects in the material at once become apparent. Interesting examples of corrugated tubes and bends are shown in Fig. 1. They can be made in sizes from $1\frac{3}{8}$ in. up to 18 in., including diameters suitable for use in boilers. Here the average length is about 18 ft., although any other length can be manufactured.

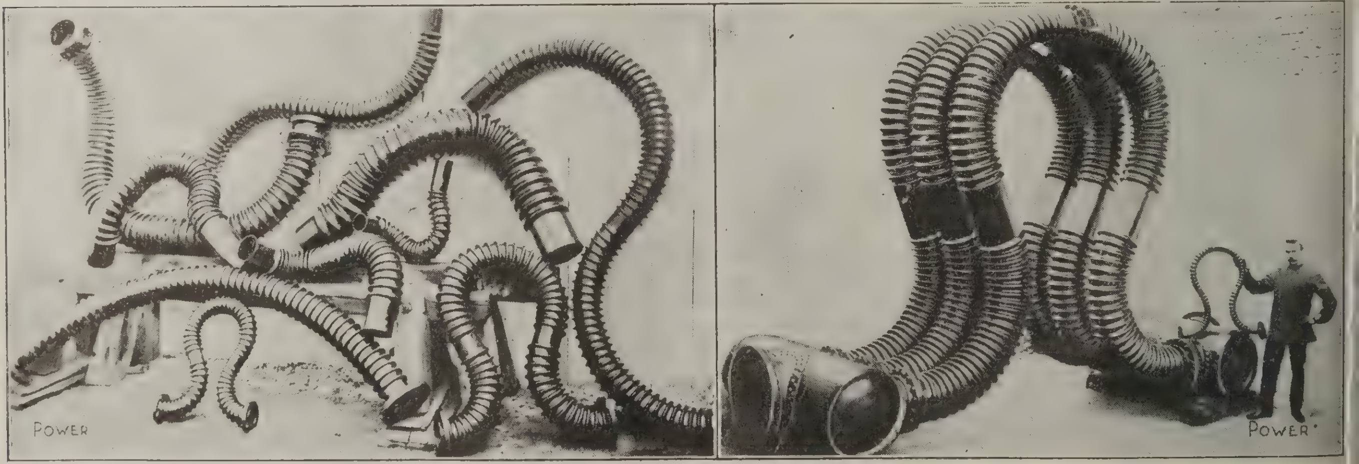

Fig. 1. Examples of Corrugated Tubing

In steam-pipe lines, contraction and expansion caused by the steam, the vibrations from the engines, pumps, or other units are effectively taken care of by the elastic property of the tubes. They may be also used in fire-tube boilers, superheaters and radiators for hot water and steam heating, to excellent advantage.

Another advantage is where the space for expansion and contraction is limited, and large bends cannot be used. When steam is turned on or off there is a wide variation in the temperature; hence a considerable linear movement in the line and its branches to the various units. This movement is easily taken up by a length of this corrugated pipe.

In Fig. 2 an ordinary 6-in. pipe is shown, bent in the shape of a loop, one end being fixed and the other movable. When subjected to a lateral pressure of 1289 lb., the axial movement was $11\frac{1}{2}$ in. A corrugated pipe of the same size and thickness was bent and fastened in like manner, and on applying 330 lb. pressure there was an axial movement of $39\frac{1}{4}$ in., or over three times that of the smooth pipe.

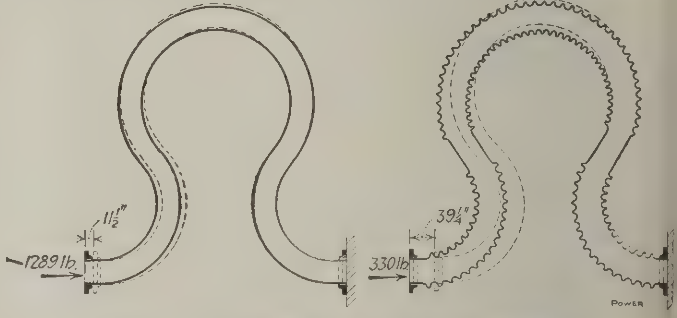

Fig. 2. Difference in Pipe Movement

The process for making this corrugated pipe is patented in Europe and in the United States by N. Maciejewski. The pipe is being made in Russia, Germany, Belguim and France. The United States patents are for sale by Schuchardt & Schütte, 90 West St., New York.

The Fireboss and the Union

When a man accepts a position of trust and control,
e must not submit himself to the dictation of those he
expected to restrain. It seems so obvious that action
f this kind ought not to be taken that it seems a folly
make this trite observation. Yet the miners in the
nthracite region are insisting that the firebosses who are
quired to maintain discipline in the mines of that dis-
ict shall join the union and subject themselves to its
llings.

We do not believe that any of the miners who advocate
unfair a proposition would want the officials of their
nion to join an operators' organization, which would
spend or fine them if they did not follow its behests
d the members of which would threaten them with
rsonal injury if they did not comply with its com-
ınds. Such an organization would under the law be
egal and is almost unthinkable under present-day con-
ions. Yet the parallel is not unfair.

Much trouble we imagine would develop if a fireboss
o had joined the union were to venture to order his pit-
nmitteeman to make the latter's place safe or to wait
his room was cleared of firedamp, or to go out and get
bit made of proper guage. The fireboss has difficul-
enough in disciplining the miners under his charge.
is not right to compel him to be amenable to both mine
ner, union and state. If any change is needed, it is
t he shall be a servant of the Department of Mines
ne, so that he may be entirely free of dictation from
vate and commercial interests.

⁂

he Workmen's Compensation Act in Illinois

he State of Illinois has done much pioneer work in
matter of testing the advisability and efficiency of a
kmen's compensation law. For some time past, the
e operators and mine workers of Illinois have been
n the opportunity of signifying their choice of
ther they would operate and work under a law pro-
ng a just compensation for time lost on account of
ry to the workman in the performance of his duties
nd about the mine.

framing the law, every care was taken that its pro-
ns should not be drastic. It was not desired to in-
rate a paternalism in the system of state govern-
that would make the mine operator responsible for
ns of every nature. Neither was it desired to shift
esponsibility from the mine worker to his employer,
dless of the questions of carelessness and neglect on
art of the worker.

dustrial accidents may, in a general way, be classified
r two heads:

rst, accidents arising from improper or badly de-
d machinery and equipment, or improper regulations
ing to the safety of the operative or worker. For
this class of accidents, the employer is or, justly, should be held responsible.

Second, accidents arising from the neglect or carelessness of the workman. It is generally agreed that the responsibility for this class of accidents rests wholly on the worker. The neglect of the worker to take proper precautions for his own safety or to obey the regulations and instructions of his superintendent or foreman, has a broad bearing. Such neglect may be intentional on the part of the worker, due to his own stubbornness; or it may arise from an absent-mindedness on his part; but, in either case, the worker is evidently to blame, and should be held alone responsible for the results of such neglect. Likewise, carelessness, on the part of the worker, makes him alone responsible for the injury resulting therefrom.

There is a class of accidents, however, the responsibility for which is not so clearly defined and regarding which there will always be some difference of opinion. This class embraces those accidents due to the ignorance of the worker. When an injured workman claims, after the accident, that he was not aware of the danger to which he was exposed, the question always arises: Was this ignorance due, in part, to the failure of the employer to make the workman understand the danger; or was it due wholly to the failure on the part of the workman to fully comprehend the importance and meaning of the instructions given? These are questions that can only be settled finally by a careful consideration of the evidence in any case.

In Illinois, the original compensation act has now been modified in many important respects, and the revised act took effect July 1. The official copies of the act have not as yet been issued. By this act, which has been broadened so as to include employees of the state, county, city, etc., and to cover industries not included in the previous act, the various employments are divided into two general classes; namely, "extra-hazardous" and "nonextra-hazardous." As before, the act is made optional; but the employer in an extra-hazardous industry, while not obliged to give notice in order to operate under the new act, is compelled to give such notice in case he desires to reject the provisions of the act. In the case of nonextra-hazardous employments, notice must be given if the new act is either accepted or rejected.

One of the advantages of the act to the employer who elects to benefit thereby, is that having given notice of his willingness to provide and pay compensation for accidental injuries sustained by any employee, arising out of and in the course of the employment, according to the provisions of the act, is thereby relieved from any liability for the recovery of damages, except as provided by the compensation act. The advantage to the employee is that, in case of injury, not only is prompt and efficient treatment afforded the injured man, but he is assured of an adequate compensation for the time lost owing to the accident, subject, of course, to the nature of its cause and the responsibility therefor.

One of the greatest advantages of the compensation act, however, lies in the fact that it "knocks out" both the ambulance-chaser and the pettifogging lawyer, which have long been regarded as well-nigh necessary evils attending every mine accident. The operator is relieved of the great burden of defending himself against lawsuits as numerous as they are unjust in the majority of cases.

One of the prominent features of the revised act is the provision for the appointment by the governor, of an industrial Board, to be composed of one representative employer, one representative employee, and one representative citizen not identified with either. Under the provisions of the new law, this board takes over the functions of county courts, in respect to the appointment of a third arbitrator and the review of decisions on appeal. Trial by jury is entirely eliminated, and only questions of law, or charges of fraud, can be taken to the Supreme Court.

⁂

A Crisis in Connellsville Coke

The Connellsville coke operators and consumers are waging a contest which promises to settle definitely who shall control the coke market in the future. The direct point at issue is the price at which furnace coke for second-half delivery shall be sold. The Connellsville coke trade has been subject to price wars before, but apparently this is the first instance where both sides have been so united and have shown such determination to win.

As is well known, the price of pig iron has been the principal factor in fixing the price of coke, so that as a rule the operators have had little to say in the matter. Theoretically, such a selling basis would seem to be fair to all concerned, since it is simply a matter of supply and demand. But practically this has not proved to be the case. Thus, the operators have frequently contracted at relatively low prices, corresponding to the ruling quotations for pig iron, but have failed to participate in a rise in the latter market. Or, again, when they have succeeded in closing at a high figure, the furnaces have frequently blown out and failed to take the coke, since such is not mandatory, coke contracts usually being made only to comply with the customer's requirements.

Coke operators have recently found that the average selling price at which coke was being marketed has not yielded them the required margin, in view of the high land values. Encouraged by their bankers, who are interested in their bonds and securities, they have stood out unitedly for a price of $2.50 on second-half furnace coke. The average price of last year's contracts, and also a number of those for the current year, was considerably higher than this, while in December of last year, the spot price touched $4 and higher. As the market eased off through the early part of this year, the operators fixed upon $2.50 as the minimum at which they would contract.

During this time the pig iron market was steadily declining, until it touched $15 at eastern Pennsylvania furnaces and $14 at valley furnaces for foundry pig iron. It is, of course, true that such prices do not justify $2.50 for coke, but the operators rightly contend that the furnace men were fully informed that this would be the minimum in the future and, knowing this, they should not have permitted the iron market to reach such a low point. Considering that they have deliberately ignored warnings to this effect, it is clear that the responsibility rests entirely with them.

As regards the tonnage involved, the operators estimate that contracts aggregating 175,000 tons per month expired June 30. During the last few days of June a compromise was effected, covering about 90,000 tons of coke for July delivery only, at $2.50; most of these sales carried a clause guaranteeing the price against decline. The remaining 85,000 tons are still to be covered and furnace men insist that they will shut down tight rather than pay the price the operators are demanding; we are informed on good authority that four or five furnaces actually were blown out early in July. The coke operators are equally determined in their position in the matter, and are likewise shutting down ovens, keeping only a sufficient number burning to meet contracts already made.

One of the chief difficulties in the situation is the unbalanced financial condition of the different operators. Many of the older companies secured their land at low prices and have practically wiped this cost off the books. On the other hand, the newer ones bought in at relatively high figures, sometimes as high as $1500 per acre, and we believe even up to $2000. These latter have in most cases been bonded at approximately the cost of the land, in order to obtain the money required for development. The buyers at these high prices justify their investment on the grounds that the life of the Connellsville region is now limited to between 20 and 25 years, and there are no other known coals making such a perfect coke. Close observers, however, have noticed that the increased demand for coke in recent years is being covered with byproduct ovens, using but a small amount of Connellsville coal. Thus the market has not shown a disposition to yield to the high margin of profit which is now economically essential to most of the operators in the Connellsville region.

This is clearly shown in the following example, the assumed figures for which are exaggerated: An operation has two acres of coal per oven, and each oven has a maximum capacity of 700 tons per annum, the life of the plant thus being 20 years, on the basis of a recovery of 7000 tons of coke per acre. If the land were acquired at $1500 per acre, and the operation bonded for an equal amount, the total investment would be $4000 for each two acres with one oven. With interest at 5 per cent. amounting to $150 per annum, and $200 a year to be charged off for exhaustion and amortization, this makes a total of $350 to be carried by 700 tons, or 50c. per ton.

Possibly in some of the best years in the Connellsville coke market, such returns have been effected, but certainly not over an average of a number of years. As a matter of fact, prices have more frequently ranged around a level that would give a profit to only such operations which have neither bonds, interest, or exhaustion charges. Hence we see the reason for the determined stand of the operators in the matter of $2.50-coke. It may be rightly said that the Connellsville acreage should never have been priced so high. Obviously, this appears only too true, but we are now confronted with a condition and not a theory.

SOCIOLOGICAL DEPARTMENT

The Fourth of July at Gary, W. Va.

By An Eye-Witness

SYNOPSIS—The United States Coal & Coke Co. used the occasion as has been customary with them to advance the interests of safety, to promote patriotism, to develop a cordial feeling between themselves and their men, to knit the community in a bond of fellowship, to encourage the local fire-fighting forces, to promote a kindly interest of drivers for their mules and to enliven the dull routine of a line of mining camps which are shut in closely in narrow valleys between forbidding hills.

⁂

The United States Coal & Coke Co. made the Fourth of July Celebration at Gary, W. Va., an opportunity for laying stress on "safety first." If this practice became common perhaps the Fourth of July might place against its terrible reputation for the destruction of life an honorable record as a promoter of safety and human welfare.

The celebration was ably managed by Col. E. O'Toole, general superintendent of the United States Coal & Coke Co. All civic societies were invited and the parade was as follows:

1. Verhovay Sick Benefit and Burial Association, Gary, W. Va.

2. Verhovay Sick Benefit and Burial Association, Filbert, W. Va.

3. First Tug River Sick Benefit and Burial Association, No. 1, Filbert, W. Va.

4. First Tug River Sick Benefit and Burial Association, No. 2, Thorpe, W. Va.

5. Count Bathtyani Sick Benefit Association, Gary, W. Va.

6. Count Bathtyani Sick Benefit Association, Filbert, V. Va.

7. Gary Lodge of Odd Fellows with band of 14 pieces and 8 members in line.

8. Tug River lodge of Odd Fellows with band of seven ieces and 30 colored members in line.

9. United Supply Co.'s decorated float with Sunday-school hildren.

10. Contestants in ball game between Gary and Hunt- igton, W. Va.

11. United States Coal & Coke Co.'s Mine No. 2, near ennon, marshalled by Superintendent J. M. Tulley, a float presenting a mine drift, followed by the first-aid corps, nd 28 mules ridden by their drivers dressed in comic cos- mes representing the nationality of each, the marshal of e cavalade being the stable boss. The mules were capari- ned in muslin with "First aid" in gold letters.

12. Sawmill department with large log float 12 ft. long, ft. thick, drawn by eight large mules, decorated with bunt- g. Woodsmen in the rear.

13. No. 3 plant marshalled by C. G. Seaton, the superin- ndent, was led by a horseless carriage pushed by a mule aped in all the colors of the rainbow and marked as gen- ating 100,000 mule power. This took first prize. All the ays at No. 3 followed carrying the sanitation, machine and rpenter's shop employees, and behind these a float of a odel miner's house with J. D. Jennings, master mechanic in arge. Then followed a float with the Sunday-school chil- n and 12 mules in working harness followed by No. 3 coke rkers.

14. Plants Nos. 4 and 5 marshaled by A. N. Harris, super- endent, with United Supply Co.'s float in the lead. All workers from these mines, American, white and colored d foreign, were in line with their wives and 22 mules ily draped. A float with Sunday-school children brought the rear.

15. Plant No. 6 marshalled by Neil Freil, superintendent, with a wagon load of school children and their teachers. Then the first-aid corps with a patient in bed swathed in bandages and 35 decorated mules and their drivers making a striking cavalcade.

16. Plants Nos. 7 and 8 were officered by F. A. Kearns superintendent, with merrymakers marching to the tune of "Dixie." The children of No. 8 carried a banner inscribed, "$358,780 paid in pensions last year—Safety first." A float of school children and a United Supply Co. float proclaiming pure food then followed. A banner brought up the rear inscribed, "$750,000 paid out last year for Safety first."

17. W. W. Harding, of No. 9 mine, expected to carry away the prize as always before. He had 30 lively mules tricked up in bunting and mounted by as many drivers. Then followed a float of well-dressed Sunday-school children, and another worthy of special mention showing a mine-room face with coal shot down and a man loading a car. The Supply company also furnished a notable float.

18. Plant No. 10 was marshalled by Superintendent Booth, with a Hungarian band of 16 pieces, a float of Sunday-school children and another with 25 fine mine mules without a scratch on any of them, and all dressed in comic costumes.

19. Plant No. 11 was marshalled by I. H. Dunn, the superintendent, and was represented by a float filled with school children followed by miners carrying flags, 39 fine mine mules, a float of the United Supply Co., filled with clerks and drawn by four large mules decorated in five colors, a farm wagon filled with "country people," and an inscribed banner.

20. H. T. Graham, the superintendent of mine No. 12, and his corps of officials tried to carry off the honors with 200 native, foreign and colored miners with 75 school children, all carrying lettered cards spelling repeatedly "Safety first." A band brought up the rear. This exhibit of mine No. 12 was especially noteworthy.

21. In the rear of the procession was an assemblage of all nations, the participants being those who had not been placed in other parts of the parade owing to their late arrival.

The program for the day was as follows:

1. Empire Theater—Moving pictures and vaudeville.

2. 10 a.m. Ball game, Gary versus Huntingdon, for a prize of $25.

3. 11:30 a.m. First-aid contest. All teams invited.

4. 1 p.m. 100-yd. dash. Prize $5; 50-yd. dash, open to boys under 16 years of age, prize $2.50.; 25-yd. dash, open to girls, prize $2.50; potato race, open to all, prize $2.50; sack race, open to all, $2.50; wheelbarrow race, open to all, $2.50; greased-pig contest, prize the pig; greased-pole contest, prize $5; society with most men in parade, $25; society with second largest number of men in line, prize $15; best double-mine team, prize $10; second best double-mine time, prize $5; third best double-mine team, prize $3; each driver must have driven his team at least a month; best float prize, $15; second best float, prize $10; third best float, $5; most comic "get up" not in the nature of a float, $5; tug of war, Sandy Lick versus Tug River (6 men on each side), prize $12; contests between fire departments, prize $10.

5. 2:30 p.m. Ball game, No. 6 Gary versus Tazewell, colored; prize $15.

6. 4:30 p.m. Herbert bicycle act, free.

7. 9 p.m. Fireworks at Gary.

The parade assembled at 8 a.m. and marched for inspection at 10 p.m., and took an hour to pass the stand. The judges were J. C. Herndon, J. Horne, E. G. Callahan, of Uniontown, Penn., and L. Blenkinsopp The first-aid contest was in charge of Vitus Klier, chemist; S. J. Price, foreman of U. S. Rescue Car No. 7; J. C. Herndon, J. Horne, E. G. Callahan and L. Blenkinsopp, mine inspector 11th district. J. R. Fleming and C. H. Brown, of the Bureau of Mines, took moving pictures of the parades. They are preparing pictures of the working conditions in the mines of the United States Coal & Coke Co. to serve as illustrations of necessary safety precautions in mining work.

It is estimated that there were 5000 people on the field. With all the excitement no one was injured. A dash of rain did make matters unpleasant for a while, but otherwise nothing occurred to mar the pleasure of the day.

Powder Regulation in the State of Washington

By Ralph W. Mayer*

A disastrous explosion, caused by a child sticking a red-hot poker into a keg of powder, wrecked a dwelling house, killed the inmates and caused the Washington legislature to pass a law prohibiting the storage of kegs of powder in homes. This caused the coal-mining companies to build small powder houses from which daily supplies could be issued to the mines.

The Northwestern Improvement Co., of Roslyn, sells powder checks at the store. Each check is good for a quarter of a keg of powder. A man starting work buys two powder cans at a merely nominal price, each holding a quarter of a keg or six and a quarter pounds of powder. He presents his empty powder can and one powder check at the powder house and in return gets a full powder can. The miner has two cans and every time he takes a full can out of the powder house he returns an empty, which is filled during the day so that it will be ready for the next shift.

If any of the cans become damaged by rock falls or in any way except by gross carelessness, the company gives the miner a new can free of charge. Clerks from the stores are stationed at each of the powder houses for one hour before each shift goes to work. They simply exchange the full canisters for the empty ones and take the powder checks in payment for the powder.

The Cans Are Not Filled by Clerks

They do not handle the loose powder or fill the cans. During the day a man chosen for his carefulness and steady habits rides from one powder house to another and fills the empty cans which the miners have returned.

He uses an automatic filling machine which is part of the equipment of each house. The powder is emptied from the kegs into a large wooden hopper, which discharges through a stationary funnel. The powder can is placed under this funnel and a lever pulled which releases just enough powder to fill the can. As this machine measures the powder out by bulk and not by weight, the can is placed on a small scale placed near the machine and any small inaccuracy corrected, although corrections are seldom necessary.

The powder cans are stored on wooden shelves around the sides of the building. Only enough powder for one day's supply is kept at these powder-distributing houses. Every evening the man who fills the cans turns in an order for the next day's supply for each powder house. The main powder magazines, into which the cans are unloaded, are large stone buildings situated out of the way of danger. The distributing powder houses are comparatively small brick and concrete buildings, one being built at each mine. They are kept scrupulously clean, being swept out every time they are used. They are electrically heated and lighted, and no open lights are allowed near them. A pipe with running water passes a few feet from the door. The powder cans are handed out through a small opening in the iron door of the building. This trap in the main door is hinged at the bottom and can only drop half way down, thus forming a stand or shelf on which the powder cans can be placed while being exchanged. There are no other openings in the building. Only the man in charge is allowed in the magazine.

At present the miners take their empty powder cans home. Sometimes they leave much powder in the cans and this practice is unsafe. It has been suggested that a small trap door be placed in the wall of the powder house with a chute leading from it to the floor so that when the miners come out of the mine they can drop their cans through it into the powder house, thus avoiding the trouble of carrying them home and the danger of having powder in their dwellings. No account would be kept of the powder left in the empty cans as it should not be there. Two men work in each room in the mine and one of them always has a can into which any small quantity of powder can be emptied and not brought to the surface.

If it is considered unsafe to have the opening for the empty cans in the powder house a small addition could be added into which they could be dropped. Every miner has metal checks for putting on his loaded cars of coal. By putting one of his coal checks on his empty powder can and calling for his check number when he wanted a full can, no difficulty would be experienced in tracing the cans.

---

*Assistant foreman, Northwestern Improvement Co., Roslyn, Wash.

⁂

Another Fourth of July Celebration

In the Fourth of July celebration held at Central City, Ky., in the heart of the western Kentucky coal fields, the most interesting feature was a first-aid contest in which eight teams participated, including one of boys from the mines of the W. G. Duncan Coal Co. Other teams came from the mines of the Central Coal & Iron Co. and from Luzerne, Martwick, Taylor, Crescent, Graham and Powderly.

The contest for first prize was a tie between Crescent and Luzerne, each team making an average of 100; and by a vote of the men the prize was divided between them. The second prize of $30 went to the corps of Central Coal & Iron Co., although this team was considerably handicapped by the eagerness of the crowd to see it work. A special prize was made up for the "Graham Junior" team of the W. G. Duncan Coal Co., as the efforts of the youngsters were thoroughly worthy of special notice.

The judges were Dr. H. Tuldesley, of Central City; G. T. Powell, in command of Government Rescue Car No. 3, and Lieut. Winston Pilcher, U. S. A., retired, of Nashville, Tenn. The committee which arranged the contest was composed of F. P. Wright, Crescent Coal Co.; S. A. Yorks, vice-president, Central Coal & Iron Co.; W. G. Duncan, Jr., W. G. Duncan Coal Co., and L. B. Walker, president District 23, U. M. W. of A. It is planned to hold a much larger meet at Central City on Labor Day, Sept. 1, as 20 teams have already entered, and handsome prizes have been offered by the Kentucky Mining Institute.

⁂

National Conservation Exposition

A national conservation exposition is to be held at Knoxville, Tenn., and the miner's field day is set for Sept. 20. The Bureau of Mines will ship a large steel tube from Pittsburgh and erect it at Knoxville, so that exhibitions can be given demonstrating the explosibility of coal dust. Contests will be held between various teams from Tennessee, Kentucky, Virginia, West Virginia and Alabama, and prizes will be awarded to the most competent teams by the American Red Cross and the Mine Safety Association. The field-day proceedings will be under the auspices of the Tennessee Mine Foremen's Association. At the meeting held at the Imperial Hotel, Knoxville, Tenn., to arrange the meet the following leaders in safety work were present: H. M. Wilson and J. W. Paul, of the Bureau of Mines, from Pittsburgh Penn.; Major R. W. Patterson, of the American Red Cross from Washington, D. C.; E. F. Buffet, of the Tennessee Mine Foremen's Association from Oliver Springs; E. C. Mahan representing the coal operators; E. B. Sutton, of the Bureau of Mines, and D. T. Blakely.

DISCUSSION BY READERS

Mixed Lights in Mining

etter No. 6—Before forming and expressirg a def-
e opinion as to the advisability of using mixed lights
coal mine, it would be well to carefully determine,
ar as possible, the degree of danger attendant there-
If the danger is within the limits of control, the
assumed in the use of mixed lights is as justifiable
ther risks incident to coal mining and arising from
ral conditions.

he bituminous mining law of Pennsylvania (1911)
nits the use of mixed lights in a mine generating
without specifically stating the conditions under
h open lights are permitted, the use of the open
ts under these conditions being left to the judgment
he mine manager, subject, however, to the approval
he state mine inspector, who, under the bituminous
is armed with discretionary power (Art. 20), which
rsonally consider of a negative character.

hen any portion of a mine becomes dangerous, owing
he generation and accumulation of explosive gas, it
mes the duty of the mine management to provide
the safe working of such section or sections of the
where gas is being generated in dangerous quantity,
rohibiting the use of any open lights therein, except
re the gas is generated only at the face of live en-
(Art. 10, Sec. 3; and Art. 28, Sec. 2).

considering the danger attending the use of mixed
s in a mine, there are two conditions that may arise:
irst, the open-light section may be adjacent to the
y-lamp section, on the return side of the latter. In
case, even assuming that all the legal requirements
trictly enforced and that the sections are completely
ted from each other as far as ventilation is con-
d, it must be admitted that the possibility of dis-
still exists. Under these conditions, the greatest
er lies in assuming that the open-light section will
in free from explosive gas, which the facts of ex-
nce prove to be a false assumption.

cond, the open-light section may be adjacent to and
e intake side of the safety-lamp section, both sec-
being ventilated by the same air current. In this
the danger is as great as that to which we have
referred, while the conditions that favor the spread
possible disaster are materially increased. My per-
experience of the danger attending this second con-
enables me to speak with positiveness of its immi-
.

gard the danger incident to the use of mixed lights,
y case in coal mining, to be exceedingly great and
d the power of control. The practice is based sim-
pon a pure assumption, and there is no man liv-
owever expert he may be, who is able to make that
ption a positive assurance. *Just as long as we per-*
bringing the two factors necessary to an explosion
the range of possible contact, just so long do we
the danger of disaster beyond the limits of control
njustifiably expose life and property to destruction. The belief that the strict enforcement of our present mining laws will *restrict* instead of eliminate the dangers of mining, leads to a false feeling of security. The best safeguards of life and property are such precautionary measures as will tend, as far as possible, to *eliminate* rather than to restrict these dangers.

The lax methods of mining operations commonly employed in the United States may be, in part, excusable on the ground that the conditions here are not such as to necessitate the enforcement of more sane and scientific measures. This excuse, however, is rapidly losing favor as conditions change and it is necessary to go deeper for the coal. It is now quite generally recognized that more scientific and practical safeguards and methods are necessary, in order to minimize the dangers that surround the miner.

Another condition that attends the use of mixed lights in the mine and one that greatly intensifies the danger, is the false sense of security that pervades the minds of the workers in an open-light section or mine. Miners naturally look upon the safety lamp as a necessity, only where there is the recognized danger of an explosion occurring. As a consequence, every mine worker is prone to regard a section of the mine where open lights are used, as entirely free from explosive gas. This belief leads to a careless disregard of danger arising from the ignition of gas in this section. Neither the miner nor the mine manager apparently considers seriously the possibility of a so-called non-gaseous section of the mine becoming dangerous at any moment, from the presence of explosive gas. I am convinced, and believe that most practical mining men will concur in the opinion, that the greatest menace to a mine worked by mixed lights, lies in the open-light section. It is my conviction that the use of mixed lights in a mine generating explosive gas is, at least, impolitic and injudicious.

The safety of mine operations is so closely related to the economy of working that a high degree of efficiency in the former instance means a proportionate increase in the latter. The common belief that the largest profits from the least expenditure in mining represent the greatest economy is only theoretically true. In practice, this principle will only hold true for a limited time and eventually fail, because it cannot be carried to extremes without disastrous results.

In reference to safety lamps, it is true that the same production cannot be effected as in the use of naked lights; because the activities of the workmen are curtailed, in a measure, by the dimness of the light. But, on the other hand, the results of working with open lights, in a gassy mine, may prove so disastrous as to more than counterbalance the advantage and profits arising from their use.

In view of the fact that workmen's compensation acts are now receiving much attention from legislators, it may prove a matter of economy as well as humanity, on the part of operators, to safeguard by every practical means the lives of their employees. It is a pleasure to note that a large number of coal operators are coming to regard the coal miner as something more than a mere physical machine designed for the production of coal.

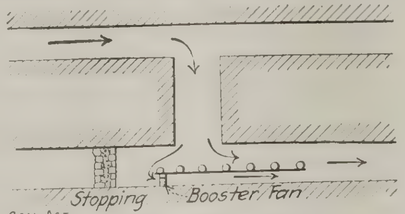
I. C. PARFITT.

Jerome, Penn.

⁂

The Booster Fan

We have used a booster fan to increase the circulation in a portion of our mine where the air was slack. My foreman, G. E. Rockefeller, after some experimenting, has discovered that in using a booster fan, it is much better not to allow all the air to pass through the booster; but to arrange this fan behind a brattice, as shown in the accompanying sketch.



COAL AGE
PROPOSED ARRANGEMENT OF A BOOSTER FAN

Some time ago (COAL AGE, Vol. 1, p. 1150) there was started an interesting discussion on the installation of a booster fan to assist the general circulation in a section of the mine where the air was deficient. In that connection, I thought the information might be of value to those who are using booster fans for this purpose.

He first built a good stopping in the entry, just outby from the crosscut through which the air current entered the heading. As shown in the figure, he then erected a brattice extending from a point near this stopping forward a few yards beyond the crosscut. The booster was installed at the end of the brattice nearest the stopping. By this arrangement, the fan was found to do good work, and the current of air discharged from behind the brattice greatly assisted the general current passing up the heading.

Fairfax, Wash.

⁂

A Humidity Chart

Regarding J. S. Watson's question, COAL AGE, July 12, p. 62, allow me to call attention to the U. S. Department of Agriculture's publication by the Weather Bureau, Bulletin No. 235, which contains complete psychometric tables for obtaining the vapor pressure, relative humidity and temperature of the dew point, from the readings o the wet- and dry-bulb thermometers. The bulletin can be obtained from the Weather Bureau, at Washington at a cost of 10c. per copy, and is a fine investment fo any student of atmospheric conditions.

DONALD M. LIDDELL.

Elizabeth, N. J.

⁂

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Having found the heat absorbed by the products, the next step is to find the heat absorbed by the unburned air. Let x = weight of air required to make 1 lb. CH_4 inflammable. Then, since 1 lb. CH_4 consmes 4 lb. O + 13.39 lb. N = 17.39 lb. air, the unburned air is x — 17.39 lb. The original temperature of the air being 60° F., the rise is 1200 — 60 = 1140 deg. and the heat absorbed is 0.2374 (x — 17.39) 1140 = 270.636 x — 4706.36 B.t.u., which makes the total heat absorbed

$$8154.3139 + 270.636x - 4706.36 = 270.636x + 3447.9539 \textit{ B.t.u.}$$

Since the heat absorbed is assumed equal to the heat generated,

$$270.636x + 3447.9539 = 23{,}513$$

and

$$x = \frac{23{,}513 - 3447.9539}{270.636} = 74.17 \textit{ lb. air.}$$

This is the total weight of air required to make 1 lb. of methane (CH_4) inflammable. In other words, the weight ratio of gas to air, at the lower inflammable limit, is 1 : 74.17; But since the specific gravity of methane, referred to air as unity, is 0.559, the volume ratio of gas to air, at this point, is 1 : 0.559 × 74.17; or 1 : 41.46. That is to say, a mixture of pure methane and air first becomes inflammable when 1 volume of this gas is mixed with 41.46 volumes of air.

The percentage of gas in this mixture is

$$\frac{1}{1 + 41.46} \times 100 = \frac{100}{42.46} = 2.3 \textit{ per cent. } CH_4$$

Lower Explosive Limit—The continued addition of air to methane causes the firedamp mixture to become more and more inflammable till a point is reached when the combustion of the gas is so rapid that the mixture is explosive. As this condition is approached, in practice, owing to the mixture of the gas and air not being uniform, the ignited gas often snaps and cracks in the combustion chamber of a safety lamp.

In the same manner, an accumulation of firedamp, in the mine, when ignited, may burn with greater or less energy or violence and small explosions may occur here and there, followed perhaps by the general explosion of the entire body of the firedamp. The explosion depends not alone on the proportion of gas and air in the mixture, although that is important, but on the intensity and volume of the igniting flame. Thus, it happens that a firedamp mixture ignited in the narrow confines of the mine workings may, after burning for a brief period with more or less energy, suddenly develop a violent explosion.

The lower explosive limit of pure methane has been determined, by experiment, to occur when 1 volume of the gas is mixed with 13 volumes of air; or the percentage of gas in the mixture is

$$\frac{1}{1 + 13} \times 100 = \frac{100}{14} = 7.14 \textit{ per cent.}$$

This limit, however, is considerably modified by any conditions that tend to increase or decrease the amount of heat developed.

The Coal Age Pocket Book

Maximum Explosive Point—The maximum explosive forc of a combustible gas is developed when the proportion of ga to air is just sufficient for complete combustion. If the gas i the mixture is in excess of this proportion the full heat en ergy is not developed, owing to the incomplete combustion o the gas. On the other hand, if the air is in excess of wha is required for complete combustion, the unburned air ab sorbs a portion of the heat generated by the combustio which thus becomes latent.

The maximum explosive force of methane is develope when the proportion of gas to air is 1 : 9.57. It is calculate in the following manner: Write, again, the chemical equatio expressing the reaction that takes place when this gas burn in oxygen, forming carbon dioxide and water; thus,

$$CH_4 + 2\,O_2 = CO_2 + 2\,H_2O$$

Molecular volumes, 1 2 1 2

It should be observed that when the symbol of each ga is written as a molecule (oxygen = O_2) the prefix or numb written before the symbol, indicating the number of mol cules of that gas taken, shows also the relative volume of th gas concerned in the reaction; because the volume of a gaseous molecules at the same temperature and pressure the same.

The above equation shows that two volumes of oxyge ($2O_2$) are required to completely burn one volume of methan (CH_4); and there are formed one volume of carbon dioxid (CO_2) and two volumes of water ($2\,H_2O$).

But, oxygen forms 20.9 per cent., by volume, of the a mosphere. Therefore, when methane is burned in air, th volume of air required to completely burn two volumes of th gas is

$$\frac{2 \textit{ volumes}}{0.209} = 9.569, \textit{ say } 9.57 \textit{ vol.}$$

Hence the proportion of gas to air that will develop, in ex plosion, the maximum force is 1 : 9.57. The percentage gas in the mixture, at this point, is

$$\frac{1}{1 + 9.57} \times 100 = \frac{100}{10.57} = 9.46 \textit{ per cent.}$$

Higher Explosive Limit—The continued addition of ai after the maximum explosive point is reached, causes the e plosion of the gas to be less and less violent as the volun of air is increased, till finally a point is reached where th gas is so diluted with the air that explosion ceases and th mixture is simply inflammable. The point at which explosi ceases is called the "higher explosive limit." For pu methane, this point is practically reached when the propo tion of gas to air is 1 : 5, although the position and cha acter of the igniting flame may vary this proportion slightl The percentage of gas in the firedamp, at this point, is pra tically

$$\frac{1}{1 + 5} \times 100 = \frac{100}{6} = 16.67 \textit{ per cent.}$$

INQUIRIES OF GENERAL INTEREST

Coking and Steaming Coals

What are the qualities or constituents of a grade of
ıl that would be termed a "good coking coal"; and
at are the qualities and constituents of a good "steam-
coal?"

What is the lowest percentage of fixed carbon in a
l that would be considered as a coking coal; and what
the highest percentage such a coal may contain?

C. A. Pearson.

Duluth, Minn.

It is only possible, in the most general way, to name
qualities that are essential to a good coking coal.
ch a coal will generally contain from 15 to 30 per
t. of volatile matter. An important property of a
ing coal is that on being heated the coal passes
ough a semifused or pasty condition and the hydrocar-
gases driven off while the coal is in that condition
der the mass highly porous. When the coal contains
small a percentage of volatile matter, it will not fuse
lily; while too large a percentage of volatile matter
develop too great a porosity and the resulting coke
not have sufficient strength for the purposes for
ch it must be used.

t is not possible to state any limiting percentages of
l carbon that would determine the coking qualities
he coal. While many attempts have been made to
rtain on what the coking properties of coal depend,
ing definite has been determined further than that
relation between the volatile matter and the fixed car-
or, preferably, the relation between the hydrogen of
coal and the fixed carbon is important. A good cok-
coal must also contain a low per cent. of ash; and,
many purposes, the sulphur content must be less
1 per cent.

ıe physical properties and condition of the coal are
believed to be of more importance than is generally
rstood, in order to produce a good merchantable
A coal having a free vertical or jointed structure
generally produce a better coke than a coal having
minated or bedded structure. Crushing the coal
ly improves its coking qualities; and some coals
would not coke otherwise have been made to pro-
a fair coke by crushing to a fine uniform grade,
permits a more regular and uniform escape of
ases and assists the formation of the porous structure
is such an important feature of a good coke. The
ntage of fixed carbon, in some of the best coking
varies from 50 to 75 per cent., while the carbon-
gen ratio has been found to vary from about 20 to
even 12, in some coals that have been coked.

qualities of a good steaming coal will depend very
y on the style of boiler used. In many of the long
lrical and flue boilers that are still used in a large
er of mining districts, it is necessary to employ a
urning, long-flaming coal to produce the best re-
Many tubular boilers cannot be fired to advantage with a highly bituminous coal, for the reason that the small tubes of the boiler require too frequent cleaning to prevent them from being clogged with the soot deposited in them. The present practice, however, is to enlarge the size of the tubes of these boilers.

Many power plants are today using hard (anthracite) coal to avoid the too frequent cleaning of the boiler tubes that is necessary when using softer coal. The higher price of the hard coal, however, makes its use prohibitive in most mining plants, except those located in the hard-coal region. Almost without exception, the smaller sizes of coal are used for steaming purposes at the present time, the larger sizes, from chestnut up, being used for domestic purposes.

An Inclined Plane Difficulty

We are lowering coal over an incline 5000 ft. long and having a grade varying from 15 to 47 deg. We use an 8-ft. double drum, having two brakes on each drum; but the friction is so great as to wear away 2¾ in. of wood in 18 days. Can you suggest something of advantage?

M. K. Marlowe.

Block, Tenn.

From the brief description given, we believe that the weight of the loaded cars is too great and should be counterbalanced by a counterweight or balance-truck, running on a separate track; or the weight of the empty cars ascending the plane should be made to counterbalance the weight of the descending loaded cars. If a balance-truck is used, the counterbalancing weight should always be sufficient to draw up the empties but not so great but that it can, in turn, be drawn up by the loaded cars descending the incline. The counterbalancing of the weight of the loaded cars, in this manner, will relieve the load on the drum and reduce the wear on the brakes holding the drum.

A Hoisting Problem

If one rope of a double-compartment mine hoist is 5½ in. short and the other rope 3 in. long, how will you arrange these ropes so that the cages will reach their respective landings at the same time?

John Nelson.

Des Moines, Iowa.

In general mine practice, in a double-compartment hoisting shaft, the ropes supporting the two cages are so arranged that one rope will wind on the drum as the other winds off, a single drum being used. In this way, one cage is hoisted while the other is being lowered. In the present case, as we understand the question, one rope being 5½ in. short and the other 3 in. long, there is a difference of 2½ in., which is the actual shortage when one of the cages is brought flush with the landing. It is then only necessary to lengthen the rope supporting the other cage 2½ in.

EXAMINATION QUESTIONS

Mine Rescue Work

(*Answered by request*)

Ques.—How would you render first aid to a person overcome by mine gases?

Ans.—Place the patient on his back with something under the shoulders to throw up the chest. Loosen the clothing around the throat and pull out the tongue. Perform artificial respiration by the Sylvester method as follows: The operator kneels at the patient's head, grasps his arms just below the elbows and draws them gently but steadily outward and upward, holding them as far above the head as they will go for about two seconds. He then brings the arms down with the elbows bent, until they press lightly against the chest, holding them there for about two seconds. The operation should be repeated about 15 times per minute. After natural respiration is begun, apply the pulmotor, if one is to be had. In a case of gas poisoning use the pulmotor at the start. A pulmotor should form a part of the first-aid equipment in every mine where gas is generated or where electrical power is installed.

Ques.—How should a person be treated who is suffering from mine burns?

Ans.—Send for a doctor. Raw, blistered surfaces should be protected from the air. If the clothing sticks, do not peel it off but cut around it. The adhering cloth or a dressing of cotton or other soft material applied to the burned surface, should be saturated with picric acid (0.5 per cent. solution). If this is not at hand, coat the spot with a paste of flour and water or a heavy oil, such as machine oil, vaseline, linseed or olive oil. Cover the dressing with cotton, gauze, lint, clean waste, a clean handkerchief or other soft cloth held lightly in place by a bandage. The same coverings should be lightly bandaged over a dry, charred burn, but without wetting the burn, in this case, or applying oil to it. Do not open blisters.

Ques.—A man is found unconscious with a live wire lying across his lower legs Assuming that the current is to be short-circuited first, should this be done at a point between the victim and the power house, or at a point on the other side of the victim from the power house? State fully if there is any difference in the two methods.

Ans.—The effect on the man will be the same whether the current is short-circuited between the power house and the victim, or on the other side of the victim from the power plant. It will always be better, if possible, to flip the wire off the man's leg with a dry stick or other nonconducting material, since this will avoid the possibility of an induced current passing through the man when the switch, or circuit-breaker, is thrown open at the power house, owing to the current being short-circuited. If there is a circuit-breaker on each of the lines ("double-pole breaker"), this would not occur; but, with a "single-pole breaker," there is danger of a possible "field discharge" from the generator further injuring th man, since such a field discharge would raise the voltag throughout all the wires in the circuit, no matter wher the "short" is placed.

The reason that the current may be short-circuited o either side of the man with equal advantage, is that th drop in potential caused by the "short" will be practicall the same on both sides of the victim, assuming the di- tance between these two points is small as compared wit the length of the circuit and therefore negligible.

Ques.—Give in full the method of artificial respiratio to be employed and any other conditions of treatme necessary in case of electric shock.

Ans.—The method of artificial respiration and treat ment recommended by the Commission on Resuscitatio from Electrical Shock, as explained in a pamphlet i sued by the National Light Association, New York, i briefly as follows:

Send for the nearest doctor; but, without waiting, a soon as the victim is clear of the live conductor, quickl feel with the finger to see that there is no obstruction i the mouth, removing any tobacco, or false teeth foun there. Then, without stopping to loosen the patient clothing, begin artificial respiration at once as every m ment is precious.

Turn the patient on his stomach, with arms extende and face turned to one side so that the nose and mout are free for breathing; and, if possible, have an assista draw the tongue forward. Kneeling astraddle the man thighs and facing his head, press the loins (muscles o the small of the back) with the palms of the hands, th thumbs nearly touching each other and the fingers sprea over the lowest ribs.

Now, holding the arms straight, swing slowly forwa so that the weight of the body is thrown gradually upo the victim. This operation should take from 2 to 3 se and must not be violent as internal organs may be i jured. Then, immediately swing backward so as to r move the pressure, but leave the hands in place, thus r turning to the first position. After 2 sec. again swin forward, repeating these operations slowly and regularl at the rate of 12 to 15 times a minute, making the doubl movement of compression and release in from 4 to 5 se Follow your own deep breathing as a guide, swingin forward with each deep expiration and backward wit each inspiration.

Continue this operation without interruption unt natural breathing is restored or until the physician a rives. During this time, keep the patient warm wit proper coverings and by laying hot-water bags or bo tles beside his body. Give no liquids whatever, by mout until consciousness is restored.

If there are any burns, they should be attended after natural respiration is restored. These should treated the same as other burns, by the application flour, oil, or vaseline to exclude the air. An emulsion boiled oil and lime water is good.

COAL AND COKE NEWS

Washington, D. C.

An important feature of the report of the Interstate Commerce Commission regarding transportation conditions in New England in general and on the New Haven road in particular, issued during the past week relates to special inquiries made by it with respect to coal and the conditions under which that article is transported. On that point the Commission says:

> We find that class rates in central freight association territory are distinctly lower than in New England, especially on classes 5 and 6. These two classes move a very large amount of carload traffic, being the two classes which apply very generally to carload business. Class rates from New York and Boston to New England points are about the same as those from New York and Pittsburgh into trunk line territory.
>
> Class rates from interior New England points appear to be rather higher than corresponding rates in both trunk line and central freight association territories.
>
> We have also instituted a comparison between rates from these same points on three or four of the principal commodities.
>
> Coal is not produced in New England, but is extensively consumed. Coal rates from the various seaports of New England to near-by interior points are uniformly high as compared with rates for similar distances in the other territories under consideration. Rates to more distant interior points are not so extravagant and are often low. The reason for this appears to be that coal reaches the various ports of New England by water and is from thence distributed by rail. This water-and-rail route competes with the all-rail route, and the purpose of these high rates to near-by points is to maintain the all-rail rate.

Allowable Deductions

In issuing the final draft of its revision of the income ax section of the new tariff the senate Finance committee luring the past week made some concessions to mining inerests designed to eliminate or break the force of criticisms hat had been passed upon the new act by operators of minng properties. Under the new acts a corporation which nakes income returns is allowed to deduct among other hings:

> All losses actually sustained within the year in business conducted by it within the United States and not compensated by insurance or otherwise, including a reasonable llowance for depreciation by use, wear and tear of property, f any, and in the case of mines a reasonable allowance for epletion of ores and all other natural deposits not to exceed per centum of the gross value at the mine of the output of the year for which the computation is made.

HARRISBURG, PENN.

From a decision of Judge Mestrezat of the Pennsylvania upreme Court, work of mine foremen is covered by statute nd aside from the duties imposed upon them by law, they annot be held liable for an accident when the company is harged with neglect.

This question was raised when the commission to codify he mine laws was at work, and it was claimed the statutes ere written in the interests of the operators. It was ointed out that one sentence in the law would prevent mine orkers from recovering damages inasmuch as it specified hat in those mines where electricity was used, responsibily for safeguarding the lives of the workers would be aced upon a certified electrician. This feature was condered a snake and was bitterly fought.

The decision in part states:

> That a mine foreman is responsible only for those duties overed by the statutes and where he exercises authority hich is not covered by statute, he is going beyond his jurisction and through the neglect of the coal company which not providing proper safeguards, the company is responsible r damages.

The decision is far reaching in the effect it will have on ture damage cases, wherein employees may have been inred or killed. It upsets the custom which has been esblished, making the mine foreman responsible for accints in mines. According to the opinion, that official must ok after the care of the mines and see that the mine laws e observed. He cannot become an agent for a coal comny to evade responsibility, where it can be shown that it s not made its mines reasonably safe from accidents.

Receivers Appointed

Judge Orr of the United States Court at Pittsburgh July 9 pointed receivers for the six bituminous coal companies of nnsylvania which were subsidiary companies of the American Water Works and Guarantee Co., which passed into the hands of a receiver on the failure of First-Second National Bank of Pittsburgh and which was one of the big "Kuhn enterprises."

The Court appointed as receivers for the Isabella-Connellsville Coke Co., S. A. Gilmore, J. D. O'Neil and Wm. K. Johnson for the Naomi Coal Co., Thurston Wright, Samuel A. Gilmore and Wm. K. Johnston; for the Somerset Smokeless Coal Co. Robert P. Watt, Samuel A. Gilmore and Wm. K. Johnson; for the United Coal Co. James D. O'Neil, Thurston Wright. Wm. K. Johnson and Robert P. Watt; for the Pittsburgh and Baltimore Coal Co., James D. O'Neil, Robert P. Watt and Wm. K. Johnson; for the Merchants Coal Co. of Pennsylvania, Robert P. Watt, Thurston Wright and Wm. K. Johnston. The bond for each of the receiverships was placed at $15,000.

The defendants all joined in the petition for the receivership. The bill in each case sets forth that the petition for the receiverships was filed for the purpose of protecting the property and assets of the companies on account of the debts due.

Judge Orr in appointing the receivers made an order which allows them to pay the miners of the United Coal Co., Pittsburgh and Baltimore Coal Co. and the Somerset Smokeless Coal Co. a total of $100,000 in wages.

J. S. Kuhn and W. S. Kuhn were president and Vice-President of the United Coal Co. which controlled the other coal companies.

No Extra Session

Governor Tenor is reported as stating on July 8 that he had not thought of calling an extra session of the legislature, either this summer or the fall after the election. For some weeks rumors have been current that it was the intention to reconvene the general assembly to act on an "Employers' Liability" and other bills and in the event of the constitutional amendment permitting the state to issue $50,000,000 of bonds for consruction of highways, to summon the legislature to pass enabling acts so that bonds might be issued next year instead of waiting until the session of 1915. The Governor said in part.

> I know of no contingency demanding the convening of the general assembly in extraordinary session nor shall I call an extra session should the constitutional amendment for the bond issue for road construction be ratified by the people at the November election.

PENNSYLVANIA

Anthracite

Harrisburg—The Governor has approved a legislative resolution authorizing the Chief of the Department of Mines to investigate conditions and operations of quarries, ore and clay banks, ore and graphite mines, oil and gas wells drilled through coal measures, and to suggest needed legislation to the Governor for presentation to the legislature of 1915.

Wilkes-Barre—The Susquehanna Coal Co. has filed appeals from the assessment and valuation of its coal and surface property as fixed by the Board of County Assessors in Newport, Nanticoke and Plymouth Townships. This is the first of appeals to be taken by a coal company to the new triennial assessment for the year 1913, as recently completed by the Board of County Assessors. All the other coal companies are expected to file appeals soon and the entire assessment will again be threshed out in the courts.

Scranton—Three men were killed recently by falling down the shaft at the Brisbin Colliery of the Lackawanna Coal Co., a depth of about 600 ft. The men were employed at the head of the shaft, taking care of the cars coming from the mine.

Philadelphia—Headquarters have been opened to prepare plans for the entertainment of the mining men who are expected to visit Philadelphia as delegates to the sixteenth annual session of the American Mining Congress which meets on Oct. 20-24.

Committees from the Chamber of Commerce are daily holding meetings to arrange for the transportation and care of the visitors.

Permanent quarters were recently opened in the Land Title Building by J. F. Callbreath, the secretary of the Mining Congress and Assistant Secretary E. L. Wolcott, both of Denver. The local finance committee of the Chamber of Commerce of Philadelphia of which E. T. Conner is chairman, and N. B. Kelley, secretary met yesterday to estimate the funds which will be needed for the entertainment of those attending the convention. It is expected that about 1500 mining engineers and experts will attend the convention.

Pottsville—The Supreme Court of Pennsylvania July 9 handed down an opinion that "robbing pillars" in the mining of coal is perfectly legal. The issue was fought out in a case "Streng vs. Buck Run Coal Co.," of Pottsville, who had asked for an injunction to restrain the above company from mining certain pillars on lands leased from the Strengs.

Judge Brumm, of the Schuylkill County Court decided that all pillars may be robbed "except those necessary for the present and future working of the mine." He also decided that the panel or "gob" system of mining is superior to the pillar system, and the Supreme Court has sustained him in both decisions.

Bituminous

Johnstown—Strike sentiment cropped out suddenly July 11 in the mines of the Altoona Coal and Coke Co. at Cupon, near Gallitzin, when several hundred men refused to work longer because the company proposed to change from two to three shifts in the main heading. This company is turning out a grade of coke said to be equal to the Connellsville variety and is pushed with orders. It is thought the trouble will be settled soon.

A part of the big coal deal of the Manor Real Estate and Trust Co., of Philadelphia in the Indiana coal field was consummated July 10 when 680 acres of bituminous coal in seven tracts were purchased by that company for $45,000. The land is situated in Green and Cherryville townships in Indiana County, and adjoins lands in Cambria County, for which the same company paid as high as $200 per acre.

Bentleyville—Residents in the northern part of town are becoming alarmed over the fact that crevices are appearing in the land in that particular section, due, it is thought, to the removal of coal. It has been found that wells are hard to find which will supply water all the year round, and many have gone dry. It is thought the removal of coal too near the surface is the cause.

Monongahela—Representatives of the Monongahela River Consolidated Coal & Coke Co., in whose mine 97 men lost their lives in an explosion on Apr. 25, are settling the death claims with the legal heirs. The company is said to be paying the widows with families $2000. The scale runs from this amount down to $500.

WEST VIRGINIA

Charleston—Miners employed at the mines of the Seng Creek Coal Co., on Coal River, who went on strike in violation of orders from the union officials, have decided to return to work rather than sever their connection with the national organization. This follows some vigorous action on the part of the union officials who ordered the miners' local union, at Coal River Siding, to end their strike or surrender their charter.

Judge Henry K. Black, of the Kanawha County Intermediate Court, has issued a call for a special Grand Jury to sit beginning July 17, for the purpose of investigating conditions in the Paint and Cabin Creek coal fields. Governor Hatfield's letter calling upon officers to resign or handle the strike situation is believed to have resulted in this action. The Senate Committee investigating conditions in West Virginia coal-mining regions will probably resume work this week.

Sheriff Bonner Hill recently sent reinforcements to the Ohlney mining camp a Consolidated Coal Co. property where rioting had broken out and nearly 1000 shots had been fired at the camp from strikers on the hillsides.

Bluefield—Miners at the Mabscott mine, which was the first operation in Raleigh County where work was discontinued in connection with the strike trouble, have returned to work, and other operations affected in a similar manner have likewise resumed active mining.

KENTUCKY

Fleming—The construction of model roads has become an important part of the work of the large coal companies operating in Eastern Kentucky. The Mineral Fuel Co., which is busily engaged in building two or three new towns and opening up a number of new mines, will start work at once on a number of miles of road in and around its towns and properties. Three miles of fine road, suitable for automobile traffic, will be constructed between Fleming, the first of the company's towns, and McRoberts, on the property of the Consolidation Coal Co., the two companies dividing the expense. The latter company has already built about twelve miles of roads in and around McRoberts and Jenkins.

Louisville — Kentucky mines will be among the first visited by the mine sanitation section of the U. S. Bureau of Mines, which has been organized for the purpose of investigating the conditions of mining in the various states, and determining the standards of living among the miners as well. The newly-developed sections of Eastern Kentucky will be visited, but it is expected that the bureau will find conditions in and around McRoberts and Jenkins, where the Consolidation Coal Co. has its mines, to be rather above the average, as this company is one of the most advanced in the state in its methods and in the housing and general treatment of its employees.

OHIO

Columbus—The officials of the Lorain Coal and Dock Co. which operates a large coal tract in Belmont County deny the statement that the Lorain Coal & Dock Co., the Y. & O. Coal Co. and the Belmont Coal and Mining Co. will consolidate. Edward Johnson, president of the Lorain Coal and Dock Co. is on a trip to Europe and nothing can be done until his return if any merger is to be effected. The negotiations for the merger of the first two named concerns, which were discussed some tme ago have been dropped.

INDIANA

Shelburn—The Kettle Creek mine, after an idleness of two months, has resumed operations.

Sullivan—A new steel tipple mine to employ 200 men will be sunk on a 700-acre tract near Cass, by Job Freeman, a coal operator of Terre Haute. The new company will be known as the Ayrdale Coal Co. The land involved is surrounded by mines in active operation and is pierced by three railroads. The mine will be just east of the new steel tipple of the J. Woolley Coal Co. at Paxton and is part of the proposed extensive coal development in the south end of Sullivan County.

Evansville—P. O. McKinney owner of a coal mine across the Ohio River at Lockport, Ky., is arranging for a distributing point in this city. His mine has a capacity of more than 1000 tons daily.

ILLINOIS

Sorento—The charges that the C. & A., C. & I. M., C. M. & St. P., and the T. St. L. & W. had arbitrarily advanced freight rates on coal shipments in Illinois, were taken before Chas. F. Gerry, special examiner of the Interstate Commerce Commission. The complainants are the shipping companies with mines at Panama, Coffeen and Sorento, who declared that the new rates mean either the shutting down of their mines or raising the price on coal that would make its sale prohibitive.

Staunton—The hoisting engineer at mine No. 14 of the Consolidated Coal Co. lost control of his engine when hoisting a load of lumber, resulting in the death of one laborer and seriously injuring another. The company explained the accident by claiming that the difference in weight between the lumber and a load of coal is so great, that the engineer, not knowing what the cage was loaded with, proceeded as he always had in hoisting coal, and the engine got beyond his control.

Peoria—A new state law provides for the abolition of the institution known as the county Mine Examiners Board composed of three men in each county, and substitutes therefor a commission of three men for the state, whose duty it shall be to examine and license miners. The Governor has not yet appointed this new board, and under the law every miner now working without a state license is subject to a penalty of from $100 to $500 fine and imprisonment for from 30 days to six months, for each day of the violation. Fortunately, however, this law is not being strictly enforced.

MISSOURI

Joplin—Mine No. 19 of the Weir Coal & Mining Co., which has been shut down since June 12 as a result of an explosion, resulting in one fatality, has been repaired and operations resumed.

ALASKA

Washington, D. C.—A bill authorizing the President to construct a railroad in Alaska and to mine coal in that territory was introduced in the Senate, July 10, by Senator Poindexter, of Washington. For these purposes the President would be authorized to borrow $50,000,000. The bill would provide that hereafter no coal land shall be disposed of except under lease.

FOREIGN NEWS

Calgary, Alberta—An English syndicate has bought a tract of coal land near Canmore, amounting to 8000 acres at a cost of about $2,000,000. It will build a road and expects to be marketing coal in Calgary by October.

Sydney, Nova Scotia—Fifteen hundred miners at Nos. 2, 3 and 4 Collieries, Sydney Mines, went on strike July 8. The cause of the trouble is that no horses are supplied in these mines and practically all the work of placing cars falls upon the miners. An early adjustment of the difficulty is anticipated.

Ottawa, Ontario—The Canadian Government has leased one of the finest coal areas in the world to American interests. This was recently discovered and staked by Dr. Reinhold Hoppe, of Oakland, Calif. It is located in the Province of Alberta, about 200 miles from Edmonton. The area is of great extent, and the coal is said to be an anthracite of a quality superior to the famous Pennsylvania hard-coal deposits.

PERSONALS

E. T. McOlvin has resigned his position as superintendent for the Rich Mountain Coal Co., to accept a similar place with the Marion Gas Coal Co., to take effect July 15, 1913.

William T. Hawkins has been appointed fuel agent on the Missouri Pacific-Iron Mountain system, succeeding W. J. Jenkins, who resigned as fuel agent of the railroad to accept the position of vice-president and general manager of the Consolidated Coal Co.

A. D. MacFarlane has resigned his position as resident engineer of construction at the Bayview Mine of the Tennessee Coal, Iron & R.R. Co., near Birmingham, Ala., to accept a position as chief engineer for the La Follette Coal, Iron & Ry. Co., at La Follette, Tenn.

Frank D. Rash, vice-president and general manager of the St. Bernard Coal Co., has been elected as one of the board of directors of the Kentucky Manufacturers' and Shippers' Association, an organization which has as its object the general betterment of conditions affecting its members, especially in the matter of freight rates.

David Ross secretary of the Illinois Bureau of Labor Statistics for the past sixteen years has resigned to Gov. Dunne. He gives no reason for his action.

After having been unsuccessful in his attempt to have John Mitchell, former president of the United Mine Workers of America, made State Labor Commissioner, Governor Sulzer, of New York, has sent to the Senate for confirmation the appointment of James M. Lynch, of Syracuse, President of the International Typographical Union.

OBITUARY

John Dunn a retired coal operator and one of the best known business men of New Philadelphia, Ohio died at the home of his son John Dunn recently, at the age of 78 years. He was a civil war veteran.

Robert Pettigrew, one of teh best known mining men of he state of Washington, was found dead of apoplexy in the arden back of his house at Roslyn, July 8, after the members f his family had searched for him several hours through he town and the surrounding hills. Mr. Pettigrew came to Roslyn 25 years ago and at one time had charge of the Missouri Pacific coal property in Missouri.

CONSTRUCTION NEWS

McClellandtown, Penn.—The Puritan Coke Co. has under way some extensive improvements at the McClellandtown plant.

Sharpsville, Penn.—The Shenango Furnace Co. has anounced that it will build a byproduct coke plant at Sharpsille to furnish its three blast furnaces with coke.

Morgantown, West Va.—The Elkins Coal & Coke Co. will add to the electric equipment of its Colliery, at Bretz, W. Va., a 200-kw. motor-generator set.

Punxsutawney, Penn.—The work of constructing 200 new coke ovens, power house, etc., at the Cascade Coal & Coke Co.'s plant in Sykesville, is going forward at a rapid rate.

Greensburg, Penn.—Within the next month the erection of sixty houses will be begun by the Greensburg Coal & Coke Co., which is opening a new coal works near the Greensburg city limits.

Barnesboro, Penn.—The Cambria Coal Co. will install in its mines, near Barnesboro, a 200-kw. motor-generator set, three 7½-kw. transformers, and the necessary switchboard apparatus.

Toledo, Ohio—A permit has been issued to the New York Central lines here, by the building inspection department, for the erection of a $100,000 coaling station to be built on Detroit avenue on the Lake Shore grounds. The construction contract has been let to the Phillis-Lang Co.

Steubenville, Ohio—The Steubenville Coal & Mining Co., operating the High Shaft, are making some extensive improvements including new steel head frames, cages, etc. It is also installing a pair of Crawford & McCrimmon Co. first-motion hoisting engines. The output will be greatly increased.

Clarksburg, W. Va.—The Central Fairmont Coal Co. is installing a complete electric system in its Snake Hill coal mine near this place. The current will be supplied by the Monongahela Valley Traction Co., and the improvement will reduce operating expenses and add to the dispatch of handling coal.

Bristol, Tenn.—Rapid progress is being made in the work of installing a central power plant in the Lee County coal field by the Electric Transmission Co., which was organized here a few months ago. This concern is now making an expenditure of $800,000 and eventually expects to invest from one to two million dollars.

Birmingham, Ala.—At a cost of $100,000 the Republic Iron & Steel Co. will erect a power-generating plant at East Thomas. This plant will be capable of furnishing sufficient power to supply the furnaces at Thomas and in addition it is planned to generate current to operate Sayreton mines and three other openings in addition to some new operations which have not yet been started.

NEW INCORPORATIONS

Uniontown, Penn.—The National Coal & Coke Co., composed of Uniontown men, has secured a charter.

Harrisburg, Penn.—The Buck Ridge Coal Mining Co. of Philadelphia, has filed notice of an increase of its capital to $600,000.

Roanoke, Va.—The Stone Mountain Coal Corporation has been incorporated with $50,000 capital stock to develop coal lands.

Joplin, Mo.—The Oak Orchard Mining Co. has been organized with a capital stock of $2000 by E. W. Hoffman, A. R. Snyder and J. A. Johnson

Tulsa, Okla.—The Schulter Mining & Coal Co. has been organized here with a capital stock of $100,000. The directors are: N. J. Kampers, A. Campbell and E. R. Perry, all of Tulsa.

Charleston, W. Va.—The Shannon Coal Co., with offices in Parkersburg, and of which H. T. Camden is president, has decreased its authorized capital from $500,000 to $100,000.

Pittsburgh, Penn.—A merger of three Pittsburgh coal companies is seriously contemplated, the Youghiogheny & Ohio Coal Co., the Lorain Coal & Dock Co., and the Belmont Coal Co. The capital of the new concern will be $15,000,000.

Connellsville, Penn.—The stockholders of the Westmoreland Coal Co., at a special meeting approved the proposed increase in the capital stock from $5,000,000 to $6,000,000, and the issue of $1,000,000, seven-year, five per cent. collateral notes.

Cleveland, Ohio—The W. H. Warner Coal Co. of Cleveland, Ohio, has been incorporated with a capital stock of $5000 to deal in coal and coke. The incorporators are Whitney Warner, W. C. Saeger, M. T. Flanagan, John C. Barkley and F. K. Studer.

El Dorado, Ill.—The Crescent Coal & Coke Co. has been incorporated here with a capital of $25,000 with E. H. Chenot, of St. Louis, Josh Anderson, A. M. Bourland and I. N. Bourland of this place as incorporators. They will take over the mine about two miles south of here.

Columbus, Ohio—The Blocton Co. has been incorporated with a capital stock of $10,000 by Charles M. Crist, H. A. Shafer and C. L. Laboiteaux. The company is organized to take over a coal mine located near Williamson, W. Va., the output of which will be handled over the Norfolk & Western R.R.

Dover, Del.—Articles of incorporation were filed, July 11, for the Lohman Hold Manufacturing Co., of Pittsburgh, Penn., to manufacture, sell and deal in and with Lohman skylit carbite pit lamps. The capital stock is $50,000 and the incorporators are H. Werner Lohman, Otto F. Lohman and William John Hold, all of Pittsburgh, Penn.

Charleston, W. Va.—The Gage Coal & Coke Co. has been organized with an authorized capital of $150,000, of which $1400 has been subscribed, and $140 paid in. The principal office of this concern is in Pittsburgh, Penn., and the chief works in Barbour County, W. Va. The incorporators are: Henry E. Lineaweaver, A. M. Godfrey, W. H. Foster, J. B. Robbins and C. G. Jones, all of Pittsburgh, Penn.

Charleston, W. Va.—A charter has been issued to the Huddlestone Coal & Coke Co., with principal office and chief works in Sherman, Logan County, W. Va. The authorized capital is $100,000, of which $500 has been subscribed and $50 paid in. The incorporators are: J. A. Huddlestone, of Excelsior; H. M. Bertolet, of Charleston; G. S. Borden, and Dan A. Newhall, also of Charleston, and W. W. Whyte, of Welch.

INDUSTRIAL NEWS

Birmingham, Ala.—The coal operators of Alabama will meet July 26, 1913, on the property of the Roden Coal Co., Marvel, Alabama.

New York, N. Y.—The "Mining and Scientific Press" announces the removal of its New York office to the Woolworth Building, Broadway, Park Place and Barclay Sts., New York City.

Clarksburg, W. Va.—The Rich Mountain Coal Co., of Clarksburg, W. Va., has sold its belongings to the Elkhorn Fuel Co. and the Consolidation Coal Co. is handling the output and managing the property.

Pittsburgh, Penn.—The Hirsch Electric Mine Lamp Co. has opened a Pittsburgh office at 328 Diamond St. This office will be in charge of M. Marks, who will oversee the distribution of Hirsch lamps in the Pittsburgh district.

St. Louis, Mo.—The Polar Wave Ice & Fuel Co. has contracted for its new office building on Olive St., west of Grand. It will be 100 ft. wide by 152 ft. deep, and will be a four-story glazed terra cotta building. The estimated cost will be about $75,000 and it will be the finest retail coal office building in the country.

St. Louis, Mo.—The C. & N. W.'s coal road extending from Benld to St. Louis, will probably be in operation about Oct. 1. It is not known yet in just what way this road will enter East St. Louis, but it is a certainty that the company is figuring on a huge tonnage of coal moving to the Northwest this fall.

Morgantown, W. Va.—J. V. Thompson has purchased three new tracts of Greene County, Penn., coal. He bought 74 acres in Whitely Township at $300 an acre; 40 acres in Morgan Township at $190 an acre, and 25 acres also in Morgan Township, also at $190 per acre.

New Salem, Penn.—More than 800 people attended the celebration at Footedale when the new concrete swimming pool was opened. A band concert and festival, together with swimming contests and other sports rendered the occasion enjoyable to all concerned.

Toledo, Ohio—The giant ore loader at the C. H. & D. docks, East Toledo, was blown against a concrete bumping post, July 5, and almost demolished during a high windstorm which swept over the city in the afternoon. Wilford Oaks who was in the cab was crushed to death when he was thrown from the tower, a distance of 90 ft., and a part of the loader fell on him. The immense crane cost $1,000,000 when built and the damage is estimated at $100,000.

Charleston, W. Va.—Suit was entered July 10, by Mrs. Maud Estep, widow of Cesco Estep, who was killed on the night of Feb. 7 last, when the armored train shot up the strikers' camp at Holly Grove, against the Chesapeake & Ohio Ry. Co., the Paint Creek Colliery Co., the Imperial Colliery Co., the Christian Colliery Co. and Quin Morton as defendant. The plaintiff asks $10,000 damages for the killing of her husband.

Boston, Mass.—Owing to the increase of business in New England of the Schutte & Koerting Co., manufacturers of high-grade bronze, cast iron and steel valves, ejector and steam and water jet apparatus, the Boston office has been moved from 98 High St. to 132 High St., Boston, Mass., where it now occupies a large part of the building on the street floor. For similar reasons the Denver office, formerly located at 1710 Glenmore St., has been moved to the First National Bank Building, Denver, Colorado.

Chattanooga, Tenn.—Objection has been raised by the Chattanooga and Birmingham creditors of the Dayton Coal and Iron Co. to the receivers. The protest has been filed in the United States district court here. It is alleged that the present receivers, H. E. Noyes, former general manager of the company, and Archbald Bowman, of New York, were named at the suggestion of the Dayton Coal and Iron Co. Ltd. and that they therefore are not proper persons to look after the interest of the petitioners in the affairs of the bankrupt concern.

Salt Lake City, Utah—The Standard Coal Co., of this city, recently concluded a contract with the L. R. Wattis Construction Co. for the building of a road to cost approximately $50,000 from the Coal company's mine in Spring Cañon, Carbon County, to Storrs, a station five miles from Helper. The coal company expects to have its first coal on the market during the last two weeks of October. Over $200,000 of mining machinery is to be installed.

Uniontown, Penn.—The Dillworth Coal Co.'s plant, at Rice's Landing, which has been closed for several months, will likely be reopened within a short time. For the past few days about fifty men have been at work inside the mine cleaning it up. At present sufficient coal is being produced to run the boilers, but it is thought the mine will be running full time within a few weeks. The work is being done by the bondholders who purchased the plant at receivers' sale a few months ago.

Scranton, Penn.—The total shipments of anthracite coal from Pennsylvania last month amounted to 5,970,047 tons as against 6,191,646 tons in June, 1912. The amount of coal on hand and at tidewater and lake shipping ports increased 30,403 tons from 502,626 tons on May 31, to 533,029 tons on June 30. The Lehigh Valley R.R. led in tonnage with 1,183,821 tons. The total anthracite shipment for the first six months of the year was 34,851,854 tons as against 26,096,979 tons in the first half of 1912.

Uniontown, Penn.—The Etna Connellsville Coke Co. instituted suit, July 10, in the Fayette County Court against the Whyel Coke Co. to recover $10,442.62, with interest from June 26 of the present year. It is stated in the suit that the plaintiff made an agreement to furnish the Whyel Coke Co., 67,200 tons of furnace coke during 1913, or 5600 tons per month at $3 per ton. For the first three months the coke was received and paid for by the defendant, then for some unknown reason part of the amount mentioned in the contract was refused and payment was not made on shipment. Suit is, therefore, instituted on the grounds that the Whyel Coke Co. broke the agreement.

Springfield, Ohio—As a result of the sale of the northern and southern ends of the Detroit, Toledo and Ironton R.R., to Otto Bannard and M. N. Buckner, of New York City for the upset price of $1,650,000 it is expected that there will soon follow a thorough reorganization of the company upon a solid basis. At least this is the aim of those at the head of the movement. One of those in a position to know something about the motives in railroad circles said that the first mortgage hondholders and the others interested evidently had an understanding before the purchase of the central division. If this were not true it was pointed out that the men representing the Central Trust Co. would not have bought the line between Lima and Wellston.

Des Moines, Iowa—Several years of commercial warfare against the good name and patents of the Christy Box Car Loader Co. were brought to a close on June 25, 1913, when Hon. Smith McPherson, judge of the Federal Court, rendered a decision holding that the Ottumwa Box Car Loader Co. was infringing the Christy patent. It was further decreed that the defendant the Ottumwa Box Car Loader Co. and its officers, agents and employees, be permanently restrained from the further manufacture, sale or use of the said infringing box-car loader or any box-car loader infringing upon claims 1 and 2 of the patent of the complainant. Following this decree the court denied a motion for a supersedeas bond. This prevents the Ottumwa company from using, making or selling the infringing machine.

COAL TRADE REVIEWS

GENERAL REVIEW

Coal markets are holding remarkably firm in view of depressed conditions. Anthracite is moderately active under a restricted production. Bituminous strong with producers in full control of the market.

The Eastern hard-coal trade is sluggish, the demand coming mostly from New England and the West. The steam grades are in fair condition, except pea, which is going into storage. Companies have few orders, but there is apparently no effort to sell; the partial suspension at the mines has restricted the production to within the limits of the demand.

The Eastern bituminous shippers are concentrating their entire efforts upon filling contracts, and are not looking for any new business. Buyers are beginning to complain about delayed deliveries, which latter are probably due to the coal being diverted to more profitable markets. Contract figures on the West Virginia grades are being well maintained, and indications are that there will be sufficient of a shortage to justify an advance. The better grades are all well sold up, and, while there is some tendency to sag in the spot market, the season's prices remain firm.

In the Pittsburgh district, a better car supply followed the suspension in mining over the Fourth of July holiday, so that production has been slightly heavier. Quotations on slack are much firmer than customary at this period, and other prices are being well maintained, though no premiums are reported. The bank failure in Pittsburgh may so embarrass the Connellsville coke producers, many of whom were relying upon this institution for accommodations, that the operators will be forced to recede from their demand for higher prices. In the adjoining markets, few coal producers are willing to contract over a long period, and it is feared that the heavy crop movement is going to result in a severe car shortage this fall.

Prices in Ohio are holding firm and showing a strong rising tendency; there is an insistent demand from the Northwest, which will probably continue throughout the season, and domestic dealers are beginning to store up to full capacity. Steam consumers are also demanding a heavy tonnage, and production was large last week because of the holidays the last of the week previous, which enabled the railroads to catch up. With the miners again at work in the New River field, the pressure in the West Virginia market will probably soon be relieved. The situation is already showing some improvement, but the dumpings have been light due to the lack of coal, and shippers are apparently about all sold up for the balance of the month.

There is already some stocking in the Middle West in anticipation of an acute car shortage the coming fall; the Eastern grades, particularly, are in heavy demand, but the pressure for Western coals is easing up slightly. Business generally is larger and along broader lines, with coal moving freely and the market showing definite indications of improvement.

BOSTON, MASS.

Soft coal is still strong, but the settlement of the West Virginia labor trouble has tended to relieve the pressure. Tonnages for future delivery difficult to obtain. Prompt market slightly softer. Retail anthracite prices advanced and trade moderately active.

Bituminous—The market here this week is almost featureless. On Pocahontas and New River the situation is quiet, but with prices firm. There is practically no Hampton Roads coal being offered. The shippers are bending their energies more toward getting down coal to load waiting vessels and steamers than in the direction of new business. The miners resumed work in New River on July 7 and a fair output has resulted since that time, although "normal" for this year is said to average less than 60% of capacity for the various mines. The expectation is, therefore, that prices will remain firm on the Southern coals, and that there may be enough of a shortage to warrant returns considerably in advance of the contract figure. The Western and Lake trades are reported in excellent shape and the general outlook is fairly satisfactory from the operators' standpoint.

Georges Creek shippers are also behind on their orders and there is more or less congestion at the Baltimore piers. Steamers have been kept waiting about the same as at Hampton Roads, and there is no let-up in sight. All the interests in that district are doing a large business this year, and at unusually remunerative prices.

The Pennsylvania coals are sagging off a little for spot shipment, but on season orders there is no change. Most operators are still reluctant to sell more than a small fraction of their output, partly through fear of a still shorter labor supply and partly because they hope to realize better prices later. The better known grades are understood to be well sold up and it is difficult to get quotations for deferred delivery.

Anthracite—Notwithstanding that companies are understood to have relatively few orders on their books, there is no apparent effort to place the domestic sizes; the dealers here are for the most part keeping their stocks up the limit of capacity. The retail price was advanced 25c. in Boston on the first of the month on all sizes, making stove now $7.50. This has now been followed in most of the cities, and there is discussion of a further advance in order to cover the new Pennsylvania State tax, which has been handed on by the shippers to the retail dealers. The hard-coal trade in New England is still active, and even the steam sizes are in good request.

Bituminous quotations at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.10@1.45	$1.35@1.65	$1.67@1.77	
Philadelphia*	2.35@2.70	2.60@2.90	2.92@3.02	
New York*	2.65@3.00	2.90@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.00
Providence†				3.78@4.00
Boston†				3.90@4.10

*F.o.b. †On cars.

NEW YORK

Bituminous movement mostly on contract. One large buyer asking for quotations for the year beginning next April. Market firm but quiet. Anthracite unsettled because of the Pennsylvania State tax.

Bituminous—There is no appreciable change in the local market. The trade is in a good, healthy position, and there has been somewhat of a shortage due to the restricted output occasioned by the holidays over the Fourth of July. There is no improvement in the labor situation, nor any prospects for any in the near future. The car supply has been sufficient, the railroads having had an opportunity to catch up during the holidays.

Supplies at tidewater continue about normal, and there is not much demand in the spot market. The movement is confined almost entirely to contracts, and there are still some inquiries from consumers who have not yet covered. There is also one important buyer sending out inquiries for quotations on a large tonnage for shipments beginning Apr. 1, 1914. The local market is not quotably changed, and we continue prices as follows, with the market firm generally:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.65@2.70; good grades of Pennsylvania, $2.75@2.80; best Miller Pennsylvania, $3.05@3.15; George's Creek, $3.25@3.30.

Anthracite—The new Pennsylvania state tax on hard coal has had an unsettling effect upon local market. Some companies are continuing to sell at the regular circular prices, but others are billing their customers for the amount of the extra tax, it being noticed, however, that they are rendering a distinctly separate statement of this account, which would seem to indicate that they desired to be in a position to reimburse the buyers.

The market is only moderately firm, and indications are that it will be duller yet before there is any improvement. Most companies are stocking pea and buckwheat in the steam grades, and there is also some chestnut going into storage. While none of the sizes are in what could be termed "short supply," stove coal probably approaches nearest this condition.

Operations in the mining regions appear to be somewhat better than was anticipated a week or ten days ago. Both the car and labor supply are only fair. We continue to quote the New York market on the following basis:

		Individual		
	Circular	Lehigh	Scranton	Schuylkill
Broken	$5.00	$4.45@$4.65	$4.50@$4.70	$4.45@$4.65
Egg	5.25	4.80@ 4.90	4.85@ 4.95	4.80@ 4.90
Stove	5.25	4.90	4.95	4.90 .....
Chestnut	5.50	5.05@ 5.15	5.10@ 5.20	5.05@ 5.15
Pea	3.50	3.25@ 3.45	3.30@ 3.50	3.25@ 3.45
Buckwheat	2.75	2.10@ 2.45	2.50@ 2.75	2.10@ 2.45
Rice	2.25	1.75@ 1.95	2.25	1.75@ 1.95
Barley	1.75	1.30@ 1.70	1.75	1.30@ 1.70

PHILADELPHIA, PENN.

Local trade sluggish, but the Western and New England consumption is absorbing the surpluses. Steam grades in fair demand except pea, which is flat. Considerable interest in the new anthracite tax. Bituminous is strong.

The second week of partial suspension of operations at the mines finds the trade absorbing practically all of the output. While the local business still continues sluggish, the demand from the New England territory and the far West is taking care of what surplus there is. This, of course, applies to the prepared sizes. The steam-coal market, outside of pea coal, is in fairly good condition, although the movement of these sizes is undoubtedly on contracts; for pea there is practically no demand at all, and it is understood that most of the production is going into stock.

The attitude of the dealers has not changed to any extent regarding the new state tax, but most of them have signified their intention of submitting to the inevitable. The most complaints seem to come from consumers outside of the state, who are undoubtedly justified in taking the stand that they are not interested in the State of Pennsylvania to the extent of paying its taxes. Threats of suits to determine the constitutionality of the tax are heard from all sides. In event of the law being declared illegal the question arises, will the companies refund the taxes to the dealers, and the householders will be just as curious to know if what they pay the retailer will be refunded to them.

The bituminous market still continues to enjoy its meed of prosperity. Considering the many disturbing elements during the past two or three weeks, the market has held its own in a remarkable manner, there being no unusual advancing of prices and no feverish demand. As a matter of fact, high-priced coals are moving off promptly, and the low-priced varieties are sold before leaving the mines. There is little free coal in the market, and buyers are complaining about delayed deliveries, which is probably due to the fact that the coal is being diverted to better markets, or on sales that will net the operator more money. The Tidewater ports are handling an immense tonnage, and the outlook is favorable for the balance of the summer months.

PITTSBURGH, PENN.

Abnormal production of slack, due to heavy lake shipments is better absorbed than usual. Prices generally being well maintained but no premiums are reported. The deadlock in Connellsville coke continues, but may be broken by the financial troubles in Pittsburgh.

Bituminous—Car supply has been better the past week, the decrease in mining the preceding week because of the holiday giving the railroads a chance to catch up. Line demand has been somewhat less on account of stock taking and closing for repairs among consumers. Prices are held without difficulty, but premiums are practically absent. The production of slack is being absorbed better this year than in any previous years, despite the largeness of lake shipments, and on most roads there is practically none to be had at under the regular season figure of 90c. On the Pan Handle there is a little to be picked up occasionally at 70@75c. We continue to quote regular prices as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh Distict.

Connellsville Coke—The market has been ominously quiet during the past week. There was about 175,000 tons a month of furnace coke involved in contracts expiring June 30, operators having demanded $2.50 for their renewal without avail until at the close of June a compromise was reached in several cases, resulting in the sale of about 90,000 tons of coke for July only at $2.50, this price being, in the great majority of cases, guaranteed against decline. It seemed probable that the remaining tonnage would be rounded up by the operators at their price, but complications developed. On Saturday, July 5, several furnaces tried to buy prompt coke, but did not satisfy their demands. Some might have paid $3 on the spur of the moment, but as the coke was not to be had they withdrew entirely. Four of five merchant furnaces have been banked, practically going on strike against the market.

The failure of J. S. & W. S. Kuhn, Incorporated, and the First-Second National Bank, in which they were interested, at the beginning of last week, has introduced fresh complications. The Kuhn Co. controlled the Isabella Connellsville Coke Co., which has gone into a receivership, while two or three coke companies were so tied up with the bank, through receiving commercial accommodations, largely with their bonds as collateral, that some other coke receiverships are not impossible. Buyers are encouraged to hold off, since receivers might not be disposed to adhere to the $2.50 price, and a break in the market is quite possible. Foundry coke has been firm, with a moderate movement on contract. We quote: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $2.85@3; contract foundry, $2.85@3 per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 5, at 333,358 tons, a decrease of 76,641 tons, and shipments at 9665 cars, a decrease of 2316 cars. The great decrease in the week was due to the holiday falling on Friday, little work being done the succeeding day. It is believed that in the past week there has been definite restriction of output by some operators, due to contracts not having been closed.

BALTIMORE, MD.

Trade holding remarkable firm in view of depressed business conditions. Prices stiffening and slack the only weak branch. Water shipments light for the week, but average for the month will be heavy.

The coal trade here is holding up remarkably well under existing circumstances. This is ordinarily the dull summer period and besides business and financial conditions are more or less unsettled. However, should the business uncertainty continue, coal men say it will undoubtedly create a feeling of uneasiness in the trade.

West Virginia three-quarter is in remarkable demand, large quantities being rushed to the lakes, and prices stiffening up from the 90c.@$1 quotations of a week ago to $1@1.05 at present. At the same time the large output of slack with but moderate orders has caused that grade to drop as low as 50@55c. at the mines. Outside of slack, even the cheap grade of coals are holding steady and are in healthy demand. Pennsylvania steam fuels are showing no signs of shading off.

The movement to the piers here continues heavy; this is almost exclusively contract fuel for either coastwise or foreign loading, and it is rare that large free tonnages are found. Not as many foreign charters were announced for the past week, but enough have been engaged to insure a heavy movement throughout the present month.

BUFFALO, N. Y.

Bituminous producers refusing to contract far in the future. Car shortage anticipated in 30 days when the crop movement opens up. Some indication of improvement in coke. Local hard coal dull, but Lake movement still heavy.

It is generally agreed that the bituminous market is growing stronger and some dealers are reporting higher prices. One sale of 50 cars is reported, half at 10c. advance over the price of a month ago for immediate delivery and the other half at 20c. advance for future delivery. The refusal of sellers to bid on contracts for longtime deliveries is becoming more marked of late and shows what the feeling is.

Some dealers have a hard time to get what they want, and in case they are badly tied up with contracts the situation is anything but pleasant. Hereafter all contract figures will be fully up to current prices, with few willing to bid on longtime business. Crops will begin to move liberally within a month which will create a car shortage in addition to the scarcity of men. Nothing but a considerable falling off in consumption will weaken the market, and such is not liable to occur as business is brisk in practically all lines.

Coke is reported stronger, with the soft 48-hr. grades showing a decided improvement in demand. This alone, if it lasts, will add a strength to the entire market that it has long lacked. Coke has been weak all the season, which would indicate that something was the matter with the iron trade, which would naturally cause uncertainty in affiliated lines. Slack coal has not been active for some time, but that trade here is almost entirely governed by the lake conditions, which are not always well understood. If the production of slack that is necessary to a sufficient amount of three-quarter, happens to be excessive, it will remain weak even when sizes are strong, and vice versa.

Bituminous prices are, therefore, quite strong with the exception of slack, which is only moderately so, at $2.90 for Pittsburgh select lump, $2.75 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley about 25c. lower. Coke is improving, but with prices remaining on about the same level.

The demand for anthracite is light and is not expected to be heavier till the farmers are through moving the crops. Country dealers are often doing actually nothing and obliged to take up other business in order to make sure of an occupation. The city demand is better than that, but it is not at all good, and the rail line coal—is moving slowly. Nothing is active but the shipment of anthracite by lake. The smaller ports are quiet, but a large amount is going into the larger ports. For the week the loading has been heavy, aggregating 152,000 tons.

COLUMBUS, OHIO

Demand heavy and prices are showing a strong raising tendency. The Lake movement is large, domestic dealers are stocking to capacity and steam users are demanding good tonnages. The week's production was heavy.

The demand from the Northwest is insistent and the indications are bright for a continuation right up to the close of navigation. Reports from the upper lake docks show that there is no congestion of consequence. Bottoms are being chartered far ahead.

Dealers in all parts of Ohio, Indiana and Michigan are placing orders both for immediate and deferred delivery in preparation for the stocking period, which shows evidence of being earlier than usual. Considerable stir is also seen in school and other public fuel contracts, while the threshing season, which is now at hand, is causing quite a good demand in the rural sections.

Manufacturing establishments are using a large tonnage, and the same is true of railroads. Some of the larger consumers are showing a disposition to stock up to guard against a car famine. Most of the coal men believe that there will be an acute car shortage later in the season, especially when the domestic demand scatters the railroad equipment all over the country.

Production is fairly good in all of the mining districts of the state. This is due to the three holidays of the previous week, which allowed cars to accumulate at the mines. In the eastern Ohio district the output is estimated at 85 per cent. and the same percentage is given from the domestic fields of Jackson, Cambridge and Massillon. In the Hocking Valley, normal production is reported. In the Pomeroy Bend district the output was about 75 per cent. of normal.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump........	$1.60		$1.60	$1.60
¾ inch...............	1.45	$1.20	1.40	1.40
Nut..................	1.25		1.35	
Mine-run.............	1.25	1.10	1.25	1.20
Nut, pea and slack....	0.65		0.65	0.65
Coarse slack..........	0.55	0.70	0.55	0.55

HAMPTON ROADS, VA.

Many steamers delayed because of shortage of coal. With miners again at work, situation will probably be relieved shortly. Operators well covered and indications are that there will be little free coal for some time. Heavy demand in both foreign and coastwise trade.

Dumpings over the various Hampton Roads piers have been anything but heavy during the past week. This has not been caused by a shortage of vessels, but by the lack of coal. However, toward the end of the week conditions have somewhat improved; contractors have managed to take care of bunker steamers and the shortage has affected them but little. The miners in the New River district having gone back to work, coal is now coming forward to tidewater and it is hoped that the next week will see all piers working under normal conditions and the accumulated vessel tonnage taken care of.

There has been a heavy demand for both coastwise and foreign buyers, but as coal has not been in sight, few quotations have been made for July delivery. All suppliers seem to be booked up for their entire output for the balance of the month and indications are that there will be little free coal at this port for some time to come. Even with the shortage suppliers have managed to take care of several foreign cargoes moving to La Plata, Panama, Talcahuano, Rio de Janeiro and Tampico.

LOUISVILLE, KY.

Summer stocking now up to maximum. Market firm and will probably continue so until consuming season starts.

The surplus in the steam coals has disappeared, due to the restricted production over the Fourth of July, and there is a mild shortage now. The situation was made more acute by the sudden cessation in the heavy shipments of pea and slack from the western Kentucky field. However, this general shortage is probably only a temporary condition and is not a serious trouble.

The summer stocking of domestic grades is now up to maximum, and this department is generally firm all along the line; indications are that this situation will continue without a break until the consuming season starts. Some of the fancy grades of eastern Kentucky block coal have recently sold as high as $2 per ton f.o.b. mine; Straight Creek nut and slack is strong at 70c. with the lower grades, including western Kentucky, at 50@60c., and pea and slack at 30@35c.

INDIANAPOLIS

Indiana production running much higher than usual at this time. Car supply good, but trouble anticipated in fall. The hopper bottom car in Indianapolis.

Indiana mines are averaging about four days a week, which is regarded satisfactory for July, since this is probably the dullest manufacturing month of the year. There is no trouble about cars, but apparently there will be as there is a big corn and wheat crop to move. Prices at the mines and in Indianapolis are unchanged. Retail business is apparently larger than it was last year at this time.

DETROIT, MICH.

Market becoming steadily stronger and railroads are handling the coal well. Orders are mostly for spot delivery. Steam coals particularly strong.

Bituminous—The demand is holding fairly strong considering the hot weather prevailing at this time; this is particularly true of the steam coals, the prices on which are holding quite firm. Most orders are for prompt delivery or for not to exceed 60 days. The railroads are handling the heavy movement in a satisfactory manner, and there is no difficulty in obtaining cars as yet, but it is predicted that the situation in this respect will be quite acute in the fall.

If anything the market is becoming steadily stronger. Smokeless coals are particularly difficult to obtain, and this is diverting a portion of the demand for these grades to anthracite. The local market is quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.55	....	$1.50	....	....	$2.25	$2.00
Egg...........	1.55	....	1.50	....	....	2.25	2.00
Steam lump....	1.25	....	....	....	....	....	....
¾-in. lump.....	1.15	$1.15	1.05	$1.15	$1.15	....	....
Mine-run.......	1.10	1.10	1.10	1.10	1.10	1.50	....
Slack..........	0.80	0.85	0.50	0.65	0.65	Open	....

CHICAGO

Eastern coals in sharp demand. Small buying of Western grades has caused prices to sag. Coke more active. Some stocking of bituminous in anticipation of transportation difficulties in the fall.

In view of an expected car shortage, Western dealers are being advised to increase their stocks. With large crops in prospect and the railroads curtailing orders for equipment, it is regarded as certain that they will be unable to meet the demand when the crop movement is in full swing.

So far as Hocking coal is concerned, the market is far from being overstocked. It is estimated that only about one-half of the retailers have as much smokeless coal in storage as ordinarily at this time of the year. As a result of a lack of buying orders for Western coals, lump and egg are selling at the price of steam lump and mine-run. During the past two months, many of the operators in Indiana and Illinois have been running at from 50 to 60 per cent. of capacity. Dullness prevails in the spot market.

An increase in activity has been noted in the coke market. Some contracts for furnace and foundry coke have been closed for the year on the basis of $2.50 at the oven for furnace coke and $3 for foundry. Prevailing prices are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump...........	$1.97@2.07	$2.55	$2.27	
Egg......................		2.55		$3.94@4.20
Steam lump..............	1.82@1.87		2.07	
Mine-run................	1.77@1.82	$2.20@2.30	1.87	3.30
Screenings..............	1.62@1.67	1.90@1.95	$1.62@1.67	

Coke—Connellsville and Wise County, $5.25@5.50; byproduct egg and stove, $4.85; byproduct, nut, $4.75@4.85; gas house, $4.50@4.60.

ST. LOUIS, MO.

The local market seems to be definitely improving. The Keokuk power it has restricted the demand for screening, but there is a general increase in quotations on other grades. Slack is the only weak branch of the trade.

The St. Louis market has started to improve, especially in regards to prices on coals from the Standard field. With the demand for screenings shut off on account of the Keokuk power coming in, there has been an abundance of these.

The prevailing circular is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.85
3-in. lump	....	....	$1.20	....
6-in. lump	$1.15 @ 1.30	....	1.25	0.95
Lump and egg	....	$2.00	....	....
No. 1 nut	1.15 @ 1.30	....	....	0.90
Screenings	0.75 @ 0.85	....	0.75	$0.65@0.70
Mine-run	1.10	....	....	0.80
No. 1 washed nut	1.50	....	....	....
No. 2 washed nut	1.30	....	....	....
No. 3 washed nut	1.25	....	....	....
No. 4 washed nut	1.15	....	....	....
No. 5 washed nut	0.95	....	....	....

St. Louis prices on July anthracite are: Chestnut, $7.25; stove and egg, $7; grate, $6.75. Smokeless lump and egg are $4.65; byproduct coke, $5.10, and gas-house coke, $4.85.

NEW ORLEANS

River movement of coal to the South will be light. Several tows out of Pittsburgh failed to get through. First high-water stage wil see a heavy shipment.

Prospects for a mid-summer movement of Pennsylvania coal are not bright. Waterfall on the Missouri watershed has been lighter than usual, with the result that dredges are already being used in the Mississippi. Shoal water was reported first from Point Pleasant and the head of Island 26. Several coal fleets, which managed to get away from Pittsburgh failed to get out of the Ohio; the big tow boat "Sprague" got through light and is making use of the time in gathering all empty barges. They will be taken as far up the river as the stage will permit

A fleet of loaded coal barges from the west Kentucky mines is coming down the river towed by the "Reaper."

With the first rise in the Ohio, local agencies expect to receive no less than 3,000,000 bushels.

PRODUCTION AND TRANSPORTATION STATISTICS

The Car Situation

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended June 30, as follows:

	Surplus	Shortage	Net*
New England Lines	189	334	145
N. Y.; New Jersey, Del.; Maryland; Eastern Penn.	1,003	692	**311**
Ohio; Indiana; Michigan; Western Pennsylvania	1,422	302	**1,119**
West Virginia, Virginia, North & South Carolina	878	1,111	233
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	300	150	**150**
Iowa, Illinois, Wis., Minn.; North & South Dakota	1,771	161	**1,610**
Montana, Wyoming, Nebraska	118	0	**118**
Kansas, Colorado, Missouri, Arkansas, Oklahoma	2,423	61	**2,362**

Totals	11,055	2,821	**8,234**
Greatest surplus in 1912 (Apr. 25)	94,692	2,144	**92,548**
Greatest shortage in 1912 (Oct. 10)	6,491	14,897	8,406

*Bold face type indicate a surplus.

LAKE SHIPMENTS

Anthracite Shipments through the Sault canals for the current year to July 1 were 1,004,028 tons as compared with 224,908 tons for the same period last year.

Bituminous Shipments for the same periods were: 5,492,091 for the current year as compared with 3,715,397 in 1912 making gross of 6,496,119 for 1913 and 3,940,305 in 1912.

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for April and May and the first four and five months of the years 1912 and 1913:

State	April 1912	April 1913	Four Months 1912	Four Months 1913
Missouri	189,751	204,255	1,142,277	1,047,445
Kansas	303,216	444,142	1,928,482	1,848,869
Arkansas	95,994	136,153	714,884	587,590
Oklahoma	164,270	246,155	1,092,475	1,155,467
Totals	753,231	1,030,705	4,878,118	4,639,371

State	May 1912	May 1913	Five Months 1912	Five Months 1913
Missouri	194,505	186,366	1,336,782	1,233,811
Kansas	254,924	407,124	2,183,406	2,255,993
Arkansas	103,647	130,020	818,531	717,610
Oklahoma	131,220	252,901	1,223,695	1,408,368
Totals	684,296	976,411	5,562,414	5,615,782

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic over the lines of the C. & O. Ry., for May, and the eleven months ending May 30, 1912-13, in short tons:

	May		11 Months			
Destination	1913	1912	1913	%	1912	%
Tidewater	284,109	391,699	3,277,754	23	4,017,374	25
East	155,872	151,952	2,357,236	17	2,012,940	12
West	908,536	893,581	8,153,781	56	10,031,074	62
Total	1,348,517	1,437,232	13,788,771		16,061,388	
Coke	29,438	25,167	285,457		215,707	
From connections						
Bituminous	101,854	13,661	638,124	4	198,125	1
Anthracite	2,638	364	13,952	.	33,555	
Grand total (except coke)	1,453,009	1,451,257	14,440,847	100	16,293,068	100

ANTHRACITE SHIPMENTS

The following is comparative statement of the anthracite shipments for June and the first six months, of the years 1912-13, in long tons:

	June		6 Months			
	1913	1912	1913	%	1912	%

DIVIDENDS

Consolidation Coal Co.—Regular quarterly dividend of 1½% payable July 31 to holders of record July 23.

Pacific Coast Co.—Regular quarterly dividend of 1½% on both the common and the second preferred and 1¼% on the first preferred, all payable Aug. 1 to holders of record July 19 to Aug. 1.

COAL TRADE NEWS

The Hard Coalers Slowing Up—The Philadelphia & Reading Coal & Iron Company's mines will work only four days per week during the balance of the month; the Susquehanna Coal Co. will restrict operations to three days per week; the Lehigh Valley Coal Co. will work on a basis of five days per week; the Lehigh Coal & Navigation Co. will work four days per week during the balance of the month.

PRICES OF MINING SUPPLIES

THE MARKET IN GENERAL

The slowing down of business in all sections of the coun- ry seems imminent, and manufacturers state that industrial nactivity has already manifested itself in many ways. There s a tendency on the part of all classes of manufacturers to o very slowly in the construction of new plants, and the cquisition of existing ones is either held up entirely, or is he subject of careful deliberation.

The volume of business has not slackened to any large ex- ent as is seen by the orders being received by the largest teel makers, which are now running at the rate of 23,000 tons day, compared with the maximum capacity of approximately 8,000 tons daily. On the other hand, this interest has, at imes, booked as high as 70,000 tons daily, spread over an ntire month.

The financial situation is the real cause of the business rouble and the higher rates demanded for money by bankers, oth in the United States and abroad, is causing a great deal f curtailment, and will probably result in the stopping of nuch work. Some of the leading railroads of the country nd industrial concerns with extremely high credit have re- ently borrowed, and paid as much as 7% for their money for hort periods. There is not enough profit in business to in- uce large manufacturers to pay such rates of interest with he hope of making anything on it.

Business is largely tied up with the political situation, hile the inability of Congress to settle the tariff and the urrency Bill has had a bad effect on the situation.

LABOR

Strikes have been less frequent, and there is not so much issatisfaction as there was in May. There continues to be ouble among the miners in West Virginia. A part of the uilding trade in Chicago is tied up, and the strike of the eavers and dyers at Paterson continues, more or less, al- ough it has been gradually weakening for the last six eeks. In New England, there have been serious differences tween capital and labor in certain of the mills around Bos- n. The attempt of the U. S. Secretary of Labor to settle me of these strikes will be watched with much interest.

The trainmen on 48 railroads operating east of the Missis- pi have voted a strike, unless increase in wages is granted. ere has been a refusal to arbitrate the differences under e Erdman Act and there is a possibility of a serious strike. the other hand, it is not generally believed that the train- n will leave their jobs at this time when there is a mani- st lessening in the amount of traffic.

Laborers for general contract work in New York and vi- ity are more plentiful than last year, but good outside or commands $2 per day, and there seems to be likeli- od of this rate being diminished during the present year at st.

IRON AND STEEL PRODUCTS

The unfilled orders of the United States Steel Corporation ing the months of May and June decreased more than 0,000 tons. Since the first of the year they have declined 0,000 tons. In spite of this fact, the unfilled orders at end of June were larger, with only three exceptions, than other year since the organization of the corporation in 2.

The unfilled orders will undoubtedly continue to decrease htly for two, if not three, months longer. By that time re should be enough information to foretell whether a tracted spell of dull business is in sight or the turning t has been reached. The mills have not, as yet, curtailed r operations to any large extent, but they will do so, uld the volume of orders decrease much more, and espe- ly if they do not receive prompt shipping instructions.

ailroads are practically out of the market as far as buy- any kind of materials is concerned, and likewise, the er industrial companies are waiting until more informa- regarding the future is at hand. Quite a little activity oted in the demand for pipe, and the automobile manu- urers continue to take large quantities of all kinds of erials.

teel Rails—Business continues to slow down, and there been very little activity in rails of standard sections, although about 100,000 tons were sold during June. In light rails, the falling off is just as marked, and in a few months the rail mills will have finished their schedules of operation. Before that time, however, it is probable that new orders will be received.

Quotations are unchanged at $1.25 per lb. per standard section, weighing from 50 to 100 lb. per yd.; $1.21 for 40- to 50 lb. rails; $1.30 for 16- to 20-lb. rails. These quotations are per 100 lb. for car-load lots f.o.b. Pittsburgh.

In Chicago, 16- to 20-lb. rails are $1.30; 12-lb., $1.333; 8-lb., $1.40. Relaying rails are sold $24 per gross ton in Chicago, and in New York at $22.50. These quotations can likewise be obtained at other points.

Track Supplies—Business has again fallen off, and is now almost nominal. With the reduction in the volume of business came a contraction of prices. Railroad spikes are now quoted at $1.80, Pittsburgh. Track bolts with square nuts, $2.30@2.40. These prices are per 100 lb. Tie plates are $33@35 per net ton. Quotations in Pittsburgh are likewise easier; railroad spikes are quoted at $1.70@1.75 for the large size and $1.80@1.85 for a small size.

Pipes—Business in the pipe trade is most satisfactory compared with the other iron and steel markets. Several makers in and around the Pittsburgh district report more business received during June than any other month of the year. There is a foreign inquiry in the market for approximately 700 miles of 8-in. pipe, and the National Tube Co. has booked an order for 110 miles of the same size. For pipe used by oil companies in particular there is an exceedingly great demand, and in some instances premiums have been paid over regular prices for prompt delivery. A revision in discount has been made, and net prices are approximately 5% higher than they were last month.

Discounts and net prices are as follows:

	Black	Galvanized
¾- to 2-in. steel butt welded...........	79%	70½%
2½- to 6-in. steel lap welded...........	78%	69½%
7- to 12-in. steel lap welded............	75%	64½%

At these discounts the net prices of pipe per foot at Pittsburgh are as follows:

Diameter	Cents		Diameter	Cents	
	Black	Galvanized		Black	Galvanized
¾-in.........	2.43	3.40	5-in.........	30.50	45.00
1-in..........	3.58	5.00	6-in.........	42.25	58.25
1¼-in........	4.85	6.80	7-in.........	59.50	85.00
1½-in........	5.80	8.10	8-in.........	62.50	89.00
2½-in........	12.90	17.80	10-in........	$1.03	$1.46
3-in..........	16.80	23.30	11-in........	1.13	1.64
4-in..........	23.90	33.20	12-in........	1.27	1.82

Sheets—Continued weakness has prevailed in the sheet market, and early in June the price of 27 galvanized in large lots, Pittsburgh, declined 5c. per 100 lb. to $2.25. At that time there was quite a fair business transacted at these prices, and the mills placed a number of orders on their books for future delivery. Since then, efforts have been made to secure galvanized sheets at $3.25, but in many instances mills have refused to accept these quotations except for fourth-quarter delivery. The reason for this is that their order books have been filled with enough third-quarter business to keep their mills very actively engaged, and for the slight additional capacity they have, there was no need of cutting the quotations. There is no doubt that numerous mills would be very willing to accept $3.25 for fourth-quarter.

The following quotations are for lots of a few bundles each. f.o.b. Pittsburgh and Chicago. Price for large lots is as stated, $2.25 f.o.b. Pittsburgh for No. 28 base.

	Cents per pound			
	Pittsburgh		Chicago	
	Black	Galv.	Black	Galv.
Nos. 22 and 24................	2.70	3.50	2.65	3.45
Nos. 25 and 26................	2.75	3.65	2.70	3.60
No. 27	2.80	3.90	2.75	3.85
No. 28	2.85	3.95	2.80	3.90

Structural Materials—There is a dearth of business in the East, principally because building operations cannot be financed on any reasonable terms. In the West, the railways are curtailing their orders for bridges and structural material for similar reasons, it being almost impossible to secure funds to pay for these improvements. How long such a condition will last is only a matter of conjecture, but in the meantime, structural mills are working on old orders, and have very little new business. Some extremely low prices have been made for fabricated work, and it is probable that mine improvements can be carried on more cheaply now than at any time in several years.

Quotations for structural steel bars are unchanged and plates, beams and angles being held at $1.50 base Pittsburgh. Chicago price is $1.68@1.73. These prices are per pound in carload lots.

Spiral Riveted Pipe—Prices are without change. The following quotations are f.o.b. factory, freight equalized with New York, being figured at a discount of 50, 10 and 10% from list. These are for orders amounting to approximately $250. For large orders, prices are cheaper by 12½ to 20½.

Diameter in in.	Thickness Birmingham wire gage	Net price per 100 ft. With bolted joints complete Plain	Asphalted	Galvanized
4	18	$19.76	$21.48	$30.74
5	18	23.40	23.70	37.14
6	16	33.05	35.76	49.73
7	16	37.58	40.76	56.82
8	16	43.17	46.80	65.00
9	16	50.06	50.10	74.22
10	14	66.42	71.08	96.15
11	14	71.20	76.57	102.24
12	14	83.75	89.15	118.30

Pig Iron—Curtailment in the output of pig iron has not been as drastic as was expected late in the spring, and in point of fact, prices have declined faster than production. The daily rate of pig-iron manufacture in June was over 87,000 tons, which is smaller than any month since October of last year, but it is a difference of only a few figures for the high record established in February was only 92,300 tons daily. For the last 19 months the pig-iron production of the country has exceeded 2,000,000 tons monthly. The make in June was 2,600,000 tons compared with 1,045,000 tons, the low point, in January, 1908. It is believed that production will show a further falling off of from 5% to 10% this month, for already several furnaces have been banked, and the high price of coke is having an influence, for there is little profit in making iron to sell at $14 with coke costing $2.50. Consumers have been buying iron only sparingly, although some fair-sized lots have been disposed of to manufacturers of cast-iron pipe and the malleable foundries in the East. Prices are down $2 to $3 below what they were in November and December, and as low as $10 has been accepted for No. 2 Southern Foundry at Birmingham.

WIRE PRODUCTS

Wire—The only orders received by manufacturers of wire and wire products are from jobbers and consumers who need material for immediate requirements. There is little or no incentive to buy for forward delivery, as prices have apparently reached their maximum, and in some cases are lower. In Pittsburgh, there has been a decline of $1 per ton on annealed fence wire. Annealed fence wire in large lots can be had at $1.55. Galvanized barbed wire at $2.20, annealed is $1.80. These quotations are f.o.b. Pittsburgh. In Chicago No. 9 plain wire is $1.78; painted barbed wire $1.98, and galvanized $2.38.

Wire Rope—The demand is less than last month. Quotations are as follows: Two-inch rope, Pittsburgh, 50c. per lin.ft.; 1¼-in., 23c.; ¾-in., 10c. These quotations are for the best grade of rope, and cheaper grades can be had at considerable concessions from these figures.

Copper Wire—There has been a distinct falling off in the volume of business and prices are very much unsettled. Some quotations are 17c. per lb., but it is probable that a desirable order for large amounts could be placed at much less than this figure. The one redeeming feature in the wire trade is the proposition to electrify several important trunk lines in the West.

HARDWARE

Nails—The nominal asking price of nails continues unchanged, at $1.80 Pittsburgh and $2.10 New York. This price is not a reflection of market conditions, except in so far as it portrays the dullness at Pittsburgh and the inability to secure orders even if concessions were made. For small lots in jobber's store, 2c. is named at Pittsburgh and 2.20c. at Chicago; approximately the same prices may be obtained in important jobbing centers throughout the Middle West as at Chicago.

Bar Iron and Steel—Prices are much better than the casual observer would think, in comparison with the small amount of business being transacted at the mills. This is easily explained, because consumers are now buying from store in New York in comparatively small lots, in preference to loading up with material at the mills, which may be considerably cheaper before it is used. Quotations from store are as follows:

Refined iron:	Per lb
1 to 1⅞ in., round and square	2.10c
1½ to 4 in. x ⅜ to 1 in.	2.10c
1½ to 4 in. x ¼ in. to 5/16 in.	2.30c
Norway bars	3.60c
Soft steel:	
¾ to 3 in., round and square	2.05c
1 to 6 in. x ⅜ to 1 in.	2.05c
1 to 6 in. x ¼ and 5/16 in.	2.20c
Rods—⅝ and 11/16 in.	2.15c
Bands—1½ to 6 3/16 in. to No. 8	2.35c
Beams and channels—3 to 15 in.	2.15c

Extras for triple B (BBB)

3/16 and ¼ in.	2c.
5/16 and larger	1.75c

Chain—There is less demand than a month ago. Ruling quotations per 100 lb., f.o.b. Pittsburgh, are as follows:

3/16 in.	$7.5
¼ in.	4.9
5/16 in.	3.9
⅜ in.	3.4
7/16 in.	3.2
½ and 9/16 in.	3.0
⅝ and 11/16 in.	2.9
¾ and 13/16 in.	2.8
⅞ and 15/16 in.	2.7
1 to 1¼ in.	2.6

Extras for BB

3/16 in.	1.5
¼ in.	1.5
5/16 and larger	1.2

METALS

Copper—Less copper was bought in June than in previou months of the year, but as consumers continue to take fai quantities on contracts made some time ago, and, principall because an important refinery in the East was closed dow the statistical position showed an improvement, and the stock remaining at the end of the month were smaller than an other month this year. This, however, had no effect on quo tations, so prices continue to melt away slowly but steadily Producers' agents made no open effort to sell below 14¾c but jobbers who frequently acted for selling agents wer willing to make sales at 14⅜c. for electrolytic. Europea consumers are not buying anywhere near as much as the were a year ago.

Tin—Not since the present boom in tin started in the earl part of 1911, have prices been as low as they now are. Th London market steadily declined throughout the month an sales were made at around 39c. per lb. This is a very drasti decline, representing a reduction price of 13@14c. in th high figures and fully 25%. Whether the tin market will re turn to a level of around 30 to 40c., as has been the case fo a number of years, is only a matter of conjecture, but fro the statistical position there seems to be no good reason wh such prices should continue for any length of time.

MISCELLANEOUS

Portland Cement—Manufacturers of portland cement hav enough orders on their books to keep them running well int September of this year. At the same time there is very littl business being transacted for forward delivery and it woul not be at all surprising if a revision of prices were made i the fall. The reason for this has been the sharp falling o of contract work all over the country. Municipalities are no doing anywhere near the amount of contracting work the were two years ago, due to inability to finance the operation Similar conditions prevent railways increasing their faciliti and it seems likely that there will be less cement used in th last half of 1913 than was in the corresponding period of 191

Prices show no change; in Pittsburgh, the price is 90c.@ $1; in Chicago, $1.10@1.20; in the Lehigh Valley district, 95c.@ $1. All these prices are in bulk at the mill, and general con sumers have to pay 40c. per bbl. for the package and als freight to destination, making a price to Pittsburgh of $1.5 and one in New York of $1.58. The allowance for bags re turned varies from 7½ to 10c.

Bars, Concrete Reinforcing—Consumers of bars are speci fying freely on old contracts, but are not entering new one Quotations for small lots from Pittsburgh warehouses ar as follows:

PITTSBURG, CENTS PER POUND

	Warehous Stock
¾-in.	2.00@2.1
⅝-in.	2.05@2.1
½-in.	2.10@1.2
⅜-in.	2.25@2.3

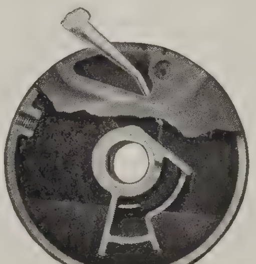
The Lubricating System

on Baldwin-Westinghouse Mine Locomotives reduces wear to a minimum

The frame is so designed that the journals, and the motor armature and axle bearings are easily reached for thorough lubrication.

The lubricating system of the motor, as shown in the illustration, is a distinctive feature of Baldwin-Westinghouse Mine Locomotive Motors. A large pocket is provided for the waste which comes in contact with the shaft through openings in the housings and the bearings.



The oil is poured into a separate reservoir and is absorbed by the waste. All grit and dirt in the oil is thus filtered out and only clean oil reaches the shaft. The depth of oil in the reservoir can be easily gauged. An overflow opening in the armature oilwell prevents flooding the bearing. The axle bearings are oiled in a similar manner.

This system, with specially designed bearings for long life in service, has been adopted as standard after years of investigation.

Full information regarding these locomotives upon request.

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 111

An excerpt from a woman's description of what she saw in Alabama coal mines. Her impressions are calculated to make us believe that our underground workings are picturesque places filled with romance.

*A RECENT UTAH COAL-MINE DEVELOPMENT: *Pages* 112-117

The topography of the country practically forbade surface haulage from the mine to the tipple. An aërial tramway was therefore installed and a type of mine car developed, the body of which is composed of two tramway buckets, which may be lifted from the supporting truck by the tram carriers and thus conveyed down the mountain to the loading tipple spanning the railway tracks. W. R. Elliott. COAL AGE, Vol. 4.

SOLUTION OF TWO GASOLINE-MOTOR PROBLEMS: *Pages* 118-119

The two most apparent objections to the gasoline motor are that the oil may explode and that the exhaust is liable to befoul the mine air. The evidence of all past experience shows these difficulties are not hard to meet, and the author believes they should not act as a bar to the further use and development of gasoline motors. R. O. Hodges. COAL AGE, Vol. 4.

*PROPOSED METHOD OF LONGWALL MINING: *Pages* 120-122

Description of a method of longwall mining proposed for working the lower Kittanning seam in the northern part of the State of West Virginia. The method contemplates the subdivision of the workings into panels to be worked on the retreating system, having due regard to the pitch of the seam so as to favor the movement of the loaded cars. F. C. Cornet. COAL AGE, Vol. 4.

WEST VIRGINIA OPERATORS ALLEGE CONSPIRACY OF COMPETITIVE STATES: *Page* 123

POWER DEPARTMENT: *Pages* 124-127

*A MOTOR-DRIVEN MINE PUMP FOR OPERATION ON INCLINES.

AN INDUCTION MOTOR OF NEW DESIGN.

PROPER INSTALLATION OF ALTERNATORS:

The principal differences in the construction of alternators, which bear directly upon the methods employed in installation, are here enumerated, together with the successive steps to be taken in setting up the machine and making it ready for successful operation. C. A. Tupper. COAL AGE, Vol. 4.

*A NEW FEED-WATER HEATER.

The Trouble With Filson

The Weekly Ad-Talk Page

A couple of weeks ago I was eating dinner in the dining room of a hotel in one of the smaller coal mining towns of Illinois.

At the next table were two business men who were engaged in conversation and their table was so close to mine that I could not help overhearing a good deal of what was said.

After comparing notes on various matters of business and talking over the affairs of the village, I heard one of them break in thus:—

"Say, what do you think of Filson's new patent device?"

"Well, it looks good to me," was the reply, "I think he has the right idea and it certainly seems well made, but there's one thing about it I don't like."

"What do you mean?" asked the other.

"Well, he doesn't advertise it—seems as if it ought to have a ready sale, for I know there's a demand for that sort of an article."

"I have thought of that myself; it certainly looks as if he doesn't believe in it himself, or he would stake some money on it and buy a few pages of advertising."

"That's the point exactly. If he had absolute confidence in it, I'd buy it, but as he doesn't, it looks as if there was a nigger somewhere in the wood pile."

At this point the busy waitress began loading up my table and I stopped eavesdropping. However, as I ate my dinner I thought to myself, "Well, from listening to those two men, I have gathered in material for another weekly ad talk page."

For the men were right. There is usually something wrong, incomplete, unaccepted, questionable about an unadvertised article. Either the maker is afraid of it, or the publishing firm is afraid of it and won't discredit itself by standing silent sponsor for it in its selling section. Something's wrong or that advertising campaign would commence.

Men are shrewd. They don't want to buy an article if they think that the manufacturer himself doesn't believe in it to the limit. If he isn't sure enough of it to come out in black and white and show it up in all its points, the buyer is pretty sure to fight shy of that article.

If a thing is not advertised—why? You do well to put that question to yourself and wait.

COAL AGE

Vol. 4 NEW YORK, JULY 26, 1913 No. 4

There's an old saying worded something like this: "A man would never know he had neighbors were it not for the women folks." The following is clipped from a recent issue of an Alabama paper and was written by a woman. Until now we never knew, or at least never realized, the manifold beauties of our mines. When we might toil in such a picturesque place and amid such romance, why should any of us want to remain on top?

* * *

"The mine machines, viewed in a machine shop, or on the surface where they are lifeless, inanimate—do not attract you.

"But come below. Now see them. They are huge shadow shapes in a quivering sensitive dark. Each one attacks a solid wall of coal, advances a long saw-like cutter bar beneath the seam at one rib of the room and feeds itself across the entire length of the face at a speed of thirty inches per minute.

"See that cutter down at Mulga—you'll never forget it! See that longwall cutter at work in Montevallo! Get lost in the depths of a great mine—these vast, strange, petrified forests of a thousand centuries ago—here are the works of Hephaistos himself come true! If ever there was a place where fancy itself may run wild riot, it is down a deep coal mine.

" 'Hear the gas?' the engineers with you halt where the track swerves off to another one of the entries into another 'room.' All is quiet save a far-off trickling sound, slight and musical.

" 'Why, like a little waterfall somewhere.' You stop and listen dumbfounded. 'Some water there, too,' says the mine superintendent, 'gas and water mixed.' The sound goes on. It never, never stops. In the silent, subtle dark it even seems to increase, until, in fancy, a hundred little white streams steal through the ancient coal plants, the black roots, the reeds, the shadowy ferns and mammoth trees buried there these million years. The old coal forest is *young again, all quivering with light and life and passion for the sun.*

"Half lost in the everlasting gloom near the rigid heading, the miners swing their pit lamps up to the low roof, where close under a stratum of slate, above the shining band of coal, ever lurks that alluring sound, the voice of a mysterious invisible vapor, poisonous breath of the long imprisoned coal plants—the deadly firedamp.

"Instantly it catches fire. Quick as forked lightning, treacherous, wild, fantastic—golden hair of the Lorelei—it plays over the face of the coal. 'Light carbureted hydrogen,' explains the engineer, 'as cooly as though he were saying, 'Fine weather we're having today.'

"The witch-like strands of the blue and yellow flames leap now like strange live things. 'The ghosts of the mines!' says the superintendent as he and the miners quietly beat out the flames.

"D'you wonder the niggers take 'em for ghosts?"

* * *

No! we are not surprised that the darkies are superstitious, but we do wonder what would have happened if about that time a full-grown rat, or perhaps two rats, "buried there these million years, should have become *young again, fresh again, all quivering with light and life and passion for the sun.*"

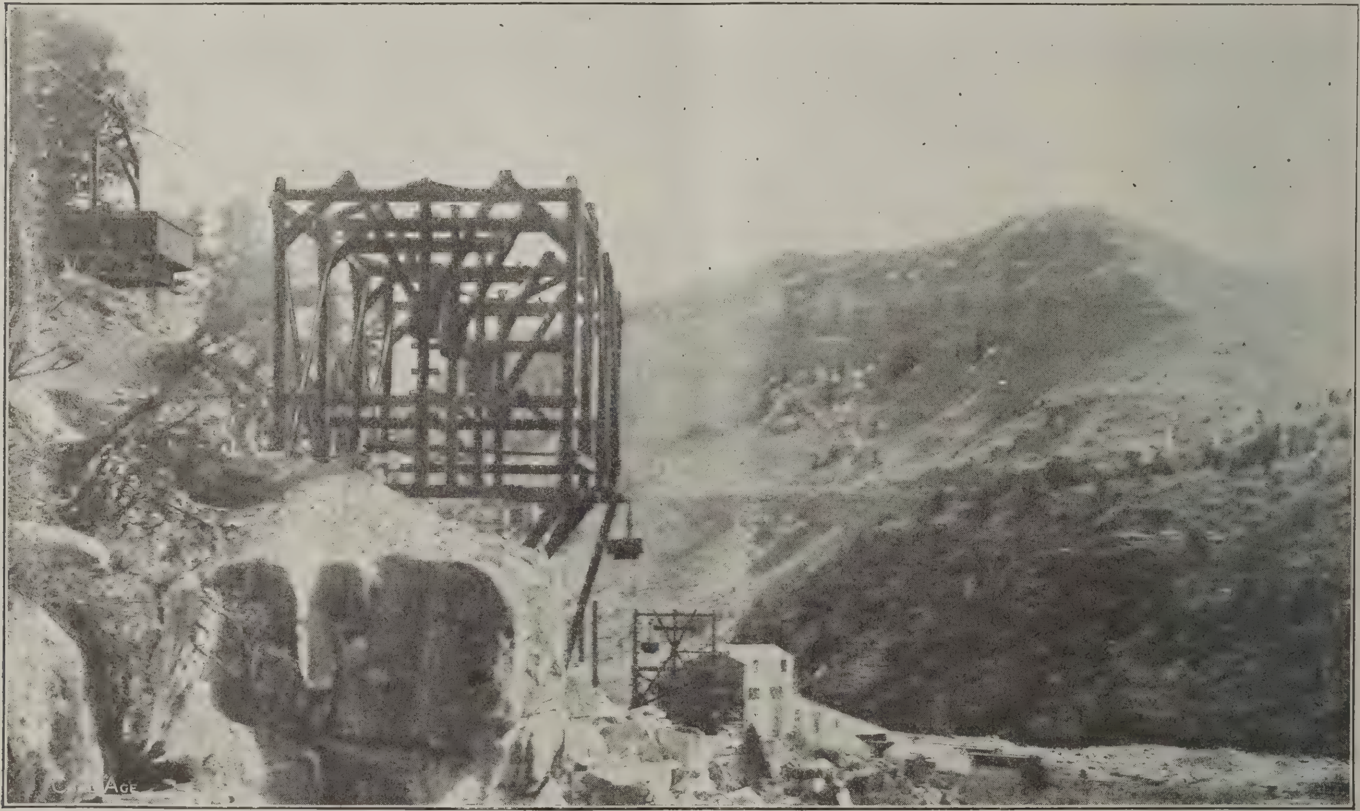
A Recent Utah Coal-Mine Development

By W. R. Elliott*

SYNOPSIS—The topography of the country practically forbade surface haulage from the mine to the tipple. An aërial tramway was therefore installed and a type of mine car developed, the body of which is composed of two tramway buckets which may be lifted from the supporting truck by the tram carriers, and thus conveyed down the mountain to the loading tipple spanning the railway tracks.

⁂

About the middle of 1912 the Spring Cañon Coal Co., an affiliated interest of the Knight Investment Co., of Provo, Utah, decided to develop its property, comprising a total of 2000 acres in Carbon County, Utah, and located about five miles up Spring Cañon from the town of Helper, a division point on the Denver & Rio Grande R.R.



The Four-Saddle, Overhanging Tower Where a Decided Change in Grade Is Made

Three workable coal beds underlie this acreage. These are known as Nos. 1, 2 and 3, the vertical distance between No. 1 and No. 3 seams being 180 ft. The coal in all these measures is jet black, heavy, hard and compact, has excellent luster, without stains, spots or pyrites. The average analysis of the samples from the different deposits are as follows: From the upper or No. 3 seam, volatile matter, 43.4 per cent.; fixed carbon, 51.2; ash, 3.6; moisture, 1.8; sulphur, 0.89; heat content, 14,725 B.t.u.; thickness of deposit, 8 ft. From the middle or No. 2 seam, volatile matter, 47.4 per cent.; fixed carbon, 47.2; ash, 4.6; moisture, 0.7; sulphur, 0.98; heat content, 14,739 B.t.u.; thickness of deposit, 4 ft. 8 in. From the lower or No. 1 seam, volatile matter, 46.7 per cent.; fixed carbon, 46.9; ash, 4.5; moisture, 1.9; sulphur, 1.07; heat content, 14,547 B.t.u.; thickness of seam, 9 ft.

A Branch Railroad Was Necessary

A branch line was built from the Denver & Rio Grande at a point immediately north of Helper to a place where a satisfactory tipple location could be secured, a distance of approximately four miles. For a distance of 3000 ft. between the tipple site and the southern extremity of the property where development work was commenced, the topography of the ground was such as to preclude the railroad being extended further, unless Shay engines were secured to operate thereon. The branch, as constructed, has a maximum gradient of 3.87 per cent., with curves of 10 deg. It is laid throughout, including the tipple tracks, with 75-lb. rails. The Spring Cañon Coal Co. owns its own roundhouse, water tank, etc., these buildings being located at the Helper terminus of the branch, and the present motive power consists of two consolidation-type locomotives.

Two systems of coal transportation from the mine to the tipple were considered, namely, surface and aërial tramways. The sides of the cañon are precipitous. There are also one or two tributary cañons over which high and expensive trestles would be necessary if surface haulage were employed. In consideration of the foregoing, the aërial tramway was selected as the most satisfactory solution of the conveying problem. This apparatus was

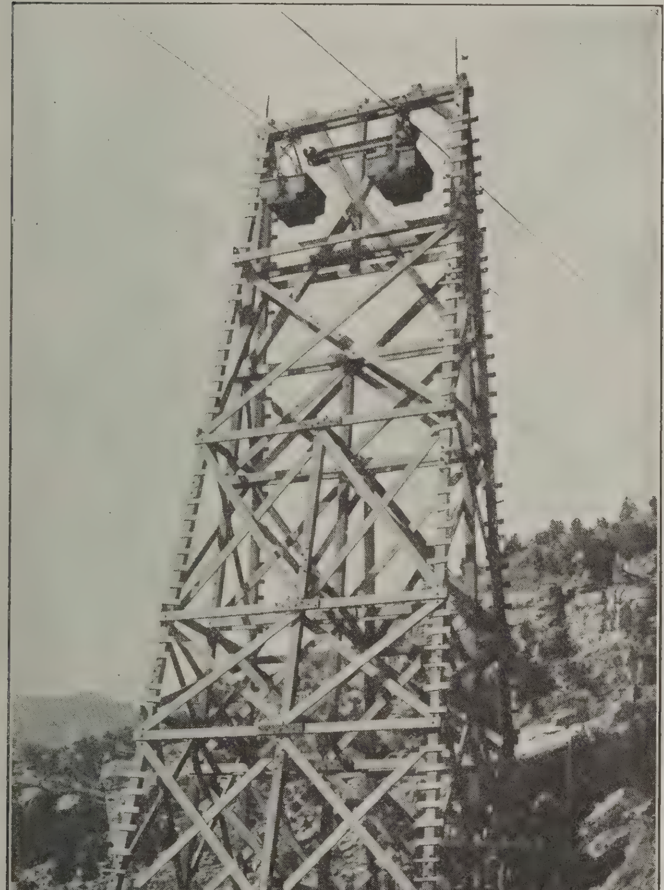
The Cable Back-Balance

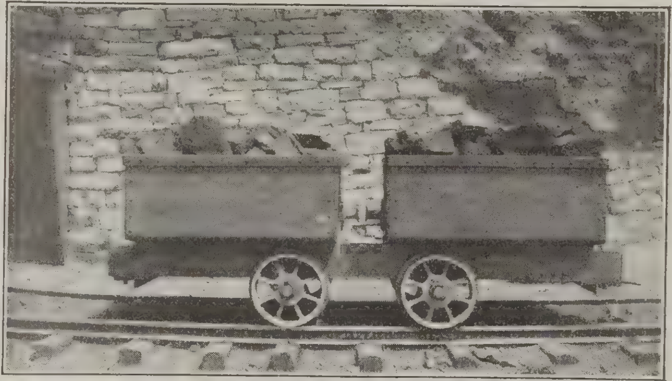


One of the Tramway Towers

furnished by the Trenton Iron Co. (now the American Steel & Wire Co.), and was installed under the direction of its engineers, Messrs. Carstarphen & Holmes.

Although most of the construction work was done during the coldest weather of winter, no time was lost. The final plans were received Jan. 9 and the last carload of machinery on Jan. 23. The line was started on Feb. 13, and has been in continuous operation ever since.

A Locomotive and Trip of Cars



The Two-Bucket Mine Car

One of the Towers, Showing the Large Bucket Clearance

Owing to the abrupt topography of the cañon and the location of the tramway, considerable ingenuity was necessary in the design of some of the supporting structures. At one point, where a sharp change of grade takes place, the vertical curve in the cable is divided between four saddles. One side of this structure rests on solid rock, while the other is cantilevered over the edge of the precipice. At the loading terminal, one end of the structure is carried on a 50-ft. arch truss. The line is 10-ft. gage and the towers are so designed as to allow ample clearance when the buckets are swinging. This was necessary on account of the high winds that prevail in the winter. Lock coil cable is used for the tracks, the one for the loaded buckets being 1⅝ in. in diameter, while that for the empties is 1¼ in. in diameter. These cables rest in grooved saddles supported by 10-in. channels on towers. Each is anchored at one end, while at the other it is attached to chains, which, in turn, pass over heavy sheaves and are fastened to weight boxes. This method of back-balancing at all times maintains a uniform tension on the cables independent of the loading or weather conditions. The gross weight of box and stone on the loaded cable is 35 tons, and on the smaller cable, 16 tons. The weight boxes are so suspended, that when the loads are off the line, the box rests on the ground, and when the line is loaded, the box springs clear. This relieves the cable from the total strain when not in use, and increases its life.

Car in Position on Transfer Table

Mine Foreman's Office and Empty and Loaded Tracks. Note Safety First Signs over Both Openings

The difference in elevation of the terminals is 321 ft., of which 225 ft. occurs in the first 1300 ft. from the loading terminal. This inclination is sufficient not only to run the tramway, but to develop considerable power. The tramway is motor-driven and required 12 hp. to start off with the empty buckets going up hill. After being limbered up about 15 hp. was developed, with a loading equal to 75 tons per hour. At the ultimate capacity of 250 tons per hour, approximately 50 hp. will be developed.

This is no inconsiderable item and is not wasted. The motor acts equally well as a generator and returns surplus current to the power line, at the same time acting as a brake to regulate the speed of travel. Brakes are also provided on both the main drive and pinion shafts for stopping the line and controlling its speed, should any accident occur to the motor or other connections.

The traction rope is a ⅞-in. lang-lay cable and is maintained at proper working tension by a 5000-lb. back balance. The rope speed is 500 ft. per min., this having been found most desirable for the loads handled. The tension sheave of the traction rope is 10 ft. in diameter and is located at the discharge terminal. This sheave runs upon a bearing mounted on a truck connected to the weight box and set at a considerable inclination from the horizontal to compensate for the difference in level between the empty and loaded tracks.

A Peculiar Coal-Mine Car

The tramway buckets are so made that they may be placed, two at a time, upon a suitable truck, which is run into the mine and otherwise handled exactly the same as an ordinary mine car. From these trucks the loaded buckets are transferred to the overhead cableway at the loading terminal by means of an apparatus called the "transfer table."

As above stated, the trucks come from the mine carrying two buckets each of a nominal capacity of 2000 lb., but in actual practice, the average weight of contents is 2300 lb. The mine locomotive pushes the cars over a knuckle from whence they coast to the scales. Immediately in front of these are set the blocks or squeeze-brakes consisting of a pair of heavy timbers set one on each side of the track. These are pivoted on the end next to the approaching cars and clear the wheels slightly. The other ends are connected with links and levers to allow of their being closed sufficiently to prevent the cars running through. When the operator stationed here releases this brake, the cars coast across the scales into the loading terminal of the tramway.

After passing the scales the cars are stopped upon the adjoining transfer table. This is a large platform pivoted at one end, the other being connected to a pair of cranks driven by an electric elevator machine and capable of being raised or lowered as desired. The track crosses this platform near the center, where there is a vertical movement of about 12 in.

A pair of hangers having been previously positioned on the overhead rail above the transfer table and pushed outward to clear the approaching loaded truck, the table is raised. This operation brings the platform track level with that of the scales. The car is run upon this platform, the support for the empty hangers withdrawn, permitting the hooks forming the ends of the hangers to fall beneath the trunnions of the buckets. The platform is then lowered which leaves the buckets suspended by the hangers from the overhead rail. They immediately coast to the front of the terminal, where an operator is stationed to space them at regular intervals.

A gong geared to a sheave wheel gives warning when the proper distance has been attained for attaching the bucket. The platform meanwhile remains down until two empty buckets have been positioned over the truck. The operator then throws a switch; the platform rises and the empty truck thereon lifts the buckets clear of the hangers, which are then pushed outward and the latch holding the truck in position on the platform withdrawn. This allows the car to run through a switchback and coast into the mine.

The Transfer Tables Are Duplicated

In order to facilitate the rapid handling of buckets two transfer tables are provided, so arranged that one man can operate both at the same time, or either independently. The time cycle for complete operation on one table is 40 sec., or for the two tables, 50 sec.; but four buckets are transferred with the two tables, while only two are handled with the one.

The Head of the Conveyor Line. Note Character of Country

The loading terminal is located on a ledge of rock, and all available space was utilized to the best advantage. The driving and breaking mechanism is placed in an excavation beneath the floor, the traction rope passing around sheaves 8 ft. in diameter to eliminate bending stresses. The track to the kick back passes directly over the wheel pit and between the incoming and outgoing parts of the traction rope.

The track, or suspension cables for the buckets entering and leaving this station, have a difference of elevation of 4 ft., to give necessary grade for the buckets to run freely anywhere in the station without assistance from the operators. The difference in elevation of the cables here required a difference of half that amount on the first tower from the loading terminal. On other towers the empty and loaded cables are carried at the same elevation with the exception of the tower next the discharge terminal, where a difference also exists.

The discharge terminal presents only one unusual feature—that of having the hopper located under a sharp curve in the overhead rail at the extreme end of the structure. This necessitates bringing the buckets to a complete stop in order to dump. The grips employed to secure a hold upon the traction rope are operated directly by the weight of the load they carry. Thus, the heavier the load the greater the pressure exerted by the grip jaws on the cable. These grips can only be relieved by bodily lifting the load and depressing the tracks simultaneously. This is accomplished in the terminal by attachers and detachers wherein the load is lifted by side rollers rising on incline planes at the same time the track is depressed. This causes the jaws to remain open long enough for the rope to enter or leave the grip as the case may require. This operation is entirely automatic, the grip at all other times remaining closed.

A Freight Elevator for Handling Supplies

A freight elevator is installed at the discharge terminal to facilitate the transportation of material brought in on the railroad for use in the mine. This elevator is 10x6 ft., with a lifting capacity of 2500 lb. It is equipped with modern safety speed governor and automatic limit stop, which prevents the platform from running beyond the terminal landing and thereby causing accidents. Material elevated from the ground to the floor of the discharge terminal is conveyed to the mine over the tramway in the coal buckets or by special hangers adapted to such material as steel rails.

Particular attention has been paid to the problem of lubrication, grease cups being provided for all bearings, sheaves and rollers on the entire tramway. The terminals are housed in with corrugated iron, which has been painted. The towers also have been painted, furnishing a pleasing contrast with similar installations often left in the rough state.

A total force of ten men at $35 per day is required to handle an output of 2000 tons. This brings the transportation charge from mine to tipple to 1¾c. per ton. Had the conditions governing the location of loading terminal and tipple been favorable, this would have been materially reduced.

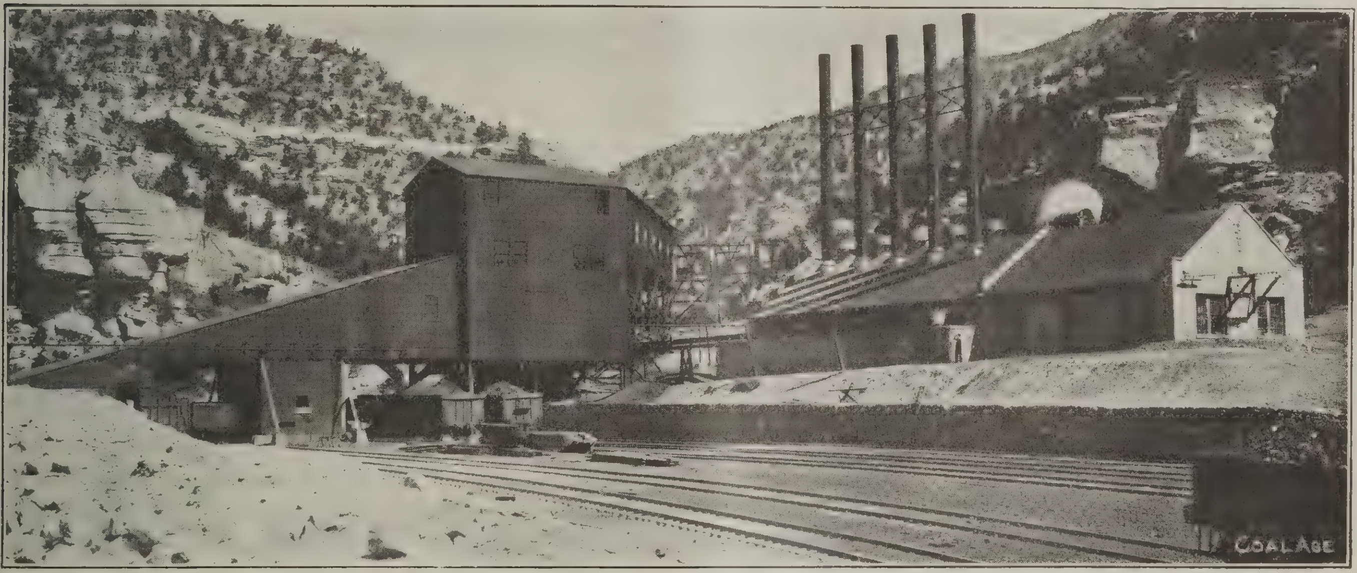
The tipple building, which is steel construction throughout, was built by the Ottumwa Box Car Loader Co., and is equipped with shaker screens which permit the standard separation, common to the district, to be made. After discharge from the tramway into a bin, provision has been made for picking the coal on a suitable table 30 ft. long between centers and 5 ft. wide. It is hardly probable, however, that this will be required in view of the clean condition of the coal naturally. This conveyor may, however, be used as a feeder.

Two box-car loaders are installed adjacent to the outside track, permitting the loading of lump and nut, or run-of-mine into cars upon either track. Provision is also made for coaling the engine with run-of-mine or lump.

A Well Equipped Power Plant

The power-plant building is a substantial stone structure with an asbestos shingle roof carried upon steel trusses. A bin for boiler coal extends the length of the boiler house, the fuel being conveyed thereto by a belt and screw conveyor. Steam is generated in five Scotch marine boilers of 150 hp. each manufactured by the Springfield Boiler & Manufacturing Co. The power-house equipment consists of two 250-kv.-a. sets and one 50 kv.-a. set. The former are Buckeye engines connected to General Electric generators, while the smaller unit is driven by a B. F. Sturtevant vertical engine. The latter unit is expected to provide current for lighting the towns, mine and mine buildings and driving the pumps.

Current is generated at 2300 volts and suitable transformers provided near the tipple and at the mine where needed. All equipment is motor driven with the exception of the box-car loaders, which are operated by engines. For the main-haulage and coal-cutting machines three motor-generator sets have been installed, each delivering 100 kw. at 250 volts. Direct current is used inside the mine. The mine fans are also driven by direct-current motors, so that the amount of air furnished may be regulated to amply meet all requirements but prevent undue absorption of moisture. Fifteen-ton haulage locomotives are used on the main haulageways, 6-ton gathering locomotives being employed to bring the cars from the rooms.



The Power Plant and Tipple Spanning Railroad Tracks

Good Houses, Water Supply and Sewerage System

The water supply for the plant is obtained from a large spring, located about one and a half miles up Spring Cañon from the tipple. The flow from this source is more than ample to care for the present requirements of the plant. Gravity supply is obtained at the boiler house, while a pump house located about midway between the tipple and mine to which the water flows supplies the town and provides for the sprinkling system underground. Two 5x6-in. vertical single-acting triplex electric pumps equipped with automatic compensator and float switch are installed in this pump house.

The miners' houses are exceptionally good, being built of stone and made strictly modern throughout, containing four rooms exclusive of the bath room.

A good sewerage system has been laid and all houses are connected thereto. Two settling tanks have been built for the purification of this sewarage. Satisfactory results are being obtained from this system of purification, the discharge being clear and odorless.

⁂

A Big Western Coal Consolidation

The *Boston News Bureau* says under date of July 3:

Plans for extensive coal development in Colorado fields are on foot. By their consummation 30,000 acres of Routt County coal lands will be taken over by a combination of Belgian and Paris capitalists. Five Paris banking concerns and coal kings of Belgium are said to be interested. These include Prince Henri de Croy, a member of the ruling house of Belgium, and Camille Peria and W. J. van Maanen, representing French and Belgian capitalists. A. R. Bickerstaff, of Consolidated Securities Co., of Toronto, Can., and Benjamin L. Dorsey, have taken over the coal lands. Foreign moneys will purchase $28,000,000 worth of bonds in Yampa Fuel & Iron Co., and Colorado & Northern R.R.

President Dorsey, of Yampa Fuel & Iron Co., says: "We have ironbound contracts with the bankers of the French and Belgian capitalists providing for sale of the $28,000,000 of bonds, as soon as they have been shown that the properties in Routt County are as represented."

Denver newspapers say that there will be an initial expenditure of $22,000,000 in Colorado and Wyoming. A railroad is projected from Hayden, Colo., to Casper, Wyo. It will be known as the Colorado & Northern Ry., and will extend from Hayden on the Moffat road through the Routt County coal lands to Hahns Peak, a copper and placer mining district. It is expected to lead to the reopening of old copper mines and the revival of the placer-mining industry in that section. It is projected thence through the copper fields of the Bartle Lake district to Walcott, Wyo., 16 miles. There it will intersect the main line of the Union Pacific Ry., thereby furnishing transportation facilities for the coal East and West.

From Walcott the railroad would extend to Caspar, Wyo., connecting with the Chicago & North Western and Burlington lines. These connections will afford facilities for placing Colorado coal in the Northeast as far as St. Paul and Minneapolis, and Puget sound in the Northwest, equal to nearly a third of the United States. The plans call for 210 miles of new road.

The first section of the road it is ascertained will be completed within a year.

⁂

Explosives transported on mine cars should be kept off the floor and away from iron fittings, as such fixtures are apt to be affected by currents from the drawbars if the rails are slippery and sand is used to overcome slipping.

Solutions of Two Gasoline-Motor Problems

By R. O. Hodges*

SYNOPSIS—The two most apparent objections to the gasoline motor are that the oil may explode and that the exhaust is liable to befoul the mine air. The evidence of all past experience shows these difficulties are not hard to meet, and the author believes they should not act as a bar to the further use and development of gasoline motors.

⁂

There are two dangers from the gasoline mine motor which have been much exploited, and which are, of course, present in some degree. The first danger is that of fire. At first sight it seems like insanity to take any quantity of such an inflammable material as gasoline into a mine. We believe, however, that we have so surrounded the transportation of the gasoline with safeguards that we have reduced this danger to a minimum, and that with reasonable attention the possibility of fire need hardly be considered.

In our system the gasoline is always handled in sealed tanks. These are filled in the oil house, carried to and installed on the motor; and after they are once in place, it is impossible to get any gasoline into them without removing them from the motor. The tanks are of extremely heavy and durable construction, and while it is not safe to say that they cannot be punctured, yet only as a result of gross carelessness could the gasoline escape from the tanks. We have a valve in the gasoline reservoir itself and another in the pipe line, so that the operator can shut off the gasoline supply at two points well removed from each other. The tanks are placed under heavy covers, so near the center of the motor that severe accidents can occur without causing the gasoline to escape.

Accidents to Motors Which Have Not Caused Explosions

We sent a motor to the experimental mine at Bruceton, Penn., and before the experts of the bureau knew as much about explosions in the mines as they do now, they set this motor, with a full gasoline tank, out in front of the mouth of the mine, with a coal car just behind it. They put a little red flag on the motor with the idea that when the explosion occurred, they might be able to see the flag wave. Nobody ever knew what happened to that flag, but the coal car with its load was blown over the top of the motor and 250 ft. beyond, ceasing to travel only when it struck the opposite hillside. The explosion also blew the metal covers from the top of the motor, but did not cause any gasoline to leak, nor did it damage the gasoline tank in any other manner.

At a mine in central Pennsylvania two of these motors met head on, one of them having 25 loads behind it and the other 25 empties. One motor had both side frames badly smashed and the bumper was broken into half a dozen pieces. On this motor the engine was heard to continue running for an hour or more after the wreck occurred; in fact, it continued its revolutions until the gasoline was exhausted. The other motor had the top entirely torn off, but the gasoline tank was not punctured, though it was torn from its fastenings, and about half a tankful of the gasoline escaped in about an 1/8-in. stream. We have since arranged the fastenings on the tops of our motors, so that in a future case probably not even this can happen. However, the officials at the mine had the possibility of a fire in mind when they approached the disaster, and they used safety lamps and moved with care and precaution, as is essential in all cases where gasoline motors are wrecked. In West Virginia two of our motors collided, and though the bumpers were badly broken and the side frames sprung, no gasoline escaped from either motor.

The Gasoline Pipe Breaks and the Oil Ignites without Injury

In a West Virginia mine the gasoline pipe of a motor broke and the motorman ignited the oil with his lamp. He became frightened and ran away from the motor. Everybody about the mine was desperately afraid that the motor might blow up at any minute, and they would not go near it. The fire, fed by gasoline from the tank, kept on burning for about an hour, the feed pipe being so small that it only supplied enough gasoline to keep a good blaze at the back end near the carburetor. This fire burned the insulation off the magneto, cables, etc., but as it did not get near the gasoline tank, the latter did not blow up and the men finally put some sand on the blaze and extinguished it. Though the fire destroyed the magneto, carburetor and cables, it did no other damage of any kind.

The Gases in the Exhaust

Many analyses have been made of the exhaust gases from gasoline motors. These gases consist of nitrogen, which, of course, is inert in combustion; carbon dioxide, CO_2, sometimes, but incorrectly called black damp; carbon monoxide, CO, or white damp; oxygen, hydrogen and water vapor.

Gasoline vapor in the exhaust gases is difficult to detect by chemical analyses. I am inclined to think that the reason for this is that the unburned gasoline, as soon as it strikes the air, and cools to atmospheric temperature, condenses into a liquid and falls to the bottom of the bottle in which the sample is taken or else to the ground. In order to obtain the worst possible conditions of operation, the motor was sometimes purposely thrown out of adjustment, and then there were undoubtedly small proportions of unburned gasoline in the exhaust. So small, however, do these appear to have been that chemists have not gone to the great trouble necessary to ascertain them.

Carbon dioxide is a suffocative gas, but possesses no poisonous quality. In quantities such as given off by the gasoline mine motor, its effect on the ventilation of the mine is practically negligible. Of course, water vapor, or steam, in such minute quantities as furnished by a gasoline locomotive, does no harm in a mine, and in many cases may do some good.

The only dangerous constituent of the exhaust is the carbon monoxide. One-tenth of 1% of this gas is decidedly dangerous, if a human being is exposed to it for a long time. We, therefore, have to consider the exhaust gases of the motor as being dangerous in direct proportion to the extent to which they contain carbon monoxide. This gas is never present in the exhaust from a motor when complete combustion has taken place in the cylinder, and its presence is an immediate evidence of incomplete combustion. Therefore, we can render the exhaust gases from these motors innocuous in direct proportion to the extent to which we can gain complete combustion.

---

*Mechanical engineer, G. D. Whitcomb Co., Rochelle, Ill.

Note—Second installment of article read before West Virginia Coal Mining Institute, June 24, 1913, at Morgantown, W. Va., entitled "Gasoline Motor Haulage in Mines." The first installment appeared July 19, Vol. 4, p. 90. The consideration of the motor as a machine will appear next week.

How Complete Combustion Is Assured

We have gone as far as we can in this direction by making our combustion chambers at the end of the cylinder as nearly of a hemispherical shape as we can, by increasing the compression to the highest possible point in order to make the heat of the explosion as great as possible and by providing a carburetor with a single adjustment which is readily understood and which can be varied easily by the motorman as the changing conditions of the atmosphere indicate. We have used, moreover, abnormally large engines the power of which is greatly in excess of that needed for the actual work of the motor, with the idea of using the leanest possible mixture, and thus decreasing the liability to incomplete combustion.

I was privileged to witness one of the tests at Bruceton on one of our motors, in which the engine was purposely thrown out of adjustment, so that it was giving off a heavy, black smoke. A section of entry 9 ft. wide and about 6 ft. high, and I think about 1000 ft. long, was bratticed off with double brattice cloths so that no air could enter or leave the space inclosed. The motor was loaded with as great a load as it could haul when working in the inefficient manner purposely provided in the test, and was caused to run up and down for a space of about 500 ft. in this closed-off entry. We had two canary birds in this inclosure during the test, and at the end of an hour's running, under these conditions, the birds had fallen to the bottom of the cage but were still moving around, and showed only slight distress. They were far from being dead; so that the air was still quite fit to support human life for a reasonable period.

No Absorbent for Carbon Monoxide

I believe there is no known solvent for carbon monoxide except a solution of cuprous chloride, and this chemical is too expensive and inefficient to be considered for a moment in connection with a mine motor. A solution of slaked lime will have some effect in dissolving the carbon dioxide and will most markedly reduce the odors from the exhaust of the locomotive. We, in common with others, in our first experience with these motors, passed the exhaust through a solution of slaked lime, with the idea that in removing the odor from the exhaust we had removed its injurious elements. We were led to abandon the lime tank by discovering that after a short time the lime became heated and the odors from it were worse than the direct odors from the exhaust; wherein we "builded better than we knew."

As I have indicated above, the presence of carbon monoxide in the exhaust in dangerous quantities, is in every case indicated by smoke and also by considerable odor. The lime tank removed this smoke and odor, but did not remove the poisonous carbon monoxide. Therefore, in using the lime, we were merely removing the only index which the operator had whereby he could tell whether his motor was giving off poisonous gases.

There is no treatment which is commercially possible, which can be given to the gases from an internal-combustion motor which can make them less injurious. Strict attention, however, to high compression, ample engine size, perfect and easily understood carburation, and complete ignition will reduce the poisonous elements in the exhaust gases to such a low point as to make the motor, in any reasonable current of air, absolutely innocuous.

The Gasoline Motor in the Presence of Gas

I will not say that the gasoline mine motor is absolutely sparkless. It is possible to conceive of conditions under which there will be quite a decided spark, or even a short flame, from certain parts of the motor. These conditions, however, are invariably caused by neglect and abuse of the motor and are not present when the locomotive is running properly or has not been broken in some of its essential parts. Even if the motor should make sparks or a flame owing to neglect or abuse, these will occur near the rail and are, therefore, less likely to ignite methane than sparks from the trolley wire.

The gasoline motor, therefore, is safer than the electric locomotive, and is nearly as safe as the compressed-air motor for use in gaseous mines. Our company has consistently avoided installing these motors in workings where we knew there was a large quantity of explosive gas. This was, however, because we believed that it was not good policy to antagonize the mine authorities by placing a new machine in places which they believed to be unsuited. We felt they would soon become accustomed to its use and would not oppose its introduction when they knew how favorably it compared with the electric locomotive. It was for this reason that we did not install the motor in such mines, and not because we believed it was dangerous under such conditions.

⁂

Coal Trade of Barcelona, Spain

The quantity of coal discharged in Barcelona, in 1912, according to the Daily Consular and Trade Reports, totaled 1,032,954 metric tons (1,138,315 short tons). Of the quantity stated, 649,351 metric tons came from Great Britain, 85,346 tons from Rotterdam, 8275 tons from Belgium, and 1832 tons from Philadelphia, the remainder being Asturian coal of Spanish production.

⁂

Much Coal Used in Coke Making

According to the U. S. Geological Survey, the quantity of coal used for coke making in the United States in 1912 was 65,485,801 short tons. The coke produced from this coal amounted to 43,916,834 short tons, valued at $111,523,336, besides large quantities of gas, tar, benzol, ammonia, etc., as byproducts from the 11,048,489 tons of coke produced in byproduct ovens.

Proposed Method of Longwall Mining

By F. C. Cornet*

SYNOPSIS—Attention is drawn to some of the questions necessary to be considered before adopting the method of working a particular seam that will accomplish the most complete exhaustion of the coal and economy of working. Description of a method of longwall mining proposed for working the lower Kitanning seam, in the northern part of the state of West Virginia. The method contemplates the subdivision of the workings into panels to be worked on the retreating system, having due regard to the pitch of the seam so as to favor the movement of the loaded cars. Description of the method of systematic timbering at the longwall face, best adapted to the peculiar roof conditions in that seam.

⁂

In the opening of a new mine, it is of the utmost importance to adopt such a system of working as will be best adapted to the extraction of the particular seam considered. This question can only be decided successfully after a careful study of the conditions affecting the mining of the coal in any given locality. These conditions are made known by a close survey of the region and careful inspection of adjoining workings, supplemented by the experience of others in that locality and the knowledge gained by thoroughly prospecting the area.

Some of the important points to be considered in this preliminary work are as follows: The depth, thickness and inclination of the seam; the character of the coal and the overlying and underlying strata; the position and general direction of any fault lines that may exist in the strata; and the probable quantity of water that may be expected and which must be provided for in the operation of the mine. The question of haulage, drainage and ventilation of the mine, together with the general configuration of the surface, and the available shipping facilities will determine the best location for the shaft, slope or drift openings. The question of markets, competition with other coals and transportation and labor must be carefully exploited before the desired output of the mine can be determined.

After a careful study of existing conditions, I have come to the conclusion that the following proposed method of longwall mining on the panel system would be particularly adapted to the working of the Kitanning seam, in the northern part of this state. The seam varies in thickness from 6 to 7 ft. In studying this seam, I have observed many times that the pillared areas of a hundred feet or more in width by several hundred feet in length, stand open sometimes for a month with absolutely no support but the props that hold the roof-slate in place. In most cases, the majority of the props had to be knocked out by hand or destroyed by shooting before a fall of roof would take place. I feel confident that the method of timbering described, simple as it is, will be adequate in the working of this seam.

In the design of the system I am about to describe, I have had particular regard to the complete exhaustion of the coal in each panel, in the speediest and most economical manner possible. At the same time, the safety of the men and regularity of the work have been given full consideration; and these items alone have led me to subdivide the panels, which not only expedites the work, but provides more avenues for escape, in case of accident. As this seam yields practically no gob for filling purposes, the retreating system of longwall was the only one to be considered.

As will appear in the following description, the proposed method is a panel system, in which each panel is worked independently on the retreating-longwall system. As shown in Fig. 1, the system can be applied either to the working of a new mine or to extending the workings of a mine already opened on the room-and-pillar system. In Fig. 1 the old room-and-pillar workings are shown on the left. Following this to the right are panels *A*, *B* and *C*, in different stages of advancement. On the same principle, in Fig. 2, there are shown two other panels *M* and *N*. The first three panels, *A*, *B* and *C*, are worked in three subdivisions. Panel *M* is not subdivided, while panel *N* has two subdivisions only.

Fig. 1 shows how the longwall method, as applied to an old mine worked on the room-and-pillar system, can be made to succeed that system without affecting the daily output of the mine. The general plan is not altered, except that the cross-entries can then be driven a greater distance apart, say 500 ft. instead of 380 ft., as in the room-and-pillar system. By this means, the area of coal in each panel is increased 44 per cent.; and there is nothing to prevent driving the cross-entries at a still greater distance apart, so as to further increase the area of coal in each panel at a later stage of the development when so doing will not interfere with the regular daily output of the mine.

It will be observed that in Fig. 1 the length of the first section developed is 1200 ft. This is a favorable length in the present instance, because the West Virginia mining law provides that not more than 60 men shall be employed on a single split of air; and, in the system employed here, it is impracticable to divide the air current in each panel. A length of 1200 ft. will permit 60 men to work on a single face, allowing 20 ft. for each man.

Moreover, the output of 60 men ought to be sufficient to justify the employment of a first-class foreman in each panel. This man would act as a "face foreman," and would be able to travel this distance and visit every working place several times a day, which would enable him to see everything that was done in his panel or district, and afford him no excuse for neglecting or overlooking anything. A face longer than 1200 ft., with only 60 men employed on that split, would result in slow progress and the "weighting" of the roof would advance too close to the face of the coal and require the use of more timber than is necessary or advisable. Again, a face shorter than 1200 ft. would make the employment of a special foreman for each panel less economical, and might result in the foreman's jurisdiction being extended over two or more panels, which would cover too large an area to enable him to make a thorough inspection of each working place, which is so essential to safe working.

A single glance at Fig. 1 shows that the working face of a panel is to be started at the inner end and on the

---

*Mining, civil and mechanical engineer, Charleston, W. Va.

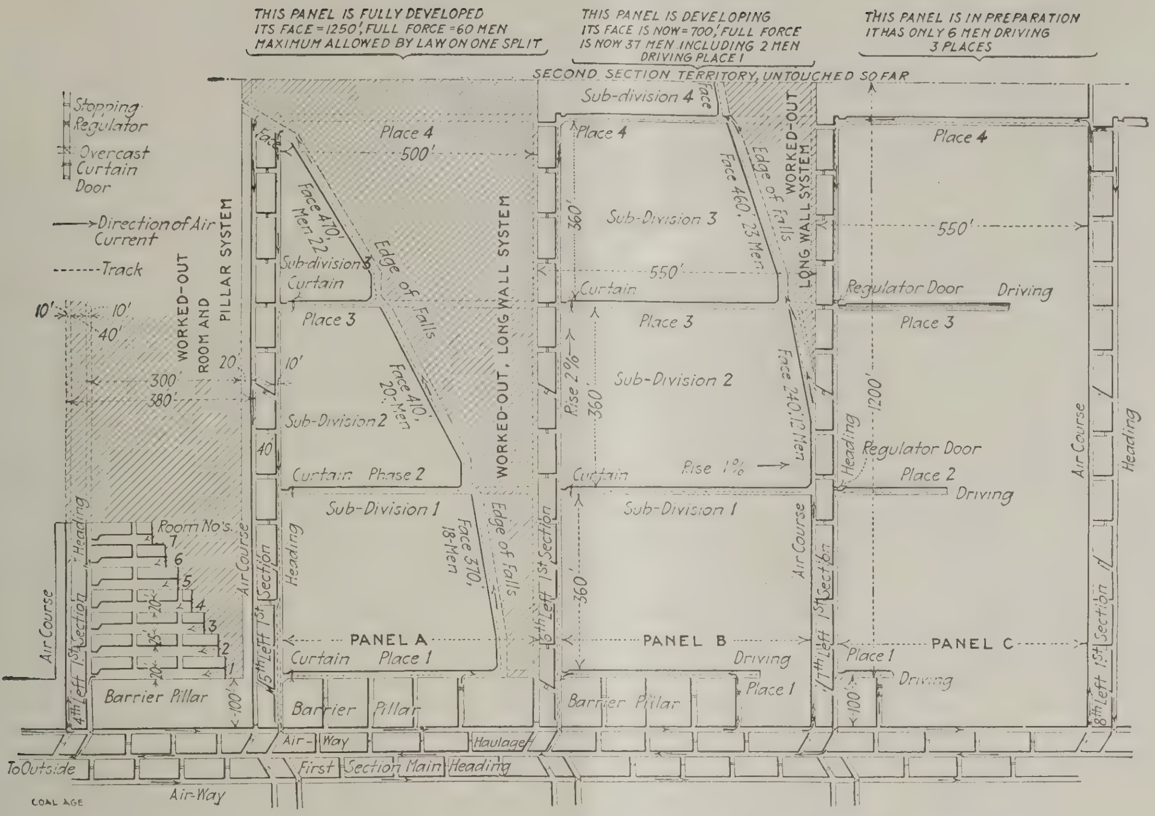

Fig. 1. A Proposed Plan of Longwall Worked on the Panel System and Started from Room-and-Pillar Workings

lower rib of the air course above the panel. For example, the working face of the panel *A* was started at the inby end and on the lower rib of the sixth-left air course. In the same manner, the working face of panel *B* was started at the inby end and on the lower rib of the seventh-left air course. Before starting this working face, it was necessary to drive a place across the inby end of the panel, to the air course above, as shown in panel *C*. The air current is then split at this point; and, while the larger portion is made to ventilate the panel below, a small scale of air is carried up to ventilate the headings being driven in the next panel above. Regulators are placed, as they are needed, at the points indicated in the figure, so as to divide the air in proportion to the requirements.

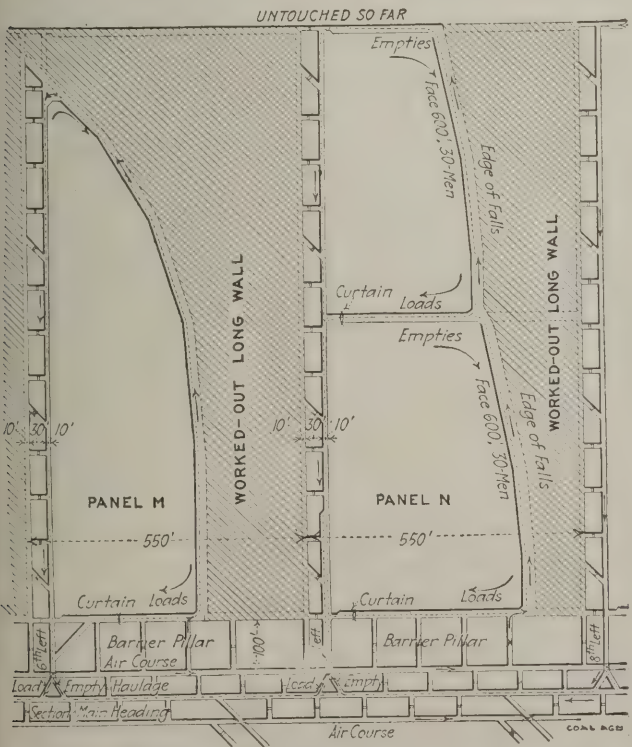

Fig. 2. Showing a Less Subdivision of Panels

The cross-heading at the inby end of the panel is driven wide enough to avoid the payment of yardage but no wider, in order to economize time. This heading is marked "Place 4" on the plan (Fig. 1). Following this, three other places are started in succession, outby on the same entry, thereby dividing the panel into three principal subdivisions. A barrier pillar 100 ft. wide is left flanking the main entries, which are driven triple to provide a main central haulage road and two intake air courses, one on each side of the haulway. As shown in the figure, the inby cross-heading (Place 4) is driven about 60 ft. from the boundary of the section, which saves the driving of the same distance of cross-entry, in each panel. As observed in panel *B*, the working face at the boundary line in each panel is 60 ft. ahead of the air, which is well within the 80-ft. limit allowed by the West Virginia mining law.

As shown in panel *C*, it is necessary to use a brattice to conduct the air current to the face when driving the cross-headings, all of which are driven wide enough to avoid the payment of yardage. The dotted line in each cross-heading and entry represents the track. The section of tracking along the working face must be shifted forward as the face is advanced. As indicated in the figure, the empties are taken up the cross-heading at the inby end of the panel or subdivision, in panels *M* and *N*; but, in panels *A*, *B* and *C*, the empties are taken up the first cross-heading leading to each subdivision and along the face, on the same track by which the loads are run out. In this arrangement, the face track has one loose end in each subdivision and is more readily shifted as the working face is advanced than where both ends are fixed and must be disjointed before the track can be shifted, and then again coupled to the track in the headings.

I have shown one undivided panel *M* with 1200 ft. of face track, and panel *N* having two subdivisions and 600 ft. of face track in each. When the empties are taken in at one end of the track and run out at the other, as in these panels, it is necessary to arrange for turning the cars end for end, either on the tipple or on a reverse switch in the heading, so that the gate-end will run out first when the car is loaded. Of course, where a rotary dump is used the cars have no end-gates, and it makes no difference in which direction they are run.

In driving the cross-heading marked "Place 1," it will be unnecessary to use a brattice, since the barrier pillar can be crosscut every 80 ft., as shown in the figure, and these crosscuts can be used, at a later stage of the development, to ventilate the workings in that subdivision.

An important feature, where the seam has a practically uniform dip, is to drive the main-haulage roads in such a direction as to provide a grade of 1 or 1.5 per cent. in favor of the loaded cars. The direction of the cross-entries must also be such as to provide a suitable grade for haulage in favor of the loaded cars. In the present plan, the main entries are shown as having a grade of 1 per cent. and the cross-entries a grade of 2 per cent., in favor of the loaded cars. It is further necessary to arrange the line of working face in a direction that will favor the movement of the cars along the face. To do this, the face foreman must start the work at the inby end of each panel and push those places ahead most rapidly, starting other places, in succession, outby from these as the line of face advances, as shown in panel *B*. The plan of ventilation is clearly shown in Fig. 1, the intake air being conducted along the face, toward the rise at the inby end, where it is returned through the cross-entries and conducted by an overcast into the main-return entry, which is here made the haulage road.

In Fig. 3 is shown a detailed plan of subdivision 2, of panel *A*, Fig. 1. The plan shows a 400-ft. face, giving room for 20 men. A number of cars have been set in on the face track, and some of these have been distributed at the inby end of the subdivision, ready for loading. Three rows of props are shown set in rows parallel and perpendicular to the face. The props are stood 6 ft. apart in the rows, the rows being 6 ft., center to center; but the first row is 7½ ft. from the face.

In the same figure are shown four cross-sections, illustrating the different phases of the mining operations. The first of these (phase 1) shows the face ready for the shooters and loaders, a cut 6 ft. deep having been made in the coal, at the bottom of the seam. The car is shown standing on the track next to the face, and the three rows of props are indicated by *A*, *B* and *C*.

In the next phase, there are two cases. The first of these shows a new cut being made by a chain machine, after the coal has been loaded out and the place cleaned up. The track has not been shifted and cannot be until the machine is out of the way. This makes it impossible to set a new row of posts, and leaves an unsupported width of roof 13 ft. 6 in. wide. It is true that posts could be set temporarily, but these posts would have to be drawn to allow the shifting of the track later. This arrangement is not advised, and it is well to remember, in this connection, that the cut made by the machine increases, almost to that extent, the unsupported width of roof.

It is preferable to follow the plan shown in phase 2, where the tracks have been shifted immediately after the place was cleaned up, and a new row of posts set, as shown at *D*. The row of posts *A* have been drawn and the roof allowed to fall. In this case, the cutting machine is loaded on a truck running on the track, the cut being made in the coal, at a given height above the floor of the seam. Phase 3 shows the face in a similar condition to that shown in phase 1. The dotted lines here show the position of the cut when made by a machine.

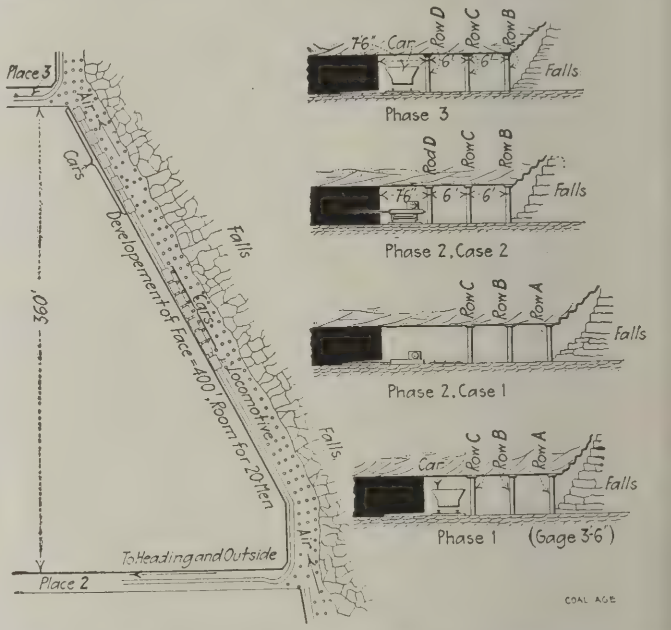

FIG. 3. DETAIL PLAN OF SUBDIVISION 2, PANEL A, AND CROSS-SECTIONS AT THE FACE

The success of the work depends, in a large measure, on the regular and prompt setting and removal of props. The setting of a new row of props immediately after the track is shifted must be followed promptly by drawing the back row of props to allow the roof to fall. By using a machine for drawing the back timbers, as explained in an article on this subject, COAL AGE, Apr. 5, p. 529, it will be unnecessary for the timbermen to leave the protection of the other rows while drawing the back row of posts nearest the fall. No props must be left standing, even though they may not be good enough to use again.

⁂

Fire Protection of Headframes

The wooden headframe of one of the shafts of the Diergardt mine in Germany is protected from fire by a sprinkling system noted in the "Zeitschrift für das Berg- Hütten- und Salinenwesen," Vol. 61, No. 1. A pipe of 1-in. inside diameter leads to the headframe from two small boiler-feed pumps of about 2300 gal. per min. duty each. At 5-ft. intervals over the drum stage, are distribution pipes with openings. The device can be operated by a valve in the piping on the ground landing.

West Virginia Operators Allege Conspiracy of Competitive States

The following is the authorized statement of the West Virginia Mining Association, of which Wm. N. Page is president, G. H. Caperton, treasurer, and Neil Robinson, secretary:

Conclusive evidence that the shooting at employees of the Ohley mine on Cabin Creek on the afternoon of July 7, in common with all the numerous other outrages of a similar character that have been perpetrated in the last 15 months, was part of a gigantic conspiracy between the operators in Illinois, Indiana, Ohio and western Pennsylvania and the United Mine Workers is to be found in the published proceedings of the conferences of these operators with representatives of the union. These proceedings are published by authority of the conference, so there can be no doubt of their authenticity.

The origin of this conspiracy as related in these official publications dates back to Jan. 28, 1898, when representatives of the operators and the miners signed a contract, Clause 8 of which reads as follows:

> That the United Mine Workers' Organization, a party to this contract, do hereby further agree to afford all possible protection to the trade and to the other parties hereto, against any unfair competition resulting from a failure to maintain scale.

In union parlance "unfair" means "nonunion." The only nonunion coal field competing with the four states mentioned is West Virginia. Therefore, Clause 8 meant that in exchange for increased wages and other concessions elsewhere provided for, the union undertook to prevent West Virginia from becoming an effective competitor of the four states.

At every one of the conferences since then, the operators have urged the union to fulfill its contract by unionizing West Virginia, and the union has always assured the operators that it was doing its best. The discussions on this subject are reported verbatim in the proceedings published by authority of the conference. A few excerpts will show the character of these discussions. On page 17 of the official report of the conference of 1910 will be found the following remarks by C. E. Maurer, an Ohio operator:

> The granting of the 8-hr. day by the operators, after making these numerous other important concessions, was with the distinct understanding and explicit promise of the miners to give to the operators of the four contracting states adequate protection against the competition of the unorganized fields. From year to year they have been called upon to fulfill their promise. The operators, parties to that agreement, at the time of its execution, felt that it was absolutely necessary to the safety of their investments that they be protected from the encroachments upon them by their competitors of the unorganized fields. We ask for the fulfillment of the pledge of 1898.

At the same conference John Green, of the United Mine Workers, said (page 29):

> The United Mine Workers of America have diligently and aggressively attempted to carry out the promise made in Chicago in 1898. They have done everything in their power to redeem any promise they may have made to organize West Virginia. Since 1898 our organization has at various times spent hundreds of thousands of dollars trying to unionize West Virginia. We have also sacrificed human life in the attempt to redeem that promise.

At the 1912 conference (page 274), H. L. Chapman, a mine operator from Ohio, said:

> When we met in Chicago in 1898 and re-established the interstate movement, the competition from the non-union fields was the element that entered into negotiations in the adoption of the scale that was made there. It was understood in that convention, although it was not mentioned in the agreement, that miners of the competitive fields of the four states were to bring the non-union field up to the price paid for mining in those states, and unless they secured the adoption of an 8-hr. day at the next convention the competitive fields were to be relieved of these burdens.

At the same meeting (page 245) John P. White, president of the United Mine Workers, said:

> We are as anxious to establish the organization in the West Virginia fields and the other non-union fields as the gentlemen on the other side of the house are to have us do so. But the operators there have been successful in defeating the aims and purposes of the United Mine Workers to a large extent, although no one can deny that under the various administrations of the organization every effort has been put forth to try to break down the conditions that are complained of here on the other side.

On p. 217 of the official report of the 1912 conference may be found the following remarks by Duncan McDonald, secretary-treasurer of the United Mine Workers of Illinois:

> We have had thousands of men go to the penitentiary for trying to establish our organization in West Virginia and other non-union fields, and not only have they gone to the penitentiary, but they have been beaten up and slaughtered. We have had men go to jail. We expect that more of us will go to jail. The penitentiary doors have no terrors for us, as far as that is concerned. And if putting two or three hundred of our men in jail will organize West Virginia we will send two or three hundred down. The chances are we will have to get busy with that situation shortly.

Men are not usually sent to the penitentiary unless they have been convicted of crime. The declaration by Mr. McDonald, therefore, that he expected two or three hundred union men to land in the penitentiary is equivalent to an admission that he and they contemplated the commission of crime on an extensive scale.

Less than a week after this blunt admission by Mr. McDonald the union men on the north side of the Kanawha, where there was no trouble of any kind, and where no demands had even been presented to the operators, began buying rifles at a certain store in Charleston for the significantly low price of $1.98. In a short time they had accumulated more than a thousand guns. Then regularly organized squads of armed union men were detailed to go, first to Paint Creek and then to Cabin Creek, where the shootings and other outrages promptly began and have continued at frequent intervals since.

COMING SOCIETY MEETINGS

Alabama Coal Operators' Association—This association will hold its annual meeting at Marvel, on July 26.

American Institute of Mining Engineers—This institute holds its next annual meeting at Butte, Mont., on Aug. 18 to 21, inclusive. Bradley Stoughton, 29 W. 39th St., New York City, is secretary.

National Conservation Exposition—Miners' Field Day, to be held under the auspices of the Tennessee Mine Foremens Association, with the coöperation of the Bureau of Mines and the American Red Cross, on Sept. 20, at Knoxville, Tenn.

International Geological Congress—The 12th session of this organization will meet, Aug. 7, at Toronto, Can. Address of Secretary, Victoria Memorial Museum, Ottawa, Can.

Kentucky Mining Institute First-Aid Meet—This meet will be held at Central City, Ky., on Labor Day, Sept. 1.

American Mine Safety Association—The second meeting of this society will be held at the Bureau of Mines, Pittsburgh, Sept. 22-24. H. M. Wilson, of the above address, is chairman of the organization.

American Mining Congress—This society meets for its 16th annual session at Philadelphia, Oct. 20-24; the secretary is J. F. Callbreath, who has opened quarters in the Land Title Building.

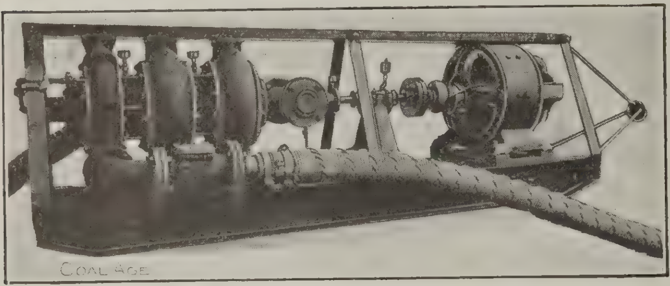
POWER DEPARTMENT

A Motor-Driven Mine Pump for Operation on Inclines

The accompanying illustration shows an interesting application of a motor-driven pump. It is designed for mine drainage and used on inclines up to 45 deg. from the horizontal.

The pump and motor are held together in a steel framework with an eye at the end to which a cable or rope is attached for lowering the outfit down the incline. The lower part of the framework acts as a skid.

Special arrangements had to be made for oiling the motor. The lubricating device for the lower bearing is seen between the coupling and the bearing housing; it is fed with oil from the upper end by means of a pipe.



The Pump and Motor on Skids

The pump, made by the United Iron Works, San Francisco, is 4-in., three-stage, and operates at heads up to 250 ft. The motor has a capacity of 30 hp. and is of Westinghouse manufacture. Several pumps of this type are in operation and are said to be giving eminently satisfactory service.

⁂

An Induction Motor of New Design

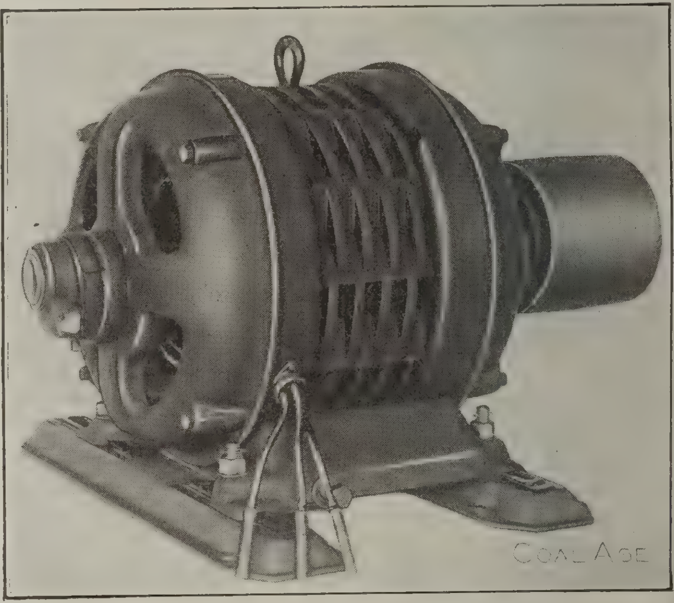
The new Westinghouse type CS squirrel-cage induction motors possess several noteworthy features. Among these are: The extensive use of pressed steel in their construction; rotors with cast-on short-circuiting rings, and moisture and heat-resisting insulation.

The use of pressed steel in motor construction represents a marked advance in design. It imparts great mechanical strength and is uniform in structure. Hence a motor of a given weight can be made with more active material than motors of corresponding capacity in cast-iron frames.

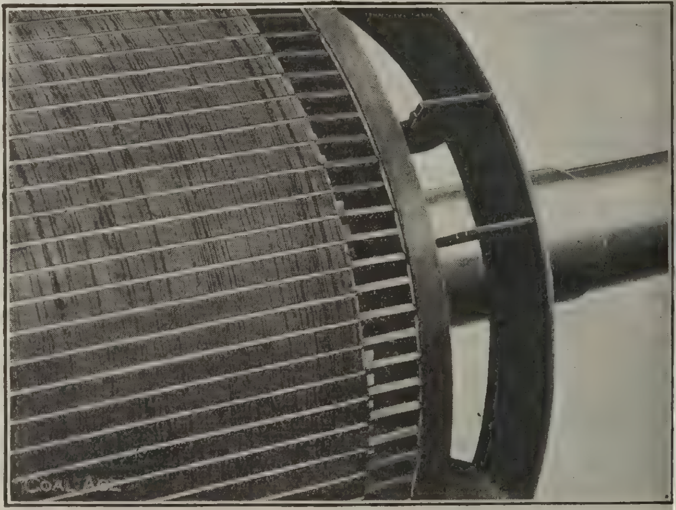
In these motors, rolled steel forms the frames of the sizes above 20 hp., the end plates of the smaller machines (which are of the so called frameless type), and the slide rails of all sizes. As a result these motors are compact.

Above 5 hp., the form-wound stator coils are laid in open slots, and repairs in case of accident can be readily made.

In all sizes, the rotor bars are insulated with a special cement which is moisture resisting and will withstand a high degree of heat and mechanical stress. In motors above 15 hp., the bars are connected electrically and mechanically by casting the short-circuiting rings around their ends. Hence these rotors, having nothing that can burn out, deteriorate under heat, or work loose under vibration, are practically indestructible.



A Complete Small-Sized Motor



End of Rotor, Showing Cast-On Short-Circuiting Rings

The bearings, being the only wearing part, have been designed liberally. They are protected from dust by a cap on the front end and by felt washers between metal rings on the pulley end.

The efficiency and power factor are high, not only at full loads, but at fractional loads also. This last feature is of special importance because industrial motors generally run at less than full load.

Proper Installation of Alternators

By C. A. Tupper*

SYNOPSIS—The principal differences in the construction of alternators, which bear directly upon the methods employed in installation, are here enumerated together with the successive steps to be taken in setting up the machine and making it ready for successful operation.

⁂

Before any alternator can be placed in successful operation, there are certain conditions of installation that must be carefully met, and which it is extremely important to observe if satisfactory results are to be secured.

The location of each generator is usually fixed by the position it must occupy relative to the prime mover or shafting by which it is driven. There is, therefore, but little choice as to location, but it is always desirable to so place alternators, or in fact, any electrical machinery, that they will be in clean, dry surroundings, where there is plenty of light and as much room as possible. Good ventilation is also important, since the better the circulation of air, the lower will be the operating temperature of the machine.

There should be no combustible material near the alternator, and sufficient headroom should be provided to permit taking the machine apart, if necessary. The best method of bringing in the various parts and putting them in position will depend largely on the size of the machine, the location in which it is placed and the handling facilities available.

If a traveling crane is at hand, the work is comparatively simple, but if temporary hoisting appliances, blocking, rigging, etc., must be depended upon, the method of handling must be suited to the conditions under which the machine is installed. Where no crane is available, a horse or derrick, made of heavy timber, and of sufficient size to hoist the parts of the machine into place by means of a chain block, should be provided.

Foundations Should Be Large and Solid

In order to prevent vibration and secure smooth running, the foundation on which an alternator rests should be firm and substantial. Small, belted machines below 100-kw. capacity can, if necessary, be set upon timber supports or mudsills, but a concrete or masonry foundation is to be recommended wherever possible. All machines above 100-kw. capacity should be provided with concrete, brick or masonry foundations, concrete being the most suitable.

A good concrete for generator foundations may be composed of one part portland cement, two parts sharp, clean sand, and four to five parts of broken stone, all proportions by bulk and not by weight. These quantities may be varied somewhat, depending principally upon the size of the broken stone, and the consequent percentage of voids.

The foundation should be sufficiently large and heavy to secure freedom from vibration and settlement. Foundation bolts for securing the base rails or sole plates of the machine, are best set by means of a template. In order to allow for slight adjustments in the position of these foundation bolts, it is a good plan to place either wooden boxes or iron pipes, the internal dimensions of which should be at least two inches larger than the foundation bolts around these bolts at the top.

The length of these pipes or boxes will depend somewhat upon the size of the bolts, but in general they should not be less than 12 in. long, nor ordinarily more than 24 in. long. Their tops should be so placed as to be from ½ in. to 1 in. below the surface of the finished foundation.

The top of the foundation should be leveled off as carefully as is convenient, but should be kept a short distance below the floor line or the bottom of the sole plate or other generator support in order to allow for leveling the latter, by means of wedges, and the concrete should be given a sufficient time for the cement to set before the machine is placed upon it.

The smaller belted machines, or those driven by waterwheels, are usually shipped completely assembled, with the stator yoke and bearings fastened to the base. In many cases, however, the stator is separate from the base, and in machines of larger diameter, particularly those of the engine type, it may be in two parts, being split horizontally.

With the engine type of alternator, the yoke either rests on an extension of the engine bed, as with some of the smaller machines coupled to a high-speed engine, or on sole plates set on suitable foundations. The stator sole plates for the larger machines are usually made in two parts, the lower one being bolted to the foundations, while the upper plate is adjustable to facilitate centering the stator with respect to the field.

How to Set Up the Machine

In setting up a machine of this type, the following are the steps to be taken:

(a) Locate the sole plates temporarily in position, and support them on iron wedges to allow for further adjustment.

(b) Place the lower half of the stator in position, and level it approximately with the leveling screws. In case this part of the machine is arranged to shift sideways on the base or sole plate, set it to one side so that it will be away from the rotor when the latter is placed in position.

(c) Place the revolving field and engine shaft in the bearings, making sure that the shaft is level and true with the rest of the apparatus. In case the engine shaft has not been pressed into the rotor spider at the factory, and it is necessary to do this work on the ground, a careful machinist should be employed, if possible. If no such mechanic is available, any person who can exercise care, caution and common sense can do the work.

(d) Place the top half of the yoke in position, first making sure that all planed surfaces are perfectly clean. Carefully center the stator, with respect to the field, by means of the adjusting screws, and measure the air gap between the stator face and the pole pieces at a number of points around the circumference; it is highly important to have the air gap uniform, as otherwise the frame will be subjected to an unbalanced, magnetic pull, causing bad operation.

On large waterwheel or engine-type alternators, where the stator is split, it is usually necessary, for convenience in shipping, to disconnect and remove a few of the stator coils at the two partings in the frame. These must be carefully put in place and properly connected. The insulation upon these coils should not be injured in any way, and all connections should be neatly made and insulated to correspond with those on the balance of the machine.

---

*Milwaukee, Wis.

In aligning the yoke, the center of the armature laminations must be in line with the center of the pole laminations. If they are not thus lined up there will be a side or end thrust on the shaft.

After the yoke has been finally adjusted, shims are to be inserted between the upper and lower part of the sole plates, so as to take the weight off of the leveling screws. Drill and tap holes in the lower sole plate to receive the holding-down bolts for the stator, and bolt the latter securely in place.

(e) Grout in the sole plates, and after the cement has set, tighten down the foundation bolts and carefully check over the alignment of the entire machine.

If at any time the engine bearings are adjusted or realigned, the air gap between the stationary and revolving parts of the machine must be checked over and equalized. Otherwise, an uneven air gap will result, or the rotor may even rub upon the stator.

EITHER INSULATE OR GROUND THE GENERATOR

Most engineers favor the insulation of generators from the ground, wherever it is possible. Such insulation is generally provided by a substantial wooden frame or by wooden stringers under the rails, the wood being well filled and varnished to prevent the absorption of moisture. This method is feasible with small generators, but with heavy machines, or those direct-connected to steam engines or waterwheels, complete insulation from the earth is practically impossible, and in such cases it is better to ground the frame positively by means of a heavy copper wire. In other words, the frame of a machine should be either thoroughly insulated or thoroughly grounded, so that there will be no doubt about its condition.

The method of setting up belted machines is as follows:

(a) The rails should be placed in position, approximately leveled, and wedged up so that the weight of the machine will be distributed evenly.

(b) If the alternator is small and comes completely assembled, it can now be set upon the rails, carefully leveled and lined up with the driving pulley.

(c) If the machine is of a large size, and is shipped in two or more parts, place the base on the rails and set the stator in position, first making sure that the planed surfaces on the base and feet of stator are perfectly clean and properly oiled to prevent rust. Most of the larger belted machines are arranged so that the stator can be shifted to one side, to give access to the field and armature coils, and, when the stator is first set on the base, it is advisable to locate it so that it will be to one side of the field when the latter is placed in position. All bearing surfaces should be thoroughly cleaned before the shaft is lowered into place. If there are any rough or rusty spots on the journals, they should be removed with crocus cloth or fine emery and polished. The oil wells also should be cleaned.

When placing the rotor in position, the oil rings should be watched carefully to see that they do not get jammed and bent out of shape. After the rotor has been placed, the caps of the bearing pedestals should be put in position and bolted down firmly. The stator can now be put into place over the rotor and bolted down.

If there are any dowel pins in the feet of the stator frame they should be put in place before the cap bolts are screwed down. The bearings may now be filled with a good quality of mineral oil to the proper height as indicated by the oil gages.

(d) Put the pulley on the shaft and line the whole machine from the driving pulley. If possible, run the generator with a slack belt and adjust the alignment while thus running so that the belt remains on the center of the pulley and allows the rotor to oscillate freely in its bearings.

(e) Tighten down the foundation bolts and grout in the rails. When the cement has partly set, the surplus may be removed and the joints smoothed up with a trowel.

WHEN MACHINES ARE DRIVEN BY WATERWHEELS

The foregoing regarding belted machines applies, for the most part, to those driven by waterwheels also, except that the latter have no rails and the base is set directly on the foundation. In this case, the machine must be lined up accurately with reference to the waterwheel, so that the halves of the flange coupling will fit exactly. After proper alignment by means of wedges, the foundation bolts should be tightened and the base well grouted.

In setting any generator, previous to grouting in, it is well to use plenty of wedges under both inside and outside edges of the base so as to give a firm and even support. In some cases, where alternators are of large diameters and run at low speed, no base is provided. In this instance, the stator and bearing pedestals rest on sole plates bolted to the foundation in the same manner as in the engine type of alternators.

With small alternators the collector rings are mounted in place on the shaft and connected to the field windings. On large machines, especially those of the engine type, the rings are usually shipped by the manufacturers separately, and, in large machines, both hub and rings are split so that they can be put in place after the rotor has been mounted in its bearings.

The collector rings should be fixed securely in position so as to run true and connected to the leads from the field windings, making sure that all contacts are clean and bolted up tight.

With large engine-type alternators and also with some of the larger waterwheel-driven machines, the brush-holders are supported by a stand bolted to the base or to a bridge fastened to the sole plate. On smaller machines the brush-holder studs are supported by the bearing pedestals.

The brushes should be carefully fitted to the collector rings. This can be done by first using coarse sand or garnet paper finishing with a finer grade. While shaping the brushes, the paper should be held well down on the rings so as not to wear away the edge of the brush. Care should be taken to see that the whole surface of the brush end makes contact with the ring and that the finger presses squarely upon the opposite end.

The brushes should be adjusted by changing the position of the tension spring on the arm and should be such as to give a good contact on the ring. Too great a pressure improves the contact very little and causes excessive friction, wear and heating of the brushes and rings. Good judgment and careful attention will soon show the best pressure to be employed.

Preparations for Starting

The oil wells should be thoroughly cleaned before filling and the covers so placed that no foreign matter can drop into the bearings. When the machine is first started, it is advisable to draw off the oil at the end of each day's run, filling up with fresh until it is certain that all fine particles of grit or dirt have been washed out of the bearings. The oil thus drawn off may be filtered and used over again. It is advisable also to run slow for an hour or so and watch the bearings closely before attempting operation at full speed.

On account of not having a commutator, alternating-current generators are, generally speaking, easier to keep in good running order than direct-current machines. At the same time they must receive adequate and proper attention. It should be remembered that they frequently generate much higher voltages than direct-current dynamos, which renders it all the more necessary to keep them perfectly clean.

No dirt, copper or carbon dust should be allowed to accumulate on or near the windings, and, in plants sufficiently large to warrant the expense, it is advisable to install a compressed-air system so that all dirt can be blown out of the corners not otherwise easily reached. It is also advisable to give the armature coils and connections a coat of insulating varnish occasionally. In operation the collector rings should be kept lubricated with a small amount of vaseline or oil applied with a cloth, and the brushes should be so adjusted as to make good contact with the rings at all times.

Alternators in Operation

The field circuit should never be opened suddenly while current is flowing, but both main and field switches should be pulled when the machine is stopped.

Two machines should never be thrown in parallel when they are out of synchronism, as the excessive rush of current throws heavy strains on the engines and generators, and may cause considerable damage.

It should be remembered that alternators are designed for the voltage indicated on their nameplates. They cannot be expected to give potentials to any extent above normal with satisfactory performance of either exciter or alternator. Frequent attempts to raise the voltage an excessive amount have resulted in poor operation of both machines. Furthermore, the rated current output should not be continuously exceeded.

All bolts and nuts should be kept tight; electrical machinery should receive as much attention in this respect as steam engines, even though it is subjected to less vibration and stress. It is advisable to keep on hand at least one of each size of armature coils in case repairs are necessary. Also an extra set of brushes for both the generators and exciters.

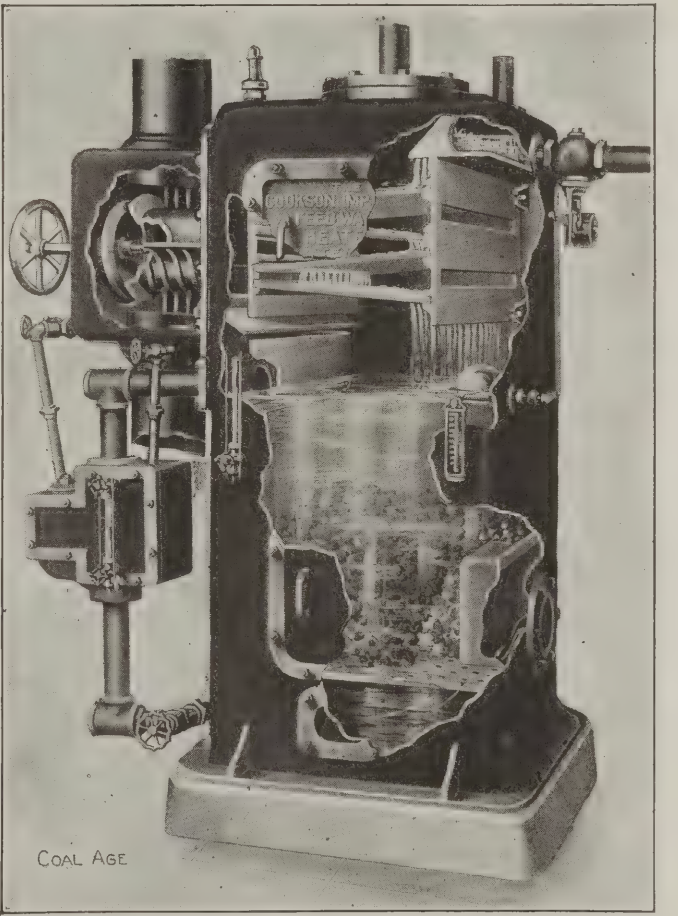
When machines are operating in parallel, and one is to be shut down, the load should first be reduced by throttling the engine or slackening the belt. The main switch should then be opened; resistance should next be cut into the field of the alternator to reduce the current therein. When this is done the field switch may be opened.

When a machine is run by itself, and is to be shut down, resistance should be first cut into the field of the alternator, thus lowering the voltage. The main switch can then be opened, and finally the field switch. The alternator field circuit should not be opened when full current is flowing, because the high induced voltage caused thereby may be sufficient to break down the field insulation.

In most large machines a grid resistance is connected to the field switch, so that in case the latter is opened the resistance is connected across the field circuit, thus forming a path through which the induced current can flow and prevent any abnormal rise in potential.

A New Feed-Water Heater

A new type of feed-water heater wherein the body is cast in one piece, giving greater strength, durability and a more handsome appearance, is being introduced by the Bates Machine Co., of Joliet, Ill., and is known as the Cookson one-piece heater.



The Cookson Feed-Water Heater

The substitution of a single casting for the customary built-up plate body does away with bolts and calked joints at all points save the oil separator, the manhole and handhole covers and the pipe fittings. In other words, there is no chance for leakage at the points, which, in any built-up heater, are most apt to give trouble from this cause. It is evident, also, that the more solid construction is practically indestructible and capable of safely withstanding the greatest back pressure that will ever be built up within the heater. The safety valve may be set to blow off at 25 lb. per sq.in. without danger of leakage or bursting plates.

This heater has large steam space, tray surface and filtering space, and the four large manholes and handholes make cleaning easy. The cleaning doors are conveniently located in front and back, and as the heater may be made right or left handed by turning it halfway around, it will fit into the plant without complications to the piping.

The oil separator is made in either of two types: First, extra large and with cutout valve so that all the exhaust is purified. Thus, a surplus over feed-water heating requirements is in best possible condition for re-use in heating or processing systems, while the cutout valve permits shutting off the body of the heater for cleaning. Second, standard oil separator which permits piping to the heater on thoroughfare or inducion principles and assures splendid oil separation from as much exhaust as is required for feed-water heating.

A steam trap and return opening are provided so that the heater may receive the returns from a steam heating system or not as desired. The fittings throughout are high grade and the flanges are furnished to meet the customers' requirements.

⁂

September Meeting of the American Mine Safety Association

The annual meeting of the American Mine Safety Association composed of leading coal- and metal-mine operators, mining engineers, mine-safety engineers, and mine surgeons will be held in Pittsburgh, Penn., Sept. 22-24.

This association, which held its first meeting a year ago, has for its purpose a reduction of the number of accidents in the mines and quarries (3602 in the year 1911) and the alleviation of the sufferings of more than 60,000 men who are injured each year.

Following the recommendations of the Bureau of Mines in the last three or four years many mining companies have organized rescue corps and first-aid teams, and as a result a number of different methods of procedure following mine explosions and fires and in caring for the injured have developed. The men who gathered a year ago to form this association felt there was need for greater uniformity in the work of the rescue and first-aid crews, and at that time some important recommendations were made.

This second meeting which has been called by H. M. Wilson, of the Bureau of Mines, chairman of the executive committee of the association, promises to take up and discuss a number of the problems that have arisen in both the rescue and first-aid work. The members of the association declare that greater progress can be made in saving life and in reducing the seriousness of injuries by the adoption of the proposed standard methods.

Mr. Wilson, in discussing the association, said: "The object of the American Mine Safety Association is to promote the science of safety in mines and mining by the adoption of improved first-aid methods, and of logical modes of procedure in rescue and recovery work in mine disasters; to recommend the adoption of approved types of first-aid, mine-rescue and recovery appliances; to obtain and circulate information on these subjects; and to secure the coöperation of its members in establishing proper safeguards against loss of life and property from explosions, fires, or other causes.

The program will include a mine-rescue and first-aid contest at Arsenal Park on Sept. 22; in the evening a reception to the members and a motion-picture lecture on the mining industry.

On the second day the opening session of the association will be held in the morning and a report of the executive committee will be made on the proposed constitution of the society. In the afternoon there will be an explosion in the experimental mine at Bruceton, Penn., upon which occasion all members will be invited to be present.

On Sept. 24 there will be a business session and a selection of officers. In the afternoon members will visit the experiment station of the Bureau of Mines at 40th and Butler Sts., Pittsburgh, Penn.

The program in detail is as follows:

Sept. 22—10:00 a.m.	Meeting of Executive Committee in Building 9. Bureau of Mines, 40th and Butler Sts.
2:00 p.m.	Mine-rescue and first-aid contest, Arsenal Park, Pittsburgh.
8:00 p.m	Reception of members by executive committee and motion-picture lecture on mining industry.
Sept. 23— 9:30 a.m.	Opening session of Association. Report of executive committee, action on constitution. Appointment of nominating and other committees.
3:45 p.m.	Explosion in Experimental Mine, near Bruceton, Penn. Leave B. & O. depot. Smithfield and Water Sts., by special train. Explosion at 3:45 p.m., returning, arriving Pittsburgh 5 p.m.
8:00 p.m.	Nomination and other committee meetings.
Sept. 24—10:00 a.m.	Business session. Election of officers. Miscellaneous business. Adjournment.
2:30 p.m.	Visit Experimental Station. Bureau of Mines, 40th and Butler Sts., and other points of interest.

OUTCROPPINGS

Every little mine has troubles of its own.

⁂

All Fools Day was probably made Apr. 1 because the labor agreements customarily expire on that day.

⁂

Advantage is a better soldier than rashness—a finger's length in a sword may determine the victor.

⁂

They might get King Nicholas, of Montenegro to settle the "button strikes" in the anthracite field.

⁂

Between the suffragette and the socialist the Government is having a busy time. Why not dispose of both by pitting one against the other?

⁂

Two libations of the liquor handled at an average mining-camp dispensary is guaranteed to make a canary bird sit up and spit in a bulldog's face.

⁂

We often discover what will do by finding out what will not do; and probably he who never made a mistake never made a discovery.

⁂

Those who measure up monthly yardage in coal mines should note that the London "Board of Trade" has found the standard yard to be two hundred and fifteen millionths of an inch short—another chance for the miners' union to kick.

EDITORIALS

West Virginia Labor Troubles

On page 123 we publish an authorized statement of the West Virginia Mining Association, claiming that operators and miners of competitive states incited the recent insurrections in the Southern fields.

The same statement has been made privately by West Virginia mine owners at various times in previous years when labor struggles have waxed hot, but never before, to our knowledge, has the charge of conspiracy been made on credited authority and in such a direct and public manner.

There is no doubt but that coal men in those states which have had to meet West Virginia competition have been greatly irritated by the success of their commercial rival in withstanding the encroachment of the miners' union. It is also easy to believe that these same operators in Pennsylvania, Ohio, Indiana and Illinois would be pleased to see the West Virginia fields thoroughly unionized. But is there anything unnatural or unlawful in such a desire? Do any of us delight in seeing our business rivals prosper at our expense?

Many times when strikes occurred in Pennsylvania, or one of the adjacent states, have the operators of the affected districts believed and stated that West Virginia owners were encouraging and aiding the miners? We are not prepared to vouch for the truth of these statements one way or the other. However, it is no secret that considerable ill-will exists between these two sets of coal owners. No one at all familiar with the situation is likely to believe that there is any fraternal bond between them. In fact this condition is one of the chief sources of weakness in the chain that binds the American coal industry together.

We are not convinced by the West Virginia charges of conspiracy.. The indictment as a whole lacks force. The statement that the miners bought rifles in a Charleston store for the "significantly low price of $1.98" is nothing unusual. In the last few years, a large part of the 500,000 rifles the Government had on hand when the Krag-Jorgensen type of firearm was adopted has been sold at auction, bringing from 41c. to $2.50 each. They have been retailed all over the country at from 95c. up. Not long ago the Siegel-Cooper Co. in New York regularly disposed of them at 95c. each.

It is also true that during recent years various European governments have been pouring vast quantities of rifles into this country at extremely low prices. Francis Bannerman, 501 Broadway, catalogs a five-shot, 41-caliber Italian Veterli at $1.48. The price of $1.98 mentioned, therefore, signifies nothing except that the Charleston dealer made some money.

West Virginia mine owners are as decent and as capable as any body of coal men in America. The public press has hounded them unmercifully, and in a majority of cases unjustly. Space writers have fattened their monthly income by supplying columns of falsely colored matter calcuated to hold these operators up to the public gaze as heartless robber barons. Demagogues everywhere have added their cry to the popular clamor.

Through it all the West Virginia owners have fought stubbornly for what they believed was right. We have admired their determination, although disagreeing with much of their policy. However, we are sorry to see them designate the operators of other states as being the chief cause of their trouble. We can't trample our neighbor's lawn and then with propriety "holler" when he walks on *our* grass.

West Virginia operators have chosen to fight a bitter industrial war. They are standing out against a worldwide social advance, not a local disturbance comprising the employees of a few mines. So far, due principally to the physical nature of their country, they have been fairly successful in their resistance to the demands of organized labor. Some day they will be beaten, not so much because their principles are wrong, but because the forces against them are so great. In the meantime, the West Virginia coal owners should not forget that the rules of every game apply equally to both sides.

⁂

The Pension System

On June 7, we published a foreword on the pensioning of employees, a subject in which we are much interested. In it we referred to the "one dissenting voice of John A. Fitch," of the New York Survey, who regards the private pension system as a lariat flung over the head of labor.

It has been pointed out that Mr. Fitch does not stand alone in this view. We are not surprised at this; there are so many people in this smug world of ours who believe that any action of betterment by the employer is sinister and every neglect of improvement by him is a scandal. He is well chided both for doing and for failing to do.

An article in the *International Steam Engineer* in April, 1912, and another in the *American Economic Review* in June, 1913, both condemned the private pension. Moreover, Louis D. Brandeis in an article entitled, "The New Peonage; Discretionary Pensions" eloquently stated the same views.

Doubtless there were others, but we are entirely undismayed by any volume of condemnation. The facts are that a company which is willing to put a pension system in operation is usually not a gross oppressor. Three instances come to mind—the United States Steel Corporation and its many subsidiaries, the Pennsylvania R.R. Co. and the E. I. Dupont de Nemours Powder Co. These organizations all have pensions and are all noted for their fair and considerate dealings with their employees, for the mind that conceives a pension system is also able to plan other betterments, and can see the needs of humanity in a broad and sympathetic light.

The pensioning companies have to pay the scale and in addition contribute to the support of their workmen in their declining years. This they could only do under two circumstances; either they must receive as a result a better service from their workmen or they must part with a percentage of their profit.

In the first instance, the satisfaction of the workingmen is necessary or the anticipated increased efficiency is not secured and how can there be satisfaction if the company acts in an arbitrary manner? The pensioning corporation is at a considerable disadvantage, begging the workingman to give him the efficiency which will permit it to fulfill its generous promises without a heavy loss.

If, however, there is no competition and the public must pay the cost of the pension scheme which the operator has chosen to put in force, then it is clear that the pension could as readily have been pocketed by the corporation as handed to the workingman. If despite this fact the operator is willing to divide this profit with his employees, he is not likely to be niggardly and imperious in other matters.

In view of the growth of unions, it is safe to say that the unionized mining and railroad corporations have not even freedom to do right and certainly cannot contemplate the parlous pleasures of wrongdoing.

⁂

President Wilson Declares Himself

In the face of a nation-wide protest, President Wilson has signed the Sundry Civil bill carrying the "rider" which exempts labor organizations from prosecution under the anti-trust laws. That the measure is now a law is to be regretted. But this point loses importance before the more significant fact that the President has so clearly defined his policy in this respect. Nor was this done without mature reflection. The bill was in his hands for some time before his signature was attached and he must have had the subject in mind long before then, since it was returned to Congress for reconsideration by President Taft during his tenure in office. Furthermore the better classes have consistently opposed it and the press of the country has generally attacked it.*

Mr. Wilson explains—or rather excuses—his approval of the bill on the grounds that "other appropriations supply the Department with abundant funds to enforce the law." As a matter of fact there are already more than sufficient applications for the funds mentioned and it is highly improbable that any of them will ever be used for the purpose under consideration.

A singular and rather ominous coincident occurred in the signing of the bill. On the same day which this was announced a party of nonunion miners in Ohio were forcibly evicted from the works by a body of union men. Possibly it is the state's duty to protect its local industries, but with a labor party in control, we doubt if the operators will receive much consideration in this direction.

On the other hand, interference with the production of a commodity used in interstate commerce is clearly an infringement of the anti-trust laws and therefore subject to the action of the national Government. We fail to see as yet where organized labor has proved that only the unionist has a right to work, and it is to be hoped that the President will find a means of diverting a portion of the "abundant funds" at his disposal to prevent a recurrence of such instances.

---

*See "Coal Age," Vol. 3, page 693.

State Mining Laws

Probably at no time in the history of coal mining in this country have changes in the state mining laws been more numerous than at the present. We refer not only to those laws directly affecting the inspection of mines and the regulation of mining operations, but other laws of wider range and having for their ultimate purpose the establishment of greater harmony between mining interests of every nature.

The subject is a broad one and involves the safe and economical extraction of the coal, together with the transportation of the same to the various markets, and such a regulation of rates and facilities of shipment as will impose no burden beyond what is necessary in the several mining districts.

The matter of mine accidents is receiving special attention at the hands of legislators, and the great principle of due compensation to workmen injured in the performance of their duties is being patiently and, we believe, successfully worked out on a basis that will prove advantageous to employer and employee alike when unavoidable accidents occur.

In this connection, a suggestion comes from West Virginia where it has recently been put in practice, and which relates to making certain that every mine employee is or should be acquainted with the mining laws of the state. Recent copies of the mining law of West Virginia contain, on the reverse side of the perforated title page, a blank form of receipt, which is to be signed by the miner receiving a copy of the law, together with a copy of the rules and regulations governing the operation of the mines of the company by which he is employed. This receipt, signed by the employee and witness, is filed by the company, and is intended to forestall the claim of any employee, injured in the mine, that he was not acquainted with the law, mine regulations, or the particular danger to which he was exposed.

In reference to the printed copies of state mining laws, it is a good suggestion that these laws should be printed in small compact form of suitable size to be handled or carried about conveniently. A good size, which has been adopted by many mining states, is 3½x6 in., or 3x5½ in.

⁂

Photography at Coal Mines

Still another instance of the importance of photography at coal mines is the case of a recent accident in a large boiler plant. The breaching attached to a single boiler gave way and let the smokestack down on to the boiler-room floor. The report of the mishap was accompanied by three photographs; one showed the boiler as it looked after the accident, and the other views showed how the breechings on two boilers of other types were secured. These photos explained the cause of the accident, which, of course, was the result of bad designing. The photographic report was shown to the boiler manufacturers, giving them as good an idea of what the trouble was as if they had sent someone there to make a personal examination.

Photograph outfits at mines are, therefore, not only useful, but extremely economical. Such apparatus does not cost much and will repay the initial expenditure in a short time.

SOCIOLOGICAL DEPARTMENT

Two Safety Devices

By J. E. Jones*

SYNOPSIS—Two substitutes of human actions, which make the employment of men unnecessary. The lever of the switch stand is turned by the motor and not by a spragger. The hands of the trip-runner do not hold the coupling link, but a dog is used which is tripped into action at the very moment when the cars collide. As is usual, the devices combine economy of labor with safety in operation.

⁂

The automatic mine switch here illustrated is simple and can be made by a mine blacksmith. There is nothing which can get out of order and all accidents resulting from the making of a "flying switch" are thereby avoided. We have had a switch stand of this type installed at one of our mines where a Whitcomb gasoline motor is used for haulage and though it has been operated for several months, it has given no trouble during that time.

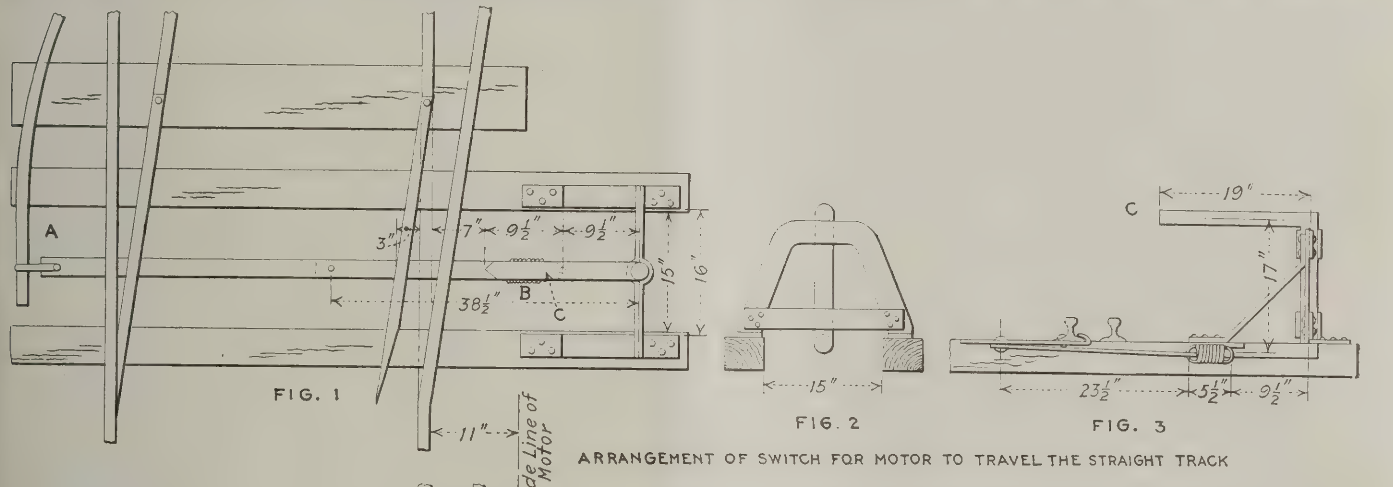


FIG. 1 FIG. 2 FIG. 3

ARRANGEMENT OF SWITCH FOR MOTOR TO TRAVEL THE STRAIGHT TRACK

Note: Spring B may be a pull spring as shown, or it may be a push spring
If used as shown, it must be stronger than spring A
Designed for 40 lb. motor rails. Either or both springs in Fig. 4 may be used

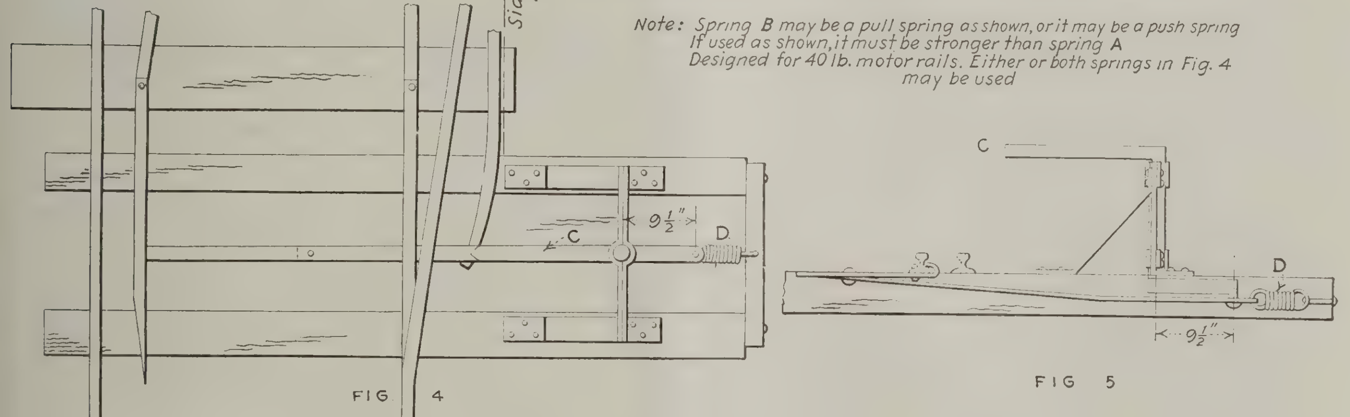

FIG 4 FIG 5

ARRANGEMENT OF SWITCH FOR MOTOR TO TRAVEL THE SIDE TRACK WHEN THE STAND CANNOT BE PLACED ON THE OPPOSITE SIDE

COAL AGE

The Switch and Stand

Switch Operated by the Motor

This mine switch is thrown in much the same manner as if operated by hand, but in this case the motor itself pushes the lever *C* and holds it in position till the locomotive passes over the points. These points are brought back into position after the motor has passed by means of a spring either such as is used on a common spring-latch, as *A*, or by a strong coil spring, such as *D*.

If a rail is used for a spring there should be a coil push-spring *B* in the connection between the stand and bridle to lessen the jar on the points, though this is not absolutely necessary. The parts of a switch of this kind must be made according to specific measurements so that there will be no unnecessary strain on the points or the stand. For the switch, here illustrated, the measurements were based upon a 38-in. gage and a point of contact between lever arm and motor 11 in. from the outside of the rail and 14 in. above it. The motor must be reasonably smooth on its sides or must be fitted with a strip of iron to hold the lever of the switch as the motor goes over the points.

In Fig. 1 it has been assumed that the locomotive

---

*Oak Hill Coal & Mining Co., 1914 McCormick Building, Chicago, Ill.

always travels the straight track and in Fig. 4 the parting is arranged so that the motor passes onto the switch track and the cars follow the straight road. The stand is shown in this figure as placed on the same side of the track, though it could be removed to the other side. Owing to this change the points must be pushed over and not pulled. This kind of switch is only necessary where there are double tracks as at the shaft bottom, it not being wise to have the switch stand between the tracks. This automatic motor parting is especially adapted to making uphill "flying shunts."

Automatic Mine-Car Coupler

The second device is an automatic car coupler for which the mining industry has long felt an urgent need. It is strange that despite the long strides made in mining machinery that a device of this kind was not introduced long ago, especially since the railroad automatic coupler has been such a national success. The need for its introduction in the mines is hardly less apparent.

The coupler is simple, few in parts, and can be manufactured at a low cost. A successful mine-car coupler must embody the following principles. It must allow trips to pass around curves of short radius and it must not project beyond the extreme ends of the car. It must have sufficient slack so that the momentum of the moving cars at the front end of a trip may be utilized to start, one by one, the wagons which are not yet in motion. All these principles and other minor requirements are embodied in this coupler.

Detailed Description of Parts

The device is composed of three distinct parts; the coupler head, the hook and the three links. The head is a malleable casting so designed as to form a connection between the three links and the drawbar and also to serve as a seat for the trip or dog, on the action of which the automatic quality of the coupler depends. One of the links, that nearest the coupler head, is shaped like a D and is permanently attached to the head, which head fits over one end of the drawbar and is bolted to it by means of three bolts, one of these passing through the end belt of the car. The dog on which the big link rests ready for coupling is fastened to the coupler head by means of a pin upon which it is free to oscillate.

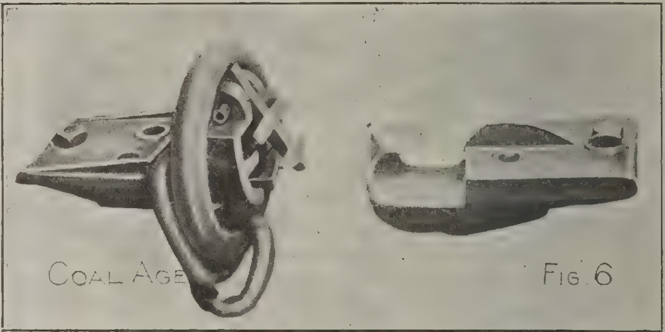
The hook is a malleable casting and is attached to the drawbar in a manner similar to the coupler head. This hook is designed to allow the big link to fall or slide into place when it is projected from head of the coupler by the oscillation of the dog. The form of the hook together with the leverage and weight of the big link make it practically impossible for the link to be thrown or jerked out of its position in the hook.

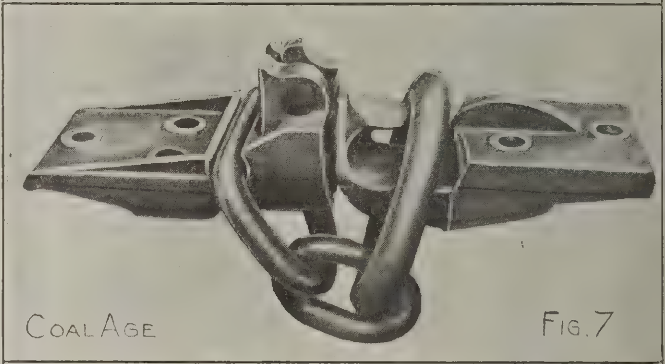
The three links are made of steel or of the best iron; the biggest is the coupling link which, when a trip is being made up, is hung on the dog at the top of the coupler head. The inside diameter of this link is 6 in., thus giving a play sufficient for all ordinary cars when on a reasonably straight track. The D link is slipped from the side into its groove in the coupler head. It is retained permanently in this position until a link is broken at which time the three links can be readily replaced. The small connecting link is roughly of an elliptical shape.

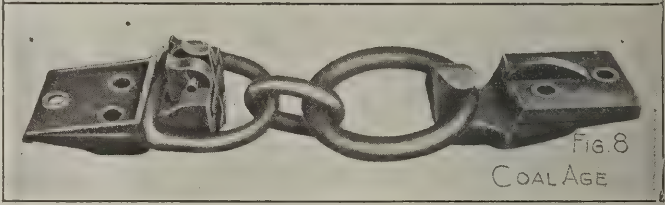
The Dog Which Replaces the Fingers of the Trip Runner

The dog is a malleable casting having a seat on the upper end for the big link and a projection to prevent that link from sliding back toward the car. The pin attachment passes through the dog at a point about one-third of its length from the upper end. The striking surface of the trigger end of the dog is increased by four side projections, two on each side at right angles to the motion of the cars.

The action of the coupler may be readily understood by reference to the accompanying figures. As the cars come together the hook of one car collides with the trigger of the other immediately the upper part of the dog is thrown forward and the end of the big link is dropped over the hook and, as the cars separate, works itself snugly into position. The cars are uncoupled by lifting the links out of the hook when trip is slacked. The big links can be hung on the coupler head ready for recoupling or can be allowed to trail on the ground.







Three Successive Positions of Coupler in Operation

Saves both Labor and Lives

The person coupling with this device need not jeopardize his life by placing his head and shoulders between the mine wagons. Time is saved in coupling up a trip because all the cars can be prepared beforehand for automatic coupling by hanging the big links from their appropriate dogs. It is not necessary for a driver or trip-rider to climb back along the trip to couple on cars, and wagons need not be pushed apart to couple or uncouple them. Coupler boys or men are not needed on partings or on the bottom. Thus not only labor but a cause of many accidents is eliminated. The weight of the castings for a 3-ton car is 17 lb.

No law has been passed requiring automatic couplers in mines, but it is likely that with their introduction will come legislation demanding that some such means be adopted to lessen the number of fatalities and injuries from mine cars.

⁂

An Emergency Cage

G. S. Rice, mining engineer of the Bureau of Mines, has invented a collapsible hoisting frame to be used in emergencies when the regular cage of a mine is injured so severely as not to be available, which often happens during an explosion.

This invention he patented June 3, 1913, the number being 1,063,285. The invention may be used by "any person in the United States without the payment of royalty."

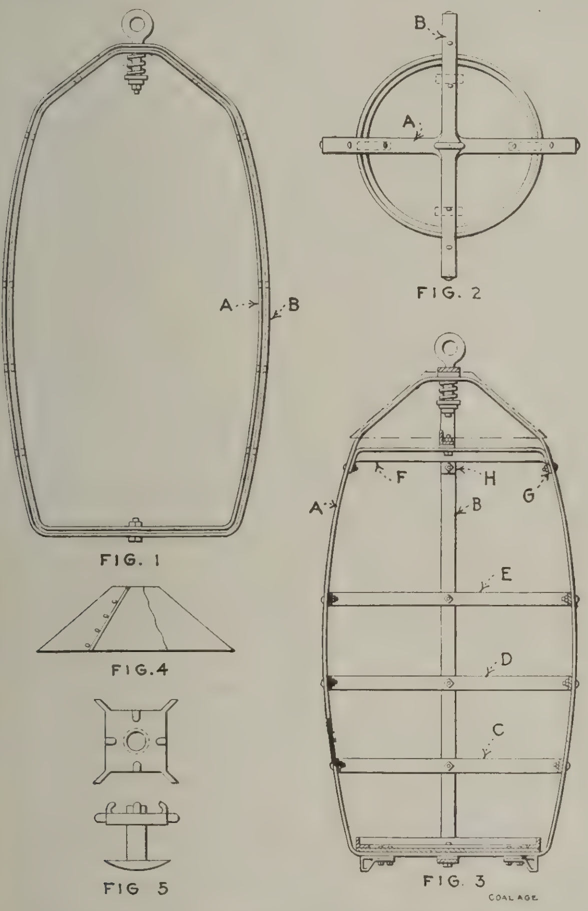


FIG. 1 FIG. 2 FIG. 3 FIG. 4 FIG. 5

Details of Collapsible Hoisting Frame

As the inventor states:

> It frequently happens in case of mine accidents that the regular hoisting equipment may be so damaged or disarranged that it cannot be used. In such case the provision of an emergency cage which can be made ready in a few minutes will greatly facilitate the work of rescue parties and aid in saving the lives of many to whom even a short delay may prove fatal. To be suited to this purpose the cage should be so constructed that it cannot be upset by striking projecting timbers or other obstructions in the shaft, and should as far as possible guide itself past such obstructions, since the men, if wearing rescue apparatus, cannot see readily nor control the movements of the conveyance used.
>
> Such cage should be sufficiently strong to withstand any blows to which it may be subjected and should be so arranged that timbers and cloth for brattices or other supplies necessary for rescue work can be successfully lowered in it. It is especially important that the cage should be of such construction that it may be quickly assembled and readily taken apart again for the purpose of convenient storage and transportation, as it is often necessary to load these cages along with other rescue apparatus on railway cars not especially equipped for mine-rescue work. All of these varied requirements are met by the cage hereinafter described.

The Whole Cage Is Collapsible

In the illustration of this device, Fig. 1 shows the collapsed cage consisting of two bales or yokes *A* and *B*, one of which is smaller than the other. They are connected at the top and bottom by pivot bolts. Thus the two bales can be swung into a position at right angles to each other as shown in Figs. 2 and 3, and secured rigidly by the hoops *C*, *D* and *E*, which are bolted to the bales. If desired a flexible hoop or chain could be used in place of hoop *E* to make entrance to the cage less difficult. A hood, Fig. 4, is dropped over the top of the cage fitting loosely as a cap over the suspending bales.

A cross brace consisting of two angle bars *F* and *G*, at right angles with flattened end-portions *H* and *I* and a pivoted connection at their intersection is bolted to the frame members near the top of the cage. These may be rotated when detached from the bales so as to lie one within the other, thus economizing space for shipment.

The platform is supported from contact with the ground by four lugs. The hood can be removed whenever it is desirable to lower timber. The king bolt by which the cage is supported is arranged to have a swiveling movement so that the twisting of the cable will not turn the cage. A spring on the king bolt relieves the strain on the rope when the cage is started upward.

Bolts Provided with Wing Nuts

To facilitate the assembling of the cage a special form of bolt and nut illustrated in Fig. 5 may be employed. The heads of the bolts are rounded in order that they may not catch on obstacles in the shaft. The nuts are provided with wing projections which can be grasped by the hand like an ordinary wing nut or readily turned by a flat bar or like tool if a wrench should not be available. For the storage of these bolts and nuts when not in use a bag should be provided attached to some member of the cage so as to be always available when needed. Copies of the patent can be obtained from the Commissioner of Patents, Washington, D. C., by inclosing five cents.

⁂

Appointments in Iowa

Gov. Geo. W. Clark has just reappointed the present state mine inspectors for another term of four years, beginning July 1, 1913. They are J. E. Jeffreys, 1st District, Albia; R. T. Rhys, 2d District, Ottumwa; and Edward Sweeney, 3d District, Des Moines.

The members of the Iowa State Mining Board, appointed for one year, are: E. M. Gray, president, Des Moines; H. W. Ladd, secretary, Madrid; T. L. Evans, Lockman; David Anderson, Ottumwa; and W. L. Jones, Colfax.

⁂

Experiments have shown that the cartridges attached to rescue apparatus often become so hot when used, as to burn the skin of the wearer. This can be overcome by inserting a piece of asbestos between the cartridge and the skin.

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 7.—Although not having the time to devote to the discussion of this subject that it deserves, I want to say that I do not believe in the use of mixed lights in a mine that generates inflammable gas in explosive quantities, even where there is a reasonably good ventilation. In mines of this character and where it is desired to obtain a better light than that given by the safety lamp, I believe the electric lamp recently approved by the Bureau of Mines, called the Ceag portable electric hand lamp, and the Hirsch portable electric cap lamp, can be substituted for the open lights, using the safety lamp for testing purposes only.

Rees H. Beddow,
State Mine Inspector.

Gallup, N. M.

First-Aid Standardization

Referring to the article, "The First-Aid Muddle," Coal Age, May 17, p. 769, permit me to express regret that the writer of the article deemed it unwise to disclose his name. In reply to my inquiry you state that he is a "physician of repute." Had the article appeared over the author's name, I can assure you that some of the eleven reputable mine physicians who prepared the report on first-aid methods would have been pleased to have answered the article.

I may add that the matters tentatively passed upon by these surgeons at the conference held in Pittsburgh last September have been under consideration by a committee of mine surgeons and physicians which was then appointed for this purpose. This committee will report at the first annual meeting of the American Mine Safety Association, which will be held in Pittsburgh beginning Sept. 22.

On behalf of that committee and of this association, I hope that in the meantime "A Physician" will either disclose his name or accept this as a general invitation extended to him by the association to be present, participate in its deliberations, and aid in perfecting standards of first aid, thereby contributing something constructive toward this most important work.

H. M. Wilson,
Chairman.

Pittsburgh, Penn.

⁂

An Open Letter

I have read with interest Mr. Powell's article entitled "A Gas Ignition Controversy," Coal Age, June 28, p. 985; and, although the matter is not of sufficient public interest to discuss it further, it seems unaccountable that the numerous statements made in his article were not brought out earlier in the discussion. As superintendent of the mine, Mr. Powell had ample opportunities for making a thorough inspection of the mine before the inquest. It is worthy of note that he states (p. 987) that pillars Nos. 76, 77, 78 and 79 were being drawn on the day of the disaster; and men were at work in Nos. 80 and 81.

These points are of the utmost importance, because, if men were at work on the pillars here mentioned, there were undoubtedly explosives and detonators at those points, and a cache of explosives was found after the third disaster, at the fourth cross-pitch up No. 79 chute.

Admitting the truth of these facts, the probability is that a fall of roof, explosives, detonators and coal dust may all be considered as operating to cause the first, second and third disasters, in this mine; and, further, that the third disaster was assisted by the ignition of marsh gas accumulated on the pitch. It can now be stated with confidence that the Bellevue disasters of Oct. 31 and Dec. 9, 1910, were not gas explosions; but, in view of the facts to which I have referred, they were coal-dust ignitions caused by a fall of roof on explosives and detonators. These fresh facts further corroborate what I have always claimed, namely, that the two first disasters were in no sense gas explosions.

James Ashworth,
Vancouver, B. C., Canada. Mining Engineer.

⁂

The Liquor Problem in Mining

Some time ago the question of the liquor problem in coal-mining communities was discussed in several articles (Coal Age, Vol. 1, pp. 25, 56, 90, 192, 222 and 258) by C. L. Fay, then state secretary of the Y. M. C. A. mining work, in Pennsylvania. I should be glad to hear the opinions of men in charge of mines, on the effect and proper control of the drink habit among coal-mining employees. My observation leads me to believe that there is no doubt but that this habit has increased with the advance in wages, if not in proportion to the same.

There is no doubt but that the inebriety of coal miners affects not only themselves and those dependent on them, but is an absolute loss to the mine operators who employ them. Apparently, it is a difficult matter to control this habit where it has gained any ascendency. However, I believe that much could be accomplished if there was some general understanding in reference to the conditions under which employment would be given to applicants for work. Attention was drawn to this particular matter by H. D. Johnson, a firmer anthracite mine inspector, in discussing the miner's certificate situation (Coal Age, Vol. 2, p. 467). Mr. Johnson, at that time, advanced the idea of the mine inspector granting three grades of certificates, A, B and C, to miners having different qualifications and capabilities. He claimed that these certificates should be presented by miners when making application for work to any mine foreman, and that it would enable the mine foreman to give them such work as they are capable of doing.

In addition to this idea, I want to suggest that the mine foreman or superintendent should demand of every applicant for work a certificate of good behavior and sober habits, from his last employer. This certificate should state the time lost, if any, on account of drink. I believe that such a system would greatly improve conditions, and every step in this direction helps to increase the profits and place coal mining on a firmer basis.

A few years ago, a church holiday, a christening, birth, or death were the causes given for lost time; but now, all of these and numerous other insignificant causes, as, for example, a new litter of pups or kittens, arrival of a new calf, a youngster's birthday, etc., etc., are offered as sufficient excuse for idleness and drinking. A reference was made recently to the numerous holidays that interfered to so large an extent with the successful operation of a mine (Coal Age, June 28, p. 994).

I believe if the shipment of intoxicants into dry territory could be prohibited, it would greatly help the situation, and to this end we should all lend our influence with the hope of bettering the conditions and the work.

Subscriber.

⁂

Systematic Timbering

I have been very forcibly impressed by reading the resolution adopted by the Rocky Mountain Coal Mining Institute, at their recent meeting in Salt Lake City, as published in Coal Age, July 5, p. 17. The resolution reads as follows:

> Resolved, that it is the sense of this meeting that any systematic method of timbering which contemplates the placing of the supports at regular intervals, is not applicable to the character of the roof overlying the coal measures in the Rocky Mountain regions, and that the only safe method is to require timbers to be set to securely support the roof in each individual working place. It is further resolved that this institute use all fair means to prevent or repeal any legislation which would attempt to establish systematic timbering in the several states in which the institute operates.

As the resolution was adopted after the discussion of D. J. Griffiths' paper, in which he made a special reference to the subject of systematic timbering, it would be of interest to those who, like myself, have not visited mines in the Rocky Mountain region, if Mr. Griffiths would further explain why systematic timbering is not adapted to that region and how falls of roof and sides are to be reduced in mines without a regular system of timbering.

From the brief reference Mr. Griffiths makes in his paper entitled "How to Reduce Falls from Roof and Sides," Coal Age, July 12, p. 47, it seems to me he has not the proper idea of what is meant by systematic timbering. It is not altogether the fixing of props at certain specified distances apart; but it means the *minimum* number of props to be set at a certain *maximum* distance apart. The system provides that if more props are needed, they should be set, according to the judgment of the miner or the instructions of the mine official in charge. The system does not contemplate a hard-and-fast rule. It is generally agreed that any hard-and-fast ule in mining is impossible and dangerous. But, sys-em in timbering, when adapted to the general condi-ions in a mine, makes mining safer by limiting the distance at which props may be placed apart. This dis-ance is determined by the mine manager or foreman, who has the power to alter this distance according to the changing conditions in the mine.

I don't understand Mr. Griffiths' reasoning where he states that "to timber according to fixed rules, the standard of safe timbering would be lowered." As it seems to me, systematic timbering gives the mine manager and his officials a more efficient and effective control over this important work at the coal face than they could secure by any other means. When inspecting the roof, the foreman will still look for bad places between the props; but if the timbers are not set, the neglect would be detected at once.

In any other system of timbering, the miner commonly waits until the roof gives some indication, before setting a prop; and most miners take many chances under dangerous roofs. It is this that causes the large number of accidents at the face. On the other hand, where systematic timbering is adopted, the props must be set even if the roof gives no indication of needing such support. Where a systematic method of timbering the working face possesses a distinct advantage over any haphazard method is that it compels the miner to set a new row of timbers regularly as the face of the coal advances. He cannot neglect or postpone doing this because he thinks it is not required at the present time. If his timbers are farther apart than the maximum distance allowed, or farther from the face of the coal and an accident should occur, the man himself is alone responsible and cannot recover under any mining act.

I do not advocate being tied down to rules adopted in particular localities. For example, in France and Belgium, they nick into the face coal, at the roof, to make places for the cap-pieces and set the posts close to the face of the coal. In South Wales, the general rule is to set the props in diamond fashion, the posts in each alternate row being opposite each other.

In every case, the system used should be adapted to the particular conditions in the mine. It is reasonable to assume that it is safer to work by a *system* than in a haphazard manner. In sections where systematic timbering is carried on, the number of accidents has been reduced not only because more attention is paid to the roof under such system; but particularly because more attention has been paid to secure the roof in a systematic way.

I consider that the Rocky Mountain Coal Mining Institute made a mistake to pass such a resolution, even though systematic timbering would not benefit them. In view of the fact that the majority of mine accidents are due to falls of roof and coal at the working face, it should be our constant endeavor to adopt such methods as will tend to reduce, as far as possible, the number of these accidents. The resolution tends to weaken the confidence of those who are adopting a systematic method of timbering.

There is danger in assuming that any experienced miner will always timber his place in a proper manner when he is left to do this in a haphazard way, using his own time and judgment in performing the work. Where such practice is followed, the work of timbering is generally done after the box is loaded, and this too often proves to be a fatal mistake.

W. L. Morgan,
State Mine Inspector, 8th District.

East St. Louis, Ill.

Fires—A Warning

I have been much impressed recently with the large number of fires that have occurred within the last few months, as recorded in the news columns of COAL AGE. I refer only to the fires in connection with coal-mining operations. These have been so frequent and the property loss so great, to say nothing of the many lives endangered thereby, that I think it advisable to call special attention to the subject. Many of the fires that occur could be prevented if proper precautions were taken and suitable means at hand to extinguish a fire when first started.

My desire in writing is to bring before the minds of readers the seriousness of the matter, and impress upon them the importance of safeguarding the properties in their charge, not only by furnishing the necessary equipment and keeping this in condition for immediate use, but by the adoption of strict regulations in regard to the use of lights, the handling of combustible material, and the storage of the same.

The appended list is by no means complete, as representing the fires that have occurred at mining plants within the past few months, but is evidence of the destruction that is constantly occurring at mining plants and cannot fail to impress the candid mind with the importance of closer supervision at every turn.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Higher Inflammable Limit—By the continued addition of gas, the firedamp having ceased to be explosive, now becomes less and less inflammable. The mixture not only ignites less readily, but when ignited burns less regulary and quietly than did the same firedamp mixture, in the lower inflammable stage when less gas and more air were present.

The higher inflammable stage of the gas is more dangerous, in mining practice, than the lower inflammable stage of the same gas, because the slightest addition of air, which is liable to occur at any moment in the mine, causes the mixture to approach the maximum explosive point. The addition of air to firedamp in the lower explosive or inflammable stages makes the mixture less explosive or inflammable.

Another important distinction between the lower and higher stages of firedamp mixtures is the relative ease with which the flame cap may be detected in the two stages. While the flame of a safety lamp burns steadily and yields a good cap that is easily detected, in the lower inflammable stage; the lamp flame is unsteady and the flame cap generally hard to discern in the higher inflammable stage. The reason is probably to be found in the uncertain and varying amount of air in the mixture feeding the flame, which makes the gas continually approach the explosive point. The gas in this (higher) stage is said to be "sharp."

The following table will make the several stages of firedamp more clear; but it must be remembered the proportions of gas to air and percentages of gas given as marking the dividing line between the different stages or the inflammable and explosive limits are only suggestive and vary with the degree of purity of the gas; the volume, intensity and position of the igniting flame, and the pressure and temperature of the surrounding atmosphere.

FIREDAMP MIXTURES (METHANE AND AIR)

Lower Inflammable Stage	Explosive Stages			Higher Inflammable Stage
	Lower Stage	Maximum Point	Higher Stage	
		Proportion of Gas to Air		
1 : 40	1 : 13	1 : 9.57	1 : 5	1 : 2.4
		Percentage of Gas		
2.5%	7.14%	9.46%	16.67%	29.5%

The continued addition of gas thus renders the firedamp extinctive of its own flame and therefore noninflammable. The proportions and percentages given in the table denote more or less closely the limits of the several stages.

Flashdamp—This is a mixture composed almost wholly of marsh gas (CH_4) and carbon dioxide (CO_2), mixed in the proportion in which these gases diffuse into each. It is formed under special conditions, in mines, where carbon dioxide from the old workings of an abandoned seam becomes mixed with the undiluted marsh gas generated in the strata. The mixture is lighter than air and possesses the peculiar and misleading properties of extinguishing the lamp at the roof of the seam or the face of a steep pitch.

The Coal Age Pocket Book

Calculation of Composition of Flashdamp—According to the law of diffusion, gases diffuse into each other in the inverse ratio of the square roots of their densities or specific gravities. For example, the specific gravities of methane and carbon dioxide are 0.559 and 1.529, respectively; and the ratio of the velocities of diffusion of these two gases into each other is then the inverse ratio of the square roots of these numbers.

$$\frac{CH_4}{CO_2} = \frac{\sqrt{1.529}}{\sqrt{0.559}} = \frac{1.236}{0.747} = 1.65$$

which can be written 1.65 : 1; or 1650 : 1000. This ratio shows that when these gases diffuse into each other, directly, before dilution with air takes place, the mixture will contain 1650 volumes of methane for each 1000 volumes of carbon dioxide. The same result is obtained by stating the law thus: The ratio of diffusion is equal to the square root of the inverse ratio of the densities or specific gravities of the gases; or, as follows:

$$\frac{CH_4}{CO_2} = \sqrt{\frac{1.529}{0.559}} = \sqrt{2.735} = 1.653$$

A slightly different, though theoretically more correct result is obtained when the calculation is based on the densities of these gases, referred to hydrogen as unity (1). The process is as follows:

Methane (CH_4); $C = 1 \times 12 = 12$
$H_4 = 4 \times 1 = 4$

Molecular wt. = 16; density = 16 ÷ 2 = 8

Carbon dioxide (CO_2); $C = 1 \times 12 = 12$
$O_2 = 2 \times 16 = 32$

Molecular wt. = 44; density = 44 ÷ 2 = 22

The ratio of diffusion is then equal to the square root of the inverse ratio of these densities; or

$$\frac{CH_4}{CO_2} = \sqrt{\frac{22}{8}} = \sqrt{2.75} = 1.658$$

Calculation of Percentage Composition, by Volume—The mixture is estimated to contain

Methane (CH_4)	1658 volumes;
Carbon dioxide (CO_2)	1000 volumes;
Total	2658 volumes.

Percentage, by volume,

$$\text{Methane,} \quad \frac{1658 \times 100}{2658} = 62.38 \textit{ per cent.}$$

$$\text{Carbon dioxide,} \quad \frac{1000 \times 100}{2658} = 37.62 \textit{ per cent.}$$

$$100.00 \textit{ per cent.}$$

EXAMINATION QUESTIONS

Ventilation and Gases

Ques.—A certain mine is ventilated by an exhaust fan that reduces the pressure of the air in the fan drift, 14.56 lb. per sq.ft. The mine is situated at an elevation of 2500 ft. above sea level; and, at the time of observation, the reading of the barometer was 27.286 in. The measurement of the air in the intake airway showed a volume of 150,000 cu.ft. per min. entering the mine, at a temperature of 40 deg. F.; while the measurement taken on the return airway showed a volume of 162,700 cu.ft. per min. passing out of the mine, at a temperature of 70 deg. F. (a) What is the estimated volume of the gas given off in this mine per minute? (b) What is the percentage of gas in the return-air current?

Ans.—(a) In this case, the intake air is expanded both by the increase of temperature from 40 to 70 deg. F., and by the fall of pressure. The fall of pressure is given in pounds per square foot while the atmospheric pressure is in inches of mercury, and it is necessary to reduce these to the same denomination. Therefore, reducing the fall of pressure (14.56 lb. per sq.ft.) to its equivalent in inches of mercury,

$$\frac{14.56}{144 \times 0.4911} = 0.206 \textit{ in.}$$

Subtracting this fall of pressure from the given atmospheric pressure gives, for the pressure in the return airway, 27.286 — 0.206 = 27.08 in.

The absolute temperature on the intake is 460 + 40 = 500 deg. F.; and that on the return 460 + 70 = 530 deg. F. The pressure on the intake is 27.286 in.; while that on the return is 27.08 in. Since the volume of the air current varies as the absolute temperature and inversely as the pressure, the volume ratio is equal to the absolute-temperature ratio, times the inverse-pressure ratio. Then, calling the required volume of the return air x

$$\frac{x}{150,000} = \frac{530}{500} \times \frac{27.286}{27.08} = 1.068$$

$$x = 150,000 \times 1.068 = 160,200 \textit{ cu.ft. per min.}$$

The volume of gas given off in this mine is then 162,700 — 160,200 = 2500 cu.ft. per min.

(b) The percentage of gas in the return current is, then,

$$\frac{2500 \times 100}{162,700} = 1.5 \textit{ per cent.}$$

Ques.—What change of volume, if any, takes place at the moment of an explosion of marsh gas in air?

Ans.—At the moment of the explosion, there is no change in volume, since the two volumes of oxygen required to burn one volume of marsh gas, produce one volume of carbon dioxide and two volumes of water vapor; while the nitrogen of the air remains unchanged.

If, however, the temperature falls after the explosion, the water vapor may be condensed to water, which will occupy so small a space comparatively that it may be practically ignored; and the ten and a half volumes of gas and air concerned in the explosion become practically eight and a half volumes of carbon dioxide and nitrogen, causing a reduction of about 19 per cent. in volume, or, say one-fifth.

Ques.—If the air is short-circuited at the fan, will this cause the speed of the fan to increase or decrease?

Ans.—When the air current is short-circuited, the resistance of the mine is cut out; and, as a result, a large quantity of air rushes through the fan, owing to the fall of pressure in the fan drift. Then, since the work lost or absorbed in the fan itself varies with the cube of the quantity of air passing, there results a large loss of work in the fan when the air is short-circuited. Therefore, assuming the power applied to the fan shaft remains unchanged, the effective power available for turning the fan is decreased and the fan runs slower than it did before the air was short-circuited.

Ques.—What is the weight of 200 cu.ft. of earth having a specific gravity of 1.4?

Ans.—This earth weighs 1.4 times as much as the same volume of water. Since 1 cu.ft. of water weighs 62.5 lb., the weight of 1 cu.ft. of the earth is 62.5 × 1.4 = 87.5 lb.; and the weight of 200 cu.ft. of this earth is 200 × 87.5 = 17,500 lb.

Ques.—What is the weight of 400 cu.ft. of carbon dioxide (CO_2) at 60 deg. F. and a barometric pressure of 30 in.? The specific gravity of this gas is 1.529 and the weight of 1 cu.ft. of air, at the given temperature and pressure is 0.0766 lb.

Ans.—The weight of 1 cu.ft. of gas, at the given temperature and pressure, being 0.0766 lb. and the specific gravity of the gas, referred to air of the same temperature and pressure, being 1.529, the weight of 1 cu.ft. of this gas is 0.0766 × 1.529 = 0.1171 lb. The weight of 400 cu.ft. of carbon-dioxide gas, at the given temperature and pressure, is then 0.1171 × 400 = 46.84 lb.

Ques.—What constitutes firedamp; and what gaseous mixtures does it include?

Ans.—The term firedamp, in this country, applies to any inflammable or explosive mixture of gas and air. It is generally understood to refer to a mixture of marsh gas and air, in explosive or inflammable proportions; although it is known that other explosive or inflammable gases are present; and, in many cases, the firedamp contains certain proportions of extinctive gases, such as carbon dioxide and nitrogen.

The presence of these gases greatly modifies the character of the firedamp, the inflammable or explosive gases increasing and the extinctive gases decreasing the danger of the mixture. The presence of inflammable gases having a lower temperature of ignition than marsh gas, such as ethane, carbon monoxide, or sulphureted hydrogen renders the firedamp more easily ignitable and dangerous, as does also fine coal dust in suspension in the air of the mine.

COAL AND COKE NEWS

Washington, D. C.

The following statement has been officially authorized here by the West Virginia Mining Association:

The Paint Creek Collieries Co. and the Standard Splint and Gas Coal Co. which were operated as Union mines before the strike which began sixteen months ago have signed new contracts with the union, thus ending the long strike at these mines, which employ about half the total number of miners on Paint Creek. The contract includes the "check-off," under the terms of which every employee, whether willingly or unwillingly, is compelled to pay union dues. The other mines on Paint Creek will not concede the check-off. Thus the union does not extend its territory under the new contracts.

The settlement was made on a basis of 51 cents a ton for pick mining splint coal, which is 4 cents a ton less than the scale in effect when the strike began, and 29 cents for machine mining splint coal, a reduction of 2½ cents a ton from the rate paid at the time the strike began.

As a pick miner averages about 250 tons a month this means that the men, after 16 months of idleness and turmoil, have been compelled by the officers of the union to lose an average of $10 a month or $120 a year in wages in order that the organization may be enriched to the tune of $1 per head fortnight in dues through the check-off.

Or, to put the same thing in other words, the officers of the union have shown by this action that the organization is really interested in the miner only as a source of revenue for its own coffers. Adding the $24 a year in dues to the reduction in wages makes an average of $144 a year that the miners will lose through their long strike.

Why is Anthracite High Priced?

Investigation of the anthracite coal companies to ascertain the causes of high prices and prospective government ownership of mines is provided for in a resolution that will be introduced in the House next week by Representative Murray of Massachusetts.

The resolution will declare that the prices of anthracite coal are advanced at will by the operators and that exactions amounting to millions of dollars annually are now enforced from the public. It will set forth that an arbitrary increase of from 60 to 70 cents a ton has been made in the prices of coal in Boston within the last few weeks and that the price is now excessive.

It will further declare that these increases have not been due to advances in wages, as the operators have declared, but that they represent increased profits to the operators solely.

Mr. Murray will ask that the investigation be made by the department of commerce, but the house itself is to consider the question of government ownership.

Japan Supplies Army Coal

A Jananese firm, Mitsui Bussan Kaisha, has been awarded a contract for 80,000 tons of coal to be supplied to the army of the Philippines during the fiscal year which began July 1. The contract is said to be the largest ever awarded by the army in the Philippines, being 20,000 tons in excess of the amount ordered for any previous year. The price at which the contract was accepted included delivery of the coal at Manila Bay and amounted to $6.20 a ton for 20,000 tons of washed nut coal or lump coal, and $5.85 a ton for 60,000 tons of best cleaned lump coal. Two other bids were made, one being $7.70 a ton for Australian coal and the other $6.45 a ton for Chinese coal.

HARRISBURG, PENN.

The State Railroad Commission has held its last hearing for it is expected that Governor Tener will name the Public Utilities Commission next week, which will take over the rairoad commission. The Commission had about a score of complaints before it and most of these were turned over to the prospective commission to investigate.

The Public Utilities Commission will also take over the Bureau of Railroads, now connected with the Department of Internal Affairs, and the Bureau of Statistics which has been connected with this department, will be taken over by the new Department of Labor and Industry.

More Petty Strikes

The absence of union buttons from the overalls of four hundred employees of the Jermyn Nos. 1 and 2 mines, at Scranton, of Jermyn & Co., led to a strike on Thursday of two thousand men. The miners refused to enter the mines until the four hundred delinquents and nonunionists ornamented themselves with emblems showing their status in the union. District officials of the U. M. W. of A. are trying to straighten out the tangle.

"Button strikes" have also been called at West Nanticoke and the Baltimore No. 5 Colliery of the Delaware & Hudson Co., in Wilkes-Barre, the men refusing to work with miners who are not in good standing with the union.

In the Hazleton region trouble broke out at Jeddo No. 5 Colliery of the G. B. Markle Co., due to the company's refusal to pay a certain class of outside labor $1.50 a day, and raise the wages of patchers from $1.41 to $1.50, it is feared that this trouble will cause a general strike throughout this company's collieries. A strike has also been called at the colliery of the Brookwood Coal Co. in this region, the miners want 99c. for a car of coal and 50c. for rock; they now receive 90c. for coal and 25c. for rock, these prices prevail in skipping pillars. As a counter proposition the company agrees to pay the miners $2.47 and laborers $2.13. In other words the company demands that the men work on a consideration basis, eight hours to constitute a day's work. All coal mined in that time belongs to the company and will not allow of extra compensation. The men are determined to fight out this issue, and it is feared that the pump runners and engineers will be called out.

The week beginning July 21, a convention will be held at Wilkes-Barre, of District No. 1, at which time the miners will try to devise some plan that will make "button strikes" unnecessary, which will probably take up the greater part of the time of the convention period. In all probability it will pass a rule that buttons be issued monthly for dues and not quarterly as is the present case.

PENNSYLVANIA

Anthracite

Scranton—Another public-school building in Scranton has been seriously damaged as a result of a mine cave. While there is no danger of an immediate collapse of the building, steps will have to be taken immediately to check any further settling of the ground.

Wilkes-Barre—In an opinion handed down by Judge Fuller refusing a new trial in the suit of Shiffer and others against the Hudson Coal Co., it is stated as regards excesive coal royalty:

> The suggestion of hardship in being compelled to pay for more coal than can be mined, has been urged and ignored in all cases. In the present case the net hardship merely consists in paying, exclusive of interest, about $50,000 for about 100,000 tons of coal, making an average royalty of about 50c. per ton which is not inordinate in view of the profits derived from the business.

Carbondale—Charles Enzian, of the United States Bureau of Mines; E. R. Pettebone, chief engineer for the D. & H. Co.; James E. Roderick, Chief of the State Department of Mines, and several other engineers have been at Carbondale endeavoring to determine the best means of extinguishing the mine fire which has been raging there for several years. It covers an area of 60 acres and is located in the surface vein. The state recently made an appropriation of $150,000 with which to extinguish the fire.

Pottsville—The coal companies of this region, on Friday, July 18, issued orders prohibiting all "beer picnics" on their grounds.

Coal tracts of these companies which extend over the mountain ranges in this region have been the scene of hundreds of "booze picnics" the last few months, particularly on Sundays, and the companies have decided to end the orgies by notifying the coal and iron police to arrest all trespassers upon their property.

The large coal companies have taken part in the movement which is not much of a surprise as they have for years prosecuted speakeasies, and the Reading company has vigorously prohibited beer drinking in all its parks. Patrons who do not indulge in intoxicants will not be molested in their recreations.

Bituminous

The Pittsburgh Coal Co. has taken up the use of gas-proof under-cutting machines, eight of these machines being now in use. Two have been placed in the mine at Manown, two in Sunnyside, and four in the Galatin mine. It is said the coal company will adopt this style of machine for work in all of its mines, as the gas-proof feature promises to settle to a great extent the differences now existing between the men and the management on the use of safety lamps and electric machines in the same mines.

Pittsburgh—With the rise of water in the Ohio River 59 barges of coal were started for Louisville, Ky., by the Monongahela River Consolidated Coal & Coke Co. With the continued high stage of water a good deal of coal will be shipped down the river.

George C. Theiff, former president of the Monongahela River Consolidated Coal & Coke Co., and Rufus Crawford, have purchased 900 acres of Washington County land at a price said to be $800 an acre.

Latrobe—The West End Co. is seeking new power consumers in the Latrobe and Ligonier districts and within the past few weeks have contracted for the delivery of approximately 4500 hp. This is all new business and is said to represent a revenue of $90,000 a year. The West End extension into the Ligonier valley is bringing results in the way of power contracts.

Monongahela—An order is being promulgated by the Monongahela River Consolidated Coal & Coke Co., that no boys under 16 years should be employed at their docks and marine ways. This order was the result of the accidental drowning of two boys while at work at Brown's Station and is said to have been the suggestion of the factory-inspection department.

Indiana—Four men were instantly killed and two others badly injured when a mine-drainage shaft caved in at Ernest. The men were sinking a new shaft on the land of the Jefferson and Clearfield Coal & Iron companies at Ernest, which was to be used to drain the water from other mines.

WEST VIRGINIA

Charleston—It is stated that the strike upon the Paint Creek has been settled again by an agreement signed between W. L. Connell, of Scranton, president of the Paint Creek Colliery Co., and John P. White, president of the United Mine Workers of America, in which the miners win many of the demands for which they were contending, among them being the check-off and recognition of the union.

A special grand jury has been convened by Judge Henry K. Black, of the Kanawha County Intermediate Court, in order to make an inquiry into the riotous conditions that have prevailed in the Paint and Cabin Creek coal field for over a year.

KENTUCKY

Louisville—F. Pigent, of Paris, France, who was passing through Louisville on his way from New Orleans to Central City, Ky., where he has mining interests, became ill a few days ago, and was taken from the Louisville & Nashville train to a local hospital. An examination desclosed the fact that he was suffering from an abdominal trouble, and an operation will be necessary. It will probably be some time before the French mining magnate can proceed on his trip to the Central City district.

Earlington—The St. Bernard Mining Co. has just completed, at Earlington, Ky., the coal washer for its mines there, which has been in course of construction for more than a year. The foundations of the washing plant were laid in 1912, and the concrete reservoir which supplies it with water was constructed during the winter. The principal feature of the plant is a belt conveyor 162 feet long, which will cary the coal from the railroad tracks, about forty feet below the washer, into the plant proper, on an incline of about 30 deg. The plant has a capacity of 800 tons a day.

Hazard—The Hazard Light & Power Co., of Hazard, Ky., which recently completed a plant designed to furnish light and power to the town, including the numerous coal mining plants which have been opened up in that vicinity during the past few months, is about ready to furnish current to all customers. The work of making connections is proceeding, and the town will soon be well lighted. The company also manufactures ice, a luxury which is much appreciated by the citizens.

Frankfort—The Elkhorn and Beaver Valley Railway Co., of Boyd county, Ky., which is building a line connecting with the Chesapeake & Ohio, in Eastern Kentucky, has filed amended articles of incorporation at Frankfort, Ky., increasing its capital stock from $270,000 to $400,000. The articles were signed by George W. Stevens, president of the company, who is also president of the Chesapeake & Ohio Railroad Company. The road, when completed, will give an outlet for large properties, which are rich in both coal and lumber.

OHIO

After Sept. 1, 1913, the Ohio Mine Inspectors Department will have ceased to exist as a separate branch of the state government. By a new law passed last winter a number of departments having to do with mines, workshops and factories, engines, fire risks, labor arbitration and the like, are to be grouped under an authority known as the Ohio Industrial Commission. Greater economy and a more thorough coöperation for the public good along industrial lines are expected from this centralization of responsibility. As matters now stand, some of the departments overlap and in a measure conflict with each other. The commission consists of three members. While no authoritative announcement has been made it is expected that Chief Mine Inspector J. C. Davies and his corps of district inspectors will be retained with the new body. It is not the design of the law to cripple the efficiency. The office of chief inspector of mines was created in 1874 with Andrew Roy as incumbent.

Cincinnati—Application has been made to the Superior Court here for receivers for the Marmet Coal Co., a million-dollar corporation, whose coal lands are located mostly in West Virginia and Pennsylvania. The request was granted and Edwin Marmet, president of the company, and Charles W. Poysell, general manager, were named by the court as receivers upon furnishing a bond of $50,000.

INDIANA

Indianapolis—Word comes to operators in this city that a vein of coal 5 ft. thick was pierced by well drillers at 300 ft., near Newman, Ill., the first discovery of the kind indicating paying quantities.

Twenty-six general organizers of the U. M. W. of A. were at headquarters in this city this week, discussing the strike situations, particularly that in Virginia.

ILLINOIS

Pana—Judge McBride, of the Christian Circuit Court, has appointed Francis R. Roberts, of Chicago, and J. M. Taylor, of Taylorville, Ill., receivers for the Pana Coal Co., a $500,000 corporation, upon petition of the Continental and Commercial Trust and Savings Bank of Chicago, trustees. It is asserted that the Pana Coal Co. defaulted in the payment of the first installment of the bonds.

Chicago—A. R. MacKlay, special examiner for the Interstate Commerce Commission, has been taking testimony concerning the freight rates on hard- and soft-coal shipment between Chicago, Proviso and Elmhurst, which are the subjects of a complaint filed by the Hammerschmidt & Franzen Co.

New regulations for the distribution of coal cars have been issued by the Baltimore & Ohio R.R., to become effective Aug. 1. During extended periods of full car supply, mines will be given cars up to order, provided such cars are loaded and consigned promptly. Mine ratings will be based upon the month showing the highest average daily shipment of the total output of the operators during the preceding 12 months. Cars will be pro-rated on a tonnage basis with a 50-ton car as a unit. A record of car distribution of all mines on the Baltimore & Ohio lines will be kept in the office of the Superintendent, and the record will be open to inspection of authorized representatives of mine operators.

ARKANSAS

Harrison—Judge F. A. Youmans has appointed Hiram Butterfield a special master in chancery for several thousand acres of land in Marion County, together with mining machinery located on the property, in order to satisfy a judgment of $65,000 in favor of the Rhode Island Hospital Trust Co., of Portland, Me., which holds bonds of the White River Lumber & Mineral Co.

Little Rock—Tom Shaw, State Mine Inspector, has reported to J. C. Clary, State Commissioner of Labor, that he has been compelled to close down a mine at Bonanza and another at Jenny Lind, because of inadequate water supply, and the lack of precautionary measures against accidents.

OKLAHOMA

McCurtain—The McCurtain Mine Relief Committee having in charge the collection and distribution of funds to those rendered dependent by the explosion in mine No. 2 of the Sans Bois Coal Co., at McCurtain, Okla., on Mar. 20, have made public their report. It shows that a total of $55,177.63 was collected for the victims of which the Carnegie Hero Fund donated $15,000, the largest single subscription. The average amount paid to each dependent family was $923.89; the average amount paid to each dependent person was $286.40, and the average amount paid each injured person was $226.80.

KANSAS

Leavenworth—The north shaft of the Home-Riverside Coal Mining Co., the first mine to be sunk in Kansas, is to be closed permanently according to an order made by Judge Wendorfs of the District Court, who granted an application of the receivers to close the old shaft.

This shaft was sunk more than fifty years ago by the Leavenworth Coal Mining Co. Recently a fire in the mule barn made it impossible to work the shaft because of the danger to the miners. It is about 750 ft. deep.

COLORADO

Colorado Springs—The officials of the Curtis-Rapsen Coal Co. have abandoned the shaft of the Curtis mine, five miles north of Colorado Springs. It has been impossible to extinguish a fire which has been raging in the different levels of this mine.

MONTANA

Butte—The recent order of the Interstate Commerce Commission reducing coal rates between Sheridan, Wyoming, and adjacent points, and points in North Dakota, Washington, Idaho and Montana has aroused considerable opposition among the coal-mining interests of Carbon County, Montana. Evidence has been presented to Federal Commissioner Esch, of the Interstate Commerce Commission, tending to show that if the order is enforced, five of the principal coal mines of Carbon County will be forced to suspend operations, with the result that 1000 miners will be thrown out of employment. It is stated in the complaint that the cost of producing coal in Montana is one dollar per ton higher than in Wyoming because of labor conditions, and that under the new ruling the mines in this state would be unable to compete with those in Wyoming, due to the fact that coal producers in the latter state would be able to ship coal into Montana competitive territory at a rate of 10c. per ton lower than the local rates.

WYOMING

Cheyenne—Federal Judge J. A. Riner has dismissed eight or nine cases, charging G. J. Quealey, a wealthy operator of Kemmerer, Wyo., with fraudulent acquisition of coal land.

FOREIGN NEWS

Paris, France—The French government has selected the port of Papeiti, one of the Society Islands in the South Pacific Ocean, as a suitable port to serve as a French coaling station in view of the opening of the Panama Canal. This port was the selection of both the private and official commissions which have been investigating the subject.

Washington, D. C.—A prominent importer, who supplies the railroad and navy of European countries with coal and the general trade with grain, wishes to establish a permanent connection with American exporters of these articles. Coal briquettes are especially desired, but they must stand a chemical test in competition with the products of other countries. Prices should be quoted at port of destination.

Bremen, Germany—The total number of tons of coal exported from Germany during the first five months of this year amounted to 13,687,651 tons, an increase of 654,804 tons compared with the coresponding period of last year. Germany's best foreign customer is Austria Hungary, which took 4½ million tons of coal. The coal strike in Belgium was particularly advantageous to the German exporters as 150,000 more tons of coal were exported during that period.

PUBLICATIONS RECEIVED

Department of the Interior, Bureau of Mines. The Analysis of Black Powder and Dynamite. By Walter O. Snelling and C. G. Storm. Bulletin 51; 78 pages, 6x9 in.; with numerous halftones, figures, curves and tables.

Department of the Interior, Bureau of Mines. Heavy Oil as Fuel for Internal Combustion Engines. By Irving C. Allen. Technical paper, 37; Petroleum technology, 5; 36 pages, 6x9 in., without illustrations. This paper is issued in response to the many inquiries regarding the supply of heavy oils and their use as fuel for steam raising and in internal-combustion engines.

PERSONALS

T. K. Webster, for many years president of the Webster Mfg. Co., has severed his connections with this company, and F. S. Shaw has been elected president in his place. The officers of the company at present are: F. S. Shaw, president; A. T. Perkins, vice-president and general manager; Alex. Kiskadden, vice-pres.; Charles S. Clarke, treasurer; L. H. Webster, secretary.

William Clifford, well known to mining men, has sold his mine-fan manufacturing plant at Jeanette, Penn., where he has been manufacturing the Clifford fan for a number of years. The reason given is that Mr. Clifford desires to retire to a less active life. It is stated that he intends to make a visit to England at the end of the month, returning in the autumn. He will retain his home in the park adjacent to the plant works, and will continue to pursue the scientific studies in which he has been engaged.

Governor Tener has announced the reappointment of John Birkinbine, of Cynwyd, Montgomery County, as a member of the State Water Commission, Mr. Birkinbine is the only member of the original commission named by Governor Pennypacker in 1905. He is one of the best known scientists of the country and an authority on hydraulic engineering. He has been president of the Franklin Institute, American Institute of Mining Engineers, the Engineers' Club of Philadelphia, and the State Forestry Commission, and is a member of many leading learned societies, in addition to being author of a number of notable works. He has been identified with many famous engineering enterprises.

OBITUARY

George Harrison, former state mine inspector, died recently at the home of his daughter at Caldwell, Noble County, Ohio, after an illness of nearly a year. He was attacked by paralysis last fall, and never recovered. He served as mine inspector during the Herrick, Pattison and Harris administrations, and during all but about six months of the Harmon administration. He succeeded in securing the enactment of a new mining code of laws. The office force of the Ohio State Mine Inspector attended the funeral.

CONSTRUCTION NEWS

Wheeling, W. Va.—Work was begun this week on the steel tipple of No. 6 coal mine of the Rail & River Coal Co.

Washington, Penn.—The Pittsburgh Coal Co. is now opening two new mines in Mt. Pleasant and Cecil townships in Washington Co. on lands which were at one time owned by George Washington, the first president of the United States. A force of men is at work at each opening, and it is expected that the work will be pushed so as to be completed by the time that the new railroad, which is being built reaches the mine.

Chicago, Ill.—The Forester Coal & Coke Co., of Duquoin, Ill., whose tipple was destroyed by fire on July 1, have just placed their order with the Roberts and Schaefer Company, Chicago, for a steel tipple which, it is claimed, will be the most modern and best equipped tipple in the State of Illinois. The equipment will include a Marcus patent picking table screen. No money will be spared to make the entire plant the very best that can be built, not only in regard to being fireproof and durable but also in the matter of preparing coal.

Cramer, Penn.—The Northwestern Mining and Exchange Co., one of the Erie subsidiaries, has announced that work will be commenced on the construction of two immense shafts at Cramer, Jefferson County. The shafts, according to specifications, will be the largest in this part of the Bituminous district. One will be 300 feet deep and the other 310 feet deep. The work of sinking these shafts will commence about the first of August. This will mean the building of a mining town at Cramer, which is now but a cross-roads.

NEW INCORPORATIONS

Kansas City, Mo.—The Grey-Bryan Coal Co. has increased its capital from $10,000 to $30,000.

Aurora, Ind.—The Pittsburgh Coal Co. of Aurora has increased its capital stock to $12,500.

Frankfort, Ky.—Joseph Walton & Co., of Louisville, have changed their name to the Pittsburgh Coal Co.

Chicago, Ill.—Bell Coal & Fuel Co. has been incorporated by Louis Metcoff, A. L. Greenberg and Eli Metcoff, with a capital of $5000.

Frankfort, Ky.—The Sturgeon Creek Coal Co., of Idomay, has been incorporated with a capital of $1000. The incorporators are H. G. Parrish, Walter Gourley, T. McGuire and D. W. Gourley.

Wheeling, W. Va.—The Wheeling Monroe Coal Co., of Wheeling, W. Va., has been incorporated with a capital stock of $25,000 in order to develop coal properties in Monroe County, W. Va.

Johnstown, Penn.—The Park Hill Coal Co. has been incorporated with a capital of $50,000. The incorporators are Harry Davis, of Conemaugh; T. J. Pearce, of Portage; E. T. Neelis, of Johnstown.

Chicago, Ill.—The Alkali Mine Co. of Chicago has been incorporated for $75,000. It is expected to mine and deal in mine products. The incorporators are John F. Hummer, J. Paul Dunne and Richard Klein.

Nashville, Tenn.—The Highland Coal & Lumber Co., of Davidson County, has been incorporated with a capital stock of $25,000. The incorporators are W. V. Davidson, M. F. Greene, Lucien Clark, M. M. Davidson and H. M. Greene.

Oklahoma City, Okla.—The Pomeroy Coal Mining Co., of McAllister, has been incorporated with a capital stock of $12,500. The incorporators are G. A. Miller, Ernest W. Schreiner, of McAllister, and Jacob Schreiner, of Oklahoma City.

North Lima, Ohio—The North Lima Coal Co., of North Lima, Ohio, has been incorporated with a capital stock of $10,000 to mine and deal in coal. The incorporators are: James Aspenwall, Hector Buxin, Thomas Murphy, Paul Koachway and Lucien Affrance.

Bentleyville, Penn.—Articles of incorporation have been taken out in Delaware by the Strange Creek Coal & Coke Co., of Bentleyville, Penn., to acquire coal and coke lands. The incorporators are James Stevenson, J. G. Richellson, of Bentleyville, and Charles R. Trew, of Charleroi, Penn. The capital stock is $200,000.

Springfield, Ill.—The Schniewind Coke Oven Co., of Hartford, Conn., has been granted a license to operate in Illinois. The capital stock is $500,000 and the incorporators are Vice-President Louis Wilputte, of New York, secretary, Robert C. Metcalfe, of Newark, N. J., and William H. Childs, of Brooklyn, N. Y. The principal place of business in Illinois is the Coal Products Co., at Joliet.

INDUSTRIAL NEWS

Johnstown, Penn.—Wm. Schaffer, of Somerset, has purchased the surface and the top vein of coal of the Harrison Lohr farm in Shade township, Somerset County.

Independence, Kan.—Attorney A. M. Parsons, formerly of Caney, now of Okmulgee, Okla., secured a lease on the Foreman farm, near Caney, and will immediately form a company to drill for coal.

Johnstown, Penn.—John Lochrie will within a few days begin work on the opening of a new mine over the hill from his present plant near Scalp Level, where he owns the coal under 200 acres.

Greensburg, Penn.—A coal deal is now on which will take up all the land on the north side of Crooked Creek, at Chambersville, Indiana County, which is one of the few tracts remaining unsold.

Waynesburg, Penn.—Georgia E. Rice and T. Riley Huffman, of Waynesburg, have closed a deal in which they sold 1000 acres of coal land in Belmont County, Ohio, to A. J. Pasie, of Pittsburgh. The consideration is $62,500.

Pottsville, Penn.—This township will profit by the new coal operation of the P. & R. C. & I. Co. at Mt. Laffee, where the immense coal strippings will lay bare the mammoth and other veins.

Winchester, Ky.—Slemp Coal Co. has sold to the Henry Coal & Coke Co., of Hazard, 2802 acres of coal lands, of which 641 acres is in fee and the remainder in mineral rights. The company will at once proceed to develop the property.

Myersdale, Penn.—The Keystone Coal Co. has moved a diamond drill to the Alex. Speicher farm, part of the Wilehlm tract in Elk Lick township to prospect for a seam of big vein coal supposed to underlie a portion of that farm.

Carbon Hills, Ohio—Three thousand coal miners, members of the United Mine Workers of America, marched to the Hawthorne & Floodwood Mines at Forest Junction in Essex County on July 18 and removed 100 nonunion miners from their work.

Fairmont, W. Va.—The Syndicate headed by the Fidelity Trust Co., of Baltimore, have disposed of more than $3,000,000 of the issue of $4,000,000 Elkhorn Co.'s 5% collateral mortgage bonds. It is expected that the rest of the bonds will be sold in a short time.

Ashland, Penn.—Gilberton colliery, an operation of the Philadelphia & Reading Coal & Iron Co., has suspended operations for four months, during which time a new breaker is to take the place of the present dilapidated structure. The colliery employs 500 men and boys.

Indiana, Penn.—Manor Real Estate & Trust Co., of Philadelphia, on Wednesday, completed the purchase of 434 acres of coal land in Green and Cherryhill townships, through their Indiana agents, Benj. J. W. Carskaddon and E. E. Davis, whose offices are in the Marshall Building.

Birmingham, Ala.—The Maryland Coal Co., which has recently opened the new mines in the Sipsey Coal fields expects to begin shipping coal by August 1. Recently the 'Frisco Railroad extended its branch line from Empire to the mine at an expense of more than $200,000.

Heber Springs, Ark.—D. M. McGraw, of Altus, superintendent of the Western Coal & Mineral Co., at Dennins, is here taking options on 10,000 acres of upland along the Missouri & North Arkansas R.R. Coal has been discovered there and this corporation is securing options with a view of prospecting.

Albany, N. Y.—Petroleum and natural gas are the only fuels that are mined in the state of New York. The value of these which was obtained in the year of 1912 was $3,220.67. There was a gain in the output of gas, which in volume amounted to 6,564,659 cu.ft., while the oil industry experienced a decline.

Somerset, Penn.—The initial first-aid meeting in Somerset County was held on July 16 on the baseball grounds. It was under the auspices of the Bituminous Committee of the State Y. M. C. A., and T. D. Dilts, of Greensburg, was in charge. Nine teams entered into the competition for the cup, medals and prizes which were awarded.

Pittsburgh, Penn.—An order has been granted by the United States District Court authorizing the payment of the wages of the miners of the Jenner-Quemahoning Coal Co. on July 26. The latter concern is a subsidiary company of the United Coal Co., which has been in the hands of a receiver for some time. The total amount of wages to be paid is $23,589.92.

Washington, D. C.—The first coal mine opened in the United States is about to resume operation. It was abandoned about one hundred years ago, and is situated in the Richmond Basin, Henrico County, Va. It was first opened in 1700 and continued working for 100 years, when it was believed that its coal had become exhausted. Recent explorations find a considerable amount of coal there, and work will soon begin.

Harrisburg, Penn.—The State Department of Mines is preparing to make a thorough investigation of the manner of drilling gas and oil wells through coal measures, in order to prepare laws for submission to the legislature of 1915, regulating such work. The inquiry will be of great importance to the Pittsburgh district, and probably will lead to devising of measures which will settle disputes of long standing.

Columbus, Ohio—The committee named by each side and approved by the commission which is investigating the systems of weighing coal for the purpose of determining miners' wages in Ohio, are as follows: Miners: C. W. Savage, Columbus; William Roy, Klee; Percy Tetlow, Washingtonville; Lee Hall, Cambridge; William Greene, Coshocton; John Moore, Columbus. Operators: E. A. Cole, Columbus; W. H. Haskins, Coshoctom; J. H. Pritchard, Columbus; D. J. Jorden, Cleveland. These committees will be present at all sessions of the commission.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite quiet but steady. High prices still ruling on soft coal. Heavy shipments to the Northwest causing a shortage in the East. Resumption of mining in West Virginia is not relieving the pressure for coal. Labor shortage growing worse.

The domestic grades of hard coal are moving off in good shape under the restricted production now in effect. There has been a fair demand for a July delivery and some improvement is noticeable. However large percentages of the steam grades are going into storage and individual operators are making some concession on the regular company circular. There is a great deal of uncertainty over the new Pennsylvania state tax on anthracite.

Some new record prices for bituminous have been paid in New England for small tonnages required to fill out cargoes; such prices cannot, however, be considered the market although it shows what a strong position the sellers hold. Operators continue adhering strictly to their policy of not quoting for future delivery and there does not appear to be any weak spot in the trade that can possibly lead to a slump. The heavy demand in the West and Northwest has more than made up for any unsteadiness as a result of the resumption of work in the West Virginia field. As a matter of fact West Virginia operators are pressed for any kind of coal while the Pennsylvania companies are entirely sold up on everything but the very lowest grades. The latter operators have had practically a full car supply, due to the slack anthracite trade, much of the hard-coal equipment being diverted into the bituminous service.

Mining in the Pittsburgh district continues at maximum capacity. Dealers agree that the business has never been so good at this season, and it is now impossible to contract at the prevailing circular. There is little new buying but the demand on contract is more than sufficient to cover the production. The settlement of the West Virginia labor trouble has not had any apparent effect upon the local situation. At some of the adjoining points conditions are so hard that considerable uneasiness is felt. Nobody has sufficient coal and even producers are being forced to buy in order to fill out their contracts.

There is a tendency to increase prices in Ohio; one of the best features of the trade there is the heavy domstic demand but manufacturers are also taking a large tonnage. There has been a heavy movement from the mines into the Hampton Roads market but there is still a shortage and prompt tonnages command a ready premium. There are no unusual surpluses in the Southern market and the trade is apparently capable of absorbing the full production; it is anticipated that this district will see one of the most severe car shortages in its history if there is no improvement.

There is an upward tendency in prices on nearly all grades in the Middle Western markets. The inadequate labor supply is making it difficult to handle the coal at destination and the car shortage is becoming steadily worse; indications are that the situation in this latter respect will be acute this fall. No change has occurred on the Eastern coals in this market, as a result of the settlement of the West Virginia labor controversy.

BOSTON, MASS.

Producers are well supplied with orders and prices continue hard, particularly for prompt delivery. Uncertainty making it difficult to buy for future delivery. Pennsylvania operators benefiting by the release of cars in the anthracite service. Hard coal picking up.

Bituminous—Prices on Pocahontas and New River continue firm, especially for spot shipment. Detention still prevails at the loading piers but another week will probably see tonnage being cared for in better fashion. Some of the shippers have been obliged to go into the market for small amounts to help load steamers and as high as $3.15 has been paid this week for purchases of that kind. All the agencies are well supplied with orders, in fact too well supplied for July and August, and there is small chance of quotations being any easier at least for weeks to come.

The Georges Creek situation does not vary much from that at Hampton Roads. While steamers and vessels have been loading at Baltimore in shorter time yet there is not much improvement from a week ago. The volume of business on this grade is large and the shippers are expected to have difficulty in meeting the market requirements

In Pennsylvania there is an increasing disposition not to close further business for deferred delivery. Operators are willing to sell at the market their current output but they lose interest when prices are asked for September and October. A slight spurt in the New England demand for Pennsylvania coals is occasioned by the release of certain anthracite transportation to freight soft coal, while the hard coal trade is temporarily dull. Quite a tonnage has been placed in this way lately to replace the shipments of Southern coals that would normally come to this market in July.

Anthracite—While slack early in the month, there is now a good demand for hard coal for shipment on July prices. Stocks are large, but as fast as room is made the dealers are asking for further shipments. Such cargoes, however, are pretty well assorted and the pinch over stove size is not being felt for the present.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.10@1.45	$1.35@1.65	$1.67@1.77	
Philadelphia*	2.35@2.70	2.60@2.90	2.92@3.02	
New York*	2.65@3.00	2.90@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.15
Providence†				3.88@4.00
Boston†				4.00@4.10

*F.o.b. †On cars.

NEW YORK

New York quotations on soft coal experienced a further advance. Still inquiries for contracts. Shortage due to heavy shipments of West Virginia coal into the Northwest. Anthracite dull and quiet.

Bituminous—The local soft-coal market is, if anything, in a stronger position than last week. The shortage is becoming so pronounced that competing companies are endeavoring to place orders with each other. There has also been more than the usual number of inquiries for contracts during the past week.

One of the principal causes for the hard local situation is due to the fact that shipments from West Virginia are light, most of this coal being diverted into the North and Northwestern markets. Another important influence is the short supply of labor. Mines generally are attempting to make the highest possible production they can, but the shortage of miners is proving a serious handicap. One large Pennsylvania company reports a shortage of fully 30 per cent. The New York market has strengthened to such an extent during the week, that it is necessary to advance quotations for the first time in several months, the trade now being hard and firm on the following basis:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.75@2.80; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.25@3.30.

Anthracite—The hard-coal market is quiet and dull, and production at the mines was further reduced during the week. Stove coal is the only grade in any demand at all, while pea and buckwheat are being stored in considerable tonnages, although not so much as was the case before the production was curtailed.

The car supply is excellent; in fact, there is such a surplus of equipment, that some is being diverted into the bituminous trade, much to the benefit of the Pennsylvania shippers into the New England market. Labor is in fair supply and fully up to requirements. We continue quoting the New York market on the following basis:

		Individual		
	Circular	Lehigh	Scranton	Schuylkill
Broken	$4.80	$4.45@$4.65	$4.50@$4.70	$4.45@$4.65
Egg	5.05	4.80@ 4.90	4.85@ 4.95	4.80@ 4.90
Stove	5.05	4.90	4.95	4.90 .....
Chestnut	5.25	5.05@ 5.15	5.10@ 5.20	5.05@ 5.15
Pea	3.50	3.25@ 3.45	3.30@ 3.50	3.25@ 3.45
Buckwheat	2.75	2.10@ 2.45	2.50@ 2.75	2.10@ 2.45
Rice	2.25	1.75@ 1.95	2.25	1.75@ 1.95
Barley	1.75	1.30@ 1.70	1.75	1.30@ 1.70

PITTSBURGH, PENN.

Mining up to maximum capacity with movement mostly on contract. Coke buyers refuse absolutely to meet the $2.50 price of the producers and the situation is tense. Both sides are holding out firmly and furnaces are being forced to bank or buy soft coke at relatively high prices.

Bituminous—Mining operations continue at practically their maximum; there is little new buying but the production is well absorbed by contract requirements. Slack continues in active demand, so that the concessions from the regular figure usually so frequent at this time of year are now almost absent. Car and labor supply are fairly good. The Pittsburgh district is not particularly disturbed over what appears to be the final settlement in the West Virginia labor difficulties, although it has been held that a considerable part of the prosperity in this district has been due to the curtailed output in West Virginia. We continue to quote prices as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The market has been almost stagnant the past week, as refers to actual transactions, but the market position has been highly interesting, a tense situation being presented by the absolute refusal of several furnaces to pay the $2.50 price demanded by operators. Such furnaces are looking for coke, and have purchased several lots of soft coke, at relatively high prices. As already reported, there have been several bankings of furnaces and it is believed that others will do likewise rather than pay the $2.50 price. There is not a sign of weakening in the position of operators, there being little coke to be found for prompt shipment at the figure, and none offered at a lower price. It is doubtful whether there will be much movement in the market until the question of August requirements comes up. This will open up the case with respect to the furnaces which paid $2.50 to secure a July supply. We quote: Prompt furnace, $2.50@2.60; contract furnace, $2.50; prompt foundry, $2.85@3; contract foundry, $2.85@3, per ton at ovens.

There has apparently been sufficient restriction of output to meet the situation presented by slightly decreased pig-iron production, and by the abstention of several operating furnaces from taking their normal tonnages. The "Courier" reports production in the week ending July 12 at 390,470 tons, an increase of 57,000 tons over the preceding week, but 18,000 tons less than the average in June, and shipments at 11,274 cars, an increase of 1609 cars, the shipments carrying 388,876 tons, an increase of 56,248 tons.

PHILADELPHIA, PENN.

Some price cutting by individual hard coal operators. Steam sizes in long supply but domestic grades are moving off well under the restricted production. Uncertainty over the new state tax continues. Bituminous remarkably strong.

Compared with the corresponding period last year, the anthracite coal business in this vicinity presents anything but a favorable outlook. The summer months always see a marked falling off in the demand for coal, and this year is no exception. It is understood, however, that with the curtailed production, the companies are moving off practically all of the domestic coals, some of course, going into stock; but the steam sizes still continue to be far in excess of the demand, and are added to the already large quantities of these grades in stock. Individual operators are reported as cutting prices anywhere from 15 to 25c. on the various sizes, the extent of the concession varying according to the demand at the time of the sale.

The Pennsylvania State tax still continues to be discussed. It has not as yet been decided by the dealers here in what way they will handle it. Some talk of an advance of 10c. per ton in the ruling price for egg, stove and chestnut sizes, and 5c. on pea, which is approximately the amount of the tax, but up to the present time, no decisive action has been taken. It is understood that some of the large companies contemplate increasing the price of the coal, rather than adding the tax to invoices as a separate item. It is also stated that one or more of the various interests may institute proceedings to test the legality of the new law. As yet, nothing seems certain, except that the consumer will ulimately pay the tax.

In every direction, one hears nothing but good of the bituminous industry. New contracts are being taken at considerable advances over quotations made six weeks or two months ago for the same business, and a postponement of purchases from one day to another, is likely to have the effect of an advance of anywhere from 10 to 15c. Buyers seem to realize this, and are accepting quotations for spot deliveries without any special canvassing of the market for better prices. The trade is in marked contrast with existing conditions for years past at this season of the year. It is really the only industry that can be said to indicate a prosperous condition, both as regards demand and prices, and operators generally do not look for a let down in the near future.

BALTIMORE, MD.

The heavy demand from the West and Northwest has more than taken up any slackness in the local situation. Better grades almost entirely out of the market. Consumers who failed to contract in the spring are now hard pressed.

This is the most active June in the history of the local coal trade. The heavy call from the West and Northwest has more than made up for any inclination to sag in the Eastern field as a whole. West Virginia operators are now pressed to get any decent kind of coal, while in Pennsylvania producers are sold up on all but the worst grades and are now busy filling their contracts.

The city board of awards has finally decided to allow the various departments to buy independently. Because of this ruling the Georges Creek Coal Co. withdrew its bid for the first installment of a bulk contract, or 40,000 tons.

There is already an advancing market in West Virginia. Slack remains low in price by reason of heavy screenings to supply the three-quarter demand at the lakes; otherwise the minimum is now $1.05. About the same condition exists for low-grade coals in Pennsylvania, while the better varieties are now hard at around $1.40. Interests which came in grudgingly during March and April at from $1.15 to $1.25 for the season are now congratulating themselves.

Anthracite business is not at all brisk, and there is the usual summer complaint from dealers. Some of the mines have notified agencies here of curtailment of production for a time, but there is sufficient coal of all grades to meet any demands.

TOLEDO, OHIO

Steam coals are in strong demand and coal dealers appear to be well sold up. Lake movement continues heavy and stronger than in previous seasons. Railroad movement good, but some congestion.

Domestic trade has been a little slow during the past week, due partly to the fact that all the farmers are busy with crops and partly because of the difficulty experienced in securing men to unload coal. Steam coal is in strong demand and locally, coal men are practically sold up on Pocahontas. The lake movement continues strong and boats are being loaded as fast as the equipment is able to take care of them. The lake movement is considerably stronger than it has been other seasons at this time.

The railroads throughout this section are in much better shape than they were a year ago when the congestion occured. There are some complaints at Detroit, which is short of yard space, a condition which cannot easily be remedied because all available space has been taken up. This greatly affects the Toledo traffic situation because it is depended upon to take care of the cars for which there is no yard space in Detroit. The congestion is not likely to be so bad as last year, however, as the railroads have been adding materially to their equipment and the Lake Shore improvements have added greatly to the trackage.

Prices quoted in Toledo are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.60	$2.50	$1.75	$2.50	$1.35	$1.35
Egg	2.25	1.20	2.50	1.50	2.50	....	....
Nut	1.80	1.20	2.25	1.50	2.50	....	....
¾ lump	....	1.35	....	....	....	1.20	1.20
Mine-run	1.50	1.10	....	....	....	1.10	1.10
Slack	....	0.70	....	....	....	0.80	....

BUFFALO, N. Y.

Impossible to contract at the prevailing circular. Situation so tight that considerable uneasines has developed. Many operators forced into the open market to fill out their contract obligations. Car shortage developing.

Bituminous dealers agree that they have never seen such conditions in their trade. While jobbers complain that they are much less in control than are the operators they are doing their share of business. Consumers are in no sort of control.

It is out of the question to get contracts, either from jobbers or operators at current prices. Some are asking an advance and other are refusing to consider them at all. It is risky for a jobber to make a contract at any price unless he has the coal assured. There are bituminous operators belonging to the Buffalo trade, out begging for coal to fill their contracts, as they have given up all expectation of producing coal required from their own mines.

Nobody is really well supplied and it is a long time since there has been any coal waiting on track for a buyer. Conditions are so hard that considerable uneasiness has developed. If it eases off gradually back to the normal there will be no trouble, but if there is a slump it will carry a lot of people with it. Many causes for the unusual situation are suggested, but, of course, it is either the actual consumption or the expected consumption that has brought it about. In the East, at least, there is no accumulation of coal in consumers' hands and there is no chance for it until conditions change. An increase in the car shortage is everywhere reported.

Quotations are therefore firm, with sizes still somewhat stronger than slack at $2 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run and $2.15 for slack. Allegheny Valley prices are about 25c. lower than Pittsburgh. There is still much of the former refusal to pay asking prices for coke, which is quotabe at $4.85 for best Connellsville foundry.

The real activity in anthracite is in the lake trade. Locally the buyer who does not lay in his supply by June is going to wait until fall for it. The rail lines are fairly active, though it is reported that there are not many orders ahead. The trade is entirely of the hand-to-mouth order. The Pennsylvania tax controversy has spoiled most of the trade that existed last month.

The shipments by lake are the heaviest in the history of the trade, the only question being whether the upper-lake market is to be satisfied before the lakes close. For the week the shipments were 201,600 tons.

COLUMBUS, OHIO

Activity still characterizes the local coal trade. The demand for all grades remains good and prices are well maintained. No cutting of quotations is necessary to stimulate buying. The prospects for the future are good in every respect.

One of the best features of the trade is the good demand for domestic grades. Stocking on the part of consumers has started much earlier than usual and as a result retailers are placing large orders both for immediate and future deliveries; retail stocks are generally light although dealers are making every effort to increase them.

Lake trade is also one of the active departments of the market. The Northwest is still demanding a large tonnage and chartering of bottoms is going on for the remainder of the season. The tonnage on the docks of the upper lake ports is being moved steadily and there is no especial congestion reported. Dock prices remain the same at the level fixed earlier in the season. So far the Hocking Valley docks at Toledo have loaded 1,310,000 tons of coal since the opening of navigation. The steam business is also one of the steady features of the trade. Factories, especially those in iron and steel lines are taking a good supply of fuel. There is a tendency to increase the requirement of many factories and railroads are taking their usual supply.

The car supply in most of the Ohio mining districts has been good. In eastern Ohio it is estimated that the production has been almost normal and the same is true of the strictly domestic fields and the Hocking Valley district. In the Pomeroy Bend the output is estimated at 85 per cent. of normal.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.60		$1.60	$1.60
¾ inch	1.45	$1.20	1.40	1.40
Nut	1.25		1.35	
Mine-run	1.25	1.10	1.25	1.20
Nut, pea and slack	0.60		0.65	0.60
Coarse slack	0.50	0.70	0.55	0.50

HAMPTON ROADS, VA.

Heavy movement in from the mines, but there is still a shortage and prompt tonnages are commanding good figures.

Dumpings over the various piers during the past week have been good, but not as heavy as expected. There is still a shortage of coal although conditions are improving somewhat, and it is hoped that the heavy accumulated vessel tonnage will shortly be loaded and away; large shipments of coal are now coming in from the mines.

Such suppliers as had any free coal during the week have been asking from $2.90 to $3 a ton, but it is not believed that any sales were made at over $2.95. Any sales made during the week have been for immediate movement where vessels were in port and it was imperative that they be gotten out quickly. Foreign shipments have been about normal and coal has moved to Havana , Panama, Para, Manos, Rio de Janeiro and one or two other South American ports.

LOUISVILLE, KY.

Demand from the Northwest sufficient alone to keep the trade steady. Large tonnages being stocked for the winter trade. New equipment on the L. & N. R.R.

With the near approach of fall, the market is naturally becoming stronger. The heavy movement into the North and Northwest continues unabated and is of sufficient volume to keep the local market steady in itself. Both the steam and domestic grades are strong.

In the western Kentucky field the market is growing steadily firmer and there appears to be a shortage developing on pea and slack. Some sales are reported at 60 to 65c. with rumors of even higher figures. This situation will probably be relieved, however, when the movement of domestic sizes bcomes more regular.

The Louisville & Nashville R.R. is introducing some large hopper bottom equipment, that is causing considerable trouble in the trade; unloading is greatly delayed and cost of same materially higher. It is stated that the company anticipates replacing all their old equipment with this new type so that dealers would do well to prepare for it.

BIRMINGHAM, ALA.

No unusual surpluses and the trade is readily absorbing the full production. Car shortage becoming steadily worse and promises to be more acute this fall than for years.

There has been no change worthy of mention in the local coal market. At present prices the trade seems to absorb all coal offered. Reports from various ports supplied by Alabama coal indicate that there is no unusual surplus on hand at these points; in fact, the amount of coal on car service is reported to be at a minimum. It is believed that labor troubles of a serious nature, which have threatened from time to time, have blown over and that all uneasiness of delay from this source during the summer has disappeared.

There is still a serious car shortage on several roads with no hope in sight for improvement. Unless the unexpected happens in this line, those in closest touch with the coal situation say that before the close of the coming winter there will be one of the worst car shortages ever experienced by this district.

The coke market is apparently unchanged, but it would not be surprising should the furnace-coke situation show weakness at any time.

INDIANAPOLIS

Recent advance in quotations has stimulated buying, consumers seeking to cover before another rise occurs. Strike settlement West Virginia does not appear to be affecting the local situation.

Local dealers are wondering what effect the reported settlement of the strike in Virginia will have on coal prices, if any. They gave that as the reason for the 50c. advance in prices here the first of the month and their customers are asking if the 50c. will be taken off again, now that the miners have agreed to go back to work. They are also wondering if they will be able to get Virginia coals any easier and in any larger quantity. The opinion seems to be that there is small likelihood of a reduction. The retail trade is good for July. The advance in prices has stimulated consumers of the domestic grades to lay in supplies before another raise occurs. Wholesalers say that while the usual July quietness prevails with them, the number of inquiries grows and indicates a considerable stir in orders later on. The demand for steam coal by the industries is up to the average and the thresher trade is about at its height.

Indiana has comparatively little use for the hopper car. In Indianapolis, for instance, there is not one yard that has elevated tracks. This situation may change soon, as the city has begun action requiring elevated tracks on all lines entering the city, and the work has been completed at important points. This may lead to the big yards putting in facilities for handling the hopper car. Another thing that may induce them to do this is the growing scarcity of labor for unloading flat cars. The demurrage bills against the yards have never been so big. Where some years ago the cost of unloading was 6c. and 7c. a ton, it is now 10c. and 15c., and at times it goes to 20c. The following are retail prices in this city:

Anthracite, chestnut	$8.00	Hocking Valley lump	$4.50
Anthracite, stove and egg	7.75	Luhrig lump	4.50
Anthracite, grate	7.50	Luhrig washed egg	4.75
Pocahontas, forked lump	5.50	Cannel	6.50
Pocahontas, shoveled lump	5.00	Linton No. 4 lump	3.25
Pocahontas, mine run	4.00	Linton No. 4 egg	3.25
Pocahontas, nut and slack	3.50	Indiana washed egg	3.50
Blossburg	5.50	Brazil block	4.00
Jackson (Ohio)	5.25	Indianapolis lump coke	6.00
Kanawha lump	4.50	Indianapolis crushed coke	6.00
Kanawha egg, nut	4.50	Connellsville lump	7.00
Pittsburg lump	4.50	Citizens' egg coke	6.00
Raymond lump	4.50	Citizens' nut coke	6.00
Winifrede lump	4.50		

DETROIT, MICH.

Slack in the strongest demand for this period it has been for years. Other grades quieter except Pocahontas which is in short supply.

Bituminous—The number of cars on track has dropped off materially during the past few days and there is a most unusual shortage of fine coal, which was in such long supply a few weeks ago; slack has not been in such sharp demand at this period of the year for a number of seasons. It is stated that a number of the large operators are unable to supply their customers and the latter are being forced into the open market, creating a strong demand and a general hardening of prices. Hocking slack is strong at 50c. f.o.b. mine, while No. 8 cannot be had at less than 70c. On the other grades the market is quieter than last week with the exception of Pocahontas which continues scarce; for August delivery lump and egg is quoted at $2.50 but is not in great demand at this figure. The smokeless coal is entirely sold up for July and what the situation will be in September it is difficult to say.

Big consuming interests that held off contracting with the intention of going through a good part of the summer in a low-priced open market and then closing in when quotations began to advance are now in bad shape. Not a few are already buying at prices in advance of what they could have contracted at for the entire year.

The local market is quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.45	....	$1.50	....	....	$2.50	$2.25
Egg	1.45	....	1.50	....	....	2.50	2.25
Steam lump	1.25	....	....	....	....	....	....
¾-in. lump	1.10	$1.10	....	$1.10	$1.10	....	....
Mine-run	1.00	1.00	1.00	1.00	1.00	1.50	....
Slack	0.80	0.85	0.50	0.70	0.70	1.20	....

Anthracite—There are uniform reports from all dealers of an active business in hard coal; the outside demand from different parts of the state is mostly responsible for this condition.

Coke—The decline in this product still continues. High sulphur, Connelsville, is now being quoted at $2.10, and 72-hr. at $2.70 to $2.80. Semet Solvay is selling at $2.75 with gashouse at $2.65. The local furnaces are mostly closed down so that the demand for coke is light.

CHICAGO

Prices showing a strong rising tendency. Labor so short that it is difficult to unload cars promptly. Car situation becoming steadily tighter and a severe shortage this fall seems inevitable.

A rising market and a shortage of labor are the chief features in the local situation. There has been an upward turn in the price of almost every kind of domestic coal and there will be an advance, Aug. 1, on all Illinois coal, ranging from 10c. to 25c. a ton; there will also be an increase on the cost of Hocking grades of 15c. a ton.

Retail dealers find it unusually difficult to obtain sufficient help to unload their cars. The farmers are offering fancy prices for laborers and they are flocking to the harvest fields. Another complication is the increasing shortage in cars. Several of the Western roads are well equipped to handle a large coal tonnage, but many others are short of equipment with the result that the situation is steadily becoming worse. Several of the lines have requested shippers to put in as much coal as possible in storage now, as a widespread congestion of freight traffic in the fall seems inevitable.

Prevailing prices are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$1.97@2.07	$2.55	$2.27	
Egg		2.55		$4.05@4.30
Steam lump	1.82@1.87		2.07	
Mine-run	1.77@1.82	$2.20@2.30	1.87	3.55@3.65
Screenings	1.57@1.62	1.85@1.90	$1.57@1.62	

Coke—Connellsville and Wise County, $5.25@5.50; byproduct egg and stove, $4.85; byproduct, nut, $4.75@4.85; gas house, $4.50@4.60.

ST. LOUIS, MO.

The situation has continued to improve during the past week. Prices on nearly all grades have advanced. Mines closed for the summer are not due to open until the first of September.

Improved conditions in the local coal situation have been apparent for the past week, as there has been an advance in price on all grades of coal, with the exception of screenings and Carterville nut. Standard lump advanced and all other domestic coals followed, and indications are that the increase will continue weekly until the middle of September or the first of October, when a high point will have been reached.

With the screenings market taken away, there will be an over-production of this grade, which will demoralize the market and force the operators to get more money for other sizes. Up to the present screenings have been the main stay of the local market, and all other grades have been gaged by the prices on them. This power will not affect the Carterville market as much as the Standard, but it will have some influence.

The only advances in coals for the first of July were on some of the Franklin County grades. Contrary to prophesies made in the early part of the season, there seems to be an overproduction of anthracite for the St. Louis market, and a great deal of it is being rejected on account of being off-grade, although the operators claim that St. Louis is the only point where they are having trouble of this nature.

The coal movement from the mines has been free and there is little complaint, except as to equipment. The railroads have been buying hopper bottoms and as few of the local yards are fitted to handle these, the cause for complaint is easy to be seen. It is probable, however, that most of the yards will be equipped for hoppers in the course of a few months.

The fifty-five cars a day of screenings that a St. Louis jobber had been commissioned to buy for several years past for the Union Electric Light & Power Co. and the United Rys., have been dumped on the market on account of the Keokuk electric power, and this has demoralized the steam market. Carterville dropped from 95 to 90c. down to 60 to 65c. in the course of ten or twelve days, and Standard screenings have fallen off about 15c. a ton. As the demand for lump increases the production of screenings does likewise and the price will go down correspondingly.

Several mines that have been idle for the summer months will not start up until the first of September, so that conditions for the next four or five weeks will not be as bad as they were a year ago when mines for the most part started up on Aug. 1.

The prevailing circular is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.87½
3-in. lump	....	....	$1.20	....
6-in. lump	$1.25 @ 1.35	....	1.30	1.00
Lump and egg	....	$2.00	1.30	....
No. 1 nut	1.00 @ 1.15	....	1.05	0.87½
Screenings	0.60 @ 0.65	....	....	0.80
Mine-run	1.10	....	....	0.75
No. 1 washed nut	1.40 @ 1.50	....	....	....
No. 2 washed nut	1.25 @ 1.35	....	....	....
No. 3 washed nut	1.15 @ 1.20	....	....	....
No. 4 washed nut	1.10 @ 1.20	....	....	....
No. 5 washed nut	0.80 @ 0.90	....	....	....

OGDEN, UTAH

Believed the summer stocking is being neglected, which may result in a serious shortage in the fall. Mines working short time as a result of the slack demand, but the market is being well maintained.

May, June and July have presented conditions in the coal market that have puzzled the operators. In previous years, these three months have always been termed the "storage period" and coal has, as a rule, moved freely to the trade; the railroads have always reduced the freight rate, and the operators made a similar reduction in the mine price, so as to induce the dealer and steam coal user to lay in a supply of coal. This year, the railroads refused to lower the freight rate and while the operators made their customary reduction with an additional discount to take care of the usual concession in freight rate, the fact that the roads offered no inducements seems to have lead the dealer to believe it would not be necessary to store coal this year. Further, there has been considerable agitation in regard to a permanent freight rate reduction, and this in connection with the general belief that there is an abundance of coal, has caused shipments during the storage period to be small.

Every year there is a bad car shortage at the Wyoming and Utah Mines during September, October and November, and it is during this period that the bulk of the coal stored is delivered to the consumer. When compared with the same period last year, it is estimated that 35% of the amount of coal is in storage, which means that the balance of 65% must be shipped during the fall and winter when the demand is greater than the production.

There has been a good market for nut and slack coal, due to the small production of lump. Nut coal is preferred to the lump during the summer months, and as the mines have been working short time the market has consumed practically all the slack produced. The sugar factories in the Inter-mountain territory have commenced to store some coal, which has given a little encouragement to the market. Indications are that there will be an increase in the mine price Aug. 1.

Present quotations for shipment to Nebraska, Kansas and California are: Lump, $2.50; nut $2; mine-run, $1.75; slack, 90c. To Utah and the Northwest: Lump, $2.25; nut, $1.75; mine-run, $1.75; slack, $1.

SPOKANE, WASH.

Some new contracts in the Rocky Mountain region.

The contracts for the six educational institutes in Idaho were awarded to the United States Coal Co. at the following figures: 450 tons of No. 1 lump for Albian delivery at $7.65, the price last year having been $10; Pocatello delivery, 575 tons of No. 1 lump at $4.40, as compared with $4.75 last year; 225 tons of No. 1 lump for Gooding delivery at $5.90, as compared with $7.50 the year before; for St. Anthony delivery, 1500 tons of No. 5 mine-run at $4.25, as compared with $4.40 last year; for Lewiston delivery, 550 tons of Roslyn lump at $7 per ton, as compared with $8.50 last year; for Moscow delivery, 200 tons of No. 1 Kinsmur lump at $6.90, as compared with $7.65 last year; for the same delivery 1000 tons of Roslyn lump at $6.25, as compared with $6.35 last year.

PORTLAND, ORE.

Market at the low point of the year. Preparations for the opening of the Panama.

This is the quiet season of the coal business here and there is little doing, except in preparation for the business that will follow later in the year. Apparently no coal will be imported here this year from Australia, but supplies will come from Washington, Wyoming and Utah. Every effort is being made to prepare for a large volume of shipping upon the completion of the Panama Canal and with this shipping will follow a considerable increase in the demand for bunker coal.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN RY.

The following is a statement of tonnages shipped over this road from mines in West Virginia and the commercial and company coal, for the month of June, in short tons:

Field	Shipped	Tipple	Total	Commercial	Company
Pocahontas.......	2,215,970	15,163	1,231,133	1,232,716	90,555
Tug River.......	214,854	2,485	217,339	178,091	39,248
Thacker.........	272,930	12,835	285,765	208,741	77,024
Kenova..........	74,944	15,802	90,746	72,557	18,189
Clinch Valley				133,128	11,662
	1,778,698	46,285	1,824,983	1,825,233	236,678

Shipments of coke entirely from the Pocahontas field, were 96.138.

COAL TRADE NEWS

The Smoke Nuisance in New York—The Court of Special Session recently declared Section 181 of the Sanitary Code, providing for the elimination of smoke, to be "unconstitutional and unreasonable." The case involves some 100 complaints lodged against the New York Edison Co. Health Commissioner Lederle expressed himself as much disappointed with the outcome and stated that if an appeal was not successful that a new ordinance would have to be introduced or all suits of this character suspended.

New Equipment on the Louisville & Nashville R.R.—The L. & N. are replacing their old equipment with new hopper bottom cars at the rate of 60 per day; about 3000 of the new cars will be put in commission immediately and the road plans to eventually replace all of their equipment with this new type of car. It is what is known as the "battleship" type and has a capacity of 110,000 lb. as compared with 80,000 to 90,000 lb. for the steel gondolas.

Heavy Coal Traffic—Total coal shipment through No. 4 Lock for the first six months amounted to 105,000,028 bushels, an increase of 27,000 bushels over the same period in 1912. There are also more than 6000 cars of coal a day being handled by the Pennsylvania R.R.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending July 19:

Burns Bros.—Regular quarterly dividend No. 2 on the preferred stock of $1.75 payable Aug. 1 to holders of record July 1.

FOREIGN MARKETS

GREAT BRITAIN

July 11—Admiralties are very scarce for prompt shipment. For smalls the demand is quiet and with an ample supply, the tendency is rather easier.

Quotations are approximately as follows

Best Welsh steam......	$4.92@5.04	Best Monmouthshires..	$4.20@4.26
Best seconds...........	4.56@4.68	Seconds................	4.08@4.14
Seconds................	4.32@4.44	Best Cardiff smalls	2.52@2.58
Best dry coals..........	4.32@4.56	Seconds...............	2.28@2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

INDIA

A recent issue of the "Colliery Guardian," London, England, says editorially:

> With the readjustment of Bengal's boundaries and the creation of the new province of Bihar and Orissa, the more important coalfields now belong to the new province; figures for production will, therefore, embrace both provinces. We understand from the "Statesman" (India), of May 28, 1913, that the production in Bengal during 1911 of 11,468,904 tons has risen in 1912 for Bengal, with Bihar and Orissa, to 13,429,566 tons, an increase of 17 per cent. For the whole of British India, excluding native states, the production advanced from 12,048,726 tons to 14,044,368 tons.

FOREIGN TRADE OPPORTUNITIES

The United States Counsellor Service reports opportunities in foreign coal markets as follows: complete details regarding different items can be obtained on application to the Bureau of Foreign and Domestic Commerce, Washington, D. C., by giving numbers.

South America—A counsel in this country reports that a company in his district is interested in American coal and briquettes. The coal should be hard and weather well since the fine grades sell at a large discount. Full particulars including analysis of the coal with prices f.o.b. both the United States ports and ports of destinations should be given. **No. 11,248.**

Europe—Counsellor in a European country reports the construction of a plant for the manufacture of cement which will have an initial consumption of 35,000 tons of coal per annum the first year and 70,000 tons the second. **No. 11,324.**

Realize *Your* Vision Of Success

By M. E. Harder

The Weekly Ad-Talk Page

Despite the fact that we are so often reminded that there is nothing new under the sun, it still remains that wonderful regions are continually being discovered and explored "at the top o' the world."

At the top of the world in a physical, intellectual and commercial sense. Far above the noise of cities and the thoughts of little men are realms hitherto undreamed of by the masses and unrealized by the few who dared to dream.

The quest for the unknown and unrealized, the desire to expand—to climb—is a universal and eternal one.

The world today is still talking of the recent return of Dr. Sven Hedin from a four years' trip through the unexplored and unmapped regions of the great Himalaya Mountains. Alone, the only white man in his band, traversing districts of which no man had ever known, for two years never seeing a European, yet, sure of the course he had passed over, with the courage born of confidence in his means of guidance, he pressed onward, to the completion of a stupendous self-assigned task. His means of guidance, telescope and sextant, small in themselves, yet in his accustomed hand, infinitely reliable!

Building cautiously, surely and steadily, a man, by preserving absolute faith in a trustworthy yet seemingly insignificant medium as compared with the greatness of his achievement, has reached a goal and proclaimed his success to the world

The great pioneers of today, however, are not those who search the uttermost parts of the earth, or who tread carefully the paths of thought marked out in ages past by great original thinkers to the proclaiming of a new philosophy.

The great pioneers of the present are those who, finding themselves in a busy, nervous, over-crowded commercial world, conceive an idea by which they may rise from beneath the feet of the hurrying masses.

Those whose guiding telescope and sextant are hard, earnest *study.* Study of organization, of appliances, of methods—hard thought on every lesson learned in school, in books, in the field or in technical papers. Of all these means, technical papers are probably the most useful because of their up-to-the-minute news value. In these papers the editorial sections are weekly bulletins of means for improving your work, while their selling sections are equally efficient bulletins of *appliances* for *accomplishing* these improvements. So *read* your technical paper—from front cover to back—and *think.*

COAL AGE

Vol. 4 NEW YORK, AUGUST 2, 1913 No. 5

The gross payroll of a small coal-mining concern averaged about $10,000 dollars a month. Deducting rent, commissary stoppages, etc., the actual amount of cash paid out was about $5000 dollars monthly. The man in charge of the payroll was an old-line timekeeper who had been with this same concern for years. Whenever there was a change in the wage schedule, he familiarized himself with it, and although he was supposed to rate his payroll each month from the wage sheets, he seldom did this, but instead would write in rates on the current roll from the previous one, or from memory.

One day the superintendent in looking over the roll, which he didn't do often, happened to notice that rockmen were being paid $3.05 a day. On asking the timekeeper to refer to his wage sheet, he found that the correct rate was $3.50. The timekeeper could offer no explanation other than that he must have written it $3.05 instead of $3.50. On looking back it was found the incorrect rate had been paid for several months and as a result, many men had left the employ of the company.

Of course, the unfortunate timekeeper had to admit he had been rating each roll from the previous one without referring to the wage sheets. Much of his rating was done from memory. This is a common fault of the average timekeeper who feels that because of his long service and familiarity with conditions, he knows rates well enough to make up his payrolls, extend time, etc., without checking each rate against the wage sheets as approved by the superintendent and management at the time wages were fixed. This instance was only another case where "Familiarity bred contempt."

How many auditors and superintendents of coal-mining companies are careful enough about the serious business of accuracy in payroll methods, and in the use of preventive measures to safeguard the rating of rolls, extending of time, etc., so that the cost sheets reflect the actual expenditures of the company?

Would it not be easy with some concerns for the man who knows how, to beat the company by working as a weigher, and without even exciting suspicion, run two or three dummy checks worth $40 or $50 apiece to him every month. How could he do it? By having one or maybe two confederates to draw the money—not on regular paydays, but through the medium of back-pay statements, for as a rule the identification of men who draw back pay is given far too little attention and the man who is onto the game could use this method.

PAYROLL LEAKS are too often the source of loss. The following suggestions may help:

1. Make the timekeeper rate his payrolls from rate sheets approved by the superintendent and executive officials.

2. Make the mine foreman approve each payroll after it is closed and before it is paid, both as to number of men and rates allowed.

3. Don't let the timekeeper pay off or have a hand in it. If he is honest he won't want to. If he is not honest, the fact that he can make up the roll and pay it off is all the opportunity to be crooked that he needs.

4. During the time of pay, have the foreman present to identify the men and don't hand one man another's money.

5. After the pay hour, have the foreman look over the undistributed envelopes and make note on each as to whether the man who did not draw his money actually worked.

6. On settling back-pay items secure a complete identification of the men paid through this channel.

It is safe to say that if these simple rules are followed closely, at least a few common losses will be avoided. At the same time the men will be pleased to feel that care is taken to see that they are compensated for all they do, and that the payroll work is both accurate and preventive of rascality.

The Matanuska River Coal Field by Districts

By W. R. Crane*

SYNOPSIS—The Matanuska field appears to vary greatly in value, the Youngs Creek district having seams of unworkable thickness. The thickest bed is on Eska Creek and this is 15 ft. thick. The coal lies on an extremely uneven bed and has been ripened like the Bering River coal by igneous intrusions.

⁂

Chickaloon Creek is the largest tributary of the Matanuska River, its course being for the greater part of its length slightly east of north. Aside from draining a large area of mountainous country, it has as its source the Chickaloon glacier, which, however, furnishes but a small volume of the water of this stream, as is shown by the clearness of the current.

The principal occurrence of coal in this locality is at the Watson Camp, about 1½ miles above its junction with the Matanuska River. See Fig. 2. The coal outcrops at this point along a steep bank some 100 ft. high. The dip of the coal beds is quite variable, ranging from 40 deg. to the vertical and in one instance at least a reversed fold appears to have been formed.

CHICKALOON FIELD HAS 55 FT. OF COAL

According to Dr. Martin[1], and I have verified the statement myself, the number and thickness of the coal beds occurring at this point are as follows: No. 1, 5 ft. 4 in.; No. 2, 4 ft. 10 in.; No. 3, 8 ft. 9 in.; No. 4, 5 ft. 6 in.; No. 5, 9 ft. 4 in.; No. 6, 2 ft. 6 in.; No. 7, 10 ft. 10 in.; and No. 8, 2 ft. 8 in., making an aggregate of 49 ft. 9 in. Not all of the beds listed are of sufficient value to work at least throughout their full extent, owing to variable thickness and the occurrence of shale partings and other impurities. Further, a large amount of impure coke occurs at this point; a coal bed affected by the intrusion of a diabase sill, is shown in Fig. 3.

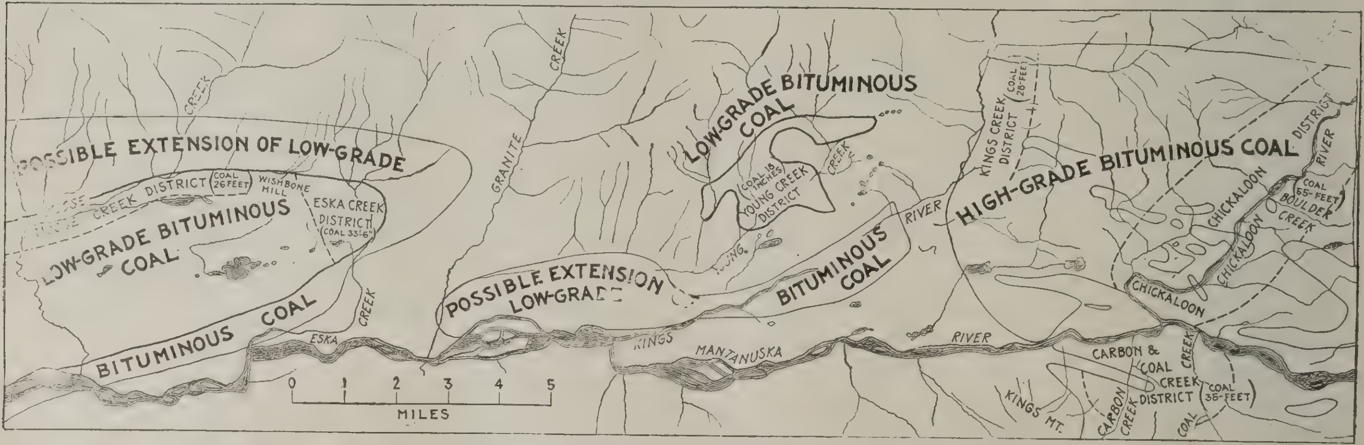

FIG. 1. THE COAL FIELDS OF THE MATANUSKA RIVER AND ITS TRIBUTARIES

FIG. 2. WATSON'S CAMP IN CHICKALOON CREEK, A BRANCH OF THE MATANUSKA

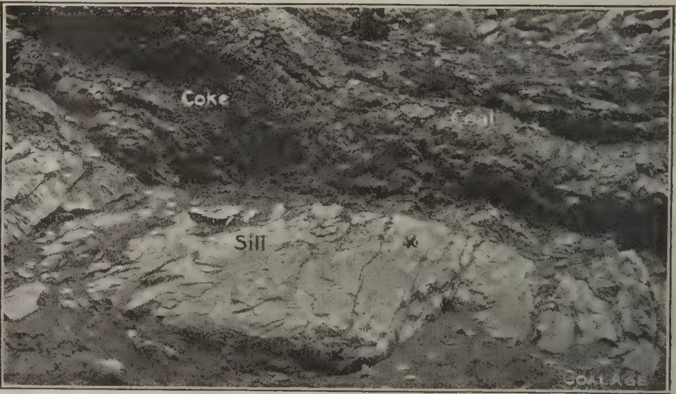

FIG. 3. THE DIABASE SILL UNDER THE COAL BED HAS COKED THE COAL

These coal beds constitute the bulk of the coal so far located in the Chickaloon Creek district, and make a most attractive showing as to amount, also a number of them are of excellent quality and in such condition as to warrant extensive exploration and also, probably, commercial development.

Another 4-ft. coal bed is reported as outcropping on the banks of Chickaloon Creek, some 26 miles above the mouth of Boulder Creek.[2] The total amount of coal in this district is then very close to 55 feet.

IGNEOUS INTRUSION MADE THESE TERTIARY COALS MATURE

While many occurrences of igneous intrusions in the form of sills following the lines of stratification are to be found in this field, and particularly in this locality, the only instance observed where a sill (more properly called a dike) cuts across the intervening strata between beds is to be found here. See Fig. 4. This occurrence is of peculiar interest in that it shows that an intrusion may be encountered at any time in the process of mining, although the coal bed worked may be apparently free from such irregularities. This is especially to be feared where a sill is known to occur in the strata either above or below the bed worked. Aside from changing the character of the coal, even transforming it into coke, what is fully as bad would be the weakening of the rock formations by fissuring and burning.

---

*Professor of mining, Pennsylvania State College, State College, Penn.

[1] U. S. Geol. Surv., Bull. No. 289, pp. 20 and 21.

[2] U. S. Geol. Surv., Bull. No. 289, p. 25.

Probably no part of the bituminous-coal area has been subjected to such extensive rock movements as at this locality in the Chickaloon Creek district. The rock and coal strata stand at high inclinations, even being folded so abruptly as to be crumpled up, while to add to the general disturbance the igneous sills have been intruded, badly burning and consequently weakening the formations. See Fig. 5.

Tunnels driven to intersect the highly inclined coal beds show the strata standing either vertically or nearly so, and further demonstrate that they have been weakened and loosened to such an extent that water entering the tunnels in some instances finds more or less ready exit through the strata to the level of the creek.

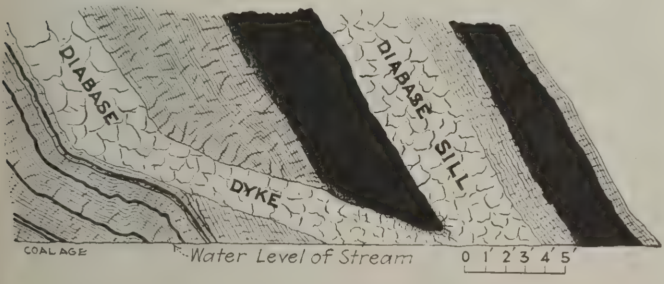

FIG. 4. A DIKE IN CHICKALOON DISTRICT

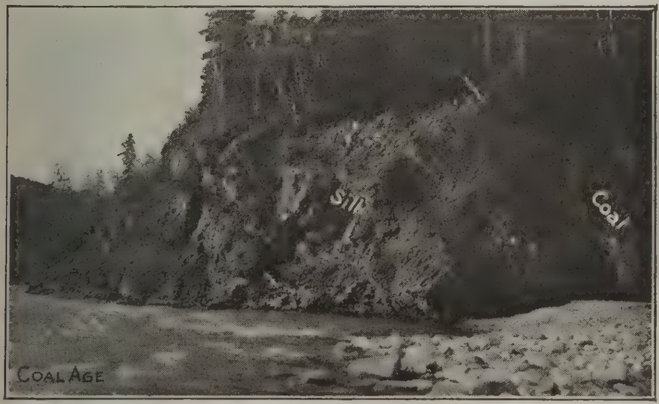

FIG. 5. VIEW SHOWING DIABASE SILL AND STEEP PITCH OF STRATA

Another irregularity observed both in the coal beds and the top-rock is shown in Fig. 6. In this particular instance, the mass of foreign material occurs in the middle of a coal bed and its appearance suggests that a mass of molten iron had at one time run into the coal. It is yellowish-red in color, more or less seamed and contorted as though it had forced its way through an irregular opening or crevice. It is not, however, of igneous origin as the condition of the adjacent coal shows, but was undoubtedly deposited with the coal and its associated strata. As an impurity in the coal, it could readily be separated, but when it occurs in the top-rock, its smooth, undulating surface presents no bond or connection, and is, therefore, a decided element of weakness and danger. The fall of large masses of top-rock exposing such an irregularity, demonstrates the ease with which the rock separates from it. See Fig. 7.

The most common irregularities occurring in this district are the shale partings, the majority of which are several inches in thickness, although many are much larger.

As would be expected from the disturbed condition of the formations, the coals of this district are soft and friable, resembling in this respect and to a marked degree the coals of the Bering River coal field.

THE KINGS CREEK DISTRICT

Kings Creek lies about five miles to the west of Chickaloon Creek, and the coal locations occur from 9½ to 9 miles above the junction of this creek with the Matanuska River. The character and occurrence of the coal of this locality, as previously mentioned, resemble very closely those of the Chickaloon Creek district.

There are four distinct and apparently separate coal beds outcropping in this locality, two on the east side of the creek and two on the west side. It is possible that one or two of these beds may be extensions of the other outcrops, but owing to the disturbed condition of the beds and extensive coverings of slide and moss, it is difficult to correlate them accurately. However, the thickness of the beds, beginning with the one furthest up the creek, is as follows: 6 ft., 10 ft., 2 ft. and 10 ft. The two last mentioned are separated by some 16 ft. of shale. If these outcrops are of separate beds the aggregate thickness of coal in this locality is 28 feet.

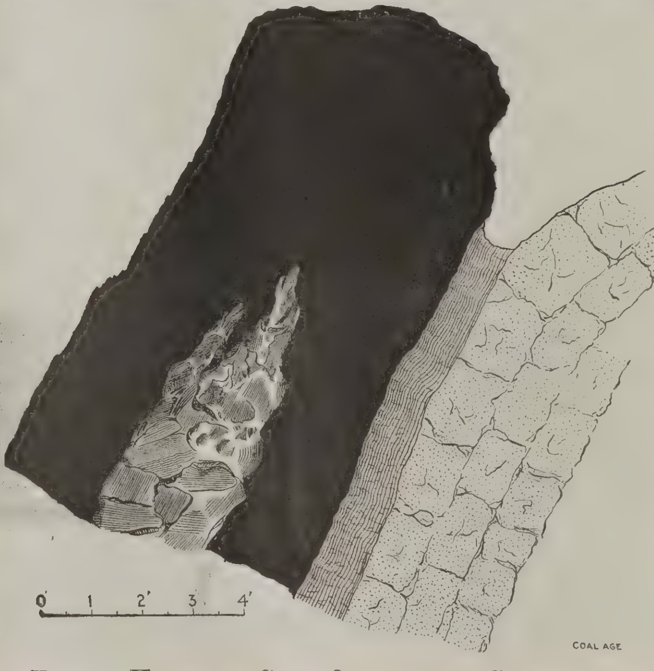

FIG. 6. HORSE IN COAL OUTCROP ON CHICKALOON CREEK

The coal occurring on the east side of the creek is very soft and friable, while that on the west side is stronger and would probably mine into lumps of fair size.

On the east side of the creek, the coal beds outcrop on a cliff which is capped by a flow of igneous rock varying in thickness from 20 to 50 ft. See Fig. 8. An igneous sill, together with the flow, have coked a large part of the coal beds. However, the action of the heat does not seem to have been uniform throughout the coal seams as portions of the beds at certain points and the entire beds at other points have not been affected. A section of one of the coal beds that has been changed to coke below and but slightly altered above is shown in Fig. 9.

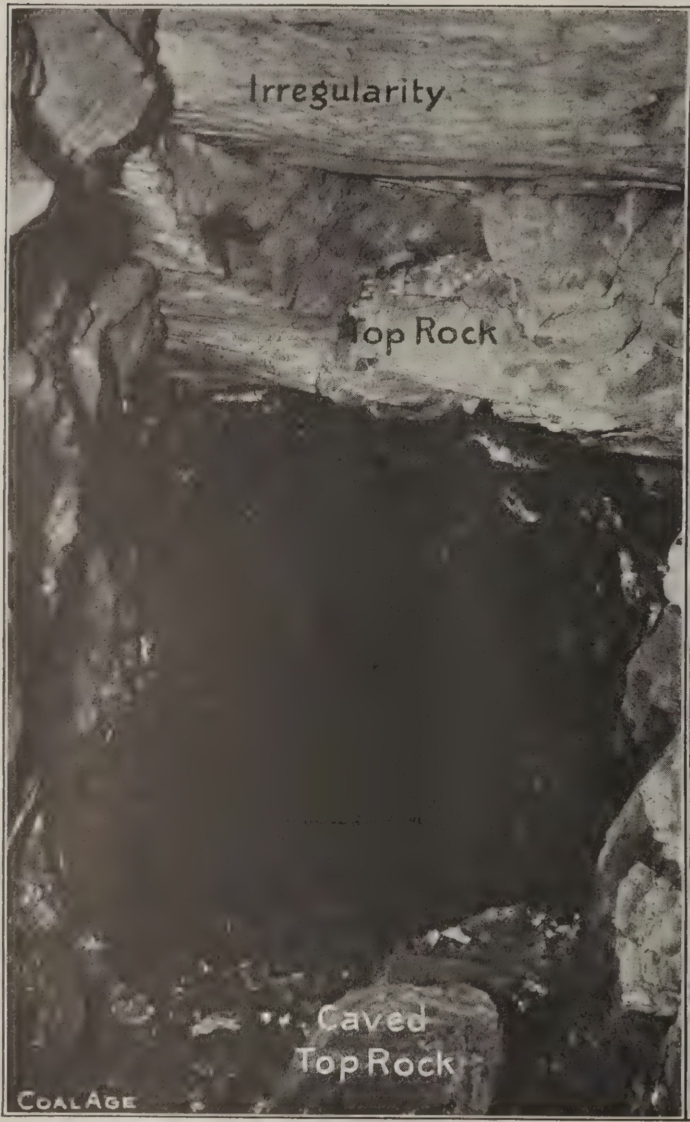

Fig. 7. Interior of Tunnel Showing Irregular Masses of Foreign Material in Roof

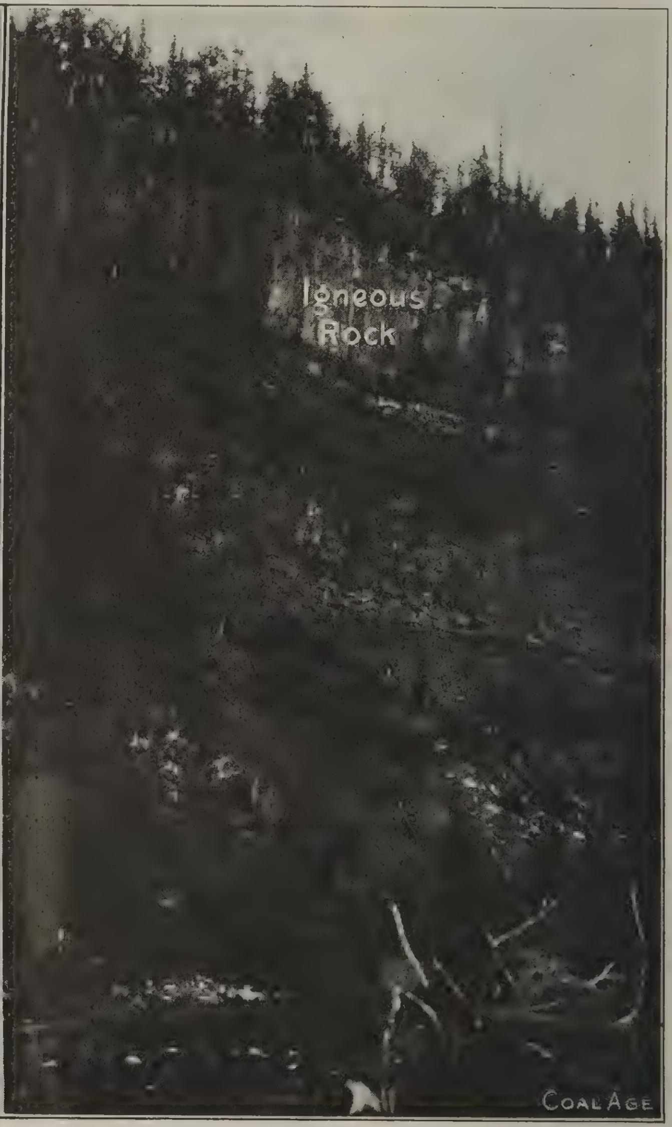

Fig. 8. A Volcanic Flow Capping Coal-Bearing Strata, Kings Creek Valley

Aside from the diabase sill and igneous flow, the principal irregularities and those of most frequent occurrence are shale partings. These are highly bituminous and of considerable thickness and when associated with the coal often resemble it so closely as to render their separation from the coal difficult.

The Youngs Creek District

There is little of interest to be said regarding the occurrence of coal on Young's Creek. The locality where coal occurs is about 3 miles west of the coals previously described on Kings Creek and 3½ miles above the junction of Youngs with Kings Creek.

The only coal found on this stream are two thin beds, 12 in. and 6 in., respectively, and separated by about 15 ft. of shale. The coal beds occur in a synclinal trough with a dip of 20 deg. The coal is, at least in places, of inferior grade, for it contains numerous nodules of clay and pyrite.

While not associated directly with coal beds, an interesting geological feature was observed, namely, a dike of igneous rock cutting beds of shale and sandstone. See Fig. 11. The shale is highly bituminous and contains small bands of coal, which appear to be of a low grade. The dike has intersected the formation approximately at right angles with the stratification, although without any material disturbance or distortion of the strata. To one side of the main body of the dike a small stringer of similar material occurs, the course of which is very much less regular than that of the large dike and indicates the termination of either a branch of the former or an entirely separate one.

The often noted tendency of fissures to assume parallelism with lines of stratification on traversing bedded deposits, is evident in the case of this small dike. Further, two isolated masses of igneous material also occur close to these dikes, being probably branches of the larger one, which cut the strata at these points, the connection with the dike either having been eroded or occurring in the strata beyond the face of the section. In either case the connection is invisible.

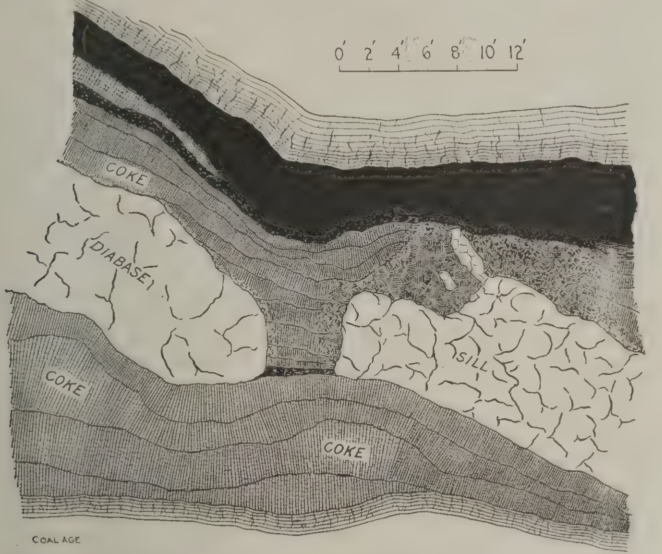

Fig. 9. Diabase Sill and Natural Coke in Coal Bed in Kings Creek

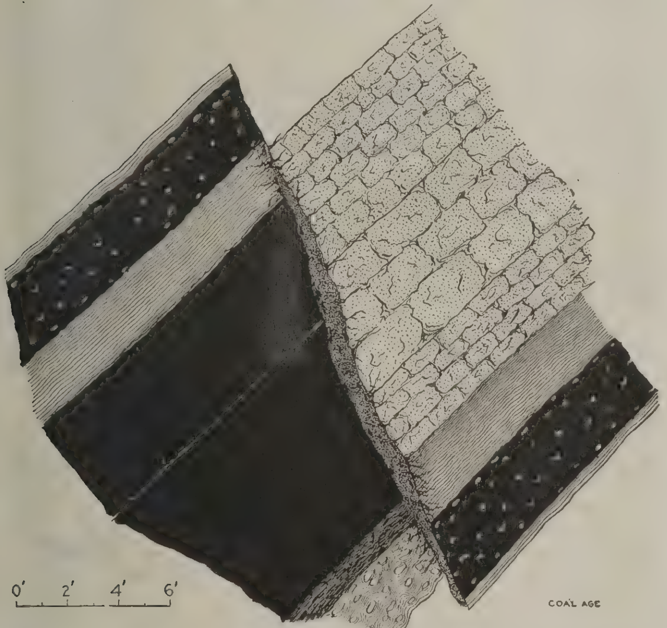

Fig. 10. Fault on Moose Creek, Showing Displacement of Beds

Mention is made of these dikes in this connection as they occur at no great distance from the coal beds in this district, and also occur in coal-bearing strata; they might, therefore, as likely be found cutting the coal beds as intersecting the barren beds adjacent.

The Eska Creek District

The coal occurs on Eska Creek some 8 miles west of the Youngs Creek field, being 3 miles above the junction of Eska Creek with the Matanuska River.

The coals of this locality are bright, but lack the luster of the fuels of the Chickaloon and Kings Creek districts. They are of good appearance and are hard, mining in large, blocky masses with the production of only a moderate amount of small coal. There are, however, numerous dull bands in the coal beds, that look suspiciously shaly.

The various coal beds occurring in this district proceeding from that of the lowest elevation upward are as follows: No. 1, 7 ft. 6 in.; No. 2, 7 ft.; No. 3, 3 ft. 8 in.; and No. 4, 15 ft. 4 in., giving an aggregate thickness of 33 ft. 6 in. of coal. The last coal bed mentioned, or No. 4, is separated into two benches by a 12-in. parting, and further is associated with three other coal beds of 2, 3 and 3 ft. in thickness, but separated from one another by shale partings ranging from 3 to 15 in., in thickness, and from No. 4, by a parting of 12 in. of shale and impure coal.

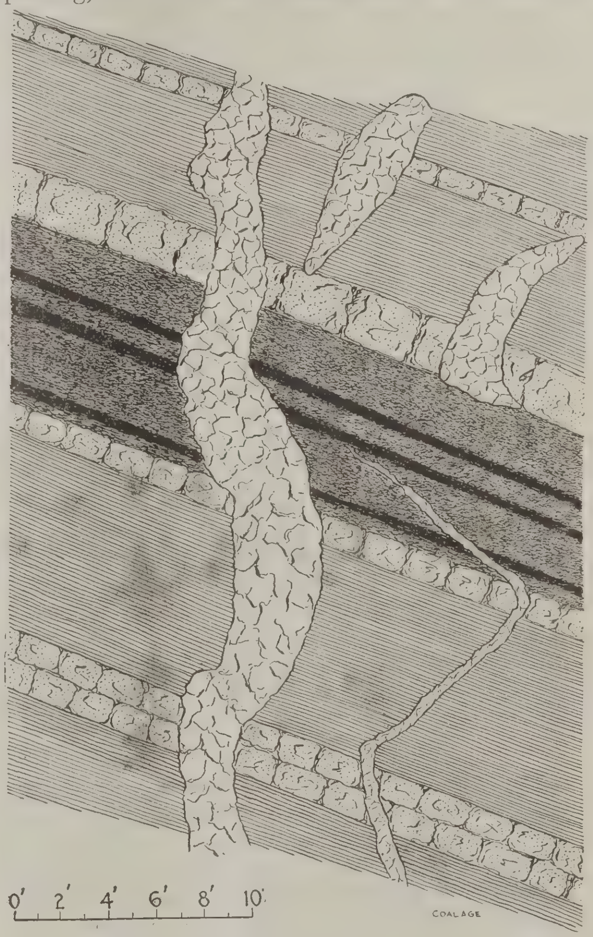

Fig. 11. Dikes through the Coal Seams in the Youngs Creek Field

Numerous partings of shale and impure coal, both in and associated with the coal, constitute the principal irregularities noted.

The coal beds lie in a gently pitching synclinal trough, the dip of the lower or down-stream side of the beds being 40 deg. to the northwest, while on the upstream side of the trough the dip is 30 deg. to the southeast. The pitch of the trough is into the bank, a bad condition of affairs owing to the difficulty of keeping the working free from water if it should flow in from the creek.

The Moose Creek District

Coal is found on Moose Creek, about 5 miles west of the Eska Creek locations, and at a distance of 4½ to 6 miles above the junction of Moose Creek, with the Matanuska River. The outcrops of the coal beds occur on the cliffs and steep bank of the east side of the creek.

The coals are of similar grade to those of Eska Creek, but hardly of equal value, according to analysis. They are, however, hard and firm, as is demonstrated in one instance by the uncovered outcrop extending into a swift mountain stream with little appreciable disintegration.

The number and thickness of coal beds occurring in this district, beginning with the first outcrop encountered on passing up the creek, are as follows: No. 1, 1 ft. 7 in.; No. 2, 1 ft. 9 in.; No. 3, 3 ft. 6 in., No. 4, 11 ft., and No. 5, 8 ft., giving a total thickness of 26 ft. The coal given in Nos. 1 to 3, inclusive, occur in the same section but separated by partings of shale and impure coal, with other stringers of coal of a few inches in thickness, interstratified throughout the section. The 8-ft. bed is also badly broken up by partings, which would seriously affect mining. The 11-ft. bed is remarkably free from partings, containing but one of 1 in. thickness. The beds Nos. 4 and 5 are the workable coals of this district, but stand at high inclinations, particularly the 11-ft. bed.

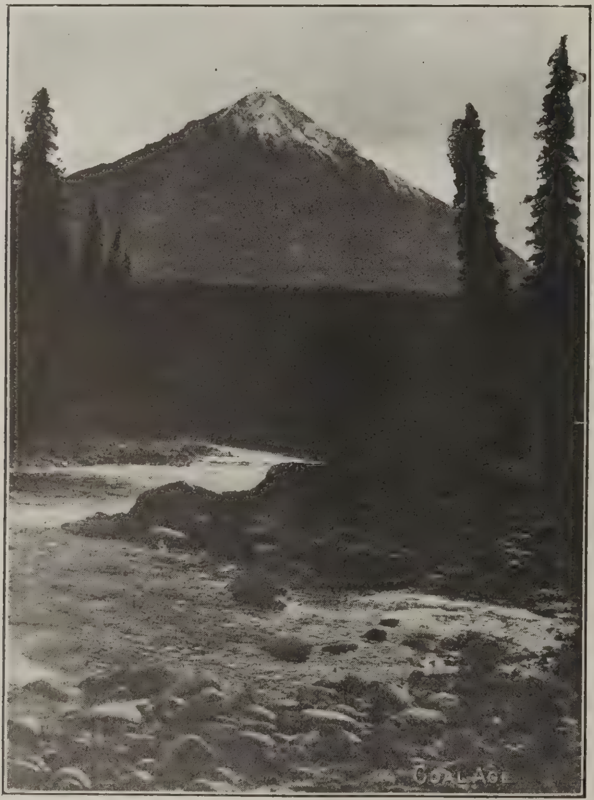

Fig. 12. Kings Mountain in the Matanuska Coal Field

The only irregularity noted in this district aside from the numerous partings of shale is a fault, which cuts the 11-ft. coal bed some 12 to 14 ft. above the level of the creek. See Fig. 10. This fault cuts across the stratification of the rock and coal strata at an angle of 80 deg., and consequently in the opposite direction to the dip of the strata, which below the fault plane dip 45 deg. to the southwest, while above the fault plane the dip is to the southeast. The displacement of the strata is practically the full width of the coal bed.

Directly above the 11-ft. bed of coal occurs another seam, which contains nodules of iron ore and is more or less disturbed, but the ore is of no economic importance.

The coal bed occurring furthest down the creek dips into the cliff at an angle of about 35 deg., and outcropping as it does but a few feet above the level of the creek soon passes below water level, which would permit much water to enter the workings by seepage if developed by openings at or near the creek.

The Carbon and Coal Creeks District

This district lies on the south side of the Matanuska River and almost directly opposite the junction of Chickaloon Creek with the Matanuska. It embraces the whole coal-bearing area and not only that adjacent to the two creeks, after which it is named, but all coal occurrences to the east and west.

The coal of this locality is similar in character to that found in the Chickaloon district. It is but natural to expect then that the coals have suffered considerable disturbance such as folding and faulting and the intrusion of igneous sills. The inclination of these coal beds throughout this district varies from 40 deg. to 75 deg. The effect of the igneous sills in coking the coal is not as extensive as across the river in the Chickaloon district, the zones affected varying from a few feet up to 14 to 16 ft.

The number and thickness of the coal beds occurring in this locality, beginning with Coal Creek and proceeding up the Matanuska River, are as follows: No. 1, 5 ft.; No. 2, 8 ft. 6 in.; No. 3, 7 ft. 6 in.; No. 4, 7 ft.; No. 5, 6 in.; No. 6, 6 ft. 6 in., giving an aggregate thickness of 35 ft. The three coal beds, Nos. 4, 5 and 6, are closely associated, being separated by shale strata varying in thickness from 4 to over 40 ft. Further the coal beds in all cases are broken up into benches by shale partings, some of which approach a foot in thickness.

⁂

Battery Renewals

Speaking before the Coal Mining Institute of America. H. H. Clark, electrical engineer of the Bureau of Mines, said:

An important item in the cost of upkeep of portable electric mine lamps arises from the deterioration of the battery plates or elements. This is most noticeable in storage batteries having lead plates. The natural depreciation of these is hastened by overcharging or overdischarging or charging at too high a current. Another trouble that is experienced with the acid batteries is the destruction of the contacts by the acid electrolyte. Even in nonspillable batteries and those using gelatin electrolytes, a certain amount of acid often gets upon the contacts, and rapidly corrodes and destroys them. Much of this trouble may be eliminated by designing the battery properly, but it may be prevented even more completely by exercising care to keep the batteries clean and the terminals occasionally wiped off with vaseline or some similar substance.

Storage batteries which make use of other electrodes than lead and other electrolyte than sulphuric acid are not materially injured by overcharging or overdischarging and do not give trouble by the corrosion of the contacts. All that the bureau has ever tested, however, have shown a more rapidly decreasing voltage curve than the lead batteries, which means that the candlepower of the lamp when the battery is first charged will be much higher than it will be near the end of the discharge.

The McAlester Coal Field in Oklahoma

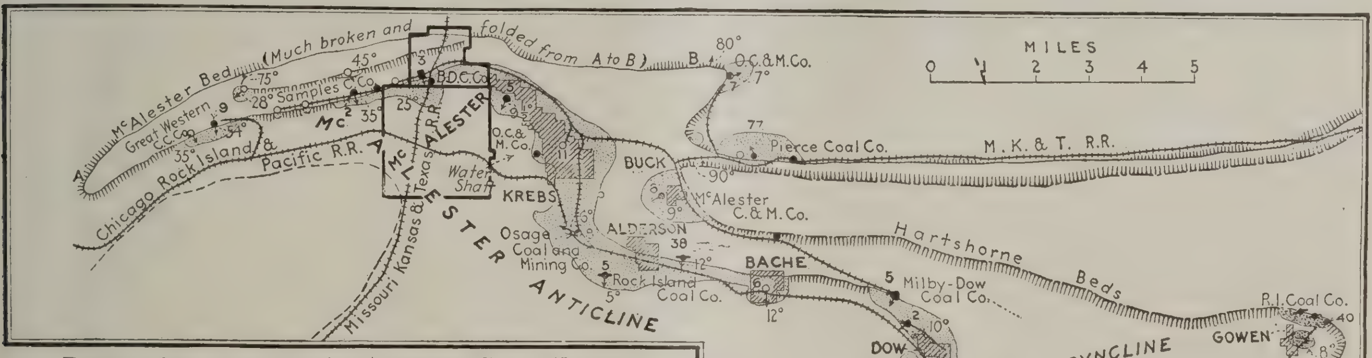
By Geo. M. Brown*

SYNOPSIS—The McAlester and Hartshorne coals are two of the highest-grade fuels west of the Mississippi. The seams are relatively thin, however, and are worked under comparatively heavy cover. There is considerable gas and the coal is quite explosive in character. Shooting off the solid is practiced.

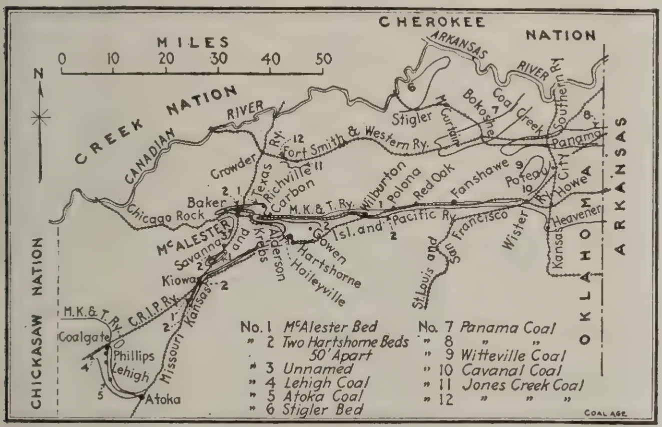
⁂

When the United States Geological Survey finished its work on the segregation of the coal lands in the Choctaw Nation, it established the following points:

"The coal should be of a quality and hardness to create a demand for its use for commercial purposes."



Detail Map of the McAlester Coal Field



General Coal Map of Oklahoma

"It should be thick enough to be worked successfully."

"Its structure or position and depth should assure profitable mining."

Geology

In accordance therewith governmental reports indicate four workable beds of coal in the McAlester district having a total area of approximately 67,000 acres, and a tonnage of 460,000,000. Of this area 30,400 acres are at present unleased, and the remaining 36,700 acres are being worked by various coal companies, who pay a royalty of 8c. a ton into the treasury of the Choctaw Nation.

Of the four workable seams in the McAlester district, the lowest is known as the Lower Hartshorne Vein. It outcrops in the district for fully 50 miles, and has a thickness ranging from three to six feet. The coal is clean and free from impurities. The roof is a hard, compact shale, locally replaced by sandstone. The floor is shale or clay. Similar in quality and character of roof and bottom, is the Upper Hartshorne bed lying about 50 feet above the Lower seam. Both of these veins will average about 4½ ft. in thickness.

The McAlester Vein is found about 1250 ft. above the Hartshorne horizon. It has a much longer outcrop in the district, and the coal is much more accessible. The quality is better, and there is less sulphur than in the Hartshorne coals; it is also much harder and slightly thicker.

All three of the foregoing coals are excellent for coke making. The fourth vein is the highest in the district, and lies to the southwest of McAlester. Its development has been limited because of the better advantage of the other veins.

PROXIMATE ANALYSES OF COALS IN THE McALESTER DISTRICT*

Seam	Moisture	Vol. comb.	Fixed carbon	Ash	Sulphur
Lower Hartshorne......	1.36	39.48	53.87	5.29	2.36
Upper Hartshorne......	1.43	38.15	50.76	9.66	1.38
McAlester	1.91	37.26	56.44	4.39	0.72

*United States Geological Survey Reports.

As shown on the accompanying map, there is a wide fold entering the southeast part of the district and bearing northeast. This is called the Kiowa syncline. Near Dow, it sweeps eastward to Gowen, forming a nearly flat basin near Hartshorne, at depths of 500 to 600 ft. North of the Hartshorne basin we find the upward fold known as the McAlester anticline, which bears due west to the Krebs district. It then deflects northward to the north side of Krebs, and then west to the vicinity of Baker, about five miles west of McAlester.

At Buck, on the Hartshorne seams, the fold bears sharply eastward, the coal dipping northward from 45 deg. to 90 deg. The McAlester seam, however, being farther from the axis of the fold, has a dip of only 15 deg. to 20 deg. The north pitch of the McAlester seam

---

*Engineer, Osage Coal & Mining Co., McAlester, Okla.

Mine No. 5 of the Osage Coal & Mining Co., and Mine No. 40 of the Rock Island Coal Mining Co.

is badly twisted and broken from Baker to Mine No. 7 of the Osage Coal & Mining Co., and is economically worthless.

At Baker, as shown on the map, the McAlester seam dips 54 deg. Two miles east of this the dip is 35 deg. In North McAlester the dip has decreased to 25 deg., and at Mine No. 5 of the Osage Coal & Mining Co., it is only 9½ deg., bearing almost due south. At Krebs we find a wide sweep in the fold, so that the coal at Mine No. 8 is pitching 6½ deg. toward the northwest. Just west of Alderson the fold turns again, and at Mine No. 5 of the Rock Island Coal Mining Co. we find a dip of 5 deg. southward; further east it varies in magnitude and direction as indicated by the arrows.

The early development of the field was in the district near Krebs, and fully a dozen slopes and several shafts were in operation at one time. The slopes were only driven a few hundred feet, and the shafts were sunk with regard only to present easy profits. Affairs went well at that time, but carelessness resulted in water breaking through from the outcrop, and in severe squeezes.

Gas and dust explosions were common, too, in the early days; the real danger of McAlester coal dust was only too well shown in the terrible explosion at No. 11, Krebs, in 1892. Ninety-six men were killed.

Bolen Darnell Coal Co.'s Mine No. 3

Mines and Mining Conditions

Mining in the district has become more settled in recent years, and now we find the following companies working mines:

The Osage Coal & Mining Co. is operating two shafts, Nos. 5 and 8, and one slope, No. 7, near Krebs. However, all the coal is obtained from slopes and planes inside of the shafts. The output is about 1200 tons a day.

The Rock Island Coal Mining Co. is operating slope No. 38, and Shaft No. 5, at Alderson, Shafts 7 and 8, at Hartshorne, and a group of slopes at Gowen. Of the latter, No. 40 is the largest producer in the state. The total output of the company will amount to about 3200 tons a day.

The Great Western Coal & Coke Co. operates a very steep slope at Baker. The pitch is 54 degrees.

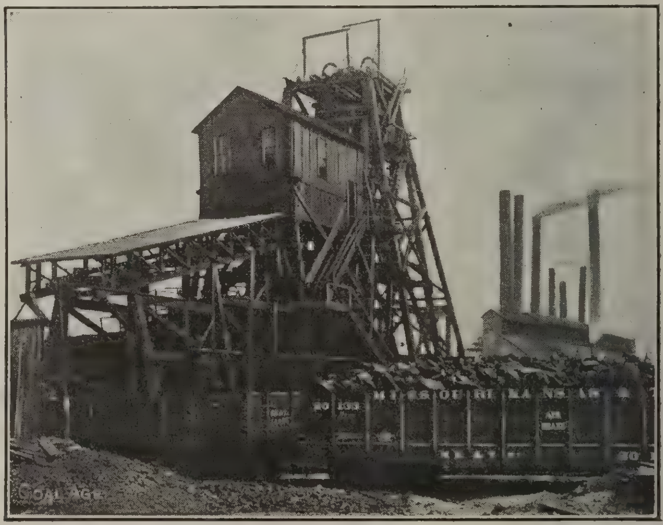
The Bolen Darnell Coal Co. operates slopes at McAlester and Craig.

The McAlester Coal & Mining Co. operates one shaft at Buck.

The Hailey Ola Coal Co. has a shaft mine in Haileyville.

The Milby Dow Coal Co. operates Slope No. 5 and Shafts Nos. 2 and 9 at Dow; No. 9 is one of the most complete plants in Oklahoma.

Besides those listed, there are several individual operators working along the outcrops of the Hartshorne and McAlester seams.



McAlester Coal & Mining Co.'s Mine No. 6

Mining in Oklahoma has the following conditions to meet: Gassy mines, very explosive dust, shooting off the solid, heavy overburden, excessive use of blasting powder, unwise legislation, and strong labor unions. Plenty of air, and much sprinkling has reduced the gas and dust dangers a great deal. Much can yet be done, however.

Shooting off the solid presents an interesting problem.

Mine No. 9 of the Milby Dow Coal Co., on the McAlester Seam at Dow, Okla.

Everybody knows its dangers, and the mine inspectors are strongly against it, but the unions stand directly opposed to its being abolished. Let an operator install an electric shot-firer, and immediately the miners want a deeper hole and more powder, and little they care what the result to life and property is. Injuries from falls of rock have increased 25% since shooting off the solid gained a foothold in Oklahoma.

COAL-MINING STATISTICS IN THE McALESTER FIELD*

	1909	1910	1911	1912
Tonnage	1,049,717	1,038,519	681,665	791,310
Number employed.....	3,178	3,094	2,923	2,933
Number killed........	37	18	13	11
Number injured	53	39	28	43
Number killed per 1000 employed......	11.6	5.8	4.5	3.75
Number killed in U. S. per 1000 employed..	4.00	3.92	3.73	3.15
Number killed per 1,000,000 tons.......	35.2	17.3	14.7	13.9
Number killed in U. S. per 1,000,000 tons...	5.79	5.66	5.48	4.29
Number kegs powder used	64,980	60,722	38,327	45,108
Tons of coal per keg..	16.2	17.3	17.7	17.5
Other explosives, in pounds	....	30,993	47,574	47,129

*This table has been prepared from the annual reports of the mine inspectors. The figures for the United States are quoted from the report on Coal Mining Statistics by Frederick W. Horton, of the Bureau of Mines. The death rate for the field is high. Less coal per keg of powder is being shot from the solid, and more explosives than ever before are used. The use of black powder is declining, however, and at present many mines are installing machines and using the permissible powders. This, it is believed, will reduce the amount of explosives, and increase the production of the district.

Recently a petition was filed by the miners for a referendum vote on that part of the recent legislative act known as Section 18, which prohibits solid shooting, limits the diameter of the bore hole, and specifies undercutting. It is noteworthy that other states are fast doing away with solid shooting, and that mining men in this district, who expressed themselves against the practice a few months ago, are now most earnestly urging the referendum. However, the operators are fast installing machines, and the future seems to promise nearly all machine coal.

Heavy overburden is a cause of much worry and efficient recovery is a big problem. Let us note here a few shafts whose depths are: 555, 600, 487, 530 and 660 ft. Within all these there are slopes whose bottoms reach depths ranging from 750 to 1000 ft. Longwall has been successfully tried in this field.

The mining laws are sometimes very much of a handicap and some parts need revision. Employers' liability acts are sometimes unjust, and the labor unions as a whole completely disregard contracts. More rigid inspection and stricter discipline will help matters much in this field.

Nearly all of the coal in the McAlester field is prepared by passing it over shaking screens. As a rule four sizes are made. The slack passes through a $\frac{5}{8}$-in. screen, the pea through a $1\frac{1}{4}$-in. screen, the nut through a $2\frac{1}{2}$-in. screen. A glance at the following table will give an idea of the distribution of the sizes:

The Osage Coal & Mining Co.'s Washer and the Great Western Coal & Coke Co.'s Mine No. 9

PRODUCTION OF COAL IN 1912—SHORT TONS

Lump	Nut	Pea and slack	Run-of-mine	Unclassified
261,857	78,106	194,673 (36.4%)	213,294	43,380
		Machine-Mined Coal		
14,563	2,180	8,040 (32.4%)	43,830	

Some parts of the various seams are more friable than others, and at some mines, a slack percentage of from 38 to 50% is often reported. Machines will, no doubt, lower this amount greatly and obviously will render the coal-preparation problem much easier to solve.

Mechanical Details of a Gasoline Motor

By R. O. Hodges*

SYNOPSIS—Because no power house is needed for the operation of a gasoline motor, it is customary to dispense with the services of a capable mechanical engineer. It must be remembered, however, that such a locomotive is a power house on wheels. Many parts of the engine, radiator and transmission cannot be copied from the automobile owing to the severity of the service. The article shows how the mechanical details have been modified to meet mining conditions.

⁂

The gasoline mine motor possesses certain advantages not present in any other form of haulage. Its flexibility is extreme. It can go wherever the rails are of sufficient weight to carry it. It does not require trolley wires, rail bonding, a power plant, or a pipe line, or even a charging station, and it can do several hours' work without needing a fresh supply of gasoline and water. In many cases the smaller motors will run for an entire eight-hour shift with one filling of gasoline. The motor has the same pulling capacity in relation to its weight that is possessed by any other form of traction haulage. It can go just as fast, if not faster, than either electric or compressed-air motors, and it is quite easy, under ordinary mining conditions, to prevent any leakage which would cut down its efficiency.

A Power Plant on Wheels Needs the Attention Given to One in a Power House

In regard to the endurance and reliability of gasoline mine motors, our experience has been contradictory. Many of our locomotives have been operated since they were installed at a low repair rate and have been as reliable as their owners could desire. A few have been expensive and not at all reliable. Some of these failures have unquestionably been our own fault. Even with the best intentions in the world, every manufacturer occasionally lets material or workmanship which is not up to standard pass through his shop, and this danger is greatly increased when the machine which he is manufacturing is as completely new as is the gasoline mine motor. Others of these machines did not give steady service owing to the fact that a motor requires intelligent attention at regular intervals, and this provident care was not given it.

It must be remembered in comparing this type of haulage with the other and better-known systems, that we have a complete power plant mounted on four wheels, and that in other installations power is being utilized in a substation on wheels but being manufactured in another place. If the same amount of attention were given the gasoline mine motor that is given to the entire power plant in a compressed-air or electric installation, its endurance and reliability would be fully equal to if not in excess of that of either of the other two systems.

But the gasoline motor is so convenient and so easy to slide into a mine and set to work that people are apt to get a motor and start it to run and keep it going just as long as it will turn a wheel. Naturally, with such treatment, wear, after a certain length of time, becomes rapid and breakage is ultimately inevitable. As the motors are becoming better understood, and the few parts which require attention are being discovered by the operators, the repair accounts are decreasing and the days during which the motors are out of service are becoming fewer.

The locomotives on every railroad are inspected by skilled men, at the end of every trip and necessary repairs are made immediately. If the gasoline motor happens to get an inspection once a week, it is fortunate; and I have known of cases where the locomotive was expected to run for five or six months without repair or adjustment of any kind. A day's work expended on the motors once a month will yield long returns in the way of low repair accounts and extreme reliability.

The Traction Qualities of a Gasoline Motor

These motors can pull as much coal as any locomotive of equal weight. We provide two speeds in each direction, which are approximately four and eight miles an hour, the low speed being used for starting the trip and for extremely heavy hauls on hard grades. Most of the work is done on high gear, under normal conditions, and owing to the flexibility of the engine, the speed of eight miles an hour is in many cases exceeded.

Another feature which makes the motor of considerable pulling capacity is the fact that it is quick and handy. In order to reverse the motor it is only necessary to move one lever about 12 in. Many times I have seen the motors run in one direction, when light or without a load, and then on the reverse lever being thrown over into the opposite side the motor would slide along the rails and the wheels turn rapidly in a direction opposite to that in which the motor was going.

Advantages of 4-Cylinder Opposed Horizontal Engines

We use a 4-cylinder, double-opposed, horizontal engine. This arrangement is not common, but we think we gain several advantages from this type of construction. In the first place, we are able to reduce materially the height of the motor without decreasing the size of the engine. In the second place, a double-opposed horizontal engine is better balanced than one of the vertical type. Third, we are able to oil the pistons with less danger of oil smoke than with the splash system used in automobiles, which has not proved well adapted to underground work. Fourth, and most essential, by using the horizontal opposed engine, we are able to get at all working parts by removal of the top without its being necessary to run the machine over a pit or to remove the entire engine from the frame.

Cooling by Direct Contact with Water

Next to the engine toward the front end of the machine is the fan. In our experiments with the original motors we tried to use the ordinary automobile type of

---

Note—Third part of an article read before the West Virginia Coal Mining Institute June 24, 1913, at Morgantown, W. Va., entitled "Gasoline Motor Haulage in Mines." The first part entitled "History of the Gasoline Mine Motor" was published July 19, Vol. IV, p. 80, the second entitled "Solutions of Two Gasoline Motor Problems" appeared July 26, Vol. IV, p. 118.

*Mechanical engineer, Geo. D. Whitcomb Co., Rochelle, Ill.

radiator, but we found that in order to be efficient, the elements of the radiator must be thin, and with the shaking and jarring of the motor and the constant danger of pieces of coal or slate striking various parts of the mechanism, it was utterly impossible to keep this radiator from leaking.

We therefore abandoned the radiator and put, on the two sides of our machine, a modified cooling tower. Water is pumped into the upper part of this chamber and drops down in the form of a spray. Through this water shower the air blows, forced by the fan which I have just mentioned. This gives us a cooler which cannot be overheated, and in which the parts are few and of great strength. The system is easy to take apart and clean. All passages are of fair size and contrast favorably with the restricted air channels in the automobile radiator. The device is bolted together so that a man with a monkey-wrench can take it apart, clean it, and put it together again without trouble, this construction contrasting to advantage with the automobile radiator which can be repaired only by an expert with the use of a soldering iron.

Reversing Gear

The bevel pinion engages with two bevel gears which it drives, of course, in opposite directions. These revolve loosely on a common shaft. A friction clutch is provided for each gear, and when either of these is in action, the shaft is rotated in the direction in which the bevel gear to which it is thus attached is revolving. In this manner by putting one friction clutch or the other in operation we obtain our forward or reverse motion. These friction clutches are of the disk type, the alternate disks being filled with holes in which are inserted small plugs of cork. These extend about $\frac{1}{32}$ in. beyond the surface of the large disk and are the only things which are in contact with the intervening steel plates.

Through the action of a force pump and spray heads these disks are constantly bathed with oil. We tried every known form of cone clutch and were unable to find any that would stand the extremely severe service expected, and not until we came to this cork-insert disk clutch did we find one which would stand the severe strains for any reasonable length of time. Under normal conditions the cork-insert disk clutch lasts a long time.

How the Speed Is Regulated

Keyed on to this same shaft are two spur pinions of different diameters which each engage with spur gears running loose on the secondary transmission shaft. These gears engage with that shaft through jaw clutches, these clutches being interlocked with the friction clutch so that they cannot be disengaged or engaged unless no power is being transmitted through the mechanism. In this way we get two speeds in each direction. From the secondary transmission shaft we chain down to the front axle with double chains and from the front axle we chain back again to the rear axle.

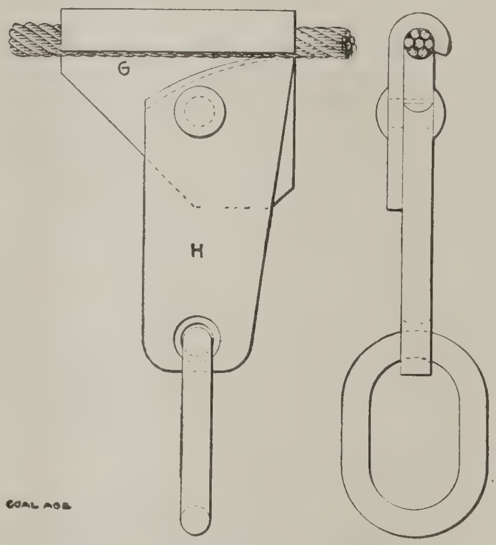
I do not know of a single part of the motor that has given more complete satisfaction from the very first than this chain drive. It seems to be durable and to give but little trouble, which could not be said of the *gear* drive to the front axle, which was used in some of the earlier motors. If the chains do happen to break, the cost of replacement is not excessive, as a full set for the 6-ton motor can be purchased for less than $40. Although some of the machines have been in use two or three years, we have had practically no sprockets to replace, those originally furnished still being in service.

We believe that the gasoline motor offers a means of haulage advantageous in so many ways and usable under so many conditions that its advent is almost revolutionary. It can be used, we believe, anywhere in a mine where there is a reasonable current of air. Its cost of installation is limited to the cost of the motor and is usually about one-third to one-half the cost of the installation of any other form of traction haulage.

Clutch for Inclines

Upon an incline of the Gerhard mine in the Saar district, Germany, is used a cable clutch which was designed by Josef Scherer, of Louisenthal. It is described in the "Zeitschrift für das Berg- Hütten- und Salinenwesen," Vol. 61, No. 1.

On the grades of 20 deg. and more, the cast-iron clutches with edge clamping arrangement did not give good service. They often broke under the heavy strains put upon them, letting the cars free and causing considerable damage. This led to the use of the clutch here described, which, because of its simplicity and strength, seems to be a good one.



Front and Side Views of Clutch

This rope clamp consists of the wrought-iron housing *G* and the lever *H*. Housing and lever are pivoted together by a strong rivet. On the lower end of the lever is a link for the attachment of the car.

After the lever has been turned backward by hand, the housing is hung on the cable. As the car is started its weight pulls the eccentric edge of the lever tight against the rope. When the car has reached the loading station at the foot of the incline, where its weight no longer has an effect, the clutch is automatically released and can be taken off without further ado. The price of the Scherer clutch, homemade, is about 45c. The rights in the invention are understood to be secured to the mine management.

Meeting of Southern Appalachian Coal Operators' Association

The annual meeting of the Southern Appalachian Coal Operators' Association was held in Knoxville, Tenn., July 25, with an excellent attendance. Several matters, such as markets, freight rates, car supply, etc., were discussed, with the best of good feeling and mutual benefit to all.

The members of this association are coöperating to make a success of the First-Aid Field Day, which is to be held in Knoxville, Sept. 20. It is said that teams from more mines have been entered for this contest and more prizes of greater value have been offered than for any field day ever held in this country.

The annual meeting was highly satisfactory and harmonious. The association is a compact organization which is doing valuable work for the field as a whole, thereby benefitting each individual operator. This is due probably in no small part to the officers, who are zealous men of keen foresight and large ideas.

⁂

The Illinois Mining Institute

At the recent Mining Conference, held at Urbana, Ill., May 10, 1913, the following committee of five were appointed to arrange for a meeting to consider the organization of a mining institute in Illinois: J. D. Peters, Chicago-Carterville Coal Co., Carbondale; A. S. Allard, Bunsen Coal Co., Westville; H. H. Stoek, professor of mining engineering, University of Illinois, Urbana; Joseph Pope, district president U. M. W. A., Springfield, and Martin Bolt, chief clerk, State Mining Board, Springfield.

At the call of this committee, a meeting was held in the parlors of the St. Nicholas Hotel, Springfield, June 24th, and attended by a large number of mining men from all parts of the state. The meeting was called to order by Mr. Bolt, who was made temporary chairman. Oscar Cartlidge, manager, Mine Rescue Station, Springfield, was selected temporary secretary.

The following committee was appointed to prepare a plan of organization: John H. Ross, superintendent, Superior Coal Co., Gillespie; W. S. Burris, state mine inspector, Danville; and Geo. S. Barrowman, mine manager, Eldorado.

The committee prepared a plan for organization, which was presented at the afternoon meeting. Later a constitution was prepared and adopted. The following officers were then elected: President, John P. Reese, general superintendent, Superior Coal Co., Gillespie; first vice-president, Andrew Fletcher, superintendent, Taylorville; second vice-president, Robert Eadie, sub-district president, U. M. W. A., Cantrall; secretary-treasurer, Martin Bolt, chief clerk, State Mining Board, Springfield.

The following were chosen as an Executive Board: A. J. Moorshead, Madison Coal Corporation, St. Louis, Mo.; Gorden Buchanan, Chicago; Harry Fishwick, miner, Springfield; Thomas Moses, superintendent Bunsen Coal Co., Westville; H. H. Stoek, professor of mining engineering, University of Illinois, Urbana.

It was decided to hold the next meeting in November, at a time and place to be designated by the Executive Board. The outlook is bright for a successful meeting and a large membership. Short addresses were then made by the following gentlemen: David Ross, secretary, Bureau of Labor Statistics, Springfield; Walton Rutledge, mine inspector, Alton; Hector McAlester, mine inspector, Streator. The president, John T. Reese, made a very interesting talk, in connection with the work of organization, which closed the meeting.

⁂

Alabama Coal Operators' Fifth Annual Outing

Special Correspondence

The Alabama Coal Operators' fifth annual outing to the coal mines of Alabama was held at Marvel, Ala., July 26. A special train left the Birmingham depot at 9 a.m., returning at 6:30 p.m. About 600 tickets were presented on the train and quite a number of guests drove into Marvel from the camps near by.

The following program was carried out:

10:45—11:15. Inspection of mine operations, town and commissary of the Roden Coal Co.

11:15—1:30. Morning session in Roden Co.'s auditorium.

1:30—2:30. Barbecue served in school hall.

2:30—4:30. Afternoon session in auditorium.

At both sessions in the auditorium moving pictures were sandwiched in between the addresses. The films were furnished by the Bureau of Mines and are the same as those shown in various parts of the country.

George F. Peters, president of the Climax Coal Co., of Maylene, presided at the meetings in the auditorium. The first paper of the session was presented by Frank Crockard, vice-president and general manager of the T. C. I. & R. R. Co. entitled, "What a Coal Operator Can Do to Provide for the Welfare of Employees and Their Families." The paper covered a wide range of topics, namely; ice and water supply, flies, mosquitoes, garbage, bath houses, food preparation and supply, education, stoves for school houses, sanitary drinking fountains, etc.

Great strides have been made in Alabama along these lines during the past two years, and as Mr. Crockard and his company have always taken the lead in this work, his address received close attention.

The second address of the morning session, "The Commissary; Its Indispensability and Purpose," was given by B. F. Roden, president of the Roden Coal Co.

There is much discussion in Alabama at the present time as to the desirability of the mine commissary; one side seeing in it only its possibilities as a "gouger" of helpless employees, while the other faction is equally positive that the improvident could not exist without it. Mr. Roden's paper was a temperate convincing exposition from the latter standpoint. One point was especially dwelt upon; namely, under the present garnishment laws of Alabama, the mine commissary is indispensable to many miners' families. Mr. Roden also emphasized the fact that if all companies would prohibit their operating officials from soliciting for the commissaries, the employees would soon get away from the idea that they are being coerced into trading there.

The last paper of the morning session was presented by L. M. Jones, of the United States Bureau of Mines, on

"Prevention of Haulageway Accidents." This paper was largely a summary of Miners' Circular No. 11, by the same author, issued by the United States Bureau of Mines. Three principal causes for such accidents were emphasized, namely: narrow roadways, lack of sufficient number of holes along haulageways for men to reach in case of danger, and trolley wires where workmen must travel.

One Way to Reduce Accidents

At the afternoon session the first paper was presented by C. H. Nesbitt, chief mine inspector of Alabama, on the subject of "Value of a Safety Inspector and Instruction for Each Coal Mine." As only one company in Alabama has so far deemed it necessary to employ safety inspectors, the paper was timely. Mr. Nesbitt referred to the fact that in 1912 over 50% of all fatal accidents in Alabama occurred at the working face, and "upon investigation it was found that a majority of these fatalities could have been avoided if proper instruction and supervision had been given." He also referred to the wonderful record made by the H. C. Frick Coke Co. in reducing accidents at its mines through the introduction of safety inspectors and instructors.

Discussion of Mr. Nesbitt's paper was given by E. Flyn, chief inspector of the T. C. I. & R. R. Co. Mr. Flyn made the rather startling statement that 80% of all accidents coming under his observation were attributable to carelessness, and most of them could have been avoided by proper supervision and instruction.

The last paper of the meeting was given by J. J. Rutledge, of the United States Bureau of Mines, on "Coal Mine Ventilation and the Removal of Gas." Most of the paper dealt with the subject from an elementary standpoint, but during the reading, several interesting experiments were mentioned. Mr. Rutledge stated that Mr. Williams, of the Bureau, has recently made some experiments in mines in the State of Illinois to determine the efficiency of stoppings, and the results were startling. Efficient fans were rendered almost useless by leaky stoppings. He also mentioned results obtained last winter by installing outside air courses to heat the air to about the temperature of the mine, by means of exhaust steam from the fans just before it entered the mine intake proper. He suggested that beneficial results could be obtained in mines where falls of roof were common by reversing the process in summer; that is, cooling the ingoing air to the temperature of the mine.

Printed copies of the papers presented were not distributed in advance, as had been done in previous years, and as a result discussions were almost lacking.

The size of the auditorium at Marvel (it is used as a church on Sunday, and often during the week picture shows are given), as well as the size and design of the public school, were commented on by all who saw them on this day for the first time. Surely the day of pleasureless mining camps in Alabama is passing.

In conclusion I wish to suggest that an excellent opportunity to illustrate the workings of sanitary measures was overlooked. During both sessions in the auditorium buckets of lemonade were passed through the hall and *all* of the members assembled were supplied through a *single* drinking cup. After the excellent description of sanitary drinking possibilities by Mr. Crockard the lone cup gave some of us the creeps.

Coal Washing in Kansas Not Profitable

By Barry Scobee*

The only coal washer in the mining district about Pittsburg, Kan., or in the whole state for that matter, is not a paying proposition from the standpoint of washed coal. It used to be, but the situation was changed by the development of the gas and oil fields which adjoin the coal district on the west.

The plant here referred to is owned by the Wear Coal Co., of Pittsburg, and is situated seven miles northwest of that town in the heart of what now is the newest district, just being opened up. In reality there are two washers, but they stand side by side and are owned by the same company.

The Only Coal Washery in Kansas

Washer No. 1 was put up in 1908, and No. 2 in 1910. At that time the oil and gas fields were at the height of their prosperity and output. This caused the demand for coal to decrease until the market was overloaded with mine-run stuff. What fuel was sold did not bring the price the operators thought it should, and as a consequence the Wear people decided to wash their coal, hoping the cleaned product would sell fairly well in competition with gas and oil.

The capacity of the first washer was 125 tons an hour. The coal sold so well that in 1910 washer No. 2 was put up, it being in capacity equal to the first. Both ran nearly all the time, and the demand for the cleaned slack often was greater than the supply. The washed coal found a market for itself in a district hitherto supplied only with dirty slack.

During the past 12 months, oil and gas in Kansas have lost much of their importance. Many authorities claim that the present wells cannot supply the demand. As a consequence, coal is again coming into its own in all this section of the country, and it is no longer necessary to wash the coal to get a good price for the product. Operators claim that more money can be made on unwashed coal, and as a result, the Wear company's washeries are idle most of the time. The coal is generally sold as it comes from the ground, except that most of it is screened.

⁂

The Manchuria Ry. Co. operates five coal mines, which give employment to 7000 Chinese laborers, who work for 25c. per day. The output is 300 tons for each mine per 24 hours. Though the coal is bituminous, anthracite methods of mining are used, as the seam is too thick (125 ft.) to make bituminous methods practical.

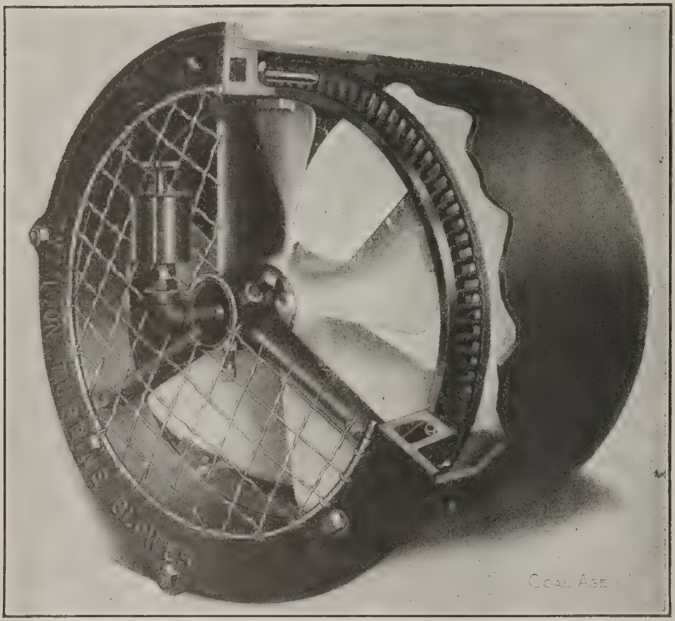
POWER DEPARTMENT

Improvements in the Typhoon Turbine Blower

The Typhoon turbine blower made by the L. J. Wing Manufacturing Co., of New York, which is familiar to many colliery power-house men, has recently had some important improvements embodied in its construction. These consist mainly in largely increasing the strength of the blading of the turbine and in mounting the rotating parts upon suitable ball bearings which absorb both the radial and thrust stresses.



Showing Improved Type of Turbine Blower

As is well known, this type of blower consists in mounting a single-stage turbine upon the rim of a highly efficient propeller type of fan. The construction of the turbine, in its improved form, is particularly interesting. The sherardized steel turbine blades are cast into a tough bronze ring upon their inner ends. The outer ends of the blades are bent over in an L-shape and are all welded together by means of an oxyacetylene flame. This method of construction renders the entire blade ring practically a unit and absolutely immune from the trouble which was formerly so frequently encountered in turbine construction, namely, the throwing of blades.

The rotating unit, consisting of the fan and its driving turbine, is mounted on two separate ball bearings placed a few inches apart. The bearing, as a whole, is entirely inclosed so that it is impossible for dust or dirt to get into it. The lubricant used is a soft mineral grease fed through a grease cup. The exhaust steam from the turbine mixes with the air supplied by the fan and has the effect of reducing considerably the amount of clinkers. This is an important consideration with many coals, as a high sulphur content or a fusible ash will ordinarily rapidly form clinkers of large size.

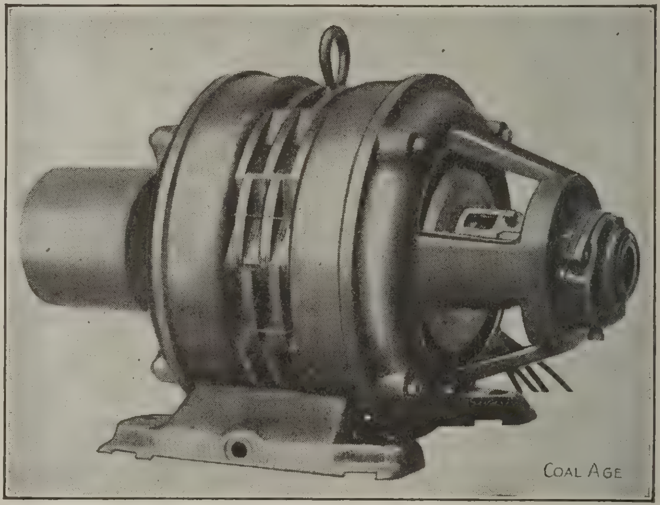
In the accompanying illustration, the outer casing of the machine has been cut away in order to show the interior parts. In ordinary practice, this casing is built into the setting walls of the boiler and thus takes up no additional floor space. The machine is at present manufactured in three standard sizes, namely 12, 16 and 20 in. The amount of air furnished varies, of course, with the size of the fan and its speed of rotation. The particular advantages gained by the employment of this blower are increased capacity or the utilization of fine or low-grade fuels, which would otherwise be unburnable. A draft pressure equivalent to 2½ in. of water may be easily obtained with one of these machines.

⁂

A New Westinghouse Single-Phase Motor

The Westinghouse Electric & Mfg. Co. has placed on the market a new line of single-phase motor made in capacities of from 2 to 10 hp. and suitable for the majority of constant-speed applications within their capacities.

This machine is of the repulsion-starting type and when up to speed, runs as an induction motor. For most applications, it can be connected directly to the line, but where low starting current is desired, a rheostat can be used.



New Single-Phase Motor

The frame is so designed that it combines great strength and radiating capacity with minimum weight and over-all dimensions. The laminations are riveted together under pressure and pressed-steel end plates are riveted to the unit thus formed. The foot, or base, is of pressed-steel plate securely riveted to the end plates. This use of pressed steel marks an important step forward in the design of large single-phase motors.

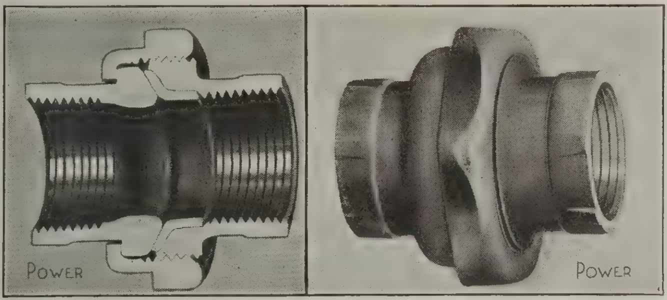
The bearings are large and dust-proof. The rotor coils are form-wound and arranged to permit excellent ventilation. The commutator is of the radial type with undercut mica segments. The shaft can be pressed out of the rotor without disturbing the windings or commutator.

Each motor can be arranged for operation on either 110- or 220-volt circuits.

⁂

Mark Cold-Drawn Steel Union

This union is made seamless from cold-drawn flat-strip steel. Each union is treated by a sherardizing process, to render it immune from rust and corrosion, says *Power* of June 10, 1913. This process consists of heating the parts with zinc dust in a retort, which causes the zinc to penetrate a short distance into the metal and also leave an exterior coating. As the threads are cut before the treatment, they are protected against corrosion without altering their sharpness and fit.



Sectional and Exterior View of the Mark Union

The Mark union, which is manufactured by the Mark Mfg. Co., Chicago, Ill., consists of three main parts, male and female ends, which are joined by coupling nuts. A brass ring *C* fits between the coupling ends as shown. The union is threaded to Briggs' standard for pipe threads and carries the same taper as the pipe. The expansion and contraction of the union under heat and cold is practically the same as that of the pipe.

⁂

Turbine Pumps with Electric Drives

Progress in the manufacture of high-grade material, and its use for high-speed rotary machines, has occasioned a continual increase of such speeds. For electric drive with alternating current and a frequency of 50 cycles per sec., a limit is reached at 3000 r.p.m. Such a speed is today often employed for motors driving centrifugal pumps, turbo-blowers and compressors. Indeed, for small rotary machines of this type such a speed is often insufficient, so that a steam turbine is frequently substituted.

The difficulties arising in the mechanical construction of high-speed motors have readily been overcome in the light of experience in the building of turbo-generators. Problems remained, it is true, in the design of rotor-collector rings and brushes, as well as short-circuit and brush-lifting devices, but today these obstacles have been surmounted. Alternating-current motors can be built and used which run at 3000 r.p.m. and deliver over 1000 hp., yet are as reliable as motors of 1500 r.p.m.

In driving these high-speed motors underground in mines containing firedamp, the ordinary safety precautions answer, so that since such machines are frequently mounted near the loading station, and, hence, are in the ingoing-air current, it suffices, if inclosure be necessary, to make only the collector rings gas proof.

Experience in general has taught that high-speed pumps, the efficiency of which is generally somewhat better than that of sets which run at the lower speed of 1450 r.p.m., but whose cost and space occupied are much less, can be employed advantageously only for pumping pure water. Sand, ashes, etc., as well as acid water, are decidedly destructive to pumps running at high water velocities. Therefore, it is best to use high-speed sets only for perfectly clean water, or where first cost is important, or when, as in the case of auxiliaries, for example, they are to be run only at intervals.

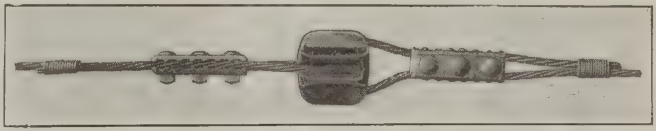
Finally, it may be asked whether the high potential motors may, under some circumstances, be successfully and reliably employed in wet places, as, for example, in sinking. Practice has shown that motors can hold their own even under such conditions, but it is advisable, in case they run intermittently, to maintain them constantly somewhat warm by keeping the field in a circuit at a suitably low voltage. For this purpose a small transformer may be provided, the low potential side of which has several contacts, so that the voltage may be readily adjusted to the heating requirements of the motor. If this machine should become so wet from dripping water that it is inadvisable to connect it with a low potential circuit, there can be placed around it a considerable number of incandescent lamps to dry out most of the dampness by their radiation.

Note—Translated by E. P. Buffet.

⁂

A New Porcelain Strain Insulator

A new porcelain strain insulator of remarkably high strength, both mechanically and electrically, has just been placed on the market by the Westinghouse Electric & Mfg. Co., of East Pittsburgh, Penn. The manufacturer recommends these insulators for use on 1500-volt direct-current railway work and on 2200-volt transmission lines, a class of service for which porcelain insulators have been seldom used in the past.



Strain Insulator, Showing Method of Application

It is claimed that the insulators will stand more strain than any cable used in line construction that will pass through the hole. They are of the interlinking type which makes it impossible for cables to separate even if the insulator should become shattered.

The glaze is of a dark-brown color, which does not attract the attention of those mischievously inclined. Sharp corners, which would be apt to chip have been avoided, and the shape of the grooves is such that the wires lie naturally in them. A large creepage distance is provided which makes it suitable for high voltages.

The smallest size of these insulators has a flashover voltage on rain test of over 13,000 volts, and the larger size, over 20,000 volts. The tensile strength of the larger size insulator is over 23,000 lb., and its dimensions are only 5x4½x4½ in.

Transformers for Outdoor Service

Special Correspondence

SYNOPSIS—The demand for small-capacity transformers for installation out of doors has greatly increased in the past few years. The principal difficulties encountered are the radiation of heat due to transformation losses within the windings and the introduction of the high-tension cables. This article tells how both of these obstacles are overcome.

⁂

Almost since the dawn of the electric era small lighting transformers of comparatively low potential have been installed out of doors and have satisfactorily withstood the service, their superior design and construction making them proof against the action of the elements. But, no effort was made at that time to develop a line of high-tension power transformers for outdoor service, owing to the demands for power then being confined to centers of population where the main stations and substations were located.

Recently, however, owing to the fact that it is often desirable to tap a high-tension line where the load is not sufficiently great to justify building a substation, high-tension transformers of all capacities and for any commercial voltage, have been designed for outdoor service.

An impetus has been given to this development by the phenomenal demand for electric power made by would-be consumers, located in the country along high-tension transmission lines, who realize the advantages of electricity for both power and light, but who do not require enough current to justify the expense of a substation.

The installation of the apparatus out of doors obviates the necessity of constructing new buildings or enlarging an existing station to provide room for the new equipment, and so may greatly reduce the cost of expansion. Yet, it is probable that very few persons outside of those connected with the design or sale of power transformers realize the rapid progress that has been made in the use of these instruments in outdoor service and the excellent records for reliability that those installed have made.

The familiar pole-type transformer, used on city distribution circuits, having a potential of from 2300 to 4000 volts, is comparatively simple to design for outdoor service, on account of the relatively low voltage. Standard transformers in capacities of from 1 to 100 kv.-a., are readily obtainable for this class of service, and all sizes embody practically the same construction with the exception of the tanks.

The core for these transformers, as built by the General Electric Co., is made up of four magnetic circuits of equal reluctance placed in multiple. Each circuit consists of four legs arranged to form a rectangle, one of these legs being built up of two widths of punchings, in such a manner as to form a tenon on the outside of the leg.

When the four circuits are assembled with these four legs together, the latter interlock to form a central leg upon which the winding is placed. The core, when viewed end-on, has the form of a cross. This construction brings the oil in contact with an unusually large part of the surface of the core and coils, so that undue heating of these parts is not possible under normal load or reasonable overloads.

As a result of the use of a thick mica shield between the primary and secondary windings, the highest degree of safety, which is the most important characteristic of a transformer, is obtained. This mica shield is designed to withstand a potential of from 15,000 to 20,000 volts and is practically indestructible when used on circuits having voltages around 2500.

An abundance of ducts and channels, through which the circulation of oil is maintained, results in uniform temperature throughout the transformer and eliminates the detrimental effects of unequal expansion in the coils with consequent rubbing and injury to the insulation.

All live terminals are located below the surface of the oil to prevent surges or lightning discharges from arcing over and short-circuiting the coils, or grounding to the tank.

The impedances of transformers of the same size vary but slightly, so, when such instruments are operated in multiple, each takes its proper share of the load.

The use of a special alloyed steel in the cores of these transformers has brought the core loss down to a minimum value with a consequent low loss when the transformer is slightly loaded and, as this steel is non-aging, there will be no increase in the core loss after an indefinite period of operation.

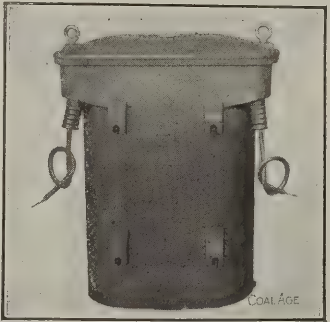


Fig. 1. A 10,000-Volt, 5-Kv.-a., Type H Transformer

Transformers below 25 kv.-a. capacity are placed in smooth cast-iron tanks. Above this size these receptacles are corrugated in order to obtain sufficient surface for radiation of the heat generated within the transformer due to the losses. The largest two sizes, if made of cast iron, would be too heavy and bulky for suspending on poles, so they are made of corrugated sheet steel. For operating on poles in the open and on the walls of buildings under the eaves, the tanks that contain these transformers must be weatherproof.

The cast-iron covers are, therefore, provided with overhanging edges and the joint between cover and tank is sealed by a gasket, effectively preventing the entrance of moisture and dust. The cover is securely fastened to the tank by two eyebolts, which also serve as a means of lifting the transformer. With eyebolts, the cover can readily be removed without the use of a wrench.

The primary bushings have thick walls and the portion which extends beyond the transformer is hemispherical in shape, so as to give a long creeping distance from the primary conductor to the frame. The rounded surface is not fractured or chipped, as it would be if the bushing had sharp corners.

Power transformers, 100 to 500 kv.-a., for distributing potentials, (2300-600), and all transformers above 6000 volts up to 500 kv.-a., employ a different type of construction than the distributing transformers above described. Here, the straight two-legged core-type construction is employed. The core consists of two vertical legs connected together at the top and bottom by yokes, thus forming a rectangle.

Cylindrical coils and insulation cylinders are placed concentrically over the two vertical legs of the core, the high-voltage winding being outside those of the low-voltage, and separated therefrom by oil ducts and the above mentioned insulating cylinders.

Two Methods of Cooling

Power transformers for all voltages may be self-cooled or water-cooled. In self-cooled transformers, the heat arising from the losses in the instrument itself is dissipated into the surrounding air by providing a tank with sufficient external radiating surface to limit the temperature inside the transformer to a safe value.

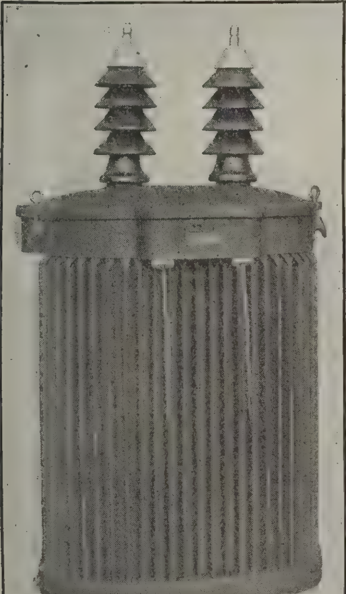

Fig. 2. A 33,000-Volt, 20-Kv.-a. Outdoor Transformer

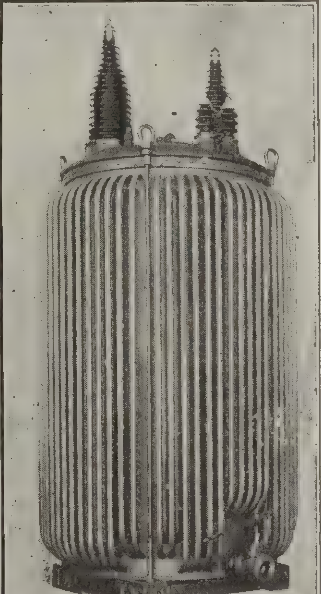

Fig. 3. A 110,000-Volt, 100-Kv.-a. Self-Cooled Outdoor Transformer

The tanks for these transformers are made from sheets of steel corrugated under great pressure and electrically welded together. A base and rim are cast directly to the corrugations, the joint between them being an actual weld. This forms a rigid one-piece tank which, when supplied with a suitable cover and gasket, is readily adapted for outdoor operation.

The main difficulty, however, in designing high-voltage transformers for outdoor use is encountered in bringing the leads out of the tank. In transformers below 17,500 volts, this is easily accomplished by leading them through porcelain bushings set in, or underneath, the rim around the top of the tank. For potentials above 17,500 volts this method is unsafe, so the leads are brought straight out through openings in the cover and protected from the weather by a porcelain covering, built up of several petticoats.

In water-cooled transformers, the heat generated by the losses in the transformer is artificially extracted from the oil by circulating cold water through a seamless coil of pipe placed in the upper part of the tank and submerged in the oil. The expensive corrugated tanks for radiating the heat are, therefore, unnecessary, so a plain steel tank is provided. Transformers in these tanks are suitable for outdoor operation when equipped with porcelain petticoat leads, brought out through metal bushing holders.

Transformers having a capacity greater than 500 kv.-a. are built of the shell type, i.e., the core surrounds the windings, which is in direct contrast to the core type, where the windings surround the core.

Self-cooled, shell type transformers are not built in capacities much above 3000 kv.-a., because of the large and expensive tank construction necessary to obtain sufficient radiating surface.

The extra radiating surface necessary for self-cooled transformers above 750 kv.-a. is obtained by compounding the corrugations, i.e., two plain corrugated sheets are welded together to form one large corrugation. This tank has about 65% more radiating surface than those of plain corrugated construction.

Another type of receptacle for large capacity, self-cooled transformers is known as the "tubular" or "pipe" tank. This consists of a boiler-plate tank having the ends of a double row of vertical steel tubes welded into it at the top and bottom, thus providing a natural circulation for the hot oil from the upper to the lower portion of the tank through these external pipes, where the heat is quickly dissipated. These tanks are very efficient.

The majority of transformers above 1000 or 1500 kv.-a. are water cooled. The tanks for these machines are made from heavy boiler plate, being round for single-phase transformers and elliptical for three-phase units. They are perfectly plain and smooth, having no corrugations or pipes, which are unecessary in this type of equipment.

All these various tanks are designed for outdoor use when furnished with a suitable cover, gasket and leads.

Three large water-cooled transformers, 2750-kv.-a. each, have recently been designed for outdoor operation on a 110,000-volt circuit. These are in successful operation at the present time. Some 1000-kv.-a. self-cooled transformers in tubular tanks are also operating satisfactorily outdoors on a 110,000-volt circuit.

⁂

A Heavy Illinois Producer

The following is the record for the new Staunton Coal Co.'s mine located at Livingston, Ill. (T. G. Hebenstreit, superintendent) for the year ended June 30, 1913:

The total production of the mine for the year was 848,721.1 tons, the actual working time being 212 days and 7 hr., making the average hoist per day 3986 tons. The total tonnage produced since October, 1904, amounts to 4,531,844.55 tons. During the month of June of the current year the mine worked only 9 days and produced 36,992.5 tons, making an average of 4110 tons per day. A breakdown in the hoisting engine, early in February, so restricted the production, that the average daily hoist for the first half of the month was only 3494 tons; had it not been for this accident, the production for the year would have averaged 4000 tons per day.

From data available at the present time, this is the record production for the state, and it is probable that no other mine will show such a tonnage. It is a noticeable fact that high-capacity mines are increasing in Illinois, while the smaller producers are on the decrease.

The Mine Fan

By Berton Braley

(Written expressly for "Coal Age.")

I am the lungs of the mine,
I am the guard against death;
The air in the workings grows stale
And the faces of miners grow pale
When I cease to take breath.
So I whirr and I whirr and I whirr
Till the chambers and entries below
Feel the dust-laden air all astir,
And the lamps, which were faint and ablur,
Shine out with a livelier glow,
Proving my worth as they shine,
I am the lungs of the mine.

I am the lungs of the mine,
I am its safety, its life,
In all of man's underground strife
With the heat and the damp and the dust,
I am his trust.
The uttermost depths of the mine,
The furthermost heading of all
Are under my thrall;
And the wind that goes sweeping so free
Through the gloom
Of each runway and room
Is from me.
So the damps and the gases they flee
On the wings of my breath;
And I shield men from death
And I give them the vigor to dare
The bowels and depths of the earth
For the coal that is there!

O my song is a deep-noted purr
As I whirr and I whirr,
Doing my task as I sing,
Keeping the workings astir
With the flood of pure air that I bring;
And the deadlier air I remove,
And thus do I prove
My value, my worth,
To the men who go under the earth
With the lights on their foreheads ashine,
For I am their life and the breath
That guards them from death,
I am the Lungs of the Mine!

A New Deputy Mine Inspector

House Bill No. 206, introduced by Representative Spogen and passed by the last legislative assembly of the State of Montana, provides for the appointment of a deputy coal-mine inspector, to be under the supervision of the state coal-mine inspector and defines his duties, qualifications and salary. The bill has since been signed by the governor; but, as yet, no appointment has been made to fill the new position. Joseph B. McDermott is the chief mine inspector of Montana.

The bill is as follows:

Sec. 1. The governor, by and with the advice and consent of the Senate, shall appoint one deputy state coal-mine inspector. The said deputy state coal-mine inspector shall be selected from among the list of names certified to by the county examining board for mine foreman, fireboss or mine examiner, as having successfully passed the examination for mine foreman and been granted a certificate of competency as such by a county examining board, in Montana.

Sec. 2. He shall have like powers and duties as the state coal-mine inspector, but shall be under the supervision, and subject to the orders of, and report to the state coal-mine inspector any and all acts pertaining to the inspection of mines, investigation of accidents, scales, wash houses and other duties of the deputy state coal-mine inspector; and shall reside in and perform the duties of deputy state coal-mine inspector, in the districts assigned to him by the state coal-mine inspector. The deputy state coal-mine inspector shall receive a salary of twenty-one hundred ($2100) dollars per year, and all necessary traveling expenses. He shall file with the state treasurer, a bond in the sum of five thousand ($5000) dollars, approved by the governor, for the faithful performance of his duties.

Sec. 3. This act shall be in full force and effect from and after its passage and approval.

Increased Coal Production in Colorado

Coal mining as an industry began in Colorado in 1864, when a production of 500 short tons was recorded. In 1876 the production reached, for the first time, a total exceeding 100,000 tons, and six years later, in 1882, according to the U. S. Geological Survey, it had attained the million-ton mark. Since that time, the increase has been almost uninterrupted. The production exceeded 3,000,000 tons in 1890; ten years later it had grown to over 5,000,000 tons, and in 1910 it exceeded 11,000,000 tons; but in 1912 it fell below the 11,000,000-ton mark.

Erratum

The first sentence of the article upon "Coal- and Ash-Handling Equipment," appearing on page 76 of our issue of July 19, reads: "A coal-handling equipment supplied with a pivoted-bucket carrier system is, of course, designed only for a small plant." This should have read: "A coal-handling equipment consisting of a centrifugal discharge elevator handling both coal and ashes and a flight conveyor for the coal is, of course, designed only for small plants." As is well known, the pivoted-bucket carrier may be used in plants of almost any size.

COMING SOCIETY MEETINGS

International Geological Congress—The 12th session of this organization will meet, Aug. 7, at Toronto, Can. Address of Secretary, Victoria Memorial Museum, Ottawa, Can.

Woodward and Pettebone First-Aid Excursion—The united first-aid teams of the Woodward and Pettebone mines of the D. L. and W. R.R. Co. at Kingston, Penn., will run an excursion to Harveys Lake on Aug. 15.

American Institute of Mining Engineers—This institute holds its next annual meeting at Butte, Mont., on Aug. 18 to 21, inclusive. Bradley Stoughton, 29 W. 39th St., New York City, is secretary.

Kentucky Mining Institute First-Aid Meet—This meet will be held at Central City, Ky., on Labor Day, Sept. 1.

National Conservation Exposition—Miners' Field Day, to be held under the auspices of the Tennessee Mine Foremen's Association, with the coöperation of the Bureau of Mines and the American Red Cross, on Sept. 20, at Knoxville, Tenn.

American Mine Safety Association—The second meeting of this society will be held at the Bureau of Mines, Pittsburgh, Sept. 22-24. H. M. Wilson is chairman.

American Mining Congress—This society meets for its 16th annual session at Philadelphia, Oct. 20-24; the secretary is J. F. Callbreath, who has opened quarters in the Land Title Building.

Coal Mining Institute of America—Winter Session meets Dec. 4 and 5 at the Fort Pitt Hotel, Pittsburgh, Penn. C. L. Fay, secretary, Wilkes-Barre, Penn.

EDITORIALS

The New Anthracite Tax

When the Pennsylvania State legislature enacted the measure which places a tax on anthracite coal, the proceeds of which are to be used by the state and county governments, a new precedent was established. Only on one other occasion has a similar tax been exacted and this was for the purpose of raising funds during the Civil War.

It is said in justification of the act that the mining industry of Pennsylvania has greatly increased the governmental expenditures, and, further, that some provision is necessary to compensate for the loss which the state will sustain when the coal supplies are finally exhausted.

These points seem reasonable enough, but as a matter of fact they will not bear a close scrutiny. State expenditures have, no doubt, been heavily increased by the mining operations, but it is equally true that the companies are already heavily assessed, and it is safe to say that they are carrying their full share; in addition to this there are entire communities that are solely dependent upon the coal operators.

In the matter of providing for the ultimate exhaustion of the coal supplies it is difficult to see wherein this is being done. The accrued funds are to be allotted in equal proportions to the state and county authorities and will in some instances effect a reduction, if not a complete elimination of existing taxes. Were the funds devoted to the interests of the coal industry in the state, the act would be more commendable. If the mining operations have been a burden, these new funds should be applied directly to the relief of these particular burdens, as might be done by establishing a workman's compensation fund or allotting a portion to the mine inspectorate.

As to the constitutionality of the law, this remains to be tested. The National Government specifically requires that states refrain from placing any tax on products used in interstate commerce, and a large part of the hard coal mined in Pennsylvania is consumed in New York and neighboring states. Exemption from this provision, however, can be obtained by special permission and the fact that the coal is sold locally, as well as outside the state, may have some bearing on the subject. However, from any viewpoint, it appears that Pennsylvania is asking the consumers of anthracite in New York and elsewhere to pay a part of her current expenses, for any additional charge on the production of hard coal must come out of the consumer's pocket.

Generally speaking, a tax of any kind on coal is to be regarded with disfavor for the reason that it is an economically wrong principle. Fuel is a basic product upon which all industries are compelled to rely to a greater or less extent and any increase in its cost must eventually narrow its limits of application, and effect a restriction in development. The present tax is an oppressive and mercenary one at the best. In fact, it savors somewhat of the Jewish extortioner and exhibits a sordid parsimoniousness that is a discredit to the people of Pennsylvania.

The Van Swearingen Decision

It has long been thought that in accord with an extended series of decisions, it would some day be ruled that a coal or other like deed could not contain a clause giving the grantee the right to buy a part of the surface whenever he desired at a fixed price unless the deed contained a clause limiting the period during which the option might be exercised to 21 years after the death of the optioner or for some shorter period.

J. Q. Van Swearingen, judge of the Fayette County Court, has just made such a decision in the case of William Barton, Priscilla King and Harriet Coffman versus the Thaw Trust. The purchasers of the coal land in dispute were J. M. Thompson and J. K. Ewing. They resold it and with it also the right to purchase the surface, which formed part of the original deed to William Thaw, who, in turn, devised it to trustees for the use of his children, grandchildren and great-grandchildren and their survivors.

The judge has declared that this option to purchase is and has been from the beginning null and void and has ordered that this decision be entered on the docket against this clause in both the deeds mentioned.

We have no doubt that the decision will stand the test of appeal. Perpetual rights of the kind which the deed seeks to establish are against the public interest. It often becomes impossible to sell lands under such a restriction, and it certainly makes inadvisable the improvement of properties menaced by such a clause. The public interest is larger even than the need of the coal operator, and the latter will, we are sure, look at the matter from a broad national viewpoint.

The law seeks that there shall be no masterless land; as our country grows the best sites must not be made worthless by a divided, unsettled ownership. The right to buy must not perpetually exist to cloud title; it must not be legalized without limitations lest it serve as an opportunity to levy blackmail under legal sanction.

Judge Van Swearingen quoted the case of Dewey versus the Great Lakes Coal Co.; we do not like that decision and hope eventually it may be proved to be bad law. It happened that substantial justice was done when the court decided that Dewey could not prevent the coal company from using land without payment for the development of its coal mines in accordance with the wording of the deed which conveyed the coal with general mining rights and the right to use the surface for mining purposes.

To the layman the Great Lakes Coal Co. was wholly within its moral rights, as it certainly took up the land within reasonable time and before any marked increment of value had taken place, but the interpretation of the law even if correct was, we think, much to be regretted. The judge said that as there was no consideration to be paid when the land was used by the corporation, the right to the land was not contingent but was immediately vested in the coal company. The taking of the land was not a remote possibility, it was practically an accomplished fact from a legal standpoint from the moment the purchase deed was signed.

We consider that this matter was open to debate and we believe that the decision, even if perfect from the standpoint of established equity, is not in accord with public advantage. An option to use land without payment for a long period of years is no more sacred from the point of view of public advantage than the option to buy it at a price, regarded as fair at the time of contract. We cannot feel that there is not the remoteness or contingency in such a case as will make it come under the perpetuity doctrine. It is equally uncertain in both cases what part of the land will be taken for mining and when that portion will be taken. As for the consideration that the use to which reference has been made is for a period of years only and the purchase is not so limited, that is rendered of no importance by the fact that the rule is directed to remove the remoteness, not of the "cesser" or termination of the alienation of the land, but its commencement.

It seems to us that some time or other the Dewey precedent will be reversed or will be corrected by statute law. In fact, we believe that not only the right to buy, but the right to use and even the right to spoil might be placed under the rule in equity relating to perpetuities with decisions reaching back to 1616. Surely the threat to injure property should not perdure from century to century, making the land threatened worthless meanwhile. The vendor in most cases gets enough at the time of sale to cover every form of surface disturbance often many times over, and we have little interest in him and his querulous complaints, but the public should not be cumbered by the uncertain ownership of land.

The laws which entailed the estates of the wealthy in England have been unfortunate. They have prevented the selling of land and have hampered its use. How much more unfortunate will our laws be if they prevent the use of a large part of the lands of the community for building purposes. Many a nation has suffered from laws which were not indeed inequitable between *the contracting* parties but which were highly unjust to the nation as a whole, a hidden canker in the economy of the people.

⁂

The Second-Class, Mine Foreman's Certificate

In another column of this issue we print an interesting discussion of the handicap that attaches to the term "second-class," as applied to mine foreman's certificates. Our correspondent draws attention to the custom practiced in several mining states, of classifying the mines in the state as gaseous or nongaseous. The examination of candidates for mine foreman's certificate, in each of these classes, is made to conform to the particular conditions in those mines. The certificates granted to successful candidates, in respect to gaseous mines, are styled "first-class mine foreman's certificates"; while those relating to nongaseous mines are styled "second-class mine foreman's certificates."

While the terms *first-class and second-class* are intended to refer only to the classification of the mine, it is true, as is pointed out by our correspondent, that the term is too often taken as applying to the holder of the certificate; and he is, as a consequence, regarded as a "second-class" man. We heartily agree with our correspondent in the suggestion that this practice should be altered; and if there is to be any division styled "first-class" and "second-class, these terms should be used in reference to the capability of the candidate as determined by examination. The classification of the certificate as referring to gaseous and nongaseous mines should be designated by these terms only.

We hope that this matter will receive the attention that it deserves at the hands of state examining boards and state departments. It is not the first time that attention has been called to the same question by those who suffer from the error.

⁂

A Contract Violation

An all but universal trait of human character is the desire to see the under dog win. There exists, however, an equally potent sentiment which demands a fair fight. Throughout the long and bitter industrial struggle which has been waged in the Kanawha coal fields in West Virginia, the mine worker has been almost universally regarded as the under dog, and few indeed have been the tongues or pens bold enough to resist public sentiment and champion the operators or their cause.

When the officers of the United Mine Workers recently signed a contract with two companies, operating upon Paint Creek, "for and in consideration of" the "check-off," whereby the union is assured of a certain revenue each payday, to all appearances they knowingly and deliberately violated an already existing agreement with other operators in the same region. Furthermore, this existing contract had been concluded with those, who, if not in actual sympathy with the organization and its motives, were at least willing to take equal chances for returns upon their investment with others in the same field when assured in all candor and upon the written agreement of the union that it would "enter into no contract with any other operator in the Kanawha district carrying different terms or conditions to those provided for herein."

However lightly the leaders of the United Mine Workers may regard the integrity of the organization they represent, they will sooner or later be made to realize that the union is primarily a commercial enterprise. From the business standpoint, the first duty of every seller of any commodity, be that commodity steel, oil, coal, labor or whatnot, is to fulfil all business obligations to the satisfaction of the customer, to give him the full value of 100c. for every dollar which he expends—otherwise no customer will long continue to make contracts or spend dollars.

⁂

Much interest now attaches to the question of concrete overcasts. In this connection it is well to remember that the cost of such overcasts can be greatly reduced by the use of reinforcement. Well screened tough coal can be economically used in place of crushed stone in places where the roof pressure or the danger from fire is not great. If, however, the coal is not well screened, too much fuel dust is apt to be present, thus necessitating the use of a large amount of cement, without any corresponding improvement in the strength of the concrete.

Relation between Railroad and Shipper

By A. L. H. Street

SYNOPSIS—A railroad need not meet the peakload requirements in transportation. Before making a demand for shipment, the shipper would do well to make tender of freight charges. A carrier cannot be compelled to accept freight from a private siding unless it has so contracted. Damages may be punitive if malice can be proved.

⁂

As a general rule, a railroad company is bound to furnish reasonable and ordinary facilities for transportation, but need not provide in advance for extraordinary occasions or an unusual influx of freight (18 Illinois Supreme Court Reports 488). Or, as decided by the Nebraska Supreme Court, the company must furnish cars necessary to transport freight offered it, but when it has provided itself with the equipment necessary for that purpose in the usual course of business, despite the fact that at certain seasons more cars are needed than at others, it has fulfilled its duty, and will not be required to meet unusual demands for cars (99 Northwestern Reporter 309).

In an Arkansas case, growing out of a carrier's refusal to furnish cars for coal shipments, it was held by the Supreme Court of that state that while a railway company must provide cars for normal conditions of its traffic, unless it has reason to foresee other conditions, it is not required, during a temporary abnormal situation, to furnish a car for every one that is sent off its line in fulfillment of previously made contracts, though cars wholly beyond its control are the same as if not owned by it (120 Southwestern Reporter 380).

The Kentucky Court of Appeals has excused a railroad company's refusal to furnish cars to move coal for a shipper in a case where a strike at the mines compelled it to use its coal-hauling equipment to obtain a fuel supply for its locomotives, etc., from more distant fields (35 Southwestern Reporter 626). But it has been decided that a railway company's action in reducing the wages of its employees, causing a strike which suspended operation of trains, did not make it liable for damages resulting from its refusal to receive a shipment. (65 Indiana Supreme Court Reports 188).

Prepayment and Shipping Rights

The fact that a shipper owes a carrier charges for previous shipments does not justify the latter in refusing to receive further consignments (4 Kentucky Law Reporter 730). But the carrier is entitled to demand prepayment of charges, though failure to tender such prepayment does not excuse refusal to receive freight for transportation unless prepayment is demanded (54 Illinois Supreme Court Reports 88). The Vermont Supreme Court has held, however, that refusal of a carrier to transport coal did not, in the absence of actual tender of freight charges, amount to a waiver of such tender, so as to subject the carrier to liability for loss of business on account of such refusal (30 Atlantic Reporter 41). It thus appears that, in order to preserve a right of action for a carrier's refusal to afford shipping facilities, it is safer to tender prepayment of the freight charges.

There is a federal-court decision to the effect that a railroad company was not entitled to enforce, as a condition precedent to the receipt of a coal shipment from canal boats at the company's dock, a requirement that the master of the boats employ shovelers designated by the company, at a price fixed by it (Federal Case No. 14,010).

Law Relating to Sidetracks

A carrier cannot be compelled to receive freight on a private switch track, unless it has contracted to do so (134 Federal Reporter 64). When it has designated a siding as the place at which it will receive coal for transportation, not in an unreasonable place, a railway company cannot be compelled by the shipper to receive shipments at another siding where merchandise other than coal is received, though the latter place may be more easily accessible to the shipper (129 Federal Reporter 753). But under the statute in force in West Virginia requiring carriers to make reasonable provisions to carry coal and coke, a railway company may be required to construct a sidetrack and switch wherever the same may be necessary (64 Southeastern Reporter 630). A railroad company having a newly constructed line through a locality underlaid with coal, by permitting owners of mines to load cars from wagons on its sidetracks at two small stations for several months, did not give them a vested right to continue that practice, nor forfeit the right to change the regulation when a change became reasonably necessary to faciliate the operation of trains and the handling of other freight (125 Federal Reporter 445).

Damages, Punitive and Actual

As a general rule, the damages recoverable against a railway company for refusing to receive a shipment are measured by the difference between the value of the property offered for shipment at the place where tendered for transportation and at the proposed destination, less freight charges (22 Hun 533 [New York]). Punitive, as well as actual, damages may be assessed if it is established by the complaining shipper that the refusal was induced by ill-will or willful disregard of his rights (7 Southeastern Reporter 493). In Kentucky, the Court of Appeals has held that where a railroad company failed to furnish the owners of a mine with cars, they could recover the difference between the value of the coal offered for carriage at the mines and at the proposed destination (13 Kentucky Law Reporter 832).

But a dealer cannot recover damages for a carrier's refusal to transport coal, arising from his contract to buy the coal, if the quantity which he could require the seller to deliver was optional with the latter, and it does not appear that the dealer made any contracts for resale that caused him loss; but as to another agreement binding the seller to deliver a specified quantity, the dealer can recover the enhanced cost of delivering the coal under contracts for resale made on the strength of that agreement (135 Southwestern Reporter 768). An Illinois statute making a railway company liable in treble damages for refusal to furnish cars to carry freight has been held not to bind a company to furnish cars for coal not yet mined (19 Illinois Appellate Court Reports 141).

SOCIOLOGICAL DEPARTMENT

"The First-Aid Muddle" Answered

By W. S. Rountree, M. D.*

In the May 17 issue, I note in the Sociological Department an article headed "The First-Aid Muddle," signed "By a Physician," which is an unjust and unwarranted attack upon the American Mine Safety Association, written by a person ignorant of the facts or else intentionally misrepresenting them. Ordinarily an anonymous article deserves no recognition, but since Coal Age has seen fit to publish the above mentioned article, as a member of the Executive Committee of the American Mine Safety Association, I am writing a brief statement of what is being done by that body to work out a uniform course in first aid to the injured.

All workers in the first-aid movement fully realize the importance and necessity of uniform standards and of forming a central organization, and it was with this end in view that the National Mine Rescue and First-Aid Meeting was held in Pitsburgh, 1911, and a conference on first-aid called by the U. S. Bureau of Mines at Pittsburgh on Sept. 25, 1912.

All great movements must have a beginning and the outcome of these meetings was the organizing of the American Mine Safety Association, the primary objects of which are not only to standardize first aid, but mine-safety and rescue methods also, and to create a central organization for carrying on the work.

The standardization of first-aid rules was referred by the conference to a committee of about two dozen surgeons, of which Dr. A. F. Knoefel is chairman. It is expected that this body will report back at the next annual meeting to the full committee of surgeons composing the association.

Both Lay and Medical Men in the Executive Council

The Executive Committee of the American Mine Safety Association which is charged with the duty of perfecting the rules for standardization as well as with the forming of a central organization is composed of the following members:

H. M. Wilson, chairman; U. S. Bureau of Mines, Pittsburgh, Penn.; John P. Reese, vice-chairman, Superior Coal Co., Gillespie, Ill.; Dr. W. S. Rountree, Tennessee Coal, Iron & Ry. Co., Birmingham, Ala.; Dr. A. F. Knoefel, Vandalia Coal Co., Terre Haute, Ind.; Dr. G. H. Halberstadt, Philadelphia & Reading Coal & Iron Co., Pottsville, Penn.; Austin King, Frick Coal & Coke Co., Scottdale, Penn.; G. H. Hawes, Oliver Iron Mining Co., Duluth, Minn.; E. H. Weitzel, Colorado Fuel & Iron Co., Pueblo, Colo.; R. A. Phillips, Delaware, Lackawanna & Western R.R. Co., Coal Department, Scranton, Penn.; C. S. Stevenson, secretary, Bureau of Mines, Pittsburgh, Penn.

Looking over the above list, it will be seen that practical mining men, as well as surgeons, were placed on this committee. The purpose of this was to obtain the best results on all the problems to be submitted and it will be readily conceded after reading the considerations here following that in appointing such a widely representative body of men, a wise decision was made insofar as first aid is concerned. As a rule, the work of the surgeon is done on the outside of the mines, while first-aid men do their work underground. Therefore, engineers and miners are those best prepared to give practical information regarding accidents and they greatly assist the surgeon in making suggestions as to the manner in which to conduct first-aid work within the mines. It is expected that when the executive and special committees meet next September that they will go over the report jointly and make suggestions, so that the first-aid work can be standardized from all viewpoints.

The noted surgeons of this country always specialize in some lines of work; so far few of them, outside the army and navy, have made a special study of first aid; in fact, this movement is still in its infancy and has developed no special leader of great fame. A man must work his way slowly to the heights.

Sylvester Versus Schaefer

The schedule of discounts is framed only temporarily, and experience will develop what changes are needed. Both the Sylvester and Schaefer methods of artificial respiration have been adopted for the reason that when one is impracticable, the other can replace it. For instance, when injuries to the arms or back are involved the Schaefer method is used—otherwise the Sylvester method may be employed; hence both methods must be taught.

In all surgery, aseptic treatment is the first and foremost necessity, standing preëminently ahead of all other needs, for without it there is no certainty of success in any treatment, especially when infection already exists. In such cases it is more vital than ever, for to add infection to infection would be a double crime.

It is beyond question that first aid should be standardized but, that it should be done wholly by a body of scientific medical men is not feasible for the reason that first aid is a necessity more practical than scientific, the scientific requirements having to be conformed to the practical surroundings; therefore, surgeons, even the most noted, must base all first-aid methods in mines, upon surrounding underground conditions, which are to be learned through the suggestions and information furnished by engineers and practical miners. Thus it is wise to include such men in the Executive Committee.

No jealousy and personal animosity should exist in the work of establishing a central organization and in adopting standard rules to be used in the mines, furnaces, factories and in fact all walks of life. First aid is a work of humanity, and not of personal grievances and should not be hampered by professional ethics and scientific methods. It is too big an undertaking to be held in check by individual narrowness. It is a work where surgeons, mine owners, engineers and miners should get together for the sake of safety and protection of life.

New Frick Developments

The Union Supply Co., having stores at all the H. C. Frick Coke Co.'s plants, has recently contracted with the Nicola Building Co., of Pittsburgh, Penn., for the erection of two new store buildings, to be erected at Leith and at Phillips, to take the place of the one recently destroyed by fire.

Under directions from Superintendent John Lynch, of Uniontown, Penn., experiments have been conducted for some time past with soda-water fountains and ice-cream parlors. Superintendent Lynch states that they have been a decided success, a great accommodation to the people at the plants, giving them the same advantages possessed by the residents in the larger towns surrounding. The new stores will both be fitted up with these departments. A feature of the equipment in these stores will be the installation of what is designed as an absolutely flyproof meat department, with refrigerating counters, several of which are now in use at various stores.

A new swimming pool, illuminated at night, has been installed at Footedale, another operation of the same company. Another is under construction or already completed at the Redstone plant.

DISCUSSION BY READERS

The Second-Class, Mine-Foreman's Certificate

All states that grant certificates of competency to candidates for the position of mine foreman invariably require a certain number of years' experience in a gaseous mine, as a prerequisite to the granting of a first-class certificate. Lacking this experience, though frequently excelling in other particulars, the applicant can only obtain a second-class certificate.

My purpose in writing is to draw attention to what may be called the psychological effect of the word "second class," as applied to a mine-foreman's certificate. While it is quite generally understood that the holder of a second-class certificate is eligible to the position of mine foreman in any mine not generating explosive gas, the general effect of the term on most mine managers is distinctly observable.

In many of the more important coal fields of the United States, little or no explosive gas is generated, yet these fields produce good men, who are well versed in both the theory and practice of mining and who are competent to fill the more lucrative and responsible position of mine foreman. I believe I am safe in the assertion that, as a rule, the man holding the second-class certificate is better equipped for the position of mine foreman in a nongaseous mine than is the man holding a first-class certificate; and yet the holder of a first-class certificate is often given the preference in respect to a position in a nongaseous mine.

The fact is not generally taken into consideration by the manager, that the holder of the second-class certificate is better acquainted with the conditions in a nongaseous mine than is the holder of a first-class certificate; because the former has obtained all of his experience in mines of that particular type. He knows or should know the methods and practices best adapted to the safe and economical extraction of the coal, in such mines, better than the holder of a first-class certificate, who has obtained his experience, perhaps, in the anthracite mines of Pennsylvania or in the large gaseous mines of the bituminous region.

Since the present method of granting certificates grades all applicants receiving the required percentage mark in the examination, on an equal footing, I want to suggest that it would, no doubt, prove beneficial to grant "first-class gaseous" and "first-class nongaseous" certificates to applicants receiving over 90 per cent. in both classes, in examination. Applicants receiving less than 90 and above, say 75 per cent., could then be granted "second-class gaseous" and "second-class nongaseous" certificates. This would relieve many good men of the handicap of being known as second-class men, or as holding second-class certificates when their capabilities are fully equal to those who hold first-class certificates.

Safety Lamps and the Eyesight

I have been interested in the recent discussion of this question and particularly in the remarks of Mine Inspector W. L. Morgan, Coal Age, July 12, p. 63. Mr. Morgan refers to the examination of the eyes of firebosses at the Globe Colliery, Wales, England. As I worked in some of the worst gaseous mines in South Wales and Bristol, I am well acquainted with the conditions that existed in the Globe Colliery and am convinced that the eyesight of the miners in that colliery was injured more by the mine gases and firedamp to which they were exposed than by the safety lamps they used.

I want to suggest that a fairer test to determine if the constant use of the safety lamp has any tendency to injure the eyesight would be to select, say 100 miners of 50 years of age, from a gaseous mine; and compare their average eyesight with that of the same number of miners taken from mines entirely free from gas. I think that such a test would prove that the safety lamp produced no bad effect on the eyes when the lamp is properly used.

Much depends on the way a fireboss carries his lamp. This is the first thing to be learned; and, until then, no man has a right to be a fireboss. He should not hold his lamp in such a way as to expose his eyes to the heat and gases from the lamp. In my opinion, the experience of men who have used the safety lamp continuously for a number of years, without receiving any appreciable injury to the eyesight, proves more than the limited knowledge to be gained by an examination, in a single district, by oculists and physicians.

⁂

Advantage of Compressive Ventilation

I was glad to notice the reference made by Robert McCune, to the advantage of compressive ventilation in mines, in his article, "The Air Current and Mine Explosions," Coal Age, July 5, p. 25. In reciting his experience and observations in regard to the effect of the exhaust and compressive systems of mine ventilation, to increase or decrease the explosive conditions in a mine, Mr. McCune has drawn attention to an important factor, both in respect to preventing mine explosions and keeping mines in a sanitary condition.

In the compressive system of ventilation, the mine is ventilated under a pressure greater than that of the atmosphere; while, in the exhaustive system of ventilation, the mine is ventilated under a pressure less than that of the atmosphere. To make this matter more clear, assume the atmospheric pressure (sea level) is 14.7 lb. per sq.in. or 2116.8 lb. per sq.ft. If the mine water-gage taken in the fan drift is 2 in., the ventilating pressure is $2 \times 5.2 = 10.4$ lb. per sq.ft., at this point. Then, assuming the efficiency of the fan is 60 per cent., the total pressure producing ventilation or circulating the air through the fan and the mine is 10.4 ÷ 0.60 = 17.3 lb. per sq. ft.

When the fan is blowing the air through the mine (compressive system) the total pressure on the intake air is 2116.8 + 17.3 = 2134.1 lb. per sq.ft. On the other hand, when the fan is exhausting the air from the mine, the pressure on the intake is the atmospheric pressure (2116.8 lb. per sq. ft.) and the pressure on the air in the fan drift (return airway) is 2116.8 — 17.3 = 2099.5 lb. per sq.ft. This shows a difference in the mine pressure, in the two cases, of 34.6 lb. per sq.ft., in favor of the compressive system. In my judgment, this difference in pressure is exerted to keep back much of the poisonous and inflammable gases that would otherwise enter the mine, and is one point in favor of the compressive system of ventilation.

REES H. BEDDOW,
State Mine Inspector.

Gallup, N. Mex.

⁂

Shooting Mine Timber

I was interested in the article by Miner, COAL AGE, June 28, p. 1007, relating to the shooting of mine timber. I want to say that a better method is always to *draw* the timber, using for this purpose the Sylvester or other similar machine. I have had this machine for some time and consider it useful in many ways. No mine where posts are to be drawn is complete without it as a part of the equipment. The pulling strength of the machine is five tons; and unless proper precautions are taken, it will often break the chain.

Where there is a great weight on the post, or the latter is roof-bound, it is often necessary to weaken the post before attempting to draw the same. This must be done with caution, but can generally be accomplished by carefully splitting some from the cap-piece with a pick. Where the roof is loose or treacherous, however, this should not be attempted.

A good scheme in drawing a post is to so arrange the hook that the pull of the chain will be exerted on the side of the post, in such a manner as to turn it around when drawing. This will help very much to loosen the post from its hold in the roof. With the hook in front of the post, the chain exerts only a dead pull, and if the roof is heavy on the timber, it will often be difficult to start the post in this way.

It often happens that a post is nearly buried in the waste. In that case, it will be necessary, after loosening the head of the post, to slip the chain down and take another hold, in order to draw it out from the gob. If fastened at the middle the chain may break the post.

CHARLES WAINE.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

MULTIPLICATION

Multiplication is only a particular form of addition in which the numbers added together are all equal. Thus, instead of adding together five sevens, as follows:

$$7 + 7 + 7 + 7 + 7 = 35$$

since these figures are all the same, the operation is expressed more simply by the methods of multiplication. For example, in the above operation, seven is taken five times, which can be expressed thus,

$$5 \times 7 = 35$$

and is read

5 times 7 equals 35.

The same result is obtained by taking five, seven times. For example, by addition,

$$5 + 5 + 5 + 5 + 5 + 5 + 5 = 35$$

or, by multiplication,

$$7 \times 5 = 35.$$

It is important to observe that in adding or multiplying numbers, the order of the numbers is not important. The sign of multiplication is an oblique cross (×) and is read "times." It is written between numbers that are to be multiplied together. It is customary to memorize the multiplication of numbers up to 10; and these are known as the "multiplication tables." Instead of these tables we give below a simple chart, which shows at a glance the result of multiplying together any figure in the top row by any figure in the vertical column on the left. The product is found at the intersection of the corresponding column and row.

MULTIPLICATION CHART

	1	2	3	4	5	6	7	8	9	10
1	1	2	3	4	5	6	7	8	9	10
2	2	4	6	8	10	12	14	16	18	20
3	3	6	9	12	15	18	21	24	27	30
4	4	8	12	16	20	24	28	32	36	40
5	5	10	15	20	25	30	35	40	45	50
6	6	12	18	24	30	36	42	48	54	60
7	7	14	21	28	35	42	49	56	63	70
8	8	16	24	32	40	48	56	64	72	80
9	9	18	27	36	45	54	63	72	81	90
10	10	20	30	40	50	60	70	80	90	100

For example, to multiply 7 by 5, find the figure 7, in the top row, above the line, and follow down that column to the row corresponding to the figure 5, in the column on the extreme left. The number found (35) is the desired result.

The Coal Age Pocket Book

Multiplication of Larger Numbers—When numbers of two or more figures are to be multiplied, the one by the other, the second, called the "multiplier," is written under the first, called the "multiplicand," so that units stand under units, tens under tens, etc. Then proceed according to the following:

Rule—Beginning on the right, multiply each figure of the multiplicand by the units figure of the multiplier, in turn, and write the units figure of the resulting number under the figure multiplied. In each case, the tens figure, if any, must be added in as units, in the next following multiplication, till the last figure has been multiplied, when it is set down in its place as the final figure of that multiplication, which is called a "partial product."

In the same manner, now, multiply each figure of the multiplicand, again, by the second figure of the multiplier, in turn. But, in this case, the units figure of each resulting number must be written one place to the left of the figure multiplied, instead of under that figure. The tens figure, as before, is added in as units, in the next following multiplication, except the last when it is written as the final figure of that multiplication.

In the same manner, multiply, in turn, each figure of the multiplicand by each figure of the multiplier; but each time a new multiplier is taken the units figure must be written another place further to the left, the tens figure, if any, being added in as units, in the next following multiplication till the last.

When all the figures of the multiplier have been used the several results must be added together, as they stand, beginning on the right and following the rule for addition.

One or two examples will make the process clear.

```
 38,509 Multiplicand         1,603,950 Multiplicand
    175 Multiplier               7 098 Multiplier
 -------                   --------------
 192 545                      12 831 600
2 695 63                     144 355 50
3 850 9                    11 227 650
 -------                   --------------
6,739,075 Product          11,384,837,100 Product
```

As indicated here, the multiplicand is written above the multiplier, and the final result is called the "product." When a cipher occurs in the multiplicand there would be a corresponding cipher in each of the partial products, except for the tens figure that is carried forward from the multiplication of the preceding figure.

As appears in the example on the right above, when a cipher occurs in the multiplier there is no corresponding partial product and the next partial product is set forward two places to the left instead of one. Always the first figure of each partial product stands under the corresponding figure of the multiplier. The proof of multiplication is division. The product divided by either the multiplier or multiplicand gives the other.

INQUIRIES OF GENERAL INTEREST

The Mine Foreman's Certificate

Kindly inform me if a Red-Cross certificate will be of any assistance to a candidate, in the examination for certificate of competency to act as mine foreman.

FIREBOSS.

Gallitzin, Penn.

The examination for a Red-Cross certificate is held under the auspices of the First-Aid Department of the National Red Cross Society. This certificate would not be accepted by an examining board appointed by the state for the examination of candidates for certificates of competency to act as mine foreman. Every mine foreman's examining board is held responsible for its own work and is not authorized to accept certificates issued by another board.

⁂

Weight of Broken Coal

Kindly give the weight per cubic foot of broken coal in the New River district of West Virginia.

INQUIRER.

Beckley, W. Va.

The average specific gravity of the New River coal may be taken as, say 1.3, which would make the coal weigh in the solid 1.3 × 62.5 = 81.25 lb. per cu.ft. When broken into the common market sizes for domestic use (stove or chestnut) the broken material increases, in bulk, from 75 to 90 per cent.; or, say, 1 cu.ft. of solid coal will occupy when broken to market size about 1.8 cu.ft. of space; and the weight of the broken coal would then be, for New River coal 81.25 ÷ 1.8 = 45.14 lb. per cu.ft. This would make a ton occupy 2000 ÷ 45.14 = 44.3 cu.ft.

⁂

The Mine-Cave Problem

In the solution of the mine-cave problem, there must often be considered a combination of facts, circumstances and conditions bearing on the case and affecting the results. These pertain mostly to the detailed manner of working the underlying seam or seams. An inquiry that often interjects itself in the solution of such a problem is: To what extent is the explosive force of the powder used in blasting, in the mine, effective at the surface?

In the mining of anthracite coal, under ordinary conditions, what energy is exerted or what is the sum total of the blow struck by the explosion of, say 25 lb. of black powder, the force of the blow to be expressed in tons; assuming that the force of the blast, in the mine, was sufficient to dislodge, say 1.14 tons of coal per pound of powder. The coal dislodged was, of course, in the line of least resistance; but, assuming the coal still in position at the initial moment of the explosion of the powder, is the force exerted equally in all directions, against the top, sides and bottom of the seam and what is the energy of the blast?

What is the effect of this explosive force to produce vibration or jar in the strata overlying the seam of coal, and how can this effect be reasonably or practically measured? What is the thickness of the overlying strata necessary to nullify or reduce to a negligible quantity the jar or vibration produced by a blast? Or, again, suppose 25 lb. of powder are exploded in 25 separate blasts, at the same time; will the combined blow be equal to or greater than what would result from the discharge of the same weight of powder, in a single blast?

ENGINEER.

Scranton, Penn.

The energy exerted in the explosion of black blasting powder is commonly estimated as 360 ft.-tons; and the total energy developed in the explosion of 25 lb. of black blasting powder would be 25 × 360 = 9000 ft.-tons. This means that if the whole energy of the blast were to be exerted in one direction, it would be capable of lifting a weight of 9000 tons through a distance of 1 ft.

This, however, does not have much practical bearing on the question of ascertaining the effect of the explosion of this weight of powder to produce vibration at the surface. Neither does the fact that the explosive force is such as to dislodge 1.14 tons of coal per pound of powder, in any way, assist in answering the question.

The charge of powder exploded is the center of a radiating explosive force, which is therefore exerted in all directions from that center. The vibratory effect produced at the surface will depend on the nature of the strata overlying the charge and the depth of the charge below the surface. Some strata are elastic and readily transmit a vibratory motion, while other strata are dead and do not respond to vibration. Moreover, the physical character of the strata, as determined by such features as the joints, cleats, fault lines and uniform structure of the rock, influence largely the transmission of the vibratory shock caused by the blast.

The jar or shock due to a mine blast is often felt a great distance in one direction, while it is scarcely perceptible in other directions, owing to peculiar geological formations, in the strata, that facilitate the transmission of the shock. On this account, the problem of calculating the effect of a mine blast at the surface is not a possible one. The effect of such a blast can only be determined, practically, by observations made with a delicate instrument, called a tromometer, for determining earth tremors. For the same reason, it would be impossible to make any calculation for determining the thickness of the strata necessary to nullify the jar or vibration at the surface.

In regard to the last question, the combined blow of 25 simultaneous blasts, if the charges are not too far separated from each other, would probably exceed, in effect, the blow caused by the same weight of powder exploded in a single blast. The reason for this opinion is that the 25 blasts properly placed would have a greater effect to break the rock, and the explosive force would be distributed over a larger area.

EXAMINATION QUESTIONS

Miscellaneous Questions

(*Answered by Request*)

Ques.—What horsepower will be required to hoist 1500 tons of coal, in nine hours, from a shaft 575 ft. deep; making an allowance of 10 per cent. of the power for overcoming friction and $\frac{1}{3}$ of the time for delays?

Ans.—Allowing $\frac{1}{3}$ of the time for delays, leaves $\frac{2}{3} \times 9 = 6$ hr. for actual hoisting. Adding 10 per cent. for friction or multiplying by 1.10, the work performed is

$$\frac{1.10\,(1500 \times 2000)\,575}{6 \times 60} = 5{,}270{,}833 \textit{ ft.-lb. per min.}$$

Since 1 hp. is equivalent to 33,000 ft.-lb. per min., the horsepower required, in this case, is

$$\frac{5{,}270{,}833}{33{,}000} = \textit{say } 160 \textit{ hp.}$$

Ques.—A certain mine has an output of 1200 tons in nine hours, from a slope. The slope rises on a grade of 1 in 8, for 2400 ft. pitch distance. The velocity of the loaded cars is 8 miles per hr., and that of the empty cars 14 miles per hr. The time lost in dumping the cars and starting and stopping the trips is 2 min., for each round trip. The capacity of the mine cars is 6720 lb., and the weight 1000 lb., for each car; and the weight of the rope is 3.375 lb. per running foot. What horsepower will be required to do this work?

Ans.—The total working time is $9 \times 60 = 540$ min. If the grade has a rise of 1 ft. vertical height, in each 8 ft. of pitch distance, the total rise is $2400 \div 8 = 300$ ft. The velocity of the loaded cars is $(8 \times 5280) \div 60 = 704$ ft. per min. The velocity of the empty cars is $(14 \times 5280) \div 60 = 1232$ ft. per min. The time of hoisting a single trip of loaded cars is $2400 \div 704 = 3.41$ min. The time of lowering a trip of empty cars is $2400 \div 1232 = 1.95$ min. Allowing 2 min. for dumping cars and starting and stopping trips, the total time consumed in making one round trip is $3.41 + 1.95 + 2 = 7.36$, say $7\frac{1}{3}$ min. On this basis, 72 trips would consume $72 \times 7\frac{1}{3} = 528$ min. This would allow $540 - 528 = 12$ min., for unavoidable delays, during the day.

In order to hoist 1200 tons in 72 trips, the total load per trip is

$$\frac{1200 \times 2000}{72} = 33{,}333 \textit{ lb.}$$

Since each car carries 6720 lb. of coal, the number of cars per trip is $33{,}333 \div 6720 =$ say 5 cars. The weight hoisted each trip, including the weight of the coal, weight of cars and rope, is then $5(6720 + 1000) + 2400 \times 3.375 = 46{,}700$ lb.

Approximately, the gravity pull on the rope, due to the loaded trip, for a grade of 1 in 8, is one-eighth of the total weight of the load hoisted. Assuming a fair condition of the track and rolling stock, the friction pull may be taken as one-fortieth of the weight hoisted. On this basis, the gravity pull is $46{,}700 \div 8 = 5837.5$ lb., and the friction pull is $46{,}700 \div 40 = 1167.5$. This makes the total load on the rope $5837.5 + 1167.5 =$ say 7000 lb.

Now, assuming an unbalanced hoist, the power of the engine must be sufficient to produce a pull of 7000 lb., at a velocity of 704 ft. per min., which gives

$$\frac{7000 \times 704}{33{,}000} = \textit{say } 150 \textit{ hp.}$$

Ques.—How would **you treat** persons suffering from broken limbs, bruises and **cuts**? Explain fully.

Ans.—Treatment depends on the character of the injury. If a limb is broken, shock often results and must be treated. Place the patient in a safe position on his back with the head low. If vomiting occurs, turn the head to one side. If the victim is conscious, water may be given. If the clothing is to be removed, cut it off. Hold ammonia or smelling salts to the nose, if procurable. Examine for bleeding and if that is severe apply a tourniquet or compress. Keep the patient warm by the application of blankets, coats, hot-water bottles, hot bricks, hot cloths, etc. Rub the legs and arms toward the body, under covers, to quicken the circulation.

If it is a simple fracture, adjust the limb gently and apply suitable splints, taking care that the points of the broken bones do not pierce the flesh. If the fracture is compound, cut away the clothing. Use every precaution to prevent any movement of the sharp ends of bones. Do not touch the wound with the fingers. If a bone protrudes, do not attempt to restore it to its place. Cover the wound with a surgically clean compress and hold the bones in place with padded splints.

Bruises if slight need no treatment; but if severe very hot or very cold water, ice, arnica, or witch-hazel should be applied. If arnica or witch-hazel is used, saturate a cloth with the liquid and apply to the bruise. If possible, keep the injured part elevated, thus diminishing the flow of blood in that part. Cuts, if bleeding is not profuse, may be left for the doctor to treat.

Ques.—What is the highest percentage of explosive gas in which you deem it safe to carry on blasting operations in the mine?

Ans.—This will depend on the nature of the coal with respct to its inflammability and the fineness of the dust; the thickness of the seam and character of the roof and floor, as determining the size of the openings or volume of the workings; the method of mining the coal and working the mine; the velocity of the air current and its gaseous condition, or the kind and proportion of gases present in the air; and the kind of explosives used in blasting.

Under ordinary mining conditions, the blasting of anthracite coal is considered safe in the presence of 2 or even 2.5 per cent. of marsh gas; while, in many bituminous mines, especially if the coal is friable and inflammable, less than 1 per cent. of gas may make blasting dangerous. In either case, the danger is more imminent in contracted workings and thin seams.

COAL AND COKE NEWS

Washington, D. C.

It is now practically a certainty that within a comparatively short time, the Interstate Commerce Commission will hand down a decision in the anthracite coal cases which have been pending before it for some time past. The belief of coal men who have been following the situation closely and carefully is that the decision in these cases will order a material reduction in the charge for transporting anthracite coal from the mines to the seaboard.

It is being noted that in all recent cases in which the commission has passed upon rates affecting commodities which move in bulk or in which the traffic may be expected to grow as the density in population increases such as lumber, coal and the like it has been directed that rates shall be cut materially below their present level. The commission has undoubtedly accepted a general policy of reducing rates upon these bulky commodities, and of placing the burden of such advances as it may deem wise upon the more highly valued articles which move in smaller quantities and at much higher charges.

Another feature of the situation which has strengthened the belief that the cuts just indicated will be made is the fact that the Commission has refused to increase the bituminous coal rates whenever they have been presented to it for adjudication. The bituminous rates, taking them upon a basis of mileage equality, are far below the level of the anthracite rates, and it seems reasonable to suppose that the commission will endeavor to produce greater equality between them by lowering the charges on anthracite, inasmuch as it has refused to raise those on bituminous.

Dissatisfaction is Manifested

Further statements issued by the West Virginia Mining Association with reference to the situation in the West Virginia district indicate that strong dissatisfaction exists with the tactics that have been followed by the United Mine Workers especially in view of the violation of the agreement between the operators of the Kanawha district and the mine workers. It appears that that contract included the following language:

> It is understood that during the life of this agreement the United Mine Workers of America shall enter into no contract with any other operator in the Kanawha District carrying different terms or conditions to hose provided for herein.

Although this agreement does not expire till Mar. 31, 1914, the contract signed with the two Paint Creek companies July 15 provides for a material reduction in prices, as follows:

> For splint machine-mined coal in rooms, the price is reduced from 32½ cents, which other operators in the district are required to pay for work on Kanawha Thick Vein No. 1 and 2 seams, to 29 cents; for splint machine-mined coal in entries the reduction is from 37 to 29 cents. Other reductions are as follows: Splint pick-mined coal from 26 to 25 cents; gas machine-mined coal in entries from 31 to 25 cents; gas pick-mined coal from 49 to 45 cents; airways and entries, splint coal, from 37 to 29 cents; airways and entries gas coal from 31 to 25 cents.

It is to be noted that the contract given the two Paint Creek companies provide even lower rates than the companies offered to pay when the long-drawn-out strike was threatened. The companies offered to pay the old scale, based on a rate of 47½ cents for pick-mining gas coal. The union insisted on an advance of 3 cents, run-of-mine, but compromised on an advance of 1½ cents, making the rate 49 cents, which the Kanawha Valley operators agreed to pay, and have paid up to the present, while the Paint Creek operators refused to accede the advance. Now, after a strike lasting 16 months, these two companies actually get a contract at a lower rate than they were willing to pay in the first place, while the operators who sacrificed their profits to purchase peace have, as they believe, been betrayed.

Reparation Awarded

The Interstate Commerce Commission has awarded reparation to the Marian Coal Co. against the Delaware, Lackawanna & Western R.R. Co. on account of unreasonable rates charged for the transportation of anthracite coal from Taylor, Penn., to Hoboken, N. J. An interesting point is raised in this decision in connection with the question "was the receipt of the original complaint against the rates an official filing of the claim with the Commission " The Commission says on this subject:

> "We are of the opinion that it was. There is no question, as we understand it, that the complaint first received did contain a prayer for reparation to be paid to complainant based upon reasonable rates to be fixed by the Commission. There has been no intervention nor complaint filed by any other party. Neither the statute nor the rules of the Commission prescribe what act or acts shall constitute the filing of a claim for reparation with the Commission. The letter which accompanied the complaint is marked as received by the Commission, Aug. 15, 1910. We hold that on that date the claim was filed, and that shipments on which reparation is asked made within two years prior thereto are not barred.'

Senator Smoot on Free Coal

Senator Smoot in his attack upon the Democratic tariff bill during the past week devoted some special attention to the fact that coal was to be free under the tariff, and asserted that this would mean great injustice to the mines located in the Northwestern states.

HARRISBURG, PENN.

The Attorney General of Pennsylvania has ruled that the Auditor General was without legal justification in his attempted holdup of $17,000,000 of appropriations to important state departments, which included the department of mines.

On July 22, Auditor General Powell served notice on eighteen departments and commissions of the state that he would refuse to approve any warrants of departments of the state government created since the adoption of the constitution of 1874, until he was satisfied on two legal questions.

> "First, whether they are legally a part of the executive branch of the state government, not having been mentioned in the constitution, which involves the question whether the legislature can create departments by statute.
>
> "Second, what are the ordinary expenses of the executive branch of the government, which involves, the question of roads, maintenance of state police, etc."

No more drastic action has ever been taken since the office was created, and if the Auditor General does not accept the opinion of the Attorney General, the effects of his action may be far reaching, as the Supreme Court cannot be reached, except after an action is begun in the Dauphin County Court. The Supreme Court will not meet until the late fall. Should this be the case, it would paralyze many of the most important departments of the state, such as the Mines, Health, Highways, Constabulary, etc.

It is the general opinion that Mr. Powell will take up one or two departments and make a test case, so as not to hold up the state government, as he is being severely criticized throughout the state for his narrow actions.

The Public Service Bill

On July 26 the governor approved the public-service bill as it came from conference in the legislature. It is expected that the governor will name the seven public-service commissioners promptly as the commission law is now in effect. The old railway commission is legislated out of existence.

The powers of the commission will be far reaching, as this body will have authority to regulate the public service of all railroads, trolleys, etc., and will also have authority over rates, extensions and the like.

Provision is made for court appeal from decisions of the commission, and it may hold its hearings any place in the state. The commissioners will receive $10,000 a year and members serve for ten years.

Appropriations Are Slashed

The governor of Pennsylvania has announced that he has vetoed the appropriation of $150,000 for the mine fire under the city of Carbondale, Lackawanna County, and likewise the appropriation of $25,000 for the commission to investigate mine accidents in the anthracite region. Also the appropriation of $50,000 for the coöperation of the state in the establishment of a mining-experiment station for investigations with a view of better safeguarding the lives of miners, and for the greater efficiency of mining has been reduced to $25,000.

PENNSYLVANIA

Anthracite

Pottsville—Several hundred miners of the Glendower Colliery of the Philadelphia and Reading Coal and Iron Co. will have to be vaccinated at once, and the doctors are endeavoring to round up all the miners who attended a picnic two weeks ago, and all the persons who bought milk from the dairy, where the man who did the milking had smallpox. Three cases of the deadly disease have broken out among the men of this colliery.

Scranton—On July 23, fifteen hundred miners of the Sloan colliery operated by the Delaware, Lackawanna and Western R.R. Co., were thrown idle when the workings were discovered to be flooded. A sub-surface settling broke water mains, causing so much damage that the mine will probably be idle for a month.

Pittston—Several properties along the Erie tracks have been considerably damaged by mine caves. Some days ago the officials of the company notified the people to be on the lookout for caves. It is thought the heavy rains caused the subsidence of the earth, but the damage done is due to the workings of the old Butler mine and the robbing of pillars.

Wilkes-Barre—By an opinion handed down by the Courts of Luzerne County, the Delaware and Hudson Co. will be compelled to pay $33,634 with interest from Oct. 1, 1912, and must also render an accounting for all coal mined since July 16, 1878 that would have passed through a ¾-in. square mesh and over a ⅝-in. square mesh screen.

The suit is one brought by the Girard Trust Co. and others, trustee, heirs, and executors of the estate of the late L. D. Shoemaker, and concerned the provisions of a lease for coal land worked by the D. & H. Co., and especially over payments for certain smaller sizes of coal. The plaintiffs charged that the company mined a considerable quantity of small sized coal on which it paid no royalty, and asked for an accounting of this coal and payment therefor.

Bituminous

Pittsburgh—Damages of $50,000 are demanded in a suit filed by Marion Hale and her six children against the United Coal Co. The damages are claimed because of the death of Alfred Hale, husband of the plaintiff, who was killed at a coal mine of the defendant at Milesville on Apr. 2. 1913.

Fairbanks—J. W. Paul and Charles Enzian, connected with the National Bureau of Mines made an investigation on July 22 of the fire which is burning in the Solon mine of the Prospect Coal and Coke Co. Samples of the gas have been taken, and after analyzing these, methods will be suggested as to fighting the fire.

Although the fire has been raging for several weeks, it does not endanger the working portion of the mine. It is the opinion of experts that this gob fire will continue for some time to come and it is possible that it will burn itself out.

Waynesburg—A suit in ejectment was filed in the local court July 24, against W. Harry Brown, the coal operator of Pittsburgh, by Charles W. Weltner and others. The suit involves coal property, title to which is held by Brown.

The plaintiffs claim that last January, Brown purchased from J. V. Thompson of Uniontown a tract of coal land, about 1700 acres in all, at $1000 per acre. It was alleged in the petition that 99 acres of this property Thompson did not own and therefore Brown does not possess legal title thereto.

Uniontown—Suit for $20,000 was entered, July 25, against the Sunshine Coal and Coke Co. by Albert Cruse a miner, who alleges that he was permanently injured by an accident in the mine at Lynn Station on Feb. 27 of this year.

All of the coal and mining rights of the W. A. Stone Coal and Coke Co., of Uniontown have been transferred to the W. A. Stone Fuel Co. of the same place. The consideration named was $147,950.

WEST VIRGINIA

Charleston—On July 24 four men were killed in a battle between striking miners and watchmen employed by the Wake Forest Coal Co. on Cabin Creek. Since the shooting in this region a few weeks ago the coal operators have had watchmen scout the hillside before the non-union miners enter or leave the mine. While performing this duty two of the watchmen at the above named mine were fired upon.

Huntington — Twenty-seven thousand acres of Island Creek coal land in Logan County have been leased for immediate development by John Laing from Cole & Crane, Cincinnati capitalists and timbermen. This tract is located in one of the finest coal fields of West Virginia and the operation which is soon to begn will involve millions of dollars and it is expected result in an output of approximately 5,000,000 tons annually.

MARYLAND

Cumberland—Two hundred miners of the Small Vein mine No. 15, George's Creek Coal Co. at Lonaconing walked out on July 25 because of alleged short weight.

KENTUCKY

Louisville—The Nebo Coal Co., recently organized in Louisville to operate the famous Nebo vein in Western Kentucky, is busy getting things in shape at the mines for the coming season's business. Considerable new machinery is being purchased and installed, and much work was found necessary within the mine itself, where falls and other obstructions must be removed before work can be begun in getting out coal. For the present the company will open no new operations, contenting itself with placing those now open in good shape.

Whitesburg—J. B. Hoge and associates, of Whitesburg, have purchased of Archie Crane, of Sergeant, Ky., a tract of coal and timber land, and plan its immediate development.

Lexington—The Eastern Kentucky Land Corporation, recently incorporated at Lexington, Ky., with a capital stock of $100,000, has acquired 5000 acres of coal lands in Owsley and Perry counties., on Buffalo and Squabble Creek. The property will be held by the company, and leased to operating concerns, as the company does not intend itself to be engaged in either coal or timber operations.

OHIO

Columbus—The Ohio Mine Commission appointed by Governor Cox to investigate the method of payment for coal mined in Ohio started out on its investigation last week. The first place visited was that of Jackson and the commission then moved to Ironton to investigate the Pine Grove mines at that place. The commission has made up an itinerary consisting of all the principal fields of the state.

East Liverpool—The West Point Coal Co. which has a large coal area and several producing mines near this place has leased its holdings to the Kirk-Dunn Coal Co., of Cleveland of which W. H. Dunn, of Salem, Ohio is manager. The new company will improve the equipment of the mine and will increase its capacity to 600 tons daily.

McLuney—The Zanesville Coal Co. owner of the Keystone mine No. 2 at McLuney, Perry County, Ohio has abandoned the mine and moved all of the equipment to mine No. 1 nearby. All of the coal land owned by the company that can be reached through this entrance has been mined.

INDIANA

Augusta—The Hartwell coal mining property situated near Augusta has been sold to a syndicate of St. Louis capitalists, the reported price being $90,000. These mines have been idle for the past three years, the property being in litigation. When in operation it employed over 400 miners and was among the best equipped mines in the country. The purchasers expect to open the mines at once, and operate them to their fullest capacity.

ILLINOIS

Nashville—The Nicholson coal mine which has been in the hands of a receiver for several months was sold on July 21 to Clarence Dallam, of Louisville, for $2000. Mr. Dallam will continue to run the mine until the court approves of the sale. The total indebtedness of the property amounts to $55,000.

Lincoln—Charged with defrauding the Lincoln Coal Mining Co. and its employees by falsifying weight, William Dugan, John and Richard Roe will face the charge of conspiracy against the company and the United Mine Workers. It is alleged that Dugan, the check weighman of the mine conspired with others in manipulating the weights and divided the profits. The amount said to be involved is $18,000.

NORTH DAKOTA

Kenmare—B. A. Bertelson reports that he has struck a 6-ft. bed of coal of unusual hardness at a depth of 174 ft. in his Spiral mine. In going down to this depth he passed through other seams and is certain that he has struck the deepest-lying lignite deposit and one which is not now being worked.

ARKANSAS

Hartford—State mine inspector, Thomas H. Shaw on July 21 closed mine No. 4 of the Central Coal & Coke Co. at Hartford until refuge holes could be cut in the mine tunnels as required by the state mining laws. Refuge holes are being rapidly cut, and the mine will be permitted to resume operations as soon as this work is completed.

FOREIGN NEWS

Geilenkirchen, Germany—On July 23 the bodies of 14 coal miners were found dead in a pit where they were entombed the day before by a fall of coal. It appears that a large area above the mine caved in as the result of extremely heavy rainfall.

Montevidéo, Uruguay—Money is not being stinted in Uruguay in the effort that the government is making in prospecting for coal. Coal seams outcrop in many places in the republic but surface indications in most of them are not promising. Extensive development, however is being carried on at several points, notably at Canadá de los Burros, in the Department of Cerro Largo. The work is being done under the direction of the National Institute of Geology, which is directed by Americans. The high price of coal in Uruguay handicaps industries of many kinds, and the government has shown great energy in attempting to secure cheaper fuel.

Panama—Improvements at the yards of the Caledonian Collieries Ltd., the largest shippers of Australian coal to South America, in Valparaiso, Santiago, Antofagasta and Callao, leads to the belief that this company is preparing to fight for this market. It is generally predicted that American coal will supplant Australian on the west coast as soon as the Panama canal is opened.

PERSONALS

F. R. Wadleigh, consulting fuel engineer, sailed on the "Celtic," July 23, for a two months' trip on professional business at different points in Europe.

State Senator William Green, of Ohio has been appointed International Secretary-Treasurer of the United Mine Workers of America to fill a vacancy created by the resignation of Edwin Perry, of Oskaloosa, Iowa.

Following a service of several years as superintendent of the landings of the Monongahela River Consolidated Coal & Coke Co. east of Louisville, Ky. George Dustin has resigned and will accept a position with a sand company in New Orleans.

J. W. Powell, superintendent and mine manager of the Columbia Coal & Coke Co., has severed his connection with that company owing to the indefinite suspension of operations at their mines. He is now visiting in the East among the anthracite mines.

F. C. Cornet, mining engineer, has given up his office at Charleston, W. Va., to accept the position of general manager of the Elkhorn Gas, Coal & Mining Co., at Melvin, Ky. This company has just been incorporated, in West Virginia, by Messrs. Schlesinger & Weeks, of Milwaukee, Wis. The new company replaces the old Beaver Creek Fuel Co.

William Grelley, well known in eastern Ohio and West Virginia coal regions has resigned his position with the West Virginia Pittsburgh Coal Co. at Wellsburg to take charge of the Buckeye mine near Flushing, Ohio, as superintendent. John T. McMahon, formerly with the United States Coal Co. at Bradley, Ohio has succeeded him with the West Virginia Pittsburgh Co.

A number of changes have recently been made in the personnel of the Davis Coal & Coke Co. Lee Ott, general superintendent, has resigned to become a member of the Board of Control of the state of Pennsylvania. His successor has not yet been named. W. W. Brewer, of the Weaver plant has been made superintendent of the Pierce plant to succeed Charles Connor resigned. H. B. Harrison, of the Elks Garden plant is made superintendent of the Weaver operations, while J. E. Ott succeeds Mr. Harrison as superintendent at Elks Garden. Harry Sharp formerly with the Youghiogheny Coal Co. has been appointed assistant to the general superintendent.

OBITUARY

H. A. Nelson, for thirty years connected with the Pleasant Valley Coal Co., Utah Fuel Co. and Wasatch Store Co., died at his home 969 East South Temple St., Salt Lake City Utah early July 18 at the age of 53 years. Mr. Nelson was widely known and universally liked.

CONSTRUCTION NEWS

East Liverpool, Ohio—John Blackford of Pennsylvania Ave. is having a shaft sunk for a new coal mine in Klondyke.

Sykesville, Penn.—The Erie Co. has advertised for bids on the sinking of two immense shafts at Cramer, two miles south of this place.

Johntown, Penn.—The Link-Belt Co., of Philadelphia has secured the contract for screening and picking equipment for the Valley Smokeless Coal Co., Mine No. 2.

Russelton, Penn.—The Bessemer Coal & Coke Co. has recently asked Pittsburgh contractors for estimates on a brick power house and engine plant at Russelton.

Martins Ferry, Ohio—A new tipple is being erected by the Belmont Coal Co. at the Glencoe mine. This structure will be 150 ft. long, built of wood and will not be completed for some time.

Marquette, Mich.—Work has been started on the construction of a 300-ft. extension to the C. Reiss Coal Co's dock at Escanaba. In addition to the dock extension, two new steel bridges for the distribution of coal upon the dock will be erected.

Holden, Va.—The United States Coal & Oil Co. has awarded the contract for an extension of their No. 7 tipple to the Link-Belt Co., Philadelphia. This new addition consists of a picking table and electrically operated loading boom, all housed in steel.

Elmira, N. Y.—The Delaware, Lackawanna & Western R.R. Co. has a force of men employed in constructing the super-structure for a new coal elevator for the Chemung Coal Co. which will replace the trestle that has been in use by that firm on East Washington Ave.

Joliet, Ill.—Louis Wilbutte, the contractor, has begun putting in concrete for the foundation of the 18 additional coke ovens for the Joliet Coal Products Co. These ovens are expected to be complete by Oct. 1, and the cost of their installation will be approximately $375,000.

Whitesburg, Ky.—Engineers are locating the Rockhouse branch of the Lexington & Eastern R.R. up Rockhouse Creek an important coal and timber section of this county. This work will be completed in about 15 days and immediately thereafter contracts are to be let for the construction of the road.

Morgantown, W. Va.—In anticipation of further enlargement of its plants at both Masontown and Burt, the Elkins Coal & Coke Co. has let the contract for the consruction of 26 five-room, two-story dwellings for the use of miners' families. Fourteen of these will be erected at Burt, and 12 are to be built at Masontown.

Chicago, Ill.—The Malcolmson Briquetting Co. have closed a deal with the Pacific Coast Coal Co. at Seattle for a complete coal briquetting plant having a capacity of 30 tons per hour of 10 oz. briquettes. The Rutledge press will be used, the entire plant being similar in design to that of the Berwind Fuel Co. The estimated cost of the plant is $250,000.

Windber, Penn.—The Berwind-White Coal Mining Co. has recently contracted with the Dodge Manufacturing Co., of Pittsburgh, for a 350 h.p. Dodge American system rope drive to connect a motor with a mine fan. The sheaves will be 40 in. and 96 in. in diameter carrying 20 rope grooves and are to be set 24 ft. on centers; 1400 ft. of 1-in. Firmus manila transmission rope together with the necessary tension equipment will also be furnished.

Connellsville, Penn.—The H. C. Frick Coke Co. has awarded the contract for 60 new houses to be built in various parts of the Connellsville region, to D. M. Fair & Sons, the approximate cost being $140,000. Thirty of the houses will be built at Colonial, seven at Lemont, five at York Run, ten at Sloan, and four at Colonial Nos. 1 and 3. Superintendents' houses will also be built at Edenborn, Wynn and Lemont.

Kempton, W. Va.—The Davis Coal & Coke Co. has completed plans for opening another mine near Kempton. The contract for sinking the shaft for the additional mining operations has been awarded to the Dravo Contracting Co., of Pittsburgh while the necessary railroad facilities will be provided by the construction of a branch line of the Western Maryland Ry. from a point near Henry, a distance of about three miles. The contract for this railway construction has already been awarded to G. L. Anderson & Bros., of Altoona, Penn.

Elmore, W. Va.—The Roberts & Schaefer Co. have closed a contract with the Virginian R.R. for a 400-ton capacity reinforced counterbalanced bucket locomotive coaling station to be built at Elmore, W. Va., at the approximate contract price of $30,000. This will be one of the largest and most complicated coaling plants ever built in this country being equipped with machinery for screening and crushing run of mine coal to stoker size which is used in the heavy Mallet compound locomotives which the Virginian employs in its coal traffic.

Melvin, Ky.—The Baltimore & Ohio is building a line 32 miles long into the Schlesinger lands. This line will, for the present, connect with the Chesapeake & Ohio R.R., at Beaver Creek station. The Baltimore & Ohio Co. has just completed a survey down the Big Sandy River to the Ohio River, crossing that stream at Huntington, W. Va. This new line will parallel the Chesapeake & Ohio line for over 110 miles, along the Big Sandy River, and will serve to transport the coal not only from the Schlesinger lands, by the 32-mile branch mentioned, but also from the new operations of the Consolidation Coal Co., in Letcher county, now connected with the B. & O. by the Sandy Valley & Elkhorn Ry., a part of the B. & O. system running from Jenkins, Letcher County, to Shelby, a distance of 28 miles.

NEW INCORPORATIONS

Ashland, Ky.—The Middle West Coal Co. has increased its capital from $50,000 to $100,000.

Harlan, Ky.—The Lynn Hollow Coal Co., of Harlan is increasing its capital stock from $10,000 to $25,000.

North Lima, Ohio—The North Lima Coal Co., has been incorporated by James Aspenwell and others with a capital stock of $10,000.

Denver, Colo.—The Crested Butte Anthracite Mining Co. has been incorporated with a capital stock of $500,000 by Frank Buckley, R. F. Buckley, and Joseph Deedlartz, all of Denver.

St. Louis, Mo.—The Southern Illinois Coal & Coke Co. has been licensed to do business in the State of Missouri. The capital stock is $1,000,000 and the headquarters are located in St. Louis.

Fort Smith, Ark.—Articles of incorporation have been granted to the Royal Coal Co. with a capital stock of $100,000. The incorporators are Wash Pigg, W. H. Collier, and E. L. Collier.

Denver, Colo.—The Turner Coal Co. has been incorporated with a capital stock of $100,000. The incorporators are James Turner, James C. Dick, of Huerfano County, and George Peart, of Denver.

INDUSTRIAL NEWS

Centralia, Ore.—Following the discovery a short time ago of a 12-ft. vein of coal four miles south of Wynlock steps are already being taken for its development.

Virgie, Ky.—On July 23 the Elkhorn Gas Coal Mining Co. took over the business and works of the Beaver Creek Fuel Co. The address of the new firm is Melvin, Ky.

Huntington, W. Va.—A seven-foot vein of coal of the finest quality has been uncovered on the Holderby farm near the city's edge. This discovery was made at a depth of 199 feet.

Philadelphia, Penn.—For the first half of this year the coal and coke shipments on the Pennsylvania R.R. east of Pittsburgh amounted to 37,087,558 tons, or an increase of 3,621,215 tons.

Cincinnati, Ohio—Edwin Marmet and Charles W. Poysell have been appointed receivers for the Marmet Coal Co. It is believed that this receivership will be only temporary as the assets of the firm greatly exceed its liabilities.

Farmington, Ill.—It is reported that a new coal mine will be located about one mile west of this town. It is believed this will be operated by the Alden Coal Co., of Davenport, Iowa. Surveys and grading will be begun at once.

Rockland, Me.—The Schooner, Charles H. Sprague, of New York, bound from Philadelphia to St. John, New Brunswick with a load of coal sprung a leak and sank off Menhegan on the night of July 23. Captain Elmer Greenlaw and all members of the crew were rescued.

Philadelphia, Penn.—Alleging that the Pennsylvania R.R. is violating the commodity clause of the Commerce Law by granting to certain coal shippers rebates and privileges, the Mitchell Coal & Coke Co., of Philadelphia recently filed complaint with the Interstate Commerce Commission.

Birmingham, Ala.—The Tennessee Coal Iron & R.R. Co. has renewed the contract with the Alabama Co. for the coal mined at the Searles mines in Tuscaloosa County. Not only will steam coal be taken on this contract but practically all of that mined at Searles during the balance of the year.

Bluefield, W. Va.—The property known as the Southern Pocahontas Coal Co. has been recently sold to a mining syndicate headed by Thomas T. Boswell, and Edward T. Boswell. This property which is located near Richland, Va., is already equipped ready for resumption of work.

New York, N. Y.—The New York court has recently declared the law prohibiting the use of bituminous coal in that city as unconstitutional. Health Commissioner Lederle says that one can now burn soft coal in New York legally, but he deprecates the result to the health and comfort of the community.

Cambridge, Ohio—The O'Gara Coal Co. has announced that it will abandon the Derwent Coal Mine. All of the 300 employees have been discharged. The generators will be taken to the Imperial mine at Belle Valley and the other machinery will be shipped to the Illinois field where the company has 21 operating mines.

Birmingham, Ala.—One thousand five hundred new coal cars are to be bought by the Southern Ry. during the next few weeks. Of this number, 1000 will be hopper cars, and the balance of the gondola type. The Virginia Northwestern Ry. which is owned by the Southern was also authorized to purchase 500 coal cars.

Vancouver, B. C.—The Canadian Pacific Ry. will use oil as fuel instead of coal, for its locomotives on the Cascade division of the main line between Vancouver and North Bend. Tanks for the fuel have been located in Fort Moody and it is now proposed to have the oil piped to Cokuitlam where the company shops are located.

New York, N. Y.—Manning, Maxwell & Moore, Inc., together with their subsidiary companies will on or about Oct. 1 next move their office from 85-89 Liberty St. to the new Lewisohn Building, 113-119 W. 40th St. This change is being made in order to secure both a more central location and more commodious offices and store rooms.

Denver, Colo.—The Interstate Commerce Commission has held that the Denver & Rio Grande Ry.'s ownership of the Utah Fuel Co. and its competition commercially in interstate markets is in violation of the commodity clause of the Interstate Commerce Law. This decision implies that the railroad must dispose of its $10,000,000 worth of coal property.

San Francisco, Calif.—Within the past few months, 20 coal carrying vessels laden with a total of over 120,000 tons of coal have sailed from Norfolk, Baltimore, and Newport News, and are now stationed at various ports of the Pacific where their cargoes can be available at a moment's notice for cruisers or battle ships. Other supplies have also been sent to Pearl Harbor, Honolulu, where additional bunkers have been completed.

Monongahela, Penn.—Nine hundred acres of Pittsburgh vein coal recently passed into new hands with the immediate prospect of development upon a large scale. The amount involved is said to be $800 an acre which with contemplated improvements will bring the amount expended to about $1,000,000. The openings for the mines will be almost opposite the Hazel Kirk mine of the Pittsburgh Westmoreland Co. with shipping facilities on the Pennsylvania R.R.

Milwaukee, Wis.—George Manierre announces that he has acquired the patent, patterns, drawings and other assets of the late Ticknor-Manierre Co. which has gone out of business and that he will continue the manufacture of box car loading machinery under the style of the Northern Conveying Machinery Co., at 418 Engineering Building, Milwaukee, Wis. The efficiency and practicability of the loaders manufactured under the Ticknor-Manierre patent have been thoroughly demonstrated in the past.

Pittsburgh, Penn.—The National Tube Co. announces that commencing Aug. 1, 1913, it will enter the elecrical conduit field. It has contracted with the National Metal Molding Co. and the Safety-Armorite Conduit Co., both of Pittsburgh, Penn., to manufacture and sell this product for it as its agents, under their various brands. It has also decided to sell this product on the "Pittsburgh basing discount" plan in the same manner as all wrought pipe for other purposes has been sold for the past thirteen years.

COAL TRADE REVIEWS

GENERAL REVIEW

Difficulty in obtaining adequate shipments of soft coal is causing some uneasiness. Little coal in the hands of the consumers and the demand is heavy in all sections. Better grades are entirely out of the market. Hard coal quiet and featureless.

The midsummer dullness on hard coal is now acutely evident, and the demand has fallen off to practically nothing. The individuals are raiding the market with low-priced coal, and this is about the only business that is being done. The steam grades are particularly heavy and can be moved only when the consumer is forced to take a certain proportion of the small sizes in order to obtain any shipments of the domestics. There is considerable interest in the new hard-coal tax.

The difficulty in obtaining adequate shipments of bituminous in the Eastern Coastwise trade is causing apprehension over what the situation will be when the fall and winter activity sets in. Although the congestion at Hampton Roads is clearing up rapidly, the movement into New England continues slow and there is much uncertainty over what tonnages can be expected. While spotty on occasions the trade as a whole is strong and large consumers, who are attempting to accumulate surpluses against a possible stringency in the fall and winter, are finding it impossible to do so. Though the market may ease up slightly this month, this is doubtful, and will not in any event, be of any serious proportion.

The Pittsburgh district is experiencing one of its best years. Mines are operating up to the full limit of the car and labor supply, both of which are good, so that the production is heavy. The prompt demand is relatively light, the heavy movement being principally on contracts. There is little coal in the hands of the consumers and the renewed activity in iron may cause a further stiffening in the coal and coke markets. The seller is still in full control and there will be little surplus fuel for some time.

The Ohio trade continues to maintain an activity far above normal. The steam grades are particularly hard, due to the increased manufacturing demand and heavy consumption on the railroads and in the iron and steel business. The Pocahontas grades in the Lake market are practically unobtainable. Foreign shipments out of Hampton Roads have eased up, but the Coastwise business is heavier; prices are holding up, and production is much improved, although there is still a shortage at the piers.

In the Southern markets the producers are issuing warnings, urging the consumers to stock against the possibility of a serious car shortage, but as usual such notices are most commonly ignored; domestic prices continue firm, but the steam grades have eased up slightly. The improvement in the Middlewestern market continues. Although the steam grades are a trifle weaker, the domestic sizes are showing a satisfactory improvement, and indications are that they will hold steady throughout the balance of the season.

BOSTON, MASS.

Uncertainty over what tonnage can be relied upon from West Virginia is causing apprehension. Congestion at Hampton Roads is gradually clearing up but all agencies are well sold. Prices stiff and firm.

Bituminous—The market here shows little change from a week ago. There is, however, an undertone of apprehension over the outlook for supplies in the late fall and winter. Pocahontas, New River and Georges Creek, on which tidewater New England so largely depends, are coming forward slowly and there is not enough improvement in despatch at the loading piers to warrant a cheerful view. At Hampton Roads the congestion due to the suspension early in July is gradually clearing up, but as August comes along it is seen that by far the most of the agencies have all the orders they can possibly take care of. Then, too, there seems a good deal of uncertainty over what output can be counted on from West Virginia, the labor shortage there being still a considerable factor.

Buyers at this end are keeping close watch on their shippers and there is a disposition apparent to make settlements on demurrage as easily as possible, so long as coal is forthcoming. There is an anxiety, too, on the part of corporations generally to be forehanded on supplies and if extra shipments are secured through such a policy something will have been done to relieve what in September and October may be a tightening situation. Prices on Pocahontas and New River are firm, sales having been made lately up to $3.10, f.o.b. There are a few shippers, however, who did not take much contract business and from such sources there is a small tonnage offering at down to $2.90 and $2.85, but the volume is insignificant.

Georges Creek continues strong and there is no surplus for sale at current prices. There are already rumblings of the anticipated car shortage and that is hardly a good sign in August. In Pennsylvania the operators are going carefully over their commitments to see what will be available the balance of the year and this is reflected in the extreme caution which selling agents show in response to inquiries for coal a month or two ahead. Prices are now about on the level of late June when a West Virginia strike seemed imminent.

Anthracite—There has been a mild rush to get hard coal forward late in July, chiefly to secure July billing, but now that another monthly advance is in force there will be another lull until about the twentieth. The dealers are not moving their stocks as fast as the spring trade seemed to indicate, but the first of September will doubtless see a spurt, especially in the cities. Broken is still in short supply, now particularly on account of the curtailment in mining, and gas companies and other large consumers are pressing for shipments.

Quotations on bituminous at wholesale range about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.15@1.45	$1.35@1.65	$1.67@1.77	
Philadelphia*	2.40@2.70	2.60@2.90	2.92@3.02	
New York*	2.70@3.00	2.90@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.10
Providence†				3.95@4.10
Boston†				4.05@4.15

*F.o.b. †On cars.

NEW YORK

Soft coal shows a tendency to ease up and may continue slightly softer the balance of the season. Still a sharp demand however and consumers taking full allotments on contracts. Hard coal easy with considerable going into storage.

Bituminous—The contract season on soft coal is now definitely closed. Any consumers who are still not under cover may possibly prevail upon concerns of which they are old customers to take care of them. It is only on such conditions, however, that contracting could be done and even in these instances operators would much prefer to carry any free tonnage they now have over into the fall trade. The prompt demand locally has eased up slightly during the week, which is no more than was to be expected in midsummer; it is very probable that it will continue more or less easy until preparations for the fall trade are actively under way. There were rumors of an acute car shortage on the B. & O. but the supply on the Pennsylvania and the New York Central have been wholly up to requirements, although trouble is anticipated before long. It is unofficially stated that the New Haven R.R. is in the market for 200,000 tons of coal. We continue New York prices on the following basis:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.75@2.80; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.25@3.30.

Anthracite—Hard coal continues stagnant and entirely devoid of interest with the possible exception of a great deal of unfavorable comment which has arisen over the new Pennsylvania state tax on anthracite. The move seems to have been entirely unexpected and no generally accepted policy has yet been adopted, either as regards increasing the cost to cover the new tax, or toward making a move to have it repealed. As a rule most companies have increased the price to the dealer sufficiently to cover the new tax burden, but there are a few notable exceptions to this.

Locally the trade is quiet. The steam sizes are particularly heavy and are going into storage rapidly, while sales of the domestic grades are made only on condition that orders for a proportion of the small sizes be given at the same time. The labor supply is only fair and the mines are slackening up considerable. We quote New York prices as follows, the circular on domestic grades being 10c. above that for last week due to the regular monthly decrease in the discounts:

		Individual		
	Circular	Lehigh	Scranton	Schuylkill
Broken	$5.10	$4.45@$4.65	$4.50@$4.70	$4.45@$4.65
Egg	5.35	4.80@ 4.90	4.85@ 4.95	4.80@ 4.90
Stove	5.35	4.90	4.95	4.90 .....
Chestnut	5.60	5.05@ 5.15	5.10@ 5.20	5.05@ 5.15
Pea	3.50	3.25@ 3.45	3.30@ 3.50	3.25@ 3.45
Buckwheat	2.75	2.10@ 2.45	2.50@ 2.75	2.10@ 2.45
Rice	2.25	1.75@ 1.95	2.25	1.75@ 1.95
Barley	1.75	1.30@ 1.70	1.75	1.30@ 1.75

PHILADELPHIA, PENN.

Anthracite flat and individuals are offering concessions on nearly all grades. Demand has fallen off to almost nothing. Heavy winter business expected. Bituminous continues abnormally strong and active.

The usual mid-summer dullness is still holding on, and as the season advances it is not likely to improve. There seems to be more talk of investigations than business, due to the fact that many of the retail dealers, effective Aug. 1, contemplate an advance of 10c. per ton over the prices generally ruling at that time, to offset the new Pennsylvania state tax. The city authorities have been called on to inquire into the matter, but no steps have as yet been taken.

The market itself shows a lamentable lack of activity, and the only business of any account is being done by the individuals, who are resorting to their practice of cutting prices to induce trade. Outside of stove coal, the demand has fallen off to almost nothing, and the call for this size is only equalled by the requisitions of the consumer so that with many homes closed, there is not much business. As usual they will probably do nothing now, and in the fall be rushed to death. It is expected by many that the coming season will see practically a duplication of last year's experience, when all sizes were in short supply and hard to get.

The bituminous trade shows up in marked contrast to the anthracite. Good prices and large orders are being received, while the current demand is far in excess of the supply. The shortage is probably due to the lack of labor at the mines. However, producers have no complaint to make as they are finding business better than ever before. This is the consensus of opinion in the trade and there is a ready market for good, as well as the cheaper grades of coal. Many buyers are now bemoaning the fact that they did not profit by the advice of the operators, and make their purchases during the period of inactivity some two months ago.

PITTSBURGH, PENN.

Pittsburgh district experiencing one of the best seasons in years. Demand on contracts heavy but light in the spot market with few premiums offered. Coke situation unchanged and indications are that the producers will win their fight for the $2.50 price on second-half contracts.

Bituminous—The great activity in the Pittsburgh district continues, mines being operated up to the limit of labor and car supply. There has been less labor shortage than expected, and the same can be said of the cars. While there is a constant tendency toward congestion in railroad yards there has been no serious difficulty thus far. Demand for coal on contract is excellent, and has shown an improvement since the first of July, when there was a slight letting up, chiefly through plants closing for repairs. Demand for prompt coal is relatively light, and premiums are exceptional. On the whole, the Pittsburgh coal trade is experiencing one of the best years in its history. Free slack is being readily absorbed, much more so than usual at this season, and only a moderate tonnage can be picked up and only on a few lines, at less than the standard price. The pressure for coal in the Northwest is unabated. We continue to quote: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55 per ton at mine, Pittsburgh district.

Connellsville Coke—The restriction of coke production, in accordance with the program of merchant operators, is fully sufficient to meet the situation and maintain the $2.50 price so long demanded. Although prompt demand is light, there is hardly enough free coke to meet it, and buyers find difficulty in securing prompt lots at $2.50, a premium occasionally being paid. The market is quiet at the moment, but a tense feeling results from the knowledge that the requirements of furnaces which covered sparingly for July will come up again for August. However, the furnacemen are less averse to paying the $2.50 price than they were, for the pig-iron market has shown signs of stiffening, and a break in coke now would doubtless weaken iron again. We quote: Prompt furnace, $2.50@2.60; contract furnace, $2.50; prompt foundry, $2.85@3; contract foundry, $2.85@3, per ton at ovens.

BALTIMORE, MD.

Trade spotty at times but exceptionally strong as a whole. Occasional surpluses of slack, due to the heavy shipments of three-quarter to the Lakes. Foreign business slacked up some, but the coastwise movement is increasing.

July has been rounded out by the coal trade here in stronger form than any similar period for years. While the market is somewhat spotty from time to time, there is apparently every prospect for a steady August trade.

As a matter of fact, the present summer has been an excellent one in the trade. While the early spring saw a rather slow contracting period, the failure of big consumers to find any quantity of cheap coal early in the season, caused a quick movement to cover. Since that time, in spite of predictions to the contrary, the changes in the spot market, and in contract renewals, have been at advances for the most part. During the past week, slack was the only grade that could be marked spotty, and this was due to the rush movement of three-quarter toward the Lakes.

Considerable activity was to be noted at the piers. While the foreign movement showed a falling off, there was a large shipment coastwise. Southern consignments particularly showed an increase. For the next two weeks this will be even heavier, as a number of coal shippers will try to avoid the hurricane season along the Southern Atlantic seaboard, which usually appears about the middle of August. A number of loadings for Vera Cruz, and other Mexican ports, will be noted in the next few days.

The board of directors of the Baltimore Coal Exchange has passed a resolution declaring that the tax of 2½%, recently imposed by the State of Pennsylvania on anthracite coal, is unjust and burdensome on the consumer. The tax has been passed from the mines to the wholesalers, and from the latter to retailers, who have now decided to add 10c. per ton on the cost of coal to consumers, in order to meet the situation without direct loss.

Notices sent out by the Baltimore & Ohio R.R. announce an important change in coke rates to this port. As a result of the recent agitation of a certain Connellsville interest for a reduction, a cut of 35c. per ton was made, which is probably a record. The rate is reduced from $2.15 per ton to $1.80. West Virginia is favored with a similar cut, the rate being reduced from $1.95 to $1.60. It is understood that Philadelphia is also to have some reduction as well as some points in Ohio. The new tariff becomes effective Aug. 1. Coal men here are rather at loss to understand such a substantial cut on coke freight rates, when the rate on bituminous coal remains unchanged.

BUFFALO, N. Y.

Renewed activity in iron, which will have a further stimulating effect on coal. Consumers have little surplus and producers are in full control of the market.

There is no slacking off in the bituminous trade and the only difficulty is to get enough coal to meet the demand. It is believed that iron is about to follow coal in activity and stiffness in price. In fact it is declared that the movement has already begun. There has been a large amount of iron sold right along, but the price has been low, so that the complaint was that no money could be made in the trade. With iron active and crops in good condition the outlook is excellent in spite of the tariff revision and other troubles.

Consumers are so eager for any coal that they are now paying within about 15c. of Pittsburgh prices for Allegheny Valley coal, which is sometimes as much as 30c. lower. Jobbers also say that there is little surplus coal in the hands of consumers and as it appears now there is not going to be any for a long time hence. Most of them are not trying to buy any more than they need for early consumption. There is all of the former complaint of shortage of men, with cars growing scarcer every week. What the ultimate result will be is difficult to say but it is clear there will not be a surplus of coal right away. The consumer has lost all control of the market and must accept what he can get at sellers' prices. At the same time it is noted that there is not so much talk as there was of $2 coal at the mines. The operators and jobbers have become aware that with much more booming of the market, they will soon be digging coal out of every farm in the state of Pennsylvania.

Quotations are strong as ever on the former basis of $2.90 for Pittsburgh lump, $2.75 for three-quarter, $2.65 for mine-run and $2.15 for slack, with Allegheny Valley not more than 20c. lower. Coke is not much changed and may therefore be quoted as quiet at $4.85 for best Connellsville foundry.

There is no stir yet in anthracite and none is looked for till cool weather sets in. Some increase in the demand was created in the spring by the reduction in price, but the consumer is indifferent now. Members of the trade locally, as well as the public generally are speaking in an uncomfortable way of the 2½% Pennsylvania tax on anthracite and there is a growing belief that it will be pronounced unconstitutional by the courts. For that reason some of the shippers have refused to add it to their regular prices for the present.

Shipments of anthracite by lake were 162,580 tons, which is a large amount, though not so large as the month will average.

COLUMBUS, OHIO

Trade still active, despite the hot weather, which has curtailed the domestic demand. Lake market is strong. Steam business holding up well and price list is firmly maintained.

The coal trade continues to maintain its strong position of the past few weeks. There is a good demand for all grades and prices at the circular figures announced July 1 are well maintained. There is little shading of quotations reported, and on the whole the tone of the market is satisfactory in every way. The future outlook is bright, with the possible exception of an expected car shortage.

One of the best features of the trade is the good demand for steam grades. Manufacturing establishments are taking a large tonnage and in some cases increases in their requisitions are reported. Iron and steel companies are good consumers of steam fuel, also the railroads, which are having a heavy freight movement. Expiring contracts are being renewed at advanced figures over those of last year.

Domestic trade is strong despite the hot weather. Operators and jobbers report a large number of inquiries, mostly for delivery in August and September. Dealers have stocked up pretty well and will not be in the market for some little time. Consumers are placing orders, but deliveries from retail yards are not large. Threshing due to the heavy wheat crop is creating a demand for domestic grades in the rural sections of the state. Municipal contracts are being awarded and the same is true of school and office building contracts.

The demand from the Northwest is still good, and consequently the lake trade continues active. The tonnage going to the Northwest via the lake is larger than in years, and the indications are bright for a continuation of the heavy movement right up to the close of navigation. The tonnage handled by the Toledo docks of the Hocking Valley up to July 25 was 1,393,000.

As a result of the good car supply which is reported from all of the mining districts of the state, the output has been large. In the Hocking Valley the production was normal and the same is true of Pomeroy Bend district; in eastern Ohio, where the car supply has not been the best in the past, there was a 100% supply reported during the week. In the domestic fields of Jackson and Massillon the output was also larger than usual.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump........	$1.60		$1.60	$1.60
¾ inch................	1.45	$1.25	1.45	1.40
Nut...................	1.25		1.35	
Mine-run..............	1.25	1.15	1.25	1.20
Nut, pea and slack....	0.65		0.65	0.60
Coarse slack..........	0.55	0.70	0.55	0.50

HAMPTON ROADS, VA.

Falling off in foreign shipments, but coastwise movement continues large. Heavier production at the mines and supplies at the piers are much improved but still inadequate. Prices being well maintained.

While the dumpings over the three Hampton Roads piers have been good there has at the same time been a falling off in the foreign shipments and it is doubtful if the past week will compare at all favorably with the first three weeks of July. There has been quite a good movement coastwise but a large portion of this business has been taken care of by practically one shipper, so that it will not offset the falling off in exports.

The working conditions at the mines having improved, coal is coming forward in much larger quantities than at any time during the month and the shortage at tidewater is greatly improved. A number of shippers are still short, however, and find it difficult to take care of contract business.

The demand for coal still continues good and prices range from $2.95 to $3.10 for New River-Pocahontas coals and Kanawha is bringing from $2.70 to $2.85. Foreign shipments have moved to Havana, Kingston and Georgetown, with one coastwise shipment to San Francisco.

TOLEDO, OHIO

Exceptionally heavy movement up the Lakes. Local demand for both steam and domestic grades above normal with prices firm. Pocahontas practically out of the market.

Conditions have not greatly changed here during the past week and there has been no variation in price. The coal movement on the Lakes has been exceptionally heavy for this season of the year and fully 200,000 tons of coal and coke were loaded at the C. H. & D. docks, the past week for uplake shipment. The proportion of coke was small, being estimated at about 25,000 tons, the remainder being steam coal for which the demand is remarkably strong. The "Ward Ames," bound for Duluth with 10,500 tons capacity, is now loading at these docks. The reports at the customs office show that the coal movement for July up to this week has been 1,516,230 tons as against 707,651 tons for the entire month of July, 1912. Of this tonnage, 461,925 was for export shipment going to Lake Superior and Georgian Bay points.

The demand for both domestic and steam coal is good locally, far above normal for this season of the year, and prices are holding firm. There is practically no Pocahontas to be had. Following are the prices quoted here:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump.........	$2.50	$1.60	$2.50	$1.75	$2.50	$1.35	$1.35
Egg...................	2.25	1.20	2.50	1.50	2.50	....	....
Nut...................	1.80	1.20	2.25	1.50	2.50	....	....
⅞ lump................	....	1.35	....	....	....	1.20	1.20

LOUISVILLE, KY.

Movement to the Northwest slackening up, due to the inadequate labor supply there. Prices remain steady, however, and mines are working full time. Much complaint about the new class of equipment on the L. & N.

There has been little change in the market during the past week, except possibly a slight easing up in the demand from the Northwest. Prices are steady at the same level that has been prevailing for the last few weeks. There are a few complaints of car shortage, but for the most part the mines are running full time.

The distribution of the "battleship" type of cars is becoming more general and is also resulting in more complaints from the shippers. A committee of operators and dealers recently consulted with the traffic officials of the Louisville & Nashville, regarding the situation, and were promised prompt relief. It is a rather significant fact that the road itself will not accept about half of their fuel requirements in this class of equipment. Even few of the larger dealers are prepared to handle the new type of cars to an advantage, so that the complaint is general.

It is obviously unfair to expect a dealer to install the trestles necessary to handle the new equipment irrespective of the size or importance of their business; this, however, seems to be the position of the railroad in the matter. Considerable friction has also occurred between producers and dealers. One result of the new situation may be the loss of considerable business to the Louisville & Nashville R.R. Dealers who cannot handle the battleship cars to an advantage will, of course, order from mines on other roads when same is possible. This may thus eventually prove a serious disadvantage to the operators on the Louisville & Nashville Railroad.

There has been little or no coal stored by the dealers so far this season; as is always the case, this is due to the reluctance on the part of the dealers to tie up any considerable amount of money. The heavy movement into the North and Northwest still continues to be one of the best features in the local trade; the indications are that this will continue as long as the mines have surplus tonnages to ship those markets.

BIRMINGHAM, ALA.

Producers anticipate a severe car shortage and are urging consumers to stock. Steam grades easier but domestics are firm and there is an increased activity in the iron market.

While the warnings given out by the producers that heavy stocks should be laid in during the summer, owing to the probability of a serious car shortage, are, no doubt, timely, the buyers are not frightened. Steam prices have suffered to some extent, especially with the mines producing both steam and domestic coal, as such operators must move their steam product in order to be able to produce domestic grades. Domestic prices on standard coals are well maintained; in fact, some of the largest mines report they are behind on shipments of this grade of coal.

The pig-iron market, around which most other markets in this district usually revolve, shows more activity, but the volume of buying has been increased largely at the expense of prices and the lowest figures of the year now prevail.

NEW ORLEANS

Heavy shipments being made from the Alabama field; consumers endeavoring to cover before the car shortage develops. Receipts by water interfered with. Large tonnage started out of Pittsburgh.

In order to take full advantage of the abundance of cars, shipments of Alabama coal are being made on an unusually large basis. As the crop movement will soon begin taking the cars, every effort is being made to move as much of the fuel as possible now. Shipments from Alabama were curtailed to some extent earlier in the year from the fact that river transportation was expected to open. The navigation of the Warrior and Tombigbee rivers has been delayed by unexpected difficulties which the engineers encountered. As a consequence, the receipts of coal by water will not begin in time to assure the accumulation of any stock before winter. A contract for 20,000 tons of Alabama coke was let by the New Orleans Gas Light Co.

Unexpected high water in the Monongahela released over 1,000,000 bushels of coal, consigned to local dealers. It is feared that the low stage in the rivers will not allow it to come through soon, however. Shipments of domestic lump are moving to western Louisianna and eastern Texas. Demand for coal in the harbor has been unusually heavy during the past week. Trade in the city is normal and featureless.

DETROIT, MICH.

Producers are no longer showing any anxiety to contract and are apparently willing to take their chances in the spot market from now on. Indications for the fall trade excellent. Dealers endeavoring to accumulate reserve stocks.

Bituminous—The season is approaching when there is little or no inducement for producers to contract so that there is a tendency on the part of the buyers to close without further delay. The operator who has contracted for only half of his production, is more or less indifferent about the remainder and probably feels that he can do better by taking a chance on the spot market.

Indications for the fall trade are excellent. The domestic fuels, particularly the larger sizes, are already in strong demand, due to the fact that dealers are endeavoring to accumulate substantial reserve stocks in anticipation of a heavy demand this winter. However, there have been previous occasions when the market displayed a similar strength, but failed to realize the full expectations of the trade, so there is still some uncertainty over the future.

We continue local quotations on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.65	....	$1.60	....	....	$2.50	$2.25
Egg	1.65	....	1.60	....	....	2.50	2.25
Steam lump	1.25	....	....	....	....	....	....
¾-in. lump	1.15	$1.15	1.20	....	....	....	....
Mine-run	1.05	1.05	1.00	$1.00	$1.00	1.50	....
Slack	0.90	0.90	0.50	0.65	0.65	....	....

Anthracite—The local dealers are keeping well up with their orders and the hard-coal situation here is comparatively easy. Payment of the additional 10c. per ton to cover the new state tax on anthracite is being made under protest. There are hopes that dealers will be reimbursed for this, but apparently the new charge has come to stay. The smaller sizes are in long supply, and are becoming difficult to move.

ST. LOUIS, MO.

Local market on the edge of a sharp advance. However, steam grades continue heavy, and this is affecting the buoyancy in the other departments. Anthracite dull and inactive.

Judging from conditions the last week in July the long expected demand in the local coal market has almost arrived. Especially was this so on the screened sizes, such as lump and egg; on steam grades the market continues to get weaker, and the accumulation of steam sizes has prevented many mines from working, so that a shortage of lump and egg is almost in sight. It is likely that these conditions will continue to exist for the next month, as nut does not as a rule begin to move freely for the fall trade until about September.

Carterville screenings took another drop of 10c., and Standard screenings have been wavering for the past week with absolutely no demand. Standard lump coal is still being held at 80c. to 85c., and screenings at about 60c. to 65c. It costs more than 80c. to get this coal out in the form of mine-run, so it is still a losing proposition for the operators. Even with the prices of Carterville and Franklin County advancing on lump and egg, the falling off on steam coal prices enables these operators in some instances to break even, but a great many of them are still losing money.

The coke market is in a demoralized condition, various grades being offered in the past week at prices far below the circular. The same pertains to anthracite coal—one or two shippers having speculated on inferior grades, and now find that they are unable to dispose of them and will probably have to sell at a loss.

Very little smokeless is coming in and it is extremely hard to get, although Arkansas coal seems to be moving in far better than was anticipated.

The local market is quotable on the following basis:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.90
3-in. lump	....	....	$1.25	....
6-in. lump	$1.35 @ 1.50	....	1.35	1.10
Lump and egg	....	$2.10	1.30	....
No. 1 nut	1.00 @ 1.15	....	1.05	0.87½
Screenings	0.65	....	....	0.80
Mine-run	1.10	....	....	0.75
No. 1 washed nut	1.40 @ 1.50	....	....	....
No. 2 washed nut	1.25 @ 1.35	....	....	....
No. 3 washed nut	1.15 @ 1.20	....	....	....
No. 4 washed nut	1.10 @ 1.20	....	....	....
No. 5 washed nut	0.80 @ 0.90	....	....	....

PORTLAND, ORE.

Customary Aug. 1 advance on Utah and southern Wyoming coals gone into effect. Market quiet and dull.

Coal dealers here have been notified that on Aug. 1, the wholesale price of coals on the Utah and south Wyoming mines will advance as usual at this time of the year in anticipation of the winter demand from $1.75 to $2.25 per ton for nut and from $2.25 to $2.75 per ton for lump. To what extent the advance at the mines will affect prices here is not known yet, but it is supposed that the local advance to the consumers will be commensurate with that assessed against the retailers. The weather has been tropical here for the past week and under the circumstances people are not inclined to turn their thoughts to fuel.

PRODUCTION AND TRANSPORTATION STATISTICS

COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during May and the first five months of this year in comparison to last year, in short tons:

Classes and Railroads	May		5 Months	
Anthracite:	1912	1913	1912	1913
B. & O. (a)	18,496	107,494	601,152	665,488

DIVIDENDS

St. Louis, Rocky Mountain & Pacific—Dividend No. 1 on the common of ½% payable July 16 to holders of record July 1.

Jefferson & Clearfield Coal & Iron Co.—Dividend of 2½% on the preferred, payable Aug. 15, to holders of record Aug. 8.

⁂

Alabama Consolidated Coal & Iron Co.—The net earnings of this concern, which is now in bankruptcy, are at the rate of $240,000 a year, which is more than sufficient to pay the fixed charges and the full dividend of 7% on the preferred stock. Since neither of these payments are being met, the earnings must apparently be applied to the improvement of the property.

American Coal—This concern operates mines at Barton and Lonaconing, Md.; also in the Pocahontas region, West Virginia. It was originally incorporated in Maryland and reincorporated in 1903, in New Jersey. During the period from 1894 to 1900, it paid dividends ranging from 6½ to 10 per cent., and from 1900 to 1909, at the rate of 10 per cent.; since that time the dividend distribution has been 6 per cent. per annum.

FOREIGN MARKETS

BELGIUM

Belgium imports and exports for May and the first five months of the year were as follows:

	Exports			Imports		
	May	5 Months		May	5 Months	
	1913	1912	1913	1913	1912	1913
Coal	418,661	2,051,833	1,952,476	677,339	3,232,351	3,821,198
Coke	90,441	385,716	423,092	92,927	370,540	535,789
Briquettes	54,349	287,675	216,618	34,972	166,215	201,107

BARCELONA

A consular report says: "The quantity of coal discharged in Barcelona in 1912 totalled 1,032,954 metric tons (of 2204.6 lb.), which was in excess of the arrivals of coal in any previous year. Of the quantity stated, 649,351 tons came from Great Britain, 83,346 tons from Rotterdam, 8275 tons from Belgium, and 1832 tons from Philadelphia, the rest being Austrian coal of Spanish production. In 1911 the arrivals of coal in Barcelona totaled 930,389 metric tons."

COAL FREIGHT DECISIONS

I. C. C. Nos. 4947—5078—5079, Sheridan (Wyo.) Chamber of Commerce vs. Chicago, Burlington & Quincy R.R.

Complaint was made of the rates on coal from Sheridan, Wyo., to points in Nebraska and South Dakota on the line of the Chicago & North Western and the Chicago, Milwaukee & St. Paul, and to points east and west of Billings, Mont., on the line of the Northern Pacific. Comparisons are made of distances and rates from Sheridan, Hudson, and from Illinois and Indiana coal fields to points of destination on the Chicago & North Western herein involved. Similar comparisons are made of distances and rates from Sheridan, Roundup, Mont., and from Illinois coal fields to points of destination on the Chicago, Milwaukee & St. Paul herein involved. Sheridan mines are at a disadvantage of from 85c. to $1 in competing at points on the Northern Pacific with the mines located on that railroad. **Held:**

1. The great discrepancy between the rates from Sheridan and from Hudson to the same points of destination on the Chicago & North Western and between rates from Sheridan and Roundup to the same points of destination on the Chicago, Milwaukee & St. Paul cannot be justified on the ground that the movement from Sheridan involves a two-line haul.
2. Where the physical connection between connecting carriers is as simple as in these small Western towns, involving no expensive terminal service, the additional cost due to the switching movement is very small, so small in fact that it may not properly be made the basis of an additional charge for a two-line haul of substantial length.
3. The facts in these cases demonstrate the necessity of promulgating rates which will allow this coal to find a market in the territory described. In order to accomplish this result there must be a free interchange of traffic at reasonable joint rates.
4. Joint rates should be established from the mines at Sheridan to the points on the Chicago & North Western which have been specified in the complaint in No. 4947, which should in no case exceed the rate from Hudson, Wyo., to the same points of destination, except that the rate to common points of the Chicago, Burlington & Quincy and the Chicago & North Western need not be changed.
5. A joint rate should be established from Sheridan to Chamberlain, S. Dak., not to exceed that from Roundup to Chamberlain and this rate should be carried back as far as Okaton, S. Dak.
6. A differential of 25c. is a reasonable allowance for the difference in the distance from Sheridan and from the Northern Pacific mines to points of destination involved in No. 5079 within 500 miles of Sheridan. As the distance to points of destination increases, the differential between the rates from Sheridan and from Red Lodge should be further contracted, so as not to exceed 15c. to points between 500 and 600 miles distant and not to exceed 5c. to points between 600 and 700 miles distant. To points over 700 miles distant the rate from Sheridan should be the same as the rate from Red Lodge. **Opinion No. 2290.**

CURRENT COAL LITERATURE

We will furnish copy of any article (if in print) in the original language for the price quoted. Where no price is quoted, the cost is unknown. Inasmuch as the papers must be ordered from the publishers, there will be some delay for foreign papers. Remittance must be sent with order.

7200 h. p. (total) Westinghouse Motors driving Air Compressors at Anaconda Copper Mine

More Air for Less Money

The most efficient and economical drive for air compressors is furnished by

Westinghouse Synchronous Motors

Being direct-connected, these motors **cost less to install** than belted drives and require less floor space. Belt maintenance expense and transmission losses are eliminated.

The first cost is about the same as for other types of drive for compressors of 1,000 cubic feet per minute; less for larger sizes.

Efficiency higher than that of any other form of drive. The high power factor at which these motors can be run improves the operating characteristics of the entire circuit.

The great reliability of these motors is proved beyond question by successful installations in all parts of the country.

We will investigate your special problems and recommend the most efficient drive for your work. Write for full information.

VOLUME 4 AUGUST 9, 1913 NUMBER 6

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 185

Some remarks advocating the expression of appreciation by mine officials. It is pointed out that such a policy not only capitalizes the loyalty of employees, but brings out the better side of their human nature and increases the efficiency of a company organization. COAL AGE, Vol. 4.

IDEAS AND SUGGESTIONS: *Pages* 186-187

The Liquor Problem in Mining—Some Plain Facts about Anthracite—The Cost of Bath Houses.

*COAL SHIPPING ON THE GREAT LAKES: *Pages* 188-191

The movement of coal up the Lakes during the summer season is one of the most interesting transportation problems in the coal industry. The Lake shippers believe they have the most advanced and modern systems of handling coal. This is the first of a series of articles that will discuss all phases of the Lake trade. J. W. Chamberlin. COAL AGE, Vol. 4.

COAL-CUTTING MACHINERY IN ENGLAND: *Page* 192

A résumé of some of the circumstances and conditions which have made the introduction of coal-cutting machines rather more backward in England than it has been in this country. Sydney F. Walker. COAL AGE, Vol. 4.

*MINES OF THE CONTINENTAL COAL CORPORATION: *Pages* 193-194

The Continental Coal Corporation having acquired 16 independent mines is about to operate them all from a central station. COAL AGE, Vol. 4.

ILLINOIS' EIGHT-MILLION DOLLAR COKE PRODUCTION: *Page* 194

NONFATAL INJURIES IN BITUMINOUS MINES: *Pages* 195-198

The nonfatal-accident rate in bituminous mines is almost equal to that in anthracite workings. The main differentiation between the regions is to be found in the fact that the percentage of injuries to the head and arms is greater in the anthracite region. F. L. Hoffman. COAL AGE, Vol. 4.

DEATH OF A VETERAN INSPECTOR: *Page* 199

THE LEHIGH VALLEY COAL CO. EMPLOYEES' MAGAZINE: *Page* 199

POWER DEPARTMENT: *Pages* 200-202

*THE CARBON COAL CO'S CENTRAL STATION: A brief history is here given of the inception of the Carbon Coal Co. and a description of its electrical equipment and recently constructed central power plant, together with operating costs and data. W. E. James and G. W. Hall. COAL AGE, Vol. 4.

EDITORIALS: *Pages* 203-204

To Save Lives—Passing of the Braggart—The Slaughter of the Innocents.

RENEWED PEACE ON CABIN AND PAINT CREEKS: *Page* 205

THE VALUE OF A SAFETY INSPECTOR AND INSTRUCTOR FOR EACH COAL MINE: *Pages* 206-207

THE EXPLOSION AT THE EAST BROOKSIDE MINE: *Page* 207

DISCUSSION BY READERS: *Pages* 208-209

The Mine-Air Current and Explosions—Mixed Lights in Mining.

The New Conception Of Advertising

The Weekly Ad-Talk Page

Printers' Ink, in its 25th Anniversary number, says editorially, in reference to advertising in the last 25 years:

". . . more advertising has been done and more has been learned about advertising than during all of the ages that have preceded them. The activities of these years have unusual significance, as marking the close of an old order and the beginning of a new. All of which activities Printers' Ink might say, in paraphrase of the classical historian, it has seen and a great part of which it has been.

Unquestionably the greatest gain to advertising during this time has been the new conception men have of it. A quarter of a century ago advertising was "magic" to the great majority, even of advertising men, and not always white magic either.

At the worst a lie, at the best often a mere whirl of words, the ad of the period showed the relatively low estimate in which the public was held.

Credulous and unsophisticated, it was too vague to be catered to, it was only just something to be manipulated.

The history of the past twenty-five years has been one of an increasing sophistication of the public and a growing respect on the part of the advertisers.

It has been a growing education, in which the instruction has been given by all of the interests in competition with each other. And this has unfailingly ushered in the new conception of advertising—advertising as a *service to the public*, to list its needs, explain and tell how and where they may be satisfied.

The conception is not widely held as yet or acted up to, but it is seen and practiced by some, and it is having its reactions in all directions. New and definite ideals are rising out of the hurly-burly, ideals of service, of efficiency, of plain, downright honesty.

Advertising men are finding in honor a better armor than was a thick skin. The professional spirit has crept in and they are beginning to be exceedingly proud of their work."

Advertisers have come to that point where they realize that readers of ads must be told the truth about goods if the advertising is to pay.

Which is why the maker of worthless goods, of goods that will not bear investigation, cannot as in days of yore use advertising as a means of "fooling the public" into buying his product.

Not only do readers of advertising today demand truth in advertising.

Not only do advertisers of good goods realize the importance of telling "the truth, the whole truth and nothing but—"

But the publishers of responsible publications refuse to accept advertising that is untruthful.

So that to you—the ad reader—the selling section of your paper represents a trustworthy guide—a guide who helps you secure the right equipment, the right tools, the kind of goods that give you the service you expect of them.

In these days of truthful advertising you can find *no better guide.*

COAL AGE

Vol. 4 NEW YORK, AUGUST 9, 1913 No. 6

Have you ever realized the value of *expressed appreciation* as an aid in the successful handling of your employees? We are all too prone to be thoughtless in observing the little amenities that lubricate life's machinery.

Real men do not exact or expect much in the way of appreciation—they are accustomed to bestow rather than receive—yet a certain amount of praise and thanks is always welcome to the diligent and faithful.

Appreciation is not, like the exercise of many virtues, difficult and painful, but is attended with so much pleasure that were there no positive command which enjoined it, nor any recompense laid up for it hereafter, a generous mind would indulge in the practice for the natural gratification it brings.

Have you ever considered the possibility of capitalizing the loyalty of your co-workers and subordinates through the expression of your appreciation of their meritorious efforts when they strive to win your approval? We do not mean in a purely mercenary sense, but as a means to bring out the better side of human nature, and to develop talents that lie dormant because you have failed to encourage well directed effort.

Do you realize that many men are discouraged because their work has not elicited the expressed approval of their superiors? And, oftentimes feeling that it would be unappreciated, they are deterred from applying their personal initiative to the solution of problems which confront them.

Look around in your own industrial circle and see if it is not the man who judiciously expresses his appreciation of the work of his employees who is supported by the most loyal and efficient organization.

The ability to bestow a word or look of approval at the proper moment is often the determining quality in individual success.

If you lack sympathy, the men about you will reflect your spirit; they will not exert themselves to further your interests. It is also true that an unappreciative employer is generally an undervalued individual, and his organization is usually inefficient, due to internal dissensions.

If you are one of those men who appreciate good work, but have not realized the value of expressing your thought, commence a new policy at once. Perhaps you will soon learn why you have not had the cordial support of your subordinates, or maybe you will discover why you lost a valuable employee to a nearby competitor.

Men are anxious to work for the fellow who gives credit where credit is due. Such an employer always has able applicants on his waiting list. A boss can often do more good by the exercise of sympathy than by his labors, and he can render the world a more lasting service by the recognition of merit than he could ever render by the straining efforts of personal ambition.

To the great majority there come hours when life loses its song. Every man has moments when the iron seems to disappear from his blood. *Meet the next deserving but disheartened employee who comes into your office with a word of appreciation, and if the change in his demeanor and the lightness of his step when he leaves don't repay your effort, then we surely miss our guess.*

IDEAS AND SUGGESTIONS

The Liquor Problem in Mining

By Mine Superintendent

I have been a constant reader of Coal Age from the beginning of its history, and have noted with much interest the pages devoted to "Discussion by Readers." The various articles relating to the "Liquor Problem in Mining," have been of especial interest to me.

This interest is, no doubt, augmented by the fact that the "liquor traffic," and especially the "beer wagon" end of it, has been one of the most serious problems in the management of the properties over which I have the supervision; in fact, from the beginning of our operations until the present time, the beer wagon has been a constant menace, and is annually costing our company thousands of dollars.

In the earlier stages we were sometimes able to bluff the drivers and by threats of law enforcement keep them off the property for limited periods, but in a short time some new driver would make a trip, and as it is impossible to at all times keep a close supervision over the houses, would make deliveries, and a shut down, or operation with a reduced force of men, at greatly increased expense to the company, would be the invariable result.

We are located in a "dry" township, with seemingly no restrictions on the liquor traffic, except that no licenses are granted. Trucks and wagons delivering beer are a daily evidence that the solicitor is getting in his work and that the will of the majority who have voted the township dry is being defeated, and that there is either no law covering the situation, or that such a statute is not enforced by those whom we have elected to enforce the law, and whose oath of office binds them to such a course of action.

I have personally appeared before the district attorney of the county in which we are located, with names of persons who would testify to giving their orders and money to a solicitor, and to the beer being delivered to them by wagons within a few days, and have been told that we could get no prosecution in such cases, as it is impossible to prove a sale.

Travelers along the county road can see large piles of full cases and kegs left there by the trucks for the delivery wagons, or empties gathered by the deliveryman ready for the truck to return to the brewery.

Now my claim is that the liquor traffic is a menace to the coal operator, and a serious handicap in the working of mines. Furthermore, the law should be enforced in order that we may successfully operate our mines six days per week.

As a mine superintendent, I am expected by my employers to get results, and have a right to their aid and coöperation in making working conditions such that results will be obtainable. Yet the great body of coal operators who have power or influence in political affairs, do nothing to bring about the prohibition of this traffic that is lessening their profits, restricting their output, endangering their property and the lives of their employees. They are thus placing, or permitting to be placed a serious handicap upon every superintendent and foreman they put in charge. I feel that coal operators should, in justice to their investments, their management and their many employees, unite in their efforts to eliminate this traffic, which is doing more than any other one agency to restrict output and increase the cost of production.

⁂

Some Plain Facts about Anthracite

By Special Correspondent

How passing strange it is how long an evil reputation, no matter how undeserved it may be, will cling to a person, a business or an institution, even surviving long after all of the original parties to it are dust.

That applies cogently to the anthracite-coal industry, as both miner and operator have, as a whole, been the objects of severe and wholly undeserved public censure, because of the actions of an almost negligible portion of each. In the mind of the general newspaper reader the anthracite-coal operator is pictured as a combination of bandit and Shylock, battening upon the necessities of mankind, extorting the last penny from the poor on one hand and heartlessly oppressing and plundering his employees on the other.

A patient and unbiased investigation will reveal that 99 per cent. of the above picture is colored with wanton falsehood, frank ignorance and the political necessities of demagogues who seek to ride into office by advocating chimeras or by posing as the miners' friend and creating hatreds between employer and employee as a sign of their good intentions toward their clients. It is one of the unsoluble enigmas of our day that the more lurid and baseless an attack on an anthracite operator is, the more it is welcomed and the more prominence is given it in the columns of the press, while colorless truth and exact facts set forth by the operator are given little or no credence in the newspaper sanctums, and if referred to at all editorially, usually with a mingled sneer and derisive incredulity, the operator being held as a scoundrel *per se*.

About every demagogue in Congress, in the various state legislatures and in the city councils, has offered a "resolution to investigate the anthracite-coal monopoly," as though there were one, and said demagogue is prolific of sentiments saturated with libelous and unwarranted adjectives portraying the operator as the sum of unvarnished saturnine villainy.

In the loose terminology generally employed in discussing the anthracite situation, that industry is habitually written or spoken of as a "trust." The statement has no foundation in fact, save that created by nature herself, the inventions of mine appliances and the legislative enactments in behalf of the mine worker. Those three things are solely responsible for whatever resemblance the industry has to a trust. That can be proven as clearly as a problem in Euclid.

While hunting in 1792, Philip Ginter built a camp fire and accidently set fire to the "black stones," lying loose on Moosic Mountain. That was the genesis of the anthracite-coal industry. Its progress was slow, for in 1814 Jesse Fell, a pioneer operator, recorded in his diary that he had sold 50 tons, while the year previous his sales were but 22. It may be set down as an irrefutable fact that for a century after its discovery the investor in an anthracite-coal mine had about the same chance to get principal and interest back, as the usual run of "birdmen" have of safely returning to earth. There were enough exceptions to prove the rule, of course, yet until 1892-5, when the large anthracite properties were virtually forced upon their present owners by bankrupt and disheartened investors, the stocks of the general run of anthracite-coal companies were shunned by far-sighted and prudent investors.

The truth of the matter is that the present owners of the mines, continually spoken of as a trust, were very reluctant to invest in the mining properties at all, and the stocks were virtually forced upon them. No secret is betrayed when it is declared that the men who disposed of their stock to the supposititious "trust" believed, as some of them also stated, that they had gotten rid of a "dead horse." It is one of the peculiar facts of that sale that one of the three men principally responsible for the selling owned the newspaper which has been the most persistant and virulent critic of the "anthracite coal trust." There is a tale connected therewith which, if set forth plainly, would throw a flood of light upon business, political and financial affairs in Pennsylvania.

In reply to the criticism, iterated and reiterated ten thousand times last fall and winter, that the "anthracite-coal trust was extorting exorbitant prices for coal from the poor," the operators in sober truth replied that "no change whatever has been made in circular prices;" still the charge was made.

To the further assertion of the operators that by buying a supply in summer, the consumer would not only get coal cheaper, but he would also prevent any chance of a "coal famine" in cold weather, the "learned Thebans" of the press reply that the poor man has neither the cash to buy a supply nor a place to store it. To this branch of consumer then we will try to show plainly that the operator has no part whatever in causing him to pay more than a fair price for anthracite coal.

Standing on South Halstead Street, Chicago, I heard the following colloquy between a woman who sought to buy some coal and a retailer who, among other commodities, sold coal by the pail and basket.

"What," asked the woman, "is the price of a basket of hard coal?"

"Forty-five cents delivered, or forty cents if you take it yourself," replied the dealer.

"How much does it weigh?" queried the woman.

"Fifty pounds, full weight," answered the dealer.

The woman bought a basket and asked why coal was always getting higher in price, to which the dealer replied by emitting the usual tirade against the operator, the least objectionable term he used in characterizing the coal producer being that of "robber," and at the same time he expressed the greatest sympathy with the poor.

Outwardly I paid no attention to the transaction or conversation, but upon my return that evening I bought a basket of coal, which the dealer repeatedly told me was the genuine Scranton hard coal. Upon weighing it at home, I found it was four pounds short in weight. That is to say, I paid at the rate of $17.38 for 2000 lb. of "genuine Scranton hard coal."

But the short weight was not the worst part of the transaction by any means. Taking the coal from the bag, I spread it out on a paper on the floor and found that a little over half the coal was Indiana block coal, screened to the chestnut size. Now examine the proposition in its true light.

The Indiana block coal cost that small dealer $4 per ton from the retail coal yards, while the "genuine Scranton hard coal" cost him $8 per ton at the lake front. Let us say, in order to be within the truth, that that basket of coal was mixed with equal parts of both kinds of coal, then that small dealer got $17.38 for coal that cost him but $6.

That transaction aroused my curiosity, and I made a searching examination among that class of coal dealers, calling on over thirty petty salesmen in various parts of Chicago, and short weight was an almost unbroken feature. Where coal was bought by the bucket, the rate at which it was sold was seldom under twenty dollars per ton.

Another almost universal feature was that these petty dealers never lost a chance to defame and vilify the operator, whether the coal sold was anthracite or bituminous. Do not for a moment think that the retail dealer with a yard and scales of his own resorted to any such practice or used any such language. It was in all cases a dealer whose stock seldom reached ten tons at a time.

It is within the bounds of truth to say that fully twenty-five thousand families in Chicago buy their coal in that way, and are habitually subjected to short weight and extortions and the extortioner invariably places the blame upon the operator. Just as a wave widens when a stone is thrown in a body of water, so the multiplicity of these baseless charges have created a wave of resentment and ill-will toward the coal operators that finds expression in editorial comment and the senseless and crippling legal enactments which create the very conditions their authors design to prevent by them.

⁂

The Cost of Bath Houses

The cost of installation of baths and fittings does not vary much, according to William Walker, Division Inspector of Mines for Scotland. In Germany the average cost is $25 and in Belgium $20 per person using the facilities. One bath house in Belgium, which was 123 ft. long by 74 ft. wide by 39 ft. high, and was completely fitted out with walls of glazed brick, cost $24,000. This accommodated 800 men. The Belgian law has the peculiarity that the men are not permitted to bathe in sight of one another, but each must have a separate compartment in which to take his bath.

A bath house in Westphalia which was built of a size to allow 2000 men to bathe in three-quarters of an hour, cost $50,000. At the Wharncliffe Silkstone Colliery in England a bath house was built at a cost of $3000, having 14 baths and 48 lockers. The cost of upkeep of this bath house is about $7 a week.

Coal Shipping on the Great Lakes

By J. W. Chamberlin*

SYNOPSIS—The movement of coal up the Lakes during the summer season is one of the most interesting transportation problems in the coal industry. The Lake shippers believe they have the most advanced and modern systems of handling coal. The necessity of such is obviously much more essential, due to the short haul and relatively greater proportion of time required in loading and unloading. This is the first of a series of articles that will discuss all phases of the Lake trade.

⁂

The coal trade of the Great Lakes, although comparatively new, has already attained to great proportions. Pennsylvania produced less than 2000 tons in 1820, but as there are no mines within mule-hauling distances of the Lakes, it is certain that the railroad, in 1830, must have preceded that traffic. "Railroading" began with the completion of the Erie to Dunkirk on Lake Erie in 1851. The first real incentive to lake navigation, at least from one lake to another, must have been given by the growth of Chicago, which was not settled till 1831.

Ashtabula Harbor, One of the Largest Coal and Ore-Handling Ports in the World

Early History of Lake Transportation

There was, however, a big impetus given to the coal trade by the opening of the Erie Canal, connecting the lakes with tidewater, in 1825. Coal, practically all anthracite, came to be one of the common articles carried by the canal. It was taken by canal-boats in probably not more than 100-ton lots to Buffalo, where it was hoisted by derrick to the lake wharf and was loaded on sailing vessels for the most part with wheelbarrows. An old Buffalo ship-store owner states that once a very big record was made by the wheelbarrow process in loading the ship "Erastus Corning" with 1400 tons of coal in 14 hours!

Lake vessels are now being loaded at the rate of 1000 tons an hour. Buffalo in those days received anthracite by canal through Seneca and Cayuga Lakes and from Rondout on the Hudson. It appears that since the days of the "Erastus Corning," which was built in 1867, both carrying and handling capacity have increased tenfold, for there are quite a number of modern steamers that will carry more than 14,000 tons of bulk freight on maximum draft. It is, of course, the shallow depth of the lake harbors and connections that makes it necessary to build all lake craft so broad and flat and which unsuits them for ocean carrying and *vice versa,* except in a limited way. Sometime in the '80's the steamer "Roanoke" was brought up from Tampa Bay to the lakes, and, though she could load down to about 26 ft., she could hardly get into any lake harbor with a cargo of more than 600 tons.

Water Depths and Methods of Handling Coal

As a rule, all lake craft must be loaded to a depth of less than 20 ft. and there are a good many harbors, especially in the upper-lake lumber districts, that are not more than 15 ft. deep. In these the primitive "horse dock," the terror of the coal shipper, still prevails. The vessel must wait for its coal to be hoisted out by a bucket moved by horses so that extra freight paid, at least 10c. a ton, is demanded to these points, with tonnage hard to get at any rate. Such shallow harbors are disappearing now, however, for if there is natural traffic enough to warrant the outlay they are deepened, and if not they are soon distanced by the rush of improvement elsewhere. The report from the two inter-lake passages, on which the shipmaster relies for his depth of draft (the Lime Kiln crossing below Detroit and the Poe Lock at Sault Ste. Marie) for the opening of this season, makes the former navigable at 20 ft. and the latter at 18.08 feet.

---

*90 Johnson Park, Buffalo, N. Y.

THE PITTSBURGH COAL CO.'S FUEL LIGHTER "PITTSBURGH"

Up to the organization of the Lake Carriers' Association at Buffalo in 1885, the government had given anything but cordial aid to lake navigation, the tidewater and general Eastern and Southern marine interests claiming the lion's share of assistance and getting it. Since that time, government aid has become much more liberal all over the lakes, till they now boast many important improvements, such as the Poe Lock at the Sault, the Livingstone channel in Detroit River, the Straight channel at Toledo, the four-mile breakwater at Buffalo, etc. All these assist navigation in some special way, largely by deepening draft. The much-canvassed Chicago drainage canal, government permission for which was given in 1901, should have a tendency in the opposite direction. The Lake Carriers' Association, in a recent report, gives some color to the belief that it reduces lake levels from 0.5 to 0.8 ft. Natural causes so influence these levels that it is not easy to determine the amount.

The anthracite trade by lake early found that the best method of handling from car to vessel was by trestle, the loaded cars being run upon it by locomotive or stationary machinery and the coal dumped or shoveled into the pockets beneath, from which it is rapidly spouted down the hatchways of the vessel. The trestle of the Delaware, Lackawanna & Western, at the mouth of Buffalo River, is an excellent example in this line. This trestle was built in 1879 and is now the oldest of its kind in Buffalo. It has 41 pockets, which vary in size according to the elevation of the tracks above them; these latter are laid on a gravity plane to facilitate the moving of a car after it is hoisted to the top of the trestle. The entire pocket capacity is about 4500 tons, the iron-lined wooden pockets being filled from three parallel tracks.

LOADING TRESTLES

When the lake craft was comparatively small it was easy to spout the coal into the hold from the pockets, but the decks of the 400- and 500-ft. steamers, when light, are much higher from the water, so that it is now occasionally found necessary to adopt various devices to list them over so the coal will flow down the spouts.

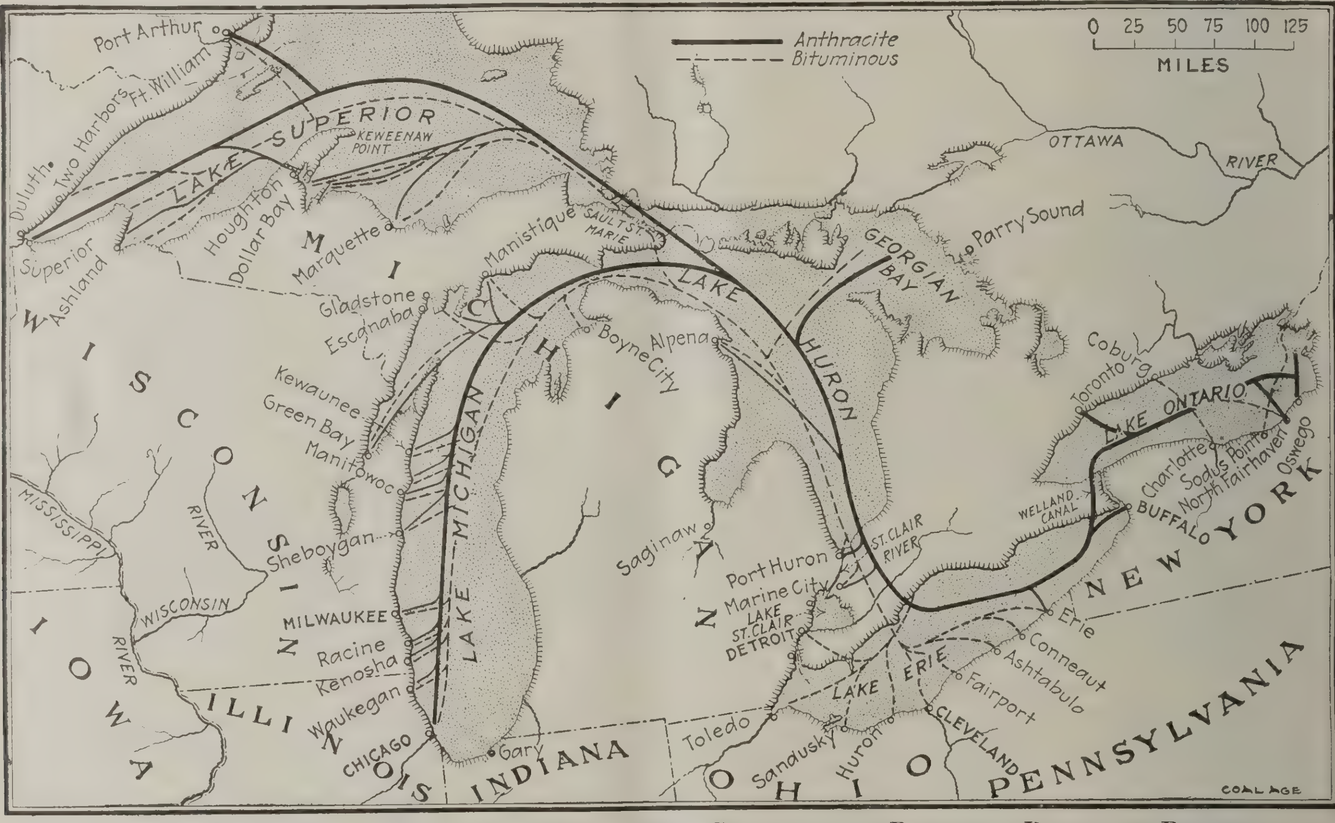
There are now four water-shipping trestles in Buffalo

STEAMER "SULTANA" OF THE TOMLINSON LINE PASSING OUT OF THE AMERICAN "SOO" LOCKS

Harbor, the Delaware, Lackawanna & Western just mentioned, the Lehigh Valley, the Erie (operated by Williams & Peters) and the Philadelphia & Reading. All hoist the loaded cars by stationary machinery, except the last named, which is operated by a locomotive incline. There are also a number of docks or trestles for fueling the steamers, including those of Frank Williams & Co., E. L. Hedstrom, Pickands, Mather & Co. and the Buffalo, Rochester & Pittsburgh R.R. The coal (always bituminous) is dumped into small pockets from the cars, whence it is drawn out into five-ton iron buckets and hoisted to the flat deck of a fuel scow, which is then towed to the lake steamer, or propelled by its own steam, and the buckets dumped into the bunkers. This is an improvement over having the steamer to go to the fuel dock for bunker coal, especially in the saving of time. Where the steamer takes a cargo of coal the fueling is done from the trestle that furnishes the cargo.

Buffalo does not ship bituminous coal by lake. Rail freight rates are too high, as compared with those to Erie or the Ohio ports. The rate from the Allegheny Valley mines to Buffalo is $1.10, as compared with 78c. from Pittsburgh to the Ohio ports, and a still lower rate has been made this season to Erie. Quite a number of years ago the Rochester & Pittsburgh, having its own coal and railroad, undertook to meet this competition and one season shipped about 150,000 tons of bituminous by lake, but it dropped out of the business after two or three seasons. The only port that ships both anthracite and bituminous extensively by lake is Erie, which till lately used the trestle chiefly for anthracite and the car dump for bituminous. There are no car dumps in use at lake ports below Erie. The Buffalo, Rochester & Pittsburgh R.R. put one in at Buffalo for loading its bituminous lake shipments, but took it out on retiring from that trade. Though either sort of coal could be handled by either trestle or dump, the conditions favor the trestle for anthracite and the car dump for bituminous.

The coal trade of Lake Ontario is in a peculiar condition. It is essentially separated from the other lakes by the fact that the Welland Canal connecting it with Lake Erie and the upper lakes admits vessels of only about 14 ft. draft and there are but few that can load more than 2000 tons on that draft and at the same time accommodate themselves to the canal locks, which are only 270 ft. long by 45 ft. wide. On that account the trade of Lake Ontario is largely confined to ports on that lake or on the St. Lawrence River, though two or three shippers of anthracite at Oswego still send cargoes to the upper lakes. For instance, of the 686,417 gross tons of anthracite shipped in 1911 from Oswego, 209,948 tons cleared for the upper lakes. The other ports on that lake, North Fairhaven, Sodus Point and Charlotte, practically confine their operations to ports below the Welland Canal.

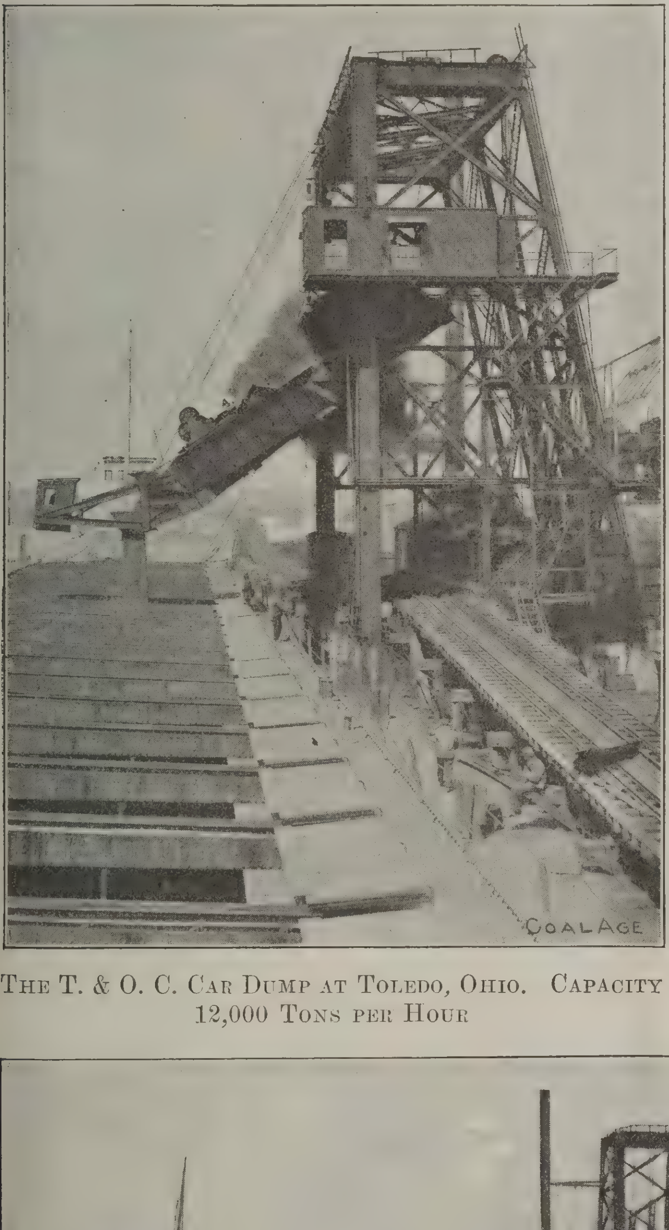


Map of the Great Lakes Showing Principal Shipping and Receiving Ports and Routes

On this account the tonnage on Lake Ontario is very small, cargoes often running down to 200 or 300 tons and vessels hard to get at that. Still the coal trade on that lake keeps up and in some instances increases. Anthracite shipments from North Fairhaven were 100,000 tons in 1911 and 150,000 tons in 1912, and the other shipping ports were holding their own well. There are three shipping trestles at Oswego, the New York, Ontario & Western, the Delaware, Lackawanna & Western and the Delaware & Hudson, the last not shipping heavily by water since the opening of its rail line to Montreal. Anthracite only is shipped from Oswego, and this is also the chief product shipped out of North Fairhaven, where the Lehigh Valley Co. has a trestle. The principal shipments from Sodus Point, where the Pennsylvania R.R. has a trestle, are bituminous. At Charlotte the Buffalo, Rochester & Pittsburgh R.R. and the Grand Trunk Ry. operate a joint car ferry to Coburg, Canada, which handles practically all the water coal there; this was formerly about all bituminous, but it is reported that the anthracite shipments will be increased this season. The ferry runs all winter.

Freight Rates

There has been little change in the numerous receiving coal ports on Lake Ontario and the St. Lawrence River in late years. Most of them receive coal in small amounts, the leading ports being Montreal and Toronto. Hamilton, a large coal port some years ago, has shifted to all-rail traffic. Canadian consumption of Pennsylvania coal is increasing, and it appears that the Lake Ontario route is to get its share. There is much need of more tonnage and larger vessels. Some shippers in Buffalo and elsewhere not long ago became tired of conditions on Lake Ontario and sent their coal to Erie, Conneaut and other Lake Erie ports, for shipment to the Lake Ontario listrict, but rates have gone up so sharply that they are likely to return to the old routes. The water rate from Lake Ontario to the upper lakes is usually 40c. a gross ton over the Buffalo rate; other rates vary. Buffalo water rates are always reckoned per net ton.



The T. & O. C. Car Dump at Toledo, Ohio. Capacity 12,000 Tons per Hour

Coal-freight rates from Lake Erie have undergone a great decline in recent years, though anthracite and bituminous freights do not differ much during the same season. The palmy days of the wooden vessel, commonly a steamer with one or more consorts, was in the '80's, coal rates reaching their maximum about 1888, when the rate, Buffalo to Chicago, was 75c.@$1; to Milwaukee, 75@90c.; to Duluth, 50@60c.; to Toledo, 25@50c. But the steel vessel was already in the trade and making itself felt, so that the rate in 1889 fell to 45@60c. to Chicago and Milwaukee and 25@50c. to Duluth. From that time the decline was steady, settling down early in this century to 40c. to leading Lake Michigan ports and 30c. to Duluth and most other Lake Superior ports.

Moreover, these later rates are practically without fluctuation the season through, for they are entirely controlled by the shipper; because of the large amount of tonnage between Lake Erie and the upper lakes, a high rate is possible only just at the close of the season, when none but the more venturesome of vessel owners would send a steamer out. In the old days the situation was largely controlled by the vessel, as the tonnage was generally inadequate to shippers' needs and was always in demand. For this reason fluctuations in rates were often of almost daily occurrence.

The lake trade has almost always been highly profitable to vessel owners until quite recently, one reason being that it has been easy to obtain full cargoes both ways. Perhaps for the money invested and the simplicity of the undertaking no traffic in fairly recent times was more satisfactory and generally profitable than in these same '80's, when the "canal-schooner" trade was so brisk between Buffalo and Toledo. The up-trip, just the length of Lake Erie, was made with 600 tons of coal at 50c. a ton and the return with 20,000 bushels of wheat at 2@3c. a bushel.

Freighter "Champlain," 8500-Ton Capacity, Loading at the T. & O. C. Dock at Toledo

Coal-Cutting Machinery in England

By Sydney F. Walker

SYNOPSIS—A résumé of some of the circumstances and conditions which have made the introduction of coal-cutting machines rather more backward in England than it has been in this country.

⁂

Coal-cutting machines have been employed to a much larger extent in America than in either the United Kingdom or in Continental Europe. Americans, as a rule, appear to be able to use and handle machinery that has been designed to economize labor, much better and more intelligently than the bulk of men who are employed for the same purpose in the countries east of the Atlantic.

The compressed-air coal puncher which has been largely used in America, has almost entirely failed in England, and at the present time there are but few of these machines in use in the United Kingdom.

A machine, which has taken the place in Great Britain which appears to be occupied in America by the puncher, is the radial coal cutter, which goes by various names. It is really a precision drilling machine, arranged to sweep out an arc in any direction; horizontal, vertical or at any angle that may be desired. In narrow working places, such as are employed in the north of England, it is nearly always necessary to "nick" the coal, as it is termed. This is to cut a vertical incision on each side of the working face as well as undercut it, in order to minimize the use of explosives and bring down the material in convenient form. The radial coal-cutting machine, which may be taken down until the parts can be easily carried from place to place, is handy indeed for nicking as well as undercutting in this class of work.

Practically the only reason for the employment of coal-cutting machines in the United Kingdom is the reduction in cost which may be effected. Take, for example, a seam of coal 18 in. thick in a certain Yorkshire colliery, the cost for undercutting by hand was $1.75 per ton; this expense was sufficient to practically debar the coal from the market. When the diamond disk machine was introduced, the cutting cost was reduced to 75c. and the whole of the seam in question could then be worked and sold to advantage.

Machines Produce Less Slack

Some years ago, it was claimed by the makers of coal-cutting machines, and this claim has been borne out to a large extent by experience, that a much smaller proportion of fine coal was made by a machine than by hand cutting. This, of course, is a natural result. The disk or bar machines cut a kurf under the coal of just sufficient vertical height to allow the passage of disk or bar and provide for the coal coming down. Except where the ground is much broken up by nodules of iron pyrites or by irregularities in the strata, this kerf is fairly uniform in section.

In order to cut well under the coal, in hand mining the miner is compelled to remove a sufficient quantity to allow his head and shoulders going under the outer edge of the face. He must also chip out enough material to allow the swinging of his pick. Such a process necessarily produces a large amount of slack.

After the successful introduction of coal-cutting machines, it was found in many cases where undercutting had been performed and the shots fired that the coal simply settled onto the strata below in some cases at least, breaking up but very little. This entailed additional labor for reducing the large blocks to such sizes as could be easily loaded into the mine cars.

It should be noted that the coal puncher closely approaches the results obtained in hand mining and makes practically as much small coal as the latter method. Where the output of the mine goes to coke ovens, it is immaterial, so far as the mining process is concerned, how much slack is produced since it is all ground or pulverized before being coked.

Machines Advance More Regularly

In working coal measures on the longwall system, there are other advantages which may be obtained by the employment of coal-cutting machines; among these might be mentioned more regular working, a more uniform advance of the face and greater safety in working conditions generally. With hand undercutting, the face may be and frequently is, advanced in an irregular manner, while with machine work the whole face advances at the same rate. This leads to economy in the use of timber and safer working conditions generally.

In a considerable number of British collieries, the coal overlies a fireclay, which may be either hard or soft in its consistency. Not infrequently the undercutting is done in this material, and the inconvenience and difficulty encountered because of the soft and yielding floor, may be overcome by mounting the machine on skids rather than wheels. There seems to be a general tendency toward skids, more and more in place of wheels and rails, for although the power required to draw the apparatus along the face is greater, yet the machine itself is more independent and flexible. Furthermore, when employing skids or similar devices, it is not necessary to have the face of the coal either level or straight.

The only locations in Britain where the economy of the coal-cutting machine is questionable are in the collieries mining a particularly soft coal. This is especially true of the mines in South Wales, where the coal is peculiarly soft, and may be cut and brought down with extreme ease. It is here difficult to devise a machine that will show marked economy over hand labor, in spite of the fact that the miners are paid large wages.

In some of the English collieries the method of working is such that the coal face is extremely long. In Yorkshire, in some cases, the working face is 900 yd. in length, there being several such faces in a single colliery. The ideal of one mining engineer who had been largely instrumental in the development of the coal-cutting machines, was a continuous circular face with a number of machines continuously chasing each other, so to speak, around it, the machines being spaced a sufficient distance apart to allow the coal which was cut each night to be loaded out during the next day. In Scotland, the practice, in some collieries at least, is to have a working face about 100 yd. in length, which is cut across during each cutting shift and the coal loaded out during the following haulage shift, the same as in Yorkshire.

Mines of the Continental Coal Corporation

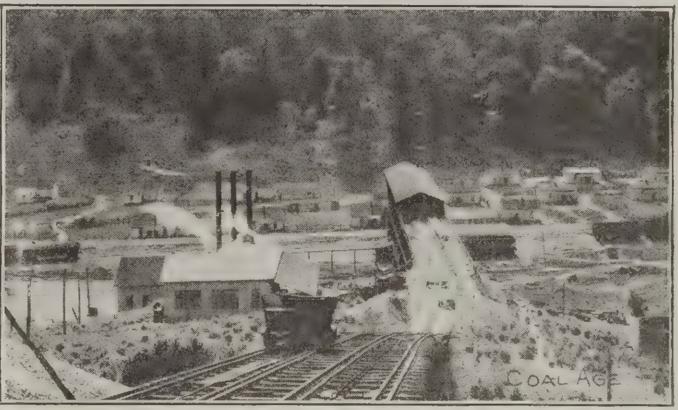
SYNOPSIS—The Continental Coal Corporation, having acquired 16 independent mines, is about to operate them all from a central station.

⁂

The Continental Coal Corporation was formed through the consolidation of nearly a dozen different companies, operating 18 different mines in southeastern Kentucky and mining a high quality of coal. The work of uniting the operations of the mines has not been completed, but it is intended to effect economies in operation through central power houses, etc.

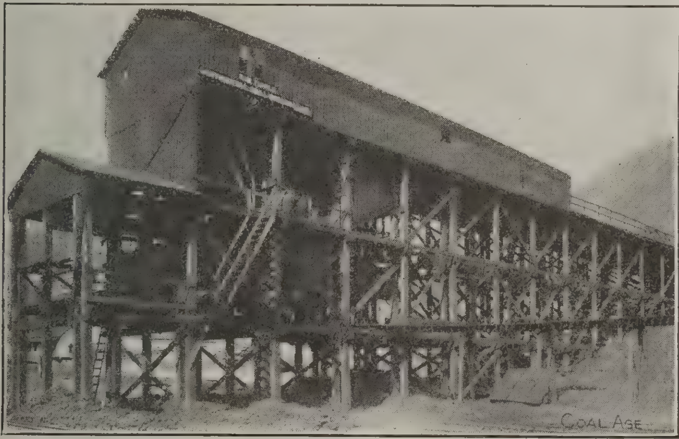
RIM NO. 4, BELL COUNTY, KY.

(This mine, having an output of about 1000 tons a day, is in the Four Mile Creek district, and is one of the two mines working the High Rim or Hickory seam.)



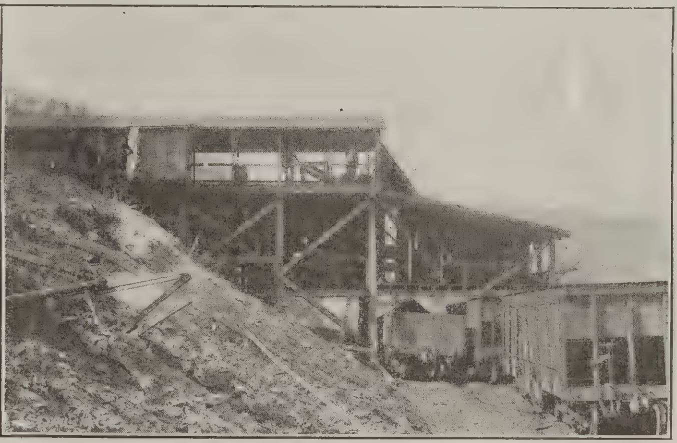
INCLINE AT RIM NO. 4

(The cars passing down this slope are restrained by a barney. The coal thus lowered is dumped to supply the locomotives of the Louisville and Nashville R.R.)



TIPPLE AT RIM NO. 4

(One of the big tipples of the Continental Coal Corporation.)



TIPPLE AT ARJAY, KY.

(A less pretentious tipple of the same company.)

The holdings of the companies reach a total of about 35,000 acres in Bell County, eastward and northward from Pineville, Ky. They are situated along the Cumberland Valley division of the main line of the Louisville & Nashville R.R., which serves the mines through its various branches. Eastward from Pineville, up Straight Creek and its forks, are nine mines, named Geraldine, Glendon, Arjay, Cory Nos. 1, 2 and 3, Castro and Barker Nos. 2 and 3. A mile down the Cumberland River, northwest from Pineville at Wallsend, are two mines, Nos. 1 and 3. Three miles farther down the river, and up Four-Mile creek, are seven mines, known as Black Raven, Rim Nos. 1, 3 and 4, No. 5, Black Bear and Cub. Of a total of 18 separate mines, some are so located as to permit one tipple to handle the coal from two or three openings. The duplication of mine numbers is due to the separate ownership preceding the consolidation.

All but two of the mines are working the Straight Creek bed of coal, which is of a high quality. Mines Nos. 4 and 5 on Four-Mile creek work the Rim or Hickory seam, lying about 90 to 100 ft. above the Straight Creek bed at this point. There are numerous other available seams higher in the hills as well as below drainage.

The Straight Creek coal is a free-burning bituminous suited for steam, gas and domestic uses. An analysis made by the United States Navy Department gave the following results:

Carbon	63.40
Volatile matter	33.17
Moisture	2.23
Ash	1.20
Total	100.00
Sulphur	0.68
B.t.u. per lb. dry	15.103

The company has introduced many forms of social betterment. A thoroughly equipped hospital is maintained in Pineville and five physicians are in the service of the company at the several groups of mines. First-aid corps are maintained, one of the crews winning the first-prize trophy at the meeting of the Kentucky Mining Institute in May of the present year. At each of the camps there are baseball and basketball teams which are the champion organizations of southeastern Kentucky.

The height of coal that is being mined varies from 5½ ft., as at the Rim No. 4 mine, where the Rim seam is being worked, to 30 in. in the Wallsend mine, working the Straight Creek bed. The coal is all machine mined, being undercut by shortwall machines.

Two Exterior Views of the Barker Mine

(The grade at Barker favors the loaded cars. Nevertheless it is not customary to let the locomotive follow the wagons out of the mine. Instead it takes the lead and crosses over by the connection shown, and is attached to the front end of the empty trip.)

(Hauling a trip of loaded cars from No. 2 opening of the Barker mine by a 10-ton Goodman, single-motor, electric locomotive. The distance from the tipple to the mine opening is about a quarter of a mile. The cars are gathered inside by a 6-ton locomotive.)

Two Interior Views at the Wallsend Mine

(A low-type Goodman locomotive chaining loaded cars to the end of a rope-haulage system. The cars in the rooms are pushed both ways by the miners and trips are gathered on the entries by a 5-ton locomotive.)

(A Goodman shortwall machine entering a low room. These machines stand 25¼ in. above the rails. Consequently they can enter rooms only 30 in. high on tracks laid on the floor. No rock is taken down in the rooms.)

⁂

Illinois' Eight-Million-Dollar Coke Production

The production of coke in Illinois in 1912, amounted to 1,764,944 short tons, valued at $8,069,903, against 1,610,212 tons, valued at $6,390,251 in 1911, acording to E. W. Parker of the U. S. Geological Survey. The average value per ton advanced from $3.97 to $4.57. In spite of the increase in production Illinois dropped from fourth to fifth place in rank among the states, because of the much larger increase in Indiana that followed the putting in blast of the entire plant of 560 koppers ovens of the United States Steel Corporation at Gary, which advanced that state from sixth to third place.

All the coke produced in Illinois in 1911 and 1912 was made in byproduct ovens, much of the coal being drawn from West Virginia mines. No bee-hive coke was produced in the state. In some of the ovens the charge consists of a mixture of West Virginia and Illinois coal in the proportions of 4 to 1. This has been found to make an entirely satisfactory coke.

There were four retort plants with a total of 568 ovens in operation in 1912. One of these plants consisted of 240 Semet-Solvay ovens operated by the By-product Coke Corporation at South Chicago. This plant has been enlarged three times, the latest addition of 40 ovens being completed in 1912. Thirteen of the same kind of ovens were operated by the North Shore Gas Co., at Waukegan, having been completed in 1912. These ovens are heated by producer gas made from the coke.

A plant of 280 koppers ovens was operated by the Illinois Steel Co., at Joliet, built in 1908 and 1909, and another of 35 by the Coal Products Manufacturing Co., also at Joliet, completed in 1912. The surplus gas from the former is used at the steel plant.

Nonfatal Injuries in Bituminous Mines

By F. L. Hoffman*

SYNOPSIS—The nonfatal-accident rate in bituminous mines is almost equal to that in anthracite workings. The conjugal relations of the injured are closely the same in both fields and the main differentiation between the regions is to be found in the fact that the percentage of injuries to the head and arms is greater in the anthracite region. In the bituminous field the workers receive a larger percentage of injuries to the body and lower limbs.

⁂

In Coal Age of May 31, 1913, I had occasion to discuss at some length the nature of nonfatal injuries in anthracite mines. To make the study complete and to provide the required data for comparison I have brought together the corresponding information for the bituminous coal mines of Pennsylvania, also for the period 1907-1911. There were, in the aggregate, 5602 nonfatal accidents, or 6.04 per 1000 men employed. The inside nonfatal accident rate was 7.22, and the outside rate, 0.42 per thousand. These rates require only to be stated to emphasize the incompleteness of the returns, which are obviously limited only to the more serious casualties.

The same conclusion applies to the anthracite statistics, for, as shown in the article to which reference has just been made, the nonfatal-accident rate for the anthracite region was 6.71 per 1000. Whether the risk is really less in the bituminous region is a matter of conjecture, for there are no means by which it is possible to determine whether the returns are more complete for the one coal field than for the other. In view of the ever-increasing agitation for adequate workmen's compensation laws it is, however, of the utmost importance that all accidents causing disablement for work should be reported, so that a complete statement of the facts may be available and may properly guide those charged with the responsibility for framing more or less far-reaching statutory requirements. Table I exhibits in a convenient form the nonfatal accidents in Pennsylvania bituminous coal mines for the period 1907-1911, together with the comparative rates for anthracite mines, discussed in my previous article.

TABLE I. NONFATAL ACCIDENTS IN PENNSYLVANIA COAL MINES, 1907-1911

	Bituminous		Rate per 1000	Anthracite		Rate per 1000
Year	Employees	Accidents	employed	Employees	Accidents	employed

Liability to Accident as Affected by Age

Table II exhibits the age distribution of the injured as determined by means of a special analysis of the facts reported in detail in the returns to the Department of Mines, and for purpose of comparison I also add the corresponding percentages for the anthracite mines.

According to this comparison the age distribution of the injured was about the same in both mining districts, for if the age periods are combined in more convenient form it appears that at ages under 25 the proportion of injured was 30.4 per cent. for the bituminous region, against 32.1 per cent. for the anthracite, whereas at ages 50 and over, the proportion was 7.6 per cent. for the bituminous, against 8.6 per cent. for the anthracite. In other words, the proportion was slightly higher for the two extremes of life in the anthracite region, but the differences are not of sufficient importance to indicate material variations in the accident liability of anthracite and bituminous mining as affected by the ages of the employees. It is a matter of regret, however, that the corresponding age distribution of the employed should not be available for the correct calculation of casualty rates, by divisional periods of life, but even under the present limitations the foregoing table is of much interest and some practical utility.

TABLE II. AGE DISTRIBUTION OF PERSONS INJURED IN NONFATAL ACCIDENTS IN PENNSYLVANIA COAL MINES, 1907-1911

Slavonians Lead List of Foreign Born Injured Nonfatally

Table III exhibits the nativities of those injured in bituminous coal mining, together with the corresponding percentages for the anthracite coal field.

This comparison is quite instructive and makes clear the wide difference between the nativities of the mining populations in the two coal regions. It is shown that the proportion of Americans injured was about the same, but that the predominating foreign nativities appearing in the accident returns of the bituminous coal regions

*Statistician, Prudential Insurance Co. of America, Newark, N. J.

were: Slavonians, Italians, Poles, Hungarians and Austrians, in the order named, and in the anthracite region: Poles, Lithuanians, Italians, Slavonians, Irish and Scotch. In the bituminous region the proportion of accidents which occurred to men born in countries where English is spoken was 30.7 per cent., against 38.7 per cent. in the anthracite mines.

It is impossible to state what percentage of the men of any nativity received nonfatal injuries since the miners having any given nativity have not been separately enumerated. If it were feasible to calculate precise death rates by nativity much valuable information would be gained regarding the greater or lesser accident liability of some foreign elements than of others. Some have possibly a better aptitude for underground work or a longer mine experience, which, it may safely be assumed, counts for much, although accidents are likely to occur even in the case of the most careful men with many years of underground experience.

The Accidents of Married Men Roughly Equal in Number Those of the Unmarried

The statistics of injured mine employees differentiate only the married and single, and do not mention the widowers, although it would be of considerable importance to have this fact stated, since in workmen's compensation legislation the awards are made to depend more or less upon the number, and degree of dependence, of surviving members of the family. It is, however, extremely suggestive that even according to the present crude nonfatal-accident statistics in Pennsylvania coal mines the conjugal condition of the injured should be shown to be almost the same. The proportion of injured married employees, for illustration, in the bituminous coal mines of Pennsylvania was 55.5 per cent., against 56.1 per cent. for the anthracite region. Recalling that much the same result was obtained in the analysis of the age distribution of injured employees, the conclusion would seem warranted that there are probably no pronounced differences in the method of reporting nonfatal accidents, for, in both mining sections only the more serious casualties appear to be recorded.

The causes of injuries have been classified in reasonable detail in the table which follows, and the minor occupations have been grouped on account of the required limitation of space. As pointed out in the previous article, for scientific purposes, reference to the occupations in detail would be useful, but the value of the analysis diminishes with the decreasing numbers yielded by a minute classification, which can only be made to advantage for a much longer period of time or upon the basis of much more complete returns than are at present available.

For a full understanding of the accident problem in bituminous mines it is necessary to take into account the relation of particular occupations to the prevailing causes of accidents, as quite fully set forth in Table IV, which also shows the percentage distribution of such causes for inside and outside employees combined.

Table IV is self-explanatory and requires no extended discussion. It is shown that the most common causes of accidents in bituminous mines were falls of slate or roof, accounting for 37.5 per cent. of the total, followed by mine cars, accounting for 29.1 per cent., and accidents due to falls of coal, responsible for 16.4 per cent. of the nonfatal injuries from all causes. These three principal groups of causes, therefore, accounted for 83 per cent. of the nonfatal accidents from all causes.

The next and most important table of the present discussion (Table V) exhibits in considerable detail the parts of the body injured in nonfatal accidents in the bituminous mines of Pennsylvania. The table conforms in its arrangement to the corresponding table for nonfatal accidents in anthracite mines as published in the article to which reference has previously been made. This analysis, as far as known, is the first contribution of its kind to a more scientific study of the accident problem in mining, and the table is deserving of the most careful study on the part of mine managers, mine physicians, and all others interested in the safety and comfort of mine employees.

The table emphasizes the great importance of thoroughly equipped departments of first aid to the injured, although as previously pointed out, a large number of the minor nonfatal accidents are unquestionably not reported at the present time. The proportion of unspecified injuries in the case of bituminous mines was only 3.2 per cent., against 7.5 per cent. for the anthracite region, and the proportion of multiple injuries combined and not available for tabular analysis was also less in the bituminous than in the anthracite, or, respectively, 4.1 per cent. against 6.5 per cent. In time, as mine man-

agers, physicians and inspectors realize the importance of accuracy and completeness of accident reports, the number of ill-defined or incomplete returns will naturally diminish. In this respect, however, the returns for the bituminous region are apparently much more satisfactory than the statistics of the anthracite coal field.

THE PERCENTAGE OF INJURIES OF THE HEAD AND ARMS TO INJURIES OF THE WHOLE BODY IS LOWER IN BITUMINOUS THAN IN ANTHRACITE MINING

The information contained in the preceding table is summarized in a more convenient form in Table VI, which follows, and which, for purposes of comparison, includes the corresponding percentage distribution of injured parts for the anthracite region.

This comparison is particularly suggestive and an important contribution to the scientific study of the mine-accident problem of Pennsylvania. Although the nonfatal-injury rates are about the same, or, as stated at the outset, 6.04 for the bituminous, and 6.71 per 1000 for the anthracite region, the nature of the injuries differs materially, or, as shown by the table, in the bituminous region 7.6 per cent. of all the accidents are injuries to the head, face, eyes and nose, against 12.1 per cent. for the anthracite region; and 13.2 per cent. of the injuries are to the shoulders, arms, rwists, hands and fingers, in the bituminous region, against 21.1 per cent. in the anthracite. In marked contrast, injuries to the collar bone, ribs, trunk and internal parts of the body are much more frequent in the bituminous region, accounting for 18.6 per cent. of the total injuries, against 11.3 per cent. for the anthracite mines.

Injuries to the lower extremities are also more common in the bituminous region, accounting, respectively, for 53.4 per cent. of the total, against 41.5 per cent. for the anthracite. An element of error, however, underlies these figures on account of the larger proportion of ill-defined and unclassified injuries in the anthracite region, or, respectively, 14 per cent., against only 7.3 per cent. for the bituminous.

Cost of Compensation

It does not fall within the limits of the present discussion to apply the preceding analysis to the concrete problem of workmen's compensation, and the question of aggregate expense which would fall upon the mining industry if all of these injuries were paid for in conformity to a specific and scientific schedule. We should take into consideration that, in all probability, a considerable number of nonserious injuries in the mining industry are not reported at the present time, but a large number of such casualties would at once become a matter of official record and require compensation in the event of the adoption of a liberal workmen's compensation statute for the benefit of those employed in the anthracite- and bituminous-mining industries.

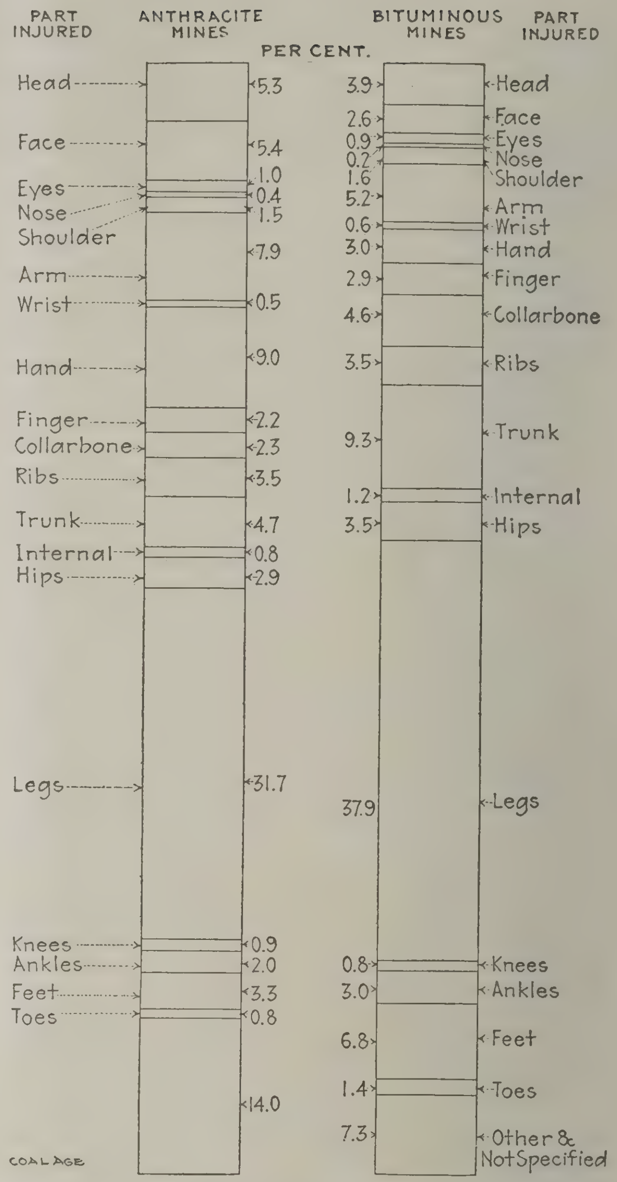
As pointed out in the previous article, on the British basis of $24.70 per accident, the aggregate cost of a fairly liberal compensation plan would entail a total expenditure of about three and a half million dollars upon the anthracite-mining industry, and on the basis of the same estimate the corresponding expense to bituminous mining would be $3,855,942. These estimates are based on the assumption that the British nonfatal-accident rates, which are accurately determined as a result of the workmen's compensation law, prevail in the Pennsylvania mining industry, although there are reasons for believing that in actual experience the true rates are probably higher. This conclusion would seem warranted in view of the employment of less experienced labor in Pennsylvania bituminous and anthracite mines, and possibly on account of more dangerous mining methods and the larger proportionate use of coal-cutting machines.



Relative Frequency of Mining Accidents to Various Parts of the Body

⁂

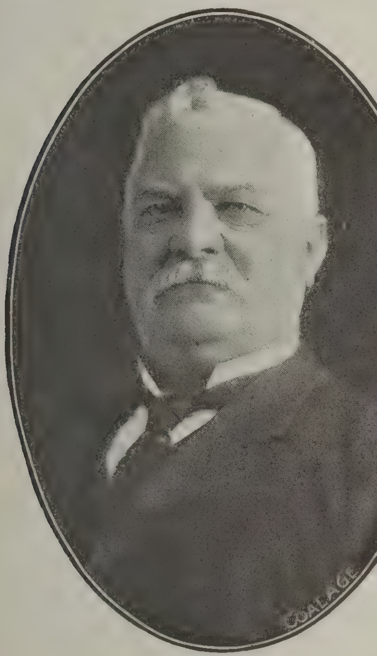
A Canadian Coal Decision

The British Columbia Court of Appeals has given a decision in the litigation between James Dunsmuir and Mackenzie & Mann over the purchase by the latter of the Wellington and other Vancouver Island collieries for $11,000,000.

The court declares Mr. Dunsmuir entitled to all the earnings from the date of the option to the time when the purchase money was paid. Mackenzie & Mann are awarded all the collateral properties, including seagoing craft employed in transporting coal, which, as Dunsmuir claims, were not included in the deal. Both parties are dissatisfied with the decision and an appeal will be taken to the British Privy Council.

Death of a Veteran Inspector

It is with regret that we learned of the recent death of George Harrison, former chief mine inspector of Ohio, which was announced in Coal Age, July 26, p. 140. Mr. Harrison died Monday night, July 14, after an illness of nearly a year. Early last fall he was stricken with paralysis, from which he failed to recover, and a final stroke has now terminated his life. Mr. Harrison had two strokes of paralysis, previously, the first occurring June, 1910, while attending the Mine Inspectors' Institute Meeting, at Chicago, Ill.; and the second, two years later, when he fell from a street car, at the Union Station, Columbus, Ohio.



George Harrison

Mr. Harrison was born at Greenhead, Northumberland County, England, April 30, 1846. He was compelled to give up school at the early age of seven years, eight months, owing to the protracted illness of his father. As far as he was able, he assisted his mother in the support of the family, which consisted of three sisters and two younger brothers. Because of the growing needs of the family, he was unable to resume his studies and, at the age of 16, moved to Leadgate, County of Durham, where he entered the mines, doing a man's work.

A few years later he married and, in 1880, came to this country, leaving a wife and children, five girls and two boys, all under twelve years of age, who joined him after four months. The family located at Byesville, Guernsey County, later going to Wellston, where he was made superintendent of the Wainwright mine. He was an active member of the U. M. W. A., serving for a time as state organizer and, again, as member of the state executive board. He was an energetic worker and a man of unquestioned integrity of character. He has filled every position in the mine from trapper boy to superintendent and mine manager. He was appointed state mine inspector by former Gov. Herrick, May 25, 1904, serving for two terms, consecutively, extending to Aug. 5, 1912.

Mr. Harrison was a charter member of the Mine Inspectors' Institute, U. S. A., and served as president of that institute, from its organization, June, 1908, to June, 1911. Last February, Mr. Harrison moved from Columbus to Caldwell. He is survived by a widow and nine children, two sons and seven daughters, six of the latter being married. Mr. Harrison's service as chief mine inspector will cause him to be remembered long in the state.

The Employees' Magazine

The first number of the magazine published by the Lehigh Valley Coal Co., for the use of its employees, has just been issued. Its purpose, scope and policy are outlined in the foreword, which reads as follows:

> "A man is known by the company he keeps."
>
> Likewise a company is known by the men it keeps.
>
> In 1910, when this company established its mining schools, the object was to give its employees an opportunity to secure an education that would better them for their work. This venture, we are pleased to say, has proven a success. Through these schools, however, we have been able to benefit only a portion of our employees, and even for them our efforts along educational lines ceased after they graduated. This limitation pointed to the necessity of a medium that would help all the men all the time; and an employees' magazine, we believe, would best fill that need.
>
> The purpose of such a magazine, then, will be: to acquaint you with uptodate and efficient mining methods; to put you in touch with improvements in machinery, equipment, apparatus, modern construction, operation, etc.; to assist you in avoiding accidents and conserving life and property; and to enable you to exchange your ideas, suggestions and experiences, in order to better your conditions in every possible way. The only discussions that will not be allowed in this magazine are those on matters which are already provided for in agreements between employers and employees in the anthracite coal region. In presenting this first number to you, we trust that you will receive it as cheerfully as it is given, and that you will not only utilize it to your best advantage, but also lend it your aid and support.
>
> THE LEHIGH VALLEY COAL CO.

The new magazine has an attractive cover design in two colors, in the center of which appears the clasped hands of labor and capital outlined against a car of coal. That the publishers hope and desire that there will be such a mutual friendship and understanding is evidenced not only by the whole tenor of its contents, but by the fact that this magazine is published entirely at the expense of the company for free distribution among its employees.

The leading article is by F. H. Gonsolus, manager of the technical division of the duPont Powder Co., of Wilmington, Del., and treats of the proper method of handling and firing explosives. The article is illustrated with half-tones and diagrams; in fact, the whole magazine is handsomely illustrated throughout.

Descriptions of new devices, technical articles which are not too hard for the average mine worker to comprehend, an account of the closing exercises of the Lehigh Valley mine schools, including the record of colliery advancement of over 70 men, as a result of their studies, interesting news items from the various divisions, articles on first-aid work and answers to inquiries take up the bulk of the space, but the publication is not too solemn to publish some good jokes and a page for women, which will appeal to the mine workers' wives.

One interesting news item tells of an innovation which is spreading among the Lehigh Valley collieries. Instead of stopping work on the day of a funeral, as heretofore, the employees send a committee to the ceremony and on the following pay day take up a collection, to which the company contributes $100, for the benefit of the family.

Keen interest has been aroused among the collieries by the publication of the Annual Report of the Inspector of Equipment on the condition of all the collieries and on the ratings of the "Fire Squads" at each colliery. The place of honor this year is held by the Mineral Spring colliery of the Wyoming division with a mark of over 97 per cent.

POWER DEPARTMENT

The Carbon Coal Co's. Central Station

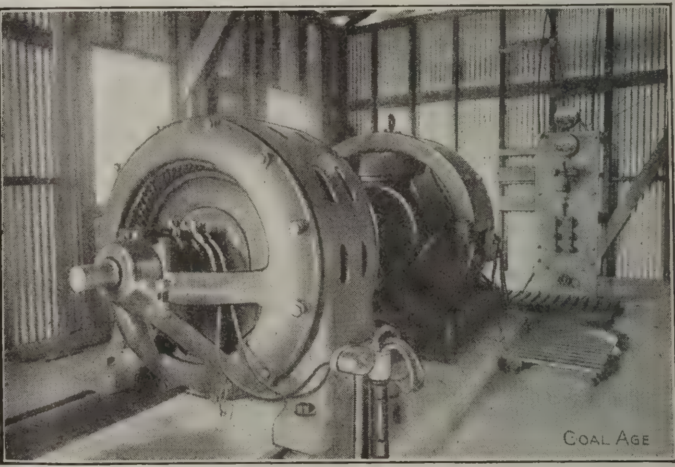
By W. Ewart James* and George W. Hall

SYNOPSIS—A brief history is here given of the inception of the Carbon Coal Co. and a description of its electrical equipment and recently constructed central power plant, together with operating costs and data.

⁂

The growth of the Carbon Coal Co., Carbon, Kanawha County, W. Va., is intimately linked with the development of that section of the state through the mining and marketing of the rich coal deposits which nestle under the surface of the region. Less than eighteen years ago the surrounding country, through which flows Cabin Creek, was but a dense forest and had furnished a hunting ground for such men as Daniel Boone, the great hunter and Indian fighter. It is said that the creek derived its name from the fact that the renowned scout pitched his "tent" or "cabin" at its mouth, and that this landmark gave the creek the name it still retains.

General View of Power Plant



Motor-Generator Set in No. 1 Substation

For some time little was known of the buzz of industrial progress in this locality; and with the exception of a few lumber camps and saw mills which were scattered along the creek and its tributaries, the resources of this remarkable field lay dormant. Coal for a number of years was apparently of no commercial value, and was mined only in a desultory way until the Garrison interests commenced developing some coal lands in the vicinity of Miami in the year 1895. Four years later Messrs. Thomas, Cabell, Dickinson and others formed the Carbon Coal Co., and at the head of the creek on the waters of Trace and Fifteen Mile Forks commenced operations, which from small beginnings have developed into a gigantic corporation, whose workings extend into three counties, Kanawha, Raleigh and Fayette.

The following year these pioneers extended the railroad from Leewood to South Carbon. At the same time Mr. A. E. Humphreys and his colleagues of the West Virginia Colliery Co. constructed a similar means of transportation from Decota to the mouth of Coal Fork, and shortly afterward were engaged in extending their track up Long Branch to the No. 4 Mine. The Republic Coal Co. was inaugurated at about this time, and within the next few months had completed a branch line of railroad throughout its entire holdings. During this period of construction, it may be said that the rapid progress of development changed the very atmosphere of the community; instead of remaining the secure haunts of the bear and the deer, it was quickly transformed into a business center.

A Gradual Growth

The Carbon Coal Co., with its subsidiaries, the Republic Coal Co., and the West Virginia Colliery Co., has gradually been spreading out in all directions and is constantly looking ahead for new developments. The several companies are operated independently, but are controlled by the same management. Electric power for operating the various collieries was being generated in three separate and distinct power plants, which contained belt-driven generators that had been in use for quite a number of years. New installations were continually being added to these plants as necessity warranted, until each became a complicated arrangement of scattered mechanism; yet it still remained inadequate for the demands. It was therefore deemed expedient to resort to a more modern means of generating the motive power required.

The project of erecting a "central power plant" was carefully worked out; and though it was found by calculation that the initial outlay would inevitably be heavy, it was evident that the ultimate advantages would be overwhelmingly in favor of the proposed new installation.

---

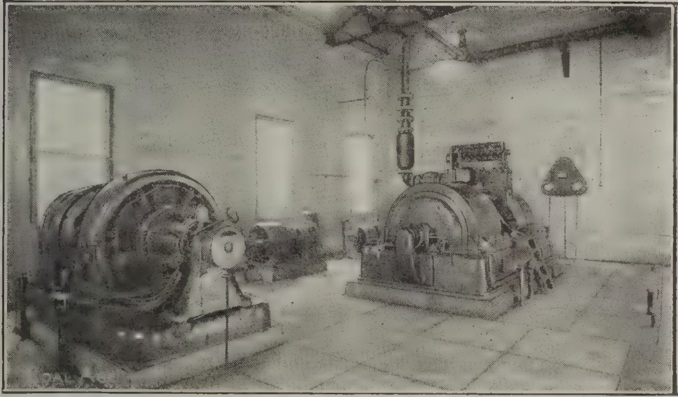
*Chief engineer, Carbon Coal Co., Carbon, W. Va.

It was therefore decided to proceed at once with the work, and Mr. James was authorized to design and superintend the construction.

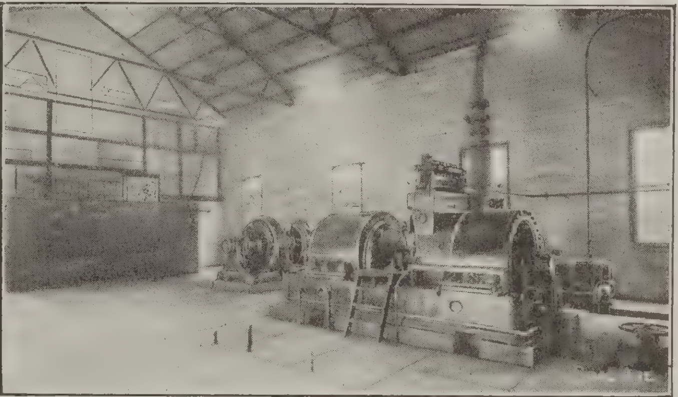
An absolutely fireproof building, designed not for the conditions of today, but for the requirements of tomorrow, houses the entire plant. It has a structural-steel frame with reinforced-concrete walls and is arranged so that another unit may be installed at any time with no extraordinary expense, the foundations being already set for a complete duplicate of the present installation, boilers included.

The boiler room, with its battery of two 440-hp. Stirling boilers, presents a pleasing appearance and is symmetrical in every detail. The ashes are dropped into a steel car, which operates in a concrete pit beneath the floor, and are transported to the end of the building where the car is elevated and dumped into an ashpit of large capacity. They are afterward hauled away to repair roads, etc., in the vicinity.

The fuel supply is obtained from an adjacent mine and is deposited by means of a conveyor in a car, which runs by gravity over a short trestle and then dumps the coal into a concrete storage bin of sufficient capacity to provide for a two weeks' run. Thus, in case of a breakdown at the mines the power plant will not suffer from lack of fuel.



Motor-Generator Set and Main Power Unit



The Turbo-Generator and Switchboard

Water for the boilers is obtained from a well sunk 150 ft. deep and operated by a 6x24-in. deep-well pump, which is driven by a 10-hp. electric motor. Before entering the boilers, the water is treated for scale prevention by a process prescribed by C. A. Cabell, general manager of the company. It is then pumped through a 2500-hp. heater, filtered and forced by a hot-water pump into the boilers at a temperature of 90 deg. C. (194 deg. F.). The boilers are equipped for a pressure of 150 lb., and draft is furnished by a circular stack 4 ft. in diameter by 100 ft. high, with damper regulators at the base so as to maintain a uniform heat. Each boiler is fitted with an automatic-feed arrangement, which keeps the water always at a fixed level. Both the hot- and cold-water pumps are 10x6x10-in. direct-acting type.

The Plant Is Strictly Modern

The new central power plant is designed and constructed along the most modern lines, and is equipped with the highest-grade machinery and apparatus. Provision has been made for any emergency that may arise, and the entire plant is worthy of a close inspection by those interested in the electrification of mines. An exceptionally noteworthy feature of the installation is the effective manner in which some of the old apparatus in the former isolated power plants has been utilized in the substations established in connection with the present central station. All the power-house equipment as well as the new substation machines were designed and built by the General Electric Co.

The proposition involved abandoning the three distinct plants, which were operating at a fair cost, and replacing them with a noncondensing turbo-generator central station, which has since been able to reduce this cost to a minimum, making the investment one of good value. The company was confronted with the question of disposing of about $10,000 worth of apparatus by placing it on the second-hand list or in some other manner, and it was a difficult matter at the time to understand wherein discarding this apparatus would warrant the expenditure of some $80,000 for a central power plant.

The problem was partly solved by retaining the old generators for the substations and building them into motor-generator sets by using synchronous and induction motors, operating through flexible coupling drives. There were four of these machines in all, one of which has since been sold to meet an emergency, and has been replaced by a new 150-kw., 600 rpm., 250-275-volt direct-current generator.

In the power plant is installed a 937-kv-a., 3600-rpm., 2300-volt, alternating, noncondensing, horizontal turbo-generator. Excitation for the unit is furnished by a 15-kw., 4500-rpm., 125-volt, noncondensing turbo-exciter and a two-unit motor-generator exciter set composed of a 25-kw., 1200-rpm., 125-volt generator direct connected to a 35hp. 2200-volt motor. The installation also includes a two-unit motor-generator consisting of a 200-kw., 720-rpm., 275-volt generator direct connected to a 300-hp. 2200-volt motor. A 12-panel switchboard, with the necessary generator and feeder circuits, which are metered by recording wattmeters that measure the power for each circuit, completes the equipment.

Five substations are at present in operation, each being located to suit the requirements of an allotted area, as shown on the annexted property map. They are all of similar design, but the installations vary slightly.

No. 1 substation is located at the Carbon Splint mine, 3200 ft. from the central station, and contains a 150-kw., 600-rpm., 250-volt generator coupled to a 220-hp. 2200-volt synchronous motor.

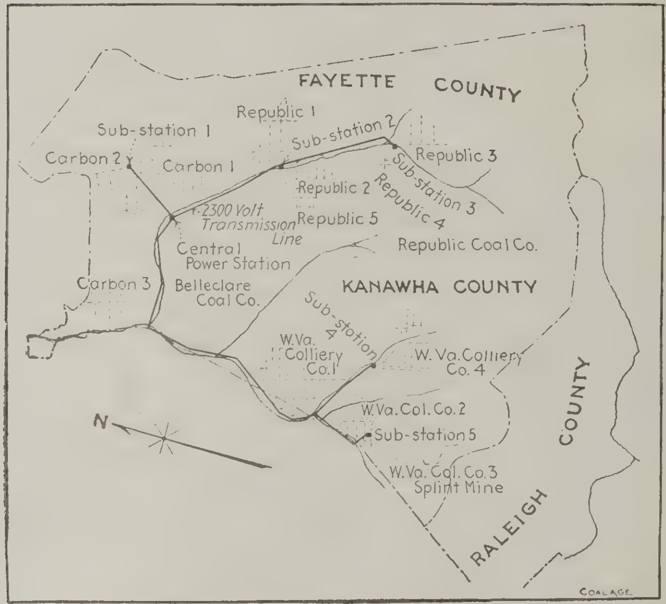
No. 2 substation is situated at Republic No. 2 mine, 6400 ft. from the plant, and its equipment consists of one 150-kw., 250-volt, 600-rpm. generator connected to a 200-hp. 2200-volt induction motor.

No. 3 substation is located at Republic No. 3 mine, 11,200 ft. from the main station, and has apparatus of the same capacity and characteristics as No. 1 substation.

No. 4 substation is situated at the entrance to the West Virginia No. 4 mine, 18,800 ft. from the power plant. It embraces practically the same equipment of apparatus as No. 2 substation.

No. 5 substation is at the mouth of the Gibson Entry of the West Virginia No. 2 mine, 18,400 ft. from the power station, and has precisely the same installation as No. 4 substation.

The various motors and machines which are operated from the substations are tabulated herewith: No. 1 substation—Two 3½-ton gathering locomotives, three 5-ton gathering locomotives, one 10-ton haulage locomotive, one 25-hp. stationary motor, four breast mining machines.



Property Map of the Carbon Coal Co.

No. 2 substation—Three 3½-ton gathering locomotives, three 5-ton gathering locomotives, two 6-ton haulage locomotives, six 10-hp. stationary motors, three breast mining machines.

No. 3 substation—Four 3½-ton gathering locomotives, one 6-ton haulage locomotive, one 15-hp. stationary motor, three breast mining machines.

No. 4 substation—Two 5-ton gathering locomotives, two 10-ton haulage locomotives, two 5-hp. stationary motors, one 7½-hp. stationary motor, two 10-hp. stationary motors, one 45-hp. stationary motor, six breast mining machines, and one short-wall mining machine.

No. 5 substation—One 5-ton haulage locomotive, one 6-ton haulage locomotive, one 5-hp. stationary motor, one 7½-hp. stationary motor, two 10-hp. stationary motors, one 25-hp. stationary motor, and four breast mining machines.

Motor-generator set in power house—One 3½-ton gathering locomotive, two 5-ton gathering locomotives, one 6-ton haulage locomotive, one 10-ton haulage locomotive, two 7½-hp. stationary motors, three 10-hp. stationary motors, one 15-hp. stationary motor, two 25-hp. stationary motors, one 45-hp. stationary motor, five breast mining machines.

The most satisfactory way to determine the relative superiority of one plant over another is to compare their merits on a basis of the cost of production in combination with their ultimate efficiency. There are no detailed accurate figures on record regarding the output obtained from the old plants, except that the average per month for the Carbon, Republic and West Virginia power plants combined was approximately 90,000 kw.-hrs. The actual cost of maintenance, including fuel, salaries and all other contingencies, amounted to $1368 per month on an average; thus the cost of production was $0.0152 per kw.-hr.

The Tabulation of Costs

The following table is compiled from the engineer's daily report and gives an accurate account of the amount and cost of power production at the central station from the commencement. It will be noticed that the cost per kw.-hr. for September, October and November was materially enhanced, owing to the recent labor trouble which invaded the coal field; that the power produced was infinitely less than when all the mines were running their full capacity, while the actual cost of maintenance was practically the same. A glance at the record for August discloses the fact that the greater the output the cheaper the power per kw.-hr.:

TABLE OF COSTS

Month	Cost of Fuel, Supplies and All Other Items	Salaries and Labor Cost	Kw.-hr.	Cost per Kw.-nr.
June	$345.95	$317.00	96,768	$0.0068
July	416.50	315.00	108,440	0.0067
August	430.10	310.00	113,700	0.0065
September	282.20	321.00	74,830	0.0080
October	300.90	314.00	57,080	0.0107
November	300.90	312.00	66,330	0.0092
	$2,076.55	$1,889.00	517,148	$0.0079

It will be seen that the actual productive cost for power generated in the new central station averaged $0.0079 per kw.-hr. during the six months' period as against a cost of $0.0152 per kw.-hr. for that generated in the three former isolated plants. Under the old régime the cost of production was slightly over $16,000 per annum. During the first six months of central station operation, practically the same amount of power was consumed as during the corresponding six months previous. Figuring on a basis of 2 cents per kw.-hr. and including ample allowance for depreciation, interest charges and all other essential incidentals, a saving has been effected of $1,221.67 in six months. This saving will more than double itself in the second half-year, since the central-power plant had only just been completed, during the first six months much in excess had been charged to the cost of production which really should have been debited to capital stock.

One important benefit derived in this instance since the introduction of central-station operation, which should not be overlooked, is the improvement in the facilities of the company for proper growth. With the old plants, the power was so inferior and inadequate that new developments were out of the question altogether.

EDITORIALS

To Save Lives

The question of what is a legitimate risk to be taken with the hope of saving lives believed to be in danger, or that may already have been sacrificed, has been raised by the recent remarks of Sir Thomas Holland, before the Indian Mining & Geological Club, at the Mining Machinery Exhibition, in the Royal Agricultural Hall, London. In the course of his remarks, Mr. Holland referred to the tragic death of the late president of the club, W. H. Pickering, who sacrificed his life in the attempt to rescue any possible survivors of the first explosion in the Cadeby Main Colliery, July 9, 1912, in the following words:

> Everyone present knows that, but for the great disaster at Cadeby last July, our revered president, in his inimitable way, would now be in this place expressing your appreciation of Mr. Montgomery's hospitality. This is the first general gathering of the club since our president and founder lost his life during what was but the last of a series of heroic acts on behalf of the miner. To those of you who know that the same unflinching regard for duty controlled Mr. Pickering's actions in small as well as in great things, the cold official comment on the Cadeby disaster recently issued by the Chief Inspector of Mines must seem like sacrilege. Allowing for Mr. Redmayne's apparent difficulty in conveying his thoughts in simple English, I have no hesitation in saying that the sentiment conveyed in the last paragraphs of his recent report will be condemned by every healthy-minded miner as unworthy of the traditions of our race.
>
> Putting aside for a moment the moral question as to whether it is right to lead a body of men into an unknown danger to save a probably much smaller number of their fellow-workers, there is good reason for assuming that Mr. Pickering was justified by the facts before him at the time in leading a rescue party. He had with him other men of known experience and good judgment, his official colleagues and the manager of the mine; he was closely followed by another party led by an inspector as experienced as J. R. R. Wilson, who, but for an accidental delay, would, as we now know, have been killed also.
>
> It is easy to be wise after the event; it is easy apparently in the comfort of an office chair to criticise the wisdom of more experienced men; but this report fails most lamentably to distinguish between the conclusions which were justified by the facts before Mr. Pickering and his colleagues at the time, and those which have since been obtained. Even as a cold official judgment, therefore, on the purely professional question of whether it was or was not discreet to go underground, the inferences drawn in this report seem to me to be unscientific and unsound. But the sentiment that it displays is even more to be deplored.
>
> Fancy this country admiring the professional wisdom of Captain Scott if he returned safely rather than expose his men to the dangers of the Antarctic! Fancy Pickering sitting at the surface estimating the distant risks of another explosion while his fellows were dying below! Doubtless if the rescue party had been restrained long enough, in this case as in similar cases, they could have proved the futility of an attempt, as the men would then have been dead. [But, the deeds of men like Pickering and Scott are worth more than lives; through their deaths the spirit of the race lives, for to this world a brave man dying in the face of danger is worth more than ten cowards living and carefully counting the costs.] After reading this report, I see the real wisdom of the Archbishop of York, who said truly of Pickering: "His was not a life cut short, but one abundantly completed and fulfilled." It is our duty to see that the memory of such a man is preserved, for the benefit of our race.

In order to enable the reader to arrive at a fair judgment of this severe arraignment of the chief mine inspector of Great Britain, made recently in an official report to the home office, which has since been issued as a blue book (Cd. 6716), we abstract the following paragraph to which reference has been made:

> THE RESCUE OPERATIONS
>
> I have formed a decided opinion in respect of the rescue operations. While there was provided at the colliery as fine a body of men trained in rescue work as one could wish to see, the organization at the mine on the occasion of these explosions was most defective. When Mr. Witty made his arrangements at the surface, he should have issued instructions prohibiting the descent into the mine of all persons unprovided with a written authorization to do so. He should also have placed a guard at the outby end of the south plane to prevent the entry into that district of unauthorized persons from other parts of the mine. Had this been done the loss of life occasioned by the second explosion would, I am sure, have been much less heavy.
>
> The further questions as to whether the work of recovering and bringing out the bodies should have been undertaken at this stage is one in respect of which there will doubtless be differences of opinion. I have no doubt on the point I know that sentiment weighs heavily in the consideration of a problem of this nature, and that there is an intense desire on the part of relatives of the dead to see and bury the bodies I do not think, however, that the management of a colliery is justified in allowing persons to risk their lives in order to recover and bring out dead bodies, for that such a procedure is always attended by the great risk of a second explosion when a fire is known to exist underground after an explosion, is evidenced by case after case. Instances may be cited in which the bodies have been recovered after an explosion of this nature (e.g., Jamage Colliery). I agree, but it is a race with death. It is hard, however, to make people realize this, and so strong may feeling run on these occasions that it sometimes requires a higher moral courage to resist a natural impulse and prohibit persons from undertaking (and undertaking oneself) a risk of this nature, than to allow the risk to be undertaken.
>
> I should also remark that great difficulty was experienced in obtaining a correct number of the casualties; this was not definitely ascertained for three days after the disaster owing to the indiscriminate issue of lamps after the first explosion. This was a regrettable incident, and one which emphasizes the necessity of strict discipline at such times.
>
> I cannot conclude this report without recording my sense of the magnitude of the loss which the Mines Department has sustained in the death of three of its inspectors. Mr. Tickle was a most promising junior inspector, and was, I know, held in high esteem by Mr. Pickering. Mr. Hewitt was a careful and experienced inspector. By Mr. Pickerings's death the country is deprived of one of its most capable and devoted public servants, and I personally have to mourn the loss of a most able colleague and a loyal and valued friend.

We believe it is wise to refrain from further comment on this sad incident. It seems to us both unseemly and unjust to assume, in the light of later developments, to call in question the acts of one who, with a limited knowledge of conditions, was forced to decide, for himself and others, the question of the advisability of taking a risk that meant possible life to others or death to themselves. It was truly, as Mr. Redmayne has expressed it, "a race with death." Who is so wise as to say, with the limited knowledge of conditions available, that a risk taken to save lives is justifiable or otherwise. It is true, sentiment is strong in the human heart, but that sentiment reasons just as strongly for the living as for the dead.

The words of Sir Thomas that, for sake of emphasis, we have placed in brackets appeal to us, as they must to all, very strongly.

Mr. Pickering is no exception among mine inspectors. Many instances have occurred, both in this country and abroad, where these men have sacrificed their lives in the endeavor, as they hoped, to save the lives of others. Two instances that we recall, at this time, are the death of Mine Inspector William Atkinson, who was killed by afterdamp while attempting to rescue victims of the explosion at Zeigler, Ill., Apr. 3, 1905; and the death of David N. Elias, who was killed in the second explosion, which occurred a few hours after the first and which resulted in the sacrifice of 41 lives in addition to the 18 lives lost in the first explosion at Hanna, Wyo., Mar. 28, 1908. Both of these men were experienced miners and men of mature judgment; and we would not say that this was in error. Judgment may differ in individuals, but can only be declared in error when shown to be so, in the light of facts available at the time.

⁂

The Passing of the Braggart

We like to think we do not miss the braggart who hauled more cars in the barroom than mule flesh and human endurance could withstand. But we do miss those men, and others like them who, in the past, measured their importance by their ability to produce and who cared less about pay than product.

We hardly realize how we are drifting from the old conditions. The difference between the man who tells how he evades his duties and the man who brags how well he performs them is the difference between unproductiveness and efficiency, between national poverty and national wealth. One-half the prosperity of America is the outcome not of great natural resources but of the large output per man employed. That productivity of labor found its origin in the belief on the part of every man that he was an important part in the community and that his success or failure in his work was a matter of general importance and concern.

The workingman of the past gloried in the fact that he was the man who could be called to do anything "in a pinch," that he was able to fill in almost any gap and always "stayed put." The contest to do better each than the other made the product larger per man employed and the national rewards have been proportional.

If we are going to drift into an existence without enthusiasm, each man striving to do his least and worst, if the coal getter is going to believe that a fortune will accrue to him and his family if he can shoot his market coal to pieces and load worthless coal, slate and pyrite, nothing but the greatness of our unused resources will save the nation from penury and these safeguards will not provide for our present standard of living.

The boaster is a living, laboring workman. We recall a superintendent who said: "I used to think that I could dig coal with any man along the Monongahela River and there were good men in the mines in those days." He admitted he found there were those who could beat him but the sense of his superiority to some and his desire to equal others increased his usefulness.

Today there are too many content to whine that the world owes them a living and we would fain see those fellows return who boasted of their work, who tried to excel and looked at the plant in which they worked as partly their own and not as a revolving wheel of which they were wearied spokes ever hurrying on to perform a work in which they had neither interest nor hope.

In the history of a nation, the era most pregnant with possibilities is that in which it boasts most loudly, and in the career of man, the least reputable period is when he doubts his mission and feels there are others who could and would fill his job to equal advantage.

⁂

The Slaughter of the Innocents

With this cheerful reference to the Herodic times, the conservationists would stigmatize child labor. We have already called attention to the fact that to forbear to work is, in most cases to weaken the physical frame, to stunt the mind and to debase the spirit of the race.

But today, we would rather confine ourselves to the question "Is the callow youth, as employed in the mining industry, subject to exceptional risks?" As usual we must look to Great Britain for a statistical answer, for while the public of the United States stresses the memory with the count of the dead few, it keeps no record of the living many. Moreover in many instances those opposed to labor ignore statistics altogether and rely on their intuitions for guidance in their advocacy of laws.

We presume that in Great Britain, the "conservationists of infancy" point with condemnation to the record of the industrially slain—50 children under 15 years of age in 1909 and 55 in 1910—and we venture to think that they suppose as do our "antis" that these might all have been saved had they been kept safely in school. Yet the figures show that per thousand employed only 1.02 were killed in 1909 and 1.07 in 1910. This compares favorably with the death rate of all ages, which for Great Britain was 1.43 in 1909 and 1.70 per thousand in 1910.

The deaths and ratios for all ages are as follows:

DEATH RATES OF BRITISH MINE WORKERS BY AGES

Ages	Deaths 1909	Deaths 1910	Per thousand 1909	Per thousand 1910
12 and under 14	10	12	0.49	0.57
14 and under 15	40	43	1.38	1.44
15 and under 20	257	277	1.60	1.66
20 and under 25	169	245	1.06	1.51
25 and under 35	308	418	1.16	1.53
35 and under 45	302	330	1.69	1.78
45 and under 55	195	249	1.68	2.07
55 and under 65	110	143	1.98	2.49
65 and upwards	27	25	1.74	1.56
Age unstated	6	12	....	....
All ages	1424	1754	1.70	1.43

It is clear that the most risky early period is that between 15 and 20 years, the very time at which our conservationists would have boys enter the mines. Yet even the death rate in this period is not as high as that which rules for men above 35 years of age.

We think that apart from the necessity for keeping the boys at school, there is no reason for holding youths under 16 years of age from the safe occupations usually accorded to such immature mine workers. But if youths are allowed by law to leave the classroom at 14, they may well enter the breaker of the mine at that age and if, perchance, they are compelled by legislative enactment to continue in school, at which we would not cavil, they should be compelled to do some manual work which would prevent them from becoming at once both too weak and too proud to labor.

⁂

Particular attention is called to the series of articles, "Coal Shipping on the Great Lakes," the first installment of which appears on p. 186 in this issue.

Renewed Peace on Cabin and Paint Creeks

*SYNOPSIS—**Another** settlement in the Cabin and Paint Creek districts gives some hope of enduring peace. The following statement sent out by the operators gives their point of view of the struggle now thought to be happily terminated.*

⁂

By the terms of an agreement signed July 29 by the Cabin Creek Consolidated Coal Co., Carbon Coal Co., Republic Coal Co., West Virginia Colliery Co. and Wake Forest Coal Co. and representatives of their employees and ratified on the night of July 31 at mass meetings of the latter, the so called strike on Cabin and Paint Creeks which has kept the state in a turmoil for sixteen months was brought to an end. An attempt was made to have the agreement ratified at an open-air meeting at Decota, on Cabin Creek, Thursday afternoon, July 31. So little interest was taken in the matter that not more than 450 miners attended the meeting. The men at one mine refused to leave their work to attend. A few Industrial Workers of the World and other disturbers prevented action, so it was necessary to hold a number of similar meetings in the evening. Under normal conditions 3000 men are employed at the mines affected by the agreement.

The Union Is Not Recognized

The principal point scored by the operators is the maintenance of the open shop. Ever since the union declined to arbitrate a disagreement in 1904, the Cabin Creek operators have refused to recognize it and it is not recognized under the newly made agreement. The check-off, the concession most vital to the union, is not granted. The mine committee, which is the union means of adjusting grievances, is also not acknowledged. In its stead a system of appeal from the mine boss to the superintendent and then to three arbitrators, one of whom is to be the president of the local union, is established. It is also stipulated that "under the terms of this contract nothing shall be done or enacted that shall increase the cost of producing coal to the operator."

The price per ton is changed but little, being in some instances reduced and in others advanced. On the whole, the change amounts to an increase of about 1 per cent., but as the short ton replaces the long, which in itself constitutes an increase of 11 per cent., the average rise in the price of mining is increased 12 per cent.

Other concessions gained are the 9-hr. day and the semi-monthly pay day. Still other nominal, but not actual concessions are the right to employ check-weighmen at the miners' expense, a right guaranteed by law and never denied by the operators, and the right of the miner to trade where he pleases, a right which they have freely exercised. Other clauses in the agreement, which terminates April 1, 1915, define in detail ordinary practices to be observed in mining.

An Insurrection Not a Strike

The so called strike on Cabin and Paint Creeks was in reality an armed insurrection, organized, financed and directed by the United Mine Workers of America for the sole purpose of compelling the miners of West Virginia to join the union. It began sixteen months ago. It was fomented by agitators hired by the union, afterwards reinforced by the socialists, and directed exclusively by men from outside the state. Within a few days after Duncan McDonald, secretary-treasurer of the United Mine Workers of Illinois announced at the joint conference of operators and miners of Illinois, Indiana, Ohio and western Pennsylvania that the union was about to "get busy" in West Virginia, the union miners on the opposite side of the Kanawha River from Cabin and Paint Creeks began buying rifles. Not until about a thousand union men had been armed was the strike called at the few union mines on Paint Creek.

A guerrilla warfare was then begun. At one time the union had five thousand men armed with modern high-power rifles, in the field. These were opposed at one time by 145 private guards on the two creeks, and later by the entire military force of the state, amounting to 1200 men.

The Cost of Industrial War

Thirteen lives were lost in the insurrection. The cost in money was as follows: operators' loss in business, $2,000,000; loss to the miners in wages, $1,500,000; cost to the taxpayers of the state, $400,000; additional cost to the taxpayers of Kanawha County, $100,000; cost to the United Mine Workers, collected by the check-off, a forced levy on the miners of Illinois, Indiana, Ohio and western Pennsylvania, $602,000; property destroyed, $10,000; total, $4,612,000. According to the latest available statement in the United Mine Workers *Journal,* the official organ, the union's total membership in the state was increased by this insurrection from 1136 in a total of 69,611 mine workers in the state to 3074. Thus it seems that the cost of union proselytes in West Virginia figures out at $2379 a head.

It is worthy of note that a large proportion of the mine workers on Cabin Creek were so strongly opposed to this method of convincing them of the benefits of unionism that they have remained at work throughout all the series of shootings and other disturbances, so that the mines have never been closed entirely but have been in continuous operation, most of the time at one-half to two-thirds normal capacity. The Cabin Creek operators have not failed to fulfill any contracts and have not canceled any orders for coal. This explains why the loss of business was so light in comparison with the loss in wages.

OUTCROPPINGS

He who abuses others must not be particular about the answers he gets.

⁂

If the young knew, if the old man could, there is nothing but would be done.

⁂

Judging from the new state tax on anthracite we presume Pennsylvania is preparing to erect another capitol building.

⁂

Some operators no doubt think of a "good striker" in the same terms that the Western pioneer thought of a "good" Indian.

⁂

The statement that Standard Oil recently paid a fine of half a million dollars in Texas, was a mistake. It simply advanced the money pending collections from the public.

The Value of a Safety Inspector and Instructor for Each Coal Mine

By C. H. Nesbitt*

It is probable that no subject, throughout the industrial world, has received more consideration than that of reducing mine accidents. On this occasion, we come, face to face, to discuss the problem, as it concerns the coal mines of Alabama. Great progress has been made, from time to time, in the mines; and each year we are adding new features and taking new steps, in the direction indicated.

The inauguration of safety inspectors and instructors, in coal mines, is of such importance as to immediately commend itself to all of our coal operators. We all, doubtless, agree that education and supervision are indispensable, in all classes of trade where the best results are to be obtained. All industries that employ labor realize that it is important to have adequate supervision over the entire force, even though life and limb are not at stake. In coal mining, supervision and discipline are difficult because the workmen are segregated, singly or in pairs, in their respective working places; and, unlike in mills, factories and quarries, the foreman or superintendent cannot keep an appreciable number of men under his eye and direction, at the same time, but successive and frequent visits to each working place in the mine are imperative.

A Department of Safety and Instruction

In coal mining, where the hazard is great, the cost of such supervision is many times offset by increased efficiency, which invariably accomplishes a reduction of accidents. I would, therefore, earnestly advocate that the operators of Alabama, each, establish a Department of Safety and Instruction; and that, in addition to the work of the mine foreman and fireboss, daily inspections be made of every working place, by an experienced person, qualified to teach and authorized to enforce provisions for safety.

In this state, in 1912, we recorded 62 fatal accidents at the working face. These accidents were attributable to the following causes, namely: Fall of rock, fall of rock and coal, fall of coal and shotfiring. This constituted over 50 per cent. of the total number of fatalities for that year. Upon investigation it was found that a majority of these fatalities could have been avoided if proper instruction had been given and supervision exercised. Probably, in all cases, the victims of these accidents followed their best judgment, which obviously was bad. It is, therefore, necessary that the advantage of experienced direction and supervision of the work should be given to all operations. No better evidence of the value of such a system could be cited than the results that have been attained by those Alabama operators who have inaugurated the system.

A striking example of the value of safety inspectors and instructors is the accident record of the Frick Coke Co. At all of the numerous mines, a sufficient number of qualified inspectors and instructors are constantly employed. Following is the coal-mine-accident record of the company, for the past three years, as compared with that of the British Isles:

	1910	1911	1912
DEATHS PER MILLION TONS PRODUCED			
Scotland	5.06	4.12	3.50
South Wales	5.60	5.67	6.53
All Britain	6.54	4.47	4.52
H. C. Frick Coke Co.	1.99	1.72	1.88
TONS OF COAL PRODUCED PER DEATH			
Scotland	197,600	242,000	285,500
South Wales	150,700	176,100	153,000
All Britain	137,100	243,500	248,000
H. C. Frick Coke Co.	502,049	578,151	531,328
DEATHS BY FALLS PER MILLION TONS MINED			
Scotland	2.10	1.76	1.86
South Wales	3.18	3.20	2.79
All Britain	2.36	2.33	2.03
H. C. Frick Coke Co.	0.97	0.90	0.70
DEATHS BY CARS PER MILLION TONS MINED			
Scotland	0.68	0.84	....
South Wales	1.68	1.47	....
All Britain	1.02	0.98	0.87
H. C. Frick Coke Co.	0.79	0.41	0.91

As long as human muscle and brains are essential to coal mining, just so long will the human element, in the causation of accidents, exist; and the percentage of avoidable accidents will remain directly proportionate to the extent that ignorance, carelessness, indolence, disobedience to rules and instructions, and poor judgment prevail.

Responsibility for Accident

We have tried placing the responsibility for accident upon the individual and have found that it did not accomplish the desired end. As we know, it is a difficult matter to convince the man of poor judgment that he is not as well equipped for his duties as another man of superior judgment; therefore, the man of poor judgment needs and will benefit by the close and constant supervision and instruction which would be obtained by the system I have advocated. It must be hammered into him. While there must of necessity be joint instead of individual responsibility; at the same time, there must always be, as in an effective military organization, some directing head or commander, immediately overlooking the work as it progresses, and intelligently managing the details, along the line of safety.

Doubtless, some operators will object to the inauguration of such a system, because of the expense entailed by the increased organization. But, if they will compare the cost of this increased organization with the losses they sustain in the absence of it, by damage suits, court attendance, and the existing high insurance rates, I believe it will at once appear to them that, ultimately, the suggested system is truly more economical, to say nothing of the protection to human life.

Accidents Increase Cost of Operation

In addition, it is well to remember the increased operating cost an accident incurs. There is a certain overhead burden, or fixed cost, that accrues at night, Sundays and holidays, as rapidly as on working days. There are the equipment, tophouse force, cars, mules and motors, drivers, etc., required to assemble and raise a certain amount of coal. There are entries and narrow-work to be driven, track to be laid, and a certain number of rooms to be turned and worked in order to yield the desired output, at a reasonable operating cost. The working force must be organized and systematized for stability, economy, efficiency and uniformity of output. The accepted orders for coal are in the books; the railroad cars are placed and everything in readiness for a good run, when the engineer is signaled to hoist slowly. Eventually, the trip emerges from the pit mouth with the crushed or maimed bodies of a miner and his helper and some six or eight rescuers and attendants. What is the result? Two men, either dead, dying, or crippled for life, together with the attendant burial or hospital expenses, lost time of attendants at the funeral or bedside; the working organization of the mine disrupted; lost time of mules and drivers; several rooms out of commission for a day or more; the necessity of cleaning and retimbering the place where the accident occurred and the enforced idleness of the place till another miner comes. But, greater than all is the fact that the productive capacity of one or two men, is, for all time, lost to the company, to their dependents and to society. All for what? *Because he did not know or failed to heed.* In addition to greater safety, greater efficiency and production may be obtained.

---

*Chief mine inspector, Birmingham, Ala.

Causes of Mine Accidents

On account of the fact that the demand for coal is so much greater than the supply of mine labor, there is a tendency to give men a check number before they are qualified to run a room; and, in many instances, miners who have worked in the mines for years are incompetent because they have never had the proper instruction and supervision, and others are naturally careless and reckless. Practices are constantly engaged in that are incredibly hazardous and which may not come to the knowledge of the mine foreman or fireboss until the damage is done. It is our duty to humanity to prevent, as far as possible, the loss of life and limb occurring through the ignorance of employees. Never let them say, "We did not know." If a man insists upon committing suicide, do not let him do it on your premises; fire him first.

The records show that the cause to which the most frequent fatalities are attributable is falls of roof. The effective way to remove the cause or, at least, to diminish the toll, is to employ constant vigilance and an efficiency of higher standard than is possessed by the average mine employer. To maintain an eternal watch on the men in close proximity to the working faces will always accomplish much. There is no real reason why we should not produce, at least, from three to four hundred thousand tons of coal each year for each life lost, which would place our operations on a parity with other important producing states.

It cannot be truthfully said that natural conditions and hazards are worse here than those in other coal fields. The natural advantages here are equal to those elsewhere. Therefore, as the record stands, it would seem that we are not employing the proper safeguards. I trust that all will indorse the statement that it is incumbent, primarily, upon operators to protect their employees. Mine officials are on duty, in the mine, every working day and should be in better position than the state mine inspectors to keep constant surveillance over the operations of their mines. The inspection department will, of course, continue earnestly to do all that lies in their power, in that direction.

Supervision and inspection, education and instruction, discipline and vigilance are the only antidotes for the causes of avoidable accidents in coal mines. Try the safety instructor and inspector system at your mines and help put Alabama at the head of the list for low coal-mine-accident records.

The Explosions at the East Brookside Mine

The Brookside Colliery of the Philadelphia & Reading Coal and Iron Co. is located at Tower Hill, 19½ miles in a straight line to the WSW of Pottsville on the line of the Philadelphia & Reading Ry. leading from Schuylkill Haven to Lykens. The mine is quite deep and generates gas, several firebosses being employed.

On Saturday, Aug. 2, seven men were working for Charles Portland driving a tunnel through rock. The gang included six muckers and a boss. Apparently as much as 175 lb. of dynamite were taken into the mine that morning for use in the tunnel. By some means this was caused to explode, killing all the men employed.

From all accounts, the explosion disturbed the ventilation, there being some evidence of a reversal of the air current at one of the shafts. However, when twenty minutes after, nine men, two of them firebosses, went down to rescue the victims, they set fire to a body of gas of some sort and an explosion occurred, killing eight of these men. It has been suggested that the gas found was formed by the incomplete combustion of the explosive. Seeing that the slow combustion of 50 per cent. dynamite produces gases containing 24.4 per cent. of carbon dioxide, 31.2 per cent. of carbon monoxide, 20.7 per cent. of hydrogen, 0.7 per cent. of methane and 23.0 per cent. of nitrogen (see Bureau of Mines Bull. 48), it is evident that explosive gases may well remain after a combustion of dynamite. However, the first explosion was sufficiently violent that it is hard to believe the dynamite produced any large percentage of explosive gas.

It is certain that the effect of a violent shock, such as an explosion of equal force to that described, would result in destroying the ventilating brattices, in forcing gas from places where it might have collected and in opening the crevices of the coal so as to permit the escape of occluded gas. Thus concurrently the cleansing draft of air would be removed and the emission of methane increased.

The nine rescuers in the first party were H. Shoffstall, night boss, H. Murphy, fireboss, D. McGinley, fireboss, T. Behny, miner, J. Kopenhaver, shaftman, Howard Hand, laborer, Harry Hand, miner, V. Zanoni, blacksmith, and E. Luchi, a blacksmith's helper. All these men were killed by the second explosion except the first man mentioned.

Another party descended the shaft and found the superintendent, John Lorenz, and Harry Shoffstall. Lorenz had been making an investigation of the mine with John Farrell, the mine foreman, and the two were involved in both the explosions. Lorenz was found crawling toward safety. When the rescuers volunteered to help him to the shaft, he told them: "Never mind me, go and help Jack Farrell; he needs your assistance. Leave me alone and take care of those that need the help more than I do." However, Lorenz later succumbed to his injuries in a Pottsville hospital. He appears to have inhaled the flames of one of the explosions. Hillary Zimmerman was the only man of those in the mine when the first explosion occurred who escaped with his life.

Harry Shoffstall is likely to recover. In all, 19 men were killed; the loss of life would have been far greater, had the mine been in operation, as 500 men are usually employed at the East Brookside colliery.

DISCUSSION BY READERS

The Mine-Air Current and Explosions

The articles bearing on this subject, by John Verner, Coal Age, Vol. 3, p. 855; and Robert McCune, July 5, p. 25, have raised a very important question in reference to what has always been considered and is still regarded as one of the requirements of safe mining. In my opinion, it is an unwarranted conclusion to regard a ventilating current in a mine as being a source of danger, except only in a limited sense, under certain special conditions. No principle of modern mining contributes more to the health and safety of the miner than that of effective ventilation.

It is wrong to consider a ventilating current in reference to preventing or diminishing the outflow of gas from the strata. That it does this, to a limited extent, is incidental; and to condemn any system of ventilation for not doing what it was not intended to accomplish is unjust.

That a pure, fresh current of air will produce an explosion of firedamp more quickly and cause it to extend farther in the mine than a vitiated atmosphere may be true; but it is equally true that such a current of air properly directed is more effective in diluting and sweeping away an accumulation of dangerous or noxious gases, than is a depleted air current.

The early methods of coal mining were characterized by many unsanitary as well as hazardous conditions, caused mainly by imperfect ventilation or, in many cases, no ventilation at all. The miner readily became a victim of blood and pulmonary diseases. It was no uncommon sight for me, as a boy, to see men, in the prime of manhood, practically incapacitated for mining work, owing to these insidious diseases. Many of these men have struggled on for years, under the spur of necessity, drawing upon their reserved vitality—nature's legacy for old age—to meet the demands of life. No one but those who have lived in such an experience can realize the horrors attending these diseases. Years of untold suffering are followed by the untimely death of a man who was otherwise muscular and vigorous.

If modern methods of mining coal have been increasingly productive of danger, they have at least the redeeming feature that, like Sir Walter Raleigh's ax, they kill quickly; but, it may be said that primitive methods of mining, though slower in action, were none the less certain. We realize that the present demand for coal could not be supplied by primitive methods of mining. It is this increasing demand that has necessitated the introduction of mechanical devices that make possible a larger production of coal. Even with these increased facilities for extraction, the demand for coal still calls for an increase in the number of workers; and these requirements necessitate increased ventilation. It is clear therefore that modern methods of mining are the products of necessity.

A comparison of primitive methods of mining with those now in use seems to point clearly to the fact that the additional dangers in mining arise chiefly from the increased production of coal dust and the distribution of this fine dust throughout the workings. The increased production of fine coal dust can be attributed directly to two causes; namely, the use of machines for undercutting the coal, and the excessive use of blasting powder. In the use of permissible powders, attention has often been called to the fact that the strength of these powders is such as to require a far less quantity of the powder for the performance of the same work.

Modern methods of mine haulage are responsible largely for the distribution of fine coal along the haulage roads. Also, the increased demand for ventilation, necessitating a higher velocity of the air current, has increased the amount of dust carried in the air, which is deposited at points where the velocity of the air is reduced by reason of an increased area of the air passages. The evils arising from new conditions must be met by, first, ascertaining the nature of the trouble and, second, devising and applying the best possible means for overcoming the danger.

Since by far the largest proportion of dust is produced at the working face, it is here that suitable means must be adopted to prevent, as far as possible, its projection into the mine air. The means thus far adopted to accomplish this are not as effective as could be desired. Again, to prevent the distribution of dust along the haulage roads, mine cars should be made dust-proof, and these should not be overloaded. This will not only add to the safety of the mine, but will increase the economy of operation, as it will reduce the cost of keeping the roads clean, which is an item of no small importance in large mines. When proper precautions are taken, in respect to these two conditions, the danger that might arise from ample ventilation is practically removed.

In my opinion, there should be a sufficient quantity of air circulated in every mine to supply ample ventilation to all working places and allow a sufficient scale of air to be taken from each split to properly ventilate the worked-out and abandoned portions of the mine, which, under the old system of ventilation, often accumulated dangerous quantities of gas. An ample and efficient air current is one that sweeps every portion of the mine with sufficient volume and velocity to insure the dilution and removal of the gases generated.

Referring to the remark that is often made, that it is frequently the model and uptodate mine that meets with disaster, I would like to ask: Is this a just criticism or a logical argument against the introduction of approved and tested methods? Cannot the same argument be used to demonstrate the fact that any disaster occurring in such a model and uptodate mine must have resulted from carelessness or reckless indifference to safety and disregard of mine regulations? It must be remembered that a good tool will not compensate for a lack of skill, or for carelessness on the part of the worker.

I. C. Parfitt.

Jerome, Penn.

Mixed Lights in Mining

Observing the great difference in the opinions expressed in reference to the use of mixed lights in mining, in recent letters on this subject, published in Coal Age, I am led to express my views on this important question, in coal mining.

I believe that conditions can exist, in many mines where gas is given off in dangerous quantities, that will render the use of mixed lights in the mines safe. Suppose, for example, that we were about to open and develop a large coal mine covering a great acreage. The main entries are to be driven due north, for a distance of, say two miles. The mine is found to be gaseous; and, in accordance with Art. 6, Sec. 4, of the bituminous mine law of Pennsylvania (1911), the mine is opened by driving five main entries, two leading from the main opening, and two from the second opening, while the fifth entry is to be used solely as a traveling way.

Now, suppose gas is given off on the west side of the mine only, there being no gas found on the east side; and the circulation of the mine is so arranged that each side has its own separate ventilating current. Under these conditions, I would consider it safe to work with open lights on the east side, while safety lamps are used exclusively on the west side of the mine; but would suggest that all precautions required by law for a gaseous mine should apply also to a mixed-light mine. The fireboss should examine every working place on the open-light side of the mine the same as he does on the gaseous side.

To attempt to enforce a rule that safety lamps be used exclusively in every section of a mine, simply because gas has been detected by an approved safety lamp in some certain portion of the mine, would be to impose a burden on the miner and operator alike, especially in a mine such as I have described. Where mixed lights are used, under the conditions described, the following regulations should be made and strictly enforced: 1. No man should be permitted to enter the safety-lamp section with an open light. 2. A safety-lamp station should be provided at a convenient point in the mine, and an attendant be on duty at all times during working hours, day and night, to see that no one enters the gaseous section without exchanging his open light for a safety lamp, in accordance with Art. 10, Sec. 4, of the mine law.

If the ventilating system is properly planned, and the overcast and stoppings are substantially built, I believe it is entirely consistent with safety to use open lights on one side and require safety lamps to be used exclusively on the other side of such a mine.

Study Course in Coal Mining

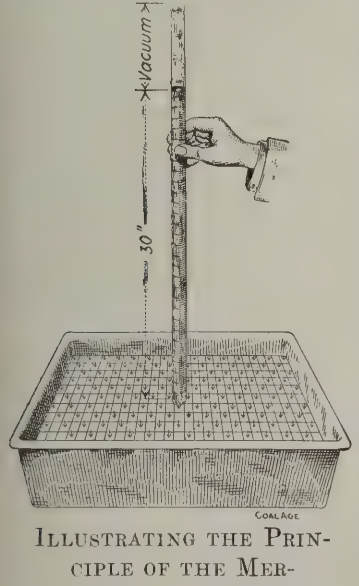
By J. T. Beard

The Coal Age Pocket Book

THE PRINCIPLE OF THE BAROMETER

The principle of the mercurial barometer is the balance of pressure between the atmosphere and the column of mercury in the tube. The weight of the atmosphere counterbalances the weight of the mercury column, which rises as the atmospheric pressure increases and falls as it decreases. The height of the mercury column is therefore a true index of the pressure of the atmosphere at the surface of the earth, at the moment of taking the observation.

The principle of the balance of pressure between the air and the mercury is clearly illustrated in the accompanying figure where a glass tube, closed at one end, is shown supported in a basin of mercury. The surface of the liquid in the basin is divided into imaginary squares, by lines one inch apart; and the small arrow-heads represent the pressure of the atmosphere exerted on each square inch of surface.



Illustrating the Principle of the Mercurial Barometer

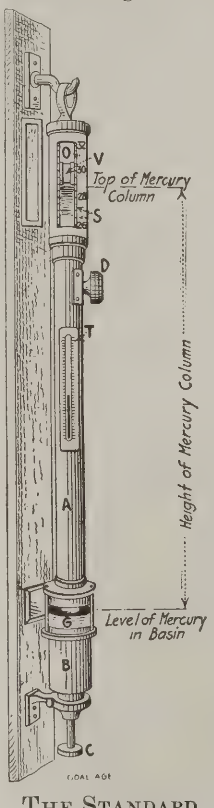
Suppose for a moment, that the column of mercury in the tube is exactly one square inch in cross-section; it is evident, in that case, that the mercury column takes the place of the atmospheric pressure on one square inch of surface; and, since there is perfect equilibrium, its weight is equal to the pressure of the atmosphere per square inch.

Furthermore, whatever the sectional area of the mercury column, it is clear that its weight will always equal the atmospheric pressure for the same area of surface. Hence, the area of the mercury column is not important, but its height only.

If the weight of one cubic inch of mercury (0.4911 lb.) be multiplied by the height of the column of mercury, as measured in inches, the product will be the pressure of the atmosphere, in pounds per square inch, at the place where the observation was taken. This assumes, that the barometric reading has been reduced to a standard reading, at a temperature of 32 deg. Fahrenheit, which is common practice.

The Coal Age Pocket Book

Description of the Instrument—In the accompanying figure is shown the common form of the standard mercurial barometer. The glass tube that contains the mercury column is here inclosed in the metal case A, to the bottom of which is attached a somewhat larger casing B. The latter holds a glass cylinder G terminated at the bottom with a chamois-skin bag, the whole forming the basin that holds the mercury.



The Standard Mercurial Barometer

The entire case AB is hung in a truly vertical position, supported on a substantial base, as shown in the figure. The top of the mercury column is observed through the opening O, in the upper end of the case. In this opening, is arranged a sliding vernier V, which can be adjusted, by means of the thumbscrew D, so that its lower edge exactly corresponds with the top of the mercury column. The position of the vernier is then read on the scale S marked on the sides of the opening in the case. This scale is graduated in inches, but only extends an inch or two above and an equal distance below the normal barometric reading. The normal reading at sea level is about 30 in., and the scale extends from 26 to 32 inches.

Before setting the vernier, however, it is necessary to adjust the level of the mercury in the basin so that it corresponds exactly with what would be the zero of the extended scale. To enable this to be done with precision, there is attached to the scale a long rod that extends downward inside the casing. The lower end of the rod is drawn to a fine point that marks the zero of the scale.

To adjust the level of the mercury in the basin, the thumbscrew C is turned. This screw bears against the bottom of the chamois-skin bag and operates to raise or lower the level of the surface of the mercury in the glass cylinder. The adjustment is complete when the fine pointed end of the rod is seen to just prick the surface of the mercury. The point of the rod is observed through the glass cylinder above the surface of the mercury.

A thermometer T is shown attached to the metal case. In making accurate observations it is necessary to reduce all readings to standard readings.

INQUIRIES OF GENERAL INTEREST

The Air Chamber of a Pump

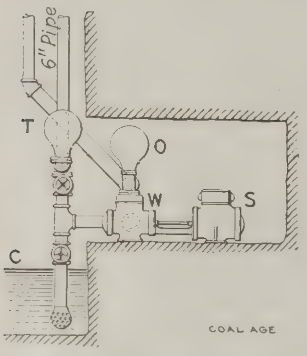
Please explain the principle of the air vessel (chamber), as used on mine pumps? Show by sketch how the air vessel should be fitted to a pump.

PUMPMAN.

West Elizabeth, Penn.

The purpose of the air chamber is to maintain a continuous flow of water in the discharge pipe of a reciprocating pump. In this type of pump, the water in the discharge pipe would come to rest between each stroke of the pump, as the action is intermittent.

In the accompanying figure the air chamber *O* is fitted, by a T, to the discharge pipe, immediately above the valve chest of the water cylinder W of the pump; *S* is the steam cylinder. The air chamber is simply a closed chamber of spherical shape. The air in this chamber is compressed by the weight of the water in the column pipe. When the pump ceases to act between each stroke the pressure of the air acting on the water maintains the flow in the discharge pipe the same as though the pump was in action, because the pressure of the air in the chamber is equal to the pressure against which the pump operates. It is important that the air chamber be located in direct connection with the discharge pipe and as close to the water cylinder of the pump as possible.



A MINE PUMP ARRANGED TO DRAIN TWO BASINS

The pump shewn in the figure is arranged either to draw its water from the sump *C* below the pump, or to be fed from another water basin a short distance up the shaft. In this arrangement, however, a second air chamber *T* is required to be attached to the pipe leading from the upper basin.

⁂

Effect of Sulphur on Mine Fire

If, just before sealing off a mine fire, a large quantity of sulphur is ignited, what effect would this have on the fire after it was sealed off?

J. C. HAYSLETT.

Arjay, Ky.

We suppose this question refers to the burning of a considerable quantity of pyrite, in the coal seam. Pyrite (sulphide of iron, FeS_2), as found in coal seams, is commonly called "sulphur," by the miner. A considerable quantity of this pyrite disseminated in the coal would give off, under the action of the fire, sulphurous fumes (SO_2), which are suffocating and extremely poisonous. In the presence of moisture, there would be the possibility of the formation, besides, of hydrogen sulphide (H_2S), which, next to carbon monoxide (CO), is the most dangerous gas known to mining.

The only effect the sulphurous fumes would have on the fire itself would arise from the dilution of the air with an extinctive gas and the consequent depletion of the available oxygen, which would reduce combustion and tend to extinguish the fire.

⁂

Effect of Washing Coal

We are preparing to put in a coal washer and would like to ask for a little information as to what results may be expected.

An analysis of the coal, before washing, is as follows:

Fixed carbon	65.80 per cent.
Volatile matter	29.71 "
Moisture	1.21 "
Ash	2.28 "
Sulphur	1.00 "
Total	100.00 per cent.

The tests we have made show that 93.5 per cent. of the washed coal passing through a ¾-in. revolving screen will pass over a $\frac{1}{32}$-in. mesh, the remaining 6.5 per cent. passing through that mesh. Analysis shows that the larger of these two sizes of screenings contains 2.06 per cent. ash and 0.95 per cent. sulphur. The smaller size contains 13.45 per cent. ash and 1.59 per cent. sulphur.

We wish to know what percentage will be added to the value of what remains after washing, by taking out the screenings that pass through the $\frac{1}{32}$-in. screen.

We also desire to ask what value the part taken out would have as a fuel; and what arrangement of furnace or appliances would be required to burn it successfully, either in stationary or locomotive boilers. We could possibly use this portion of the screenings ourselves, as we have both kinds of boilers.

L. K. MOSS,
Supt., Mabel Mining Co.

Warrior, Ala.

The above inquiry, submitted to A. J. Sayers, engineer for the Link-Belt Co., Chicago, Ill., elicited the following reply:

The question of your correspondent cannot be answered satisfactorily without making quite extensive tests on samples of the coal in question. Without doubt, the value of the coal for blacksmithing purposes would be increased by screening out the $\frac{1}{32}$-in. screenings. This is clearly shown from the analysis given of these screenings.

As there is only 6.5 per cent. under $\frac{1}{32}$ in., it does not affect the general sample to any great degree, in spite of the fact that this small percentage runs very high in ash and sulphur. The only suggestion we would have to make would be for Mr. Moss to screen out and re-treat the coal from $\frac{3}{16}$ in. or ⅛ in. down, mixing it with the other size for his market. This could be done successfully by the ordinary Foust or Feldspar Luhrig Jig.

We are not in position to tell Mr. Moss the exact commercial value this would be to him, or to answer his question in regard to the analyses of the screenings. We do not believe, however, that it would pay him to screen out this fine product and try to consume it in his own boilers. It would be a very uneconomical coal to burn, under ordinary conditions, and the treating of a small percentage would not be an inexpensive proposition for him.

EXAMINATION QUESTIONS

Mine Development

(West Virginia Examination)

Ques.—Locate on the accompanying plan, the position of the fan and show the method of ventilation, by marking thereon the different overcasts, doors, stoppings or brattices, regulators, curtains or check doors, and the direction of the air currents, by means of the indicated symbols. Note any violation of the mine law by the letter *V*.

Ans.—In reply to this question, we have marked on the mine plan, the position of the several overcasts, doors, stoppings, etc., and indicated by arrows the direction of the air currents. The triple-entry system shown on the plan suggests the possibility of this being a gaseous mine; and we have adopted an exhaust fan, placed at the mouth of one of the side entries, flanking the main haulage road, which is thus made the main intake for the mine.

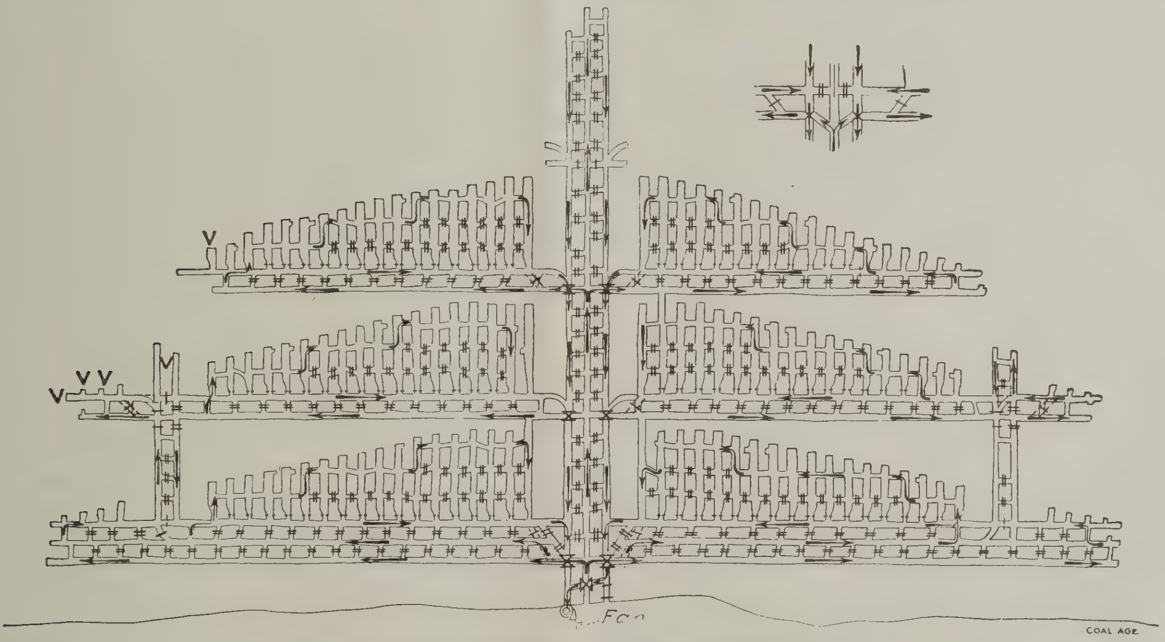
Ques.—State your opinion as to whether or not this mine is being properly developed.

Ans.—This mine is evidently planned for an output of, say 1000 tons per day. It is divided, by the cross-headings, into sections capable of producing, in 6-ft. coal, under fair conditions of roof and floor, say 150 tons per day, per section. If, however, the total output of the mine should exceed 1000 or 1200 tons per day, it would be preferable to use a four-entry system for the main roads and airways. This would provide separate roads for the loads and empties on the main-intake airways and separate return airways for the two sides of the mine, assuming a gaseous mine.

The proposed plan of dividing the mine into separate sections is good, providing each section is worked out regularly and closed promptly when the same is abandoned. The method of holing through the first or second room on each pair of entries provides good ventilation until such time as the overcast on the main return is built at the mouth of the cross-entry, which should be done as soon as the development of that pair of entries will warrant the expense of the overcast. A substantial stopping should then be built where the room holed through into the entry.

Ques.—Would you change this method of mining? Give reasons.

Ans.—We have indicated in the small detailed sketch an improved arrangement at the mouth of each pair of cross-entries. An oblique crosscut should be provided between the two cross-entries of each pair, at the mouth of the first room on each entry, to allow the coal in that section to be hauled out on the intake air. An overcast is built on the main-return airway, at the mouth of each pair of cross-headings.



Showing Development of a West Virginia Mine

Ques.—How would you begin to draw pillars in this mine?

Ans.—This will depend on the nature of the roof and floor. Under fair conditions, the rooms can be held open until the last room is driven on each section; and many would prefer to begin drawing the pillars, in each section, as soon as the last room had reached the limit. Under certain conditions, however, it will be impracticable to hold the rooms open this length of time, and the drawing of pillars should then be commenced as quickly as each room reaches the limit. In every case, the line of pillar work should be kept as uniform as possible.

[The two remaining questions on this map will follow next week.—Ed.]

COAL AND COKE NEWS

Washington, D. C.

Representative Murray, of Massachusetts, has taken action which is calculated to hasten the rendering of the decisions in the anthracite coal cases, which are being held back to an unexpected degree by the Interstate Commerce Commission. Mr. Murray has introduced a resolution (Aug. 1) calling for an investigation by the Government that will bring out the fact on the following points:

1. Capitalization, ownership and control of the Pennsylvania anthracite mines.
2. Intercorporate relationships of the coal-mining, coal-handling, and coal-selling companies, and in the companies transporting coal by water and rail.
3. The total revenues, expenses and profits of the anthracite-mining companies for a period of years.
4. The total revenues, expenses and profits of the anthracite-carrying railroads for a period of years.
5. Wholesale prices of anthracite coal at the mines and at the principal distributing points, and retail prices of coal in the principal cities.

Much of this ground was covered in the anthracite coal inquiry of last year and part of it has been published in a government report. Mr. Murray in fact admits this, saying:

> I have reason to believe that there is now on hand in the executive departments enough data to show that 90 per cent. of the available anthracite coal, and between 85 and 90 per cent. of the anthracite shipped each year is in control of the seven railroad systems which form the only means of transporting the coal to the markets. These roads are bound together by their common interests, by interlocking directorates, and by agreements of various kinds so that they act as a unit in controlling the price of anthracite coal. For example, the net earnings of the Philadelphia & Reading Coal & Iron Co. for the last half of 1912 were $2,921,139 or nearly ten times as great as they were for the last half of 1911.

Mr. Murray's action is understood to be due to widespread complaints in New England regarding both price and supply of anthracite, and it is believed that there will have to be a renewal of the subject notwithstanding that rather elaborate inquiry was devoted to it only about a year ago while a report was filed less than six months ago.

Reasonable Time Defined

The Interstate Commerce Commission has handed down opinion No. 2405 in which it refuses to award reparation to a retail coal dealer for excessive rates inasmuch as he had been advised by the Commission that his claim informally presented would be considered only on the formal docket, yet took no action for five years and then filed a complaint. This amounts to a definition of the meaning of "reasonable time" for the presentation of complaints and is equivalent to the statement that all such demands lose their basis if they are withheld beyond the time when they might by the exercise of "due diligence" have been presented.

The Earnings of West Virginia Miners

Statements made public here show that according to the West Virginia Department of Mines, the average earnings of miners for the year ending June 30, 1912, were $618.52, the highest average earned by soft-coal miners anywhere. West Virginia is a nonunion state. In the unionized state of Illinois the average earnings of miners in the same year, according to the State Department of Mines, were only $556.33, or $62.19 less than the nonunion miners of West Virginia averaged.

Men who belong to the union must pay dues and assessments, which according to statements published in the United Mine Workers "Journal," amount at present to 25c. with strike assessments of 50c. each semi-monthly payday or $18 a year. The 400,000 members of the United Mine Workers, at present rates of collection appear to be yielding a fund of $7,200,000 annually. It is estimated that if the 69,611 miners of West Virginia can be added to the union rolls, they will increase this sum at the present rate by $1,252,998 a year.

So eager are the union officers to increase the receipts of the general treasury that in the so called "Paint Creek Settlement," which really was a settlement with only two companies, the officers actually signed a contract binding their members to return to work for less money than the companies had offered to pay before the strike began.

HARRISBURG, PENN.

The officials of the United Mine Workers hold out little hope that the coal operators will accept the proposition of the miners to establish a "check-off" in the anthracite region as a remedy for the frequent petty "button strikes," which have prevailed ever since the ratification of the 1912 agreement, due mainly to the refusal of the men to join the union or pay dues toward the support of the organization. The plan was proposed at the convention recently held in Wilkes-Barre. The proposition has not yet been presented to the operators, but preliminary arrangements are now being made to do so at an early date.

The argument of the men in the union is that this is the only way to stop the trouble, and they point out that it is as much to the advantage of the companies to adopt this method as it will be to the union.

John P. White, national president of the mine workers, is expected to be in the anthracite region in the course of a few weeks. The principal purpose of his visit is to urge the men to refrain from these petty strikes. His argument will be that the operators will use these strikes as a reason for not entering into a new agreement with the miners' organization upon the expiration of the present contract.

In the Schuylkill region last week about 200 rock men employed by contractors went on strike for an increase in wages, and all rock work in tunnels being done by the Lehigh Valley and Reading companies between Centralia and Mahanoy City came to a standstill. The 1100 employees of the William Penn Colliery of the Susquehanna Coal Co. went out on strike on account of the dockage question, but the men agreed to return to work and then adjust their troubles. At the Midvalley Colliery of the Midvalley Coal Co. and the Cameron Colliery of the Mineral Railroad & Mining Co., "button strikes" are in order. The Beaver Brook Colliery of the Dodson Coal Co. is about the only one that has not had a case before the Conciliation Board this year.

Following a conference held last week between Governor Tener, representatives of the Attorney General's department, Auditor General Powell and State Treasurer Young, Auditor General Powell decided to pay state funds to virtually all state departments.

These payments will start as soon as vouchers are presented from the various departments which the Auditor General believes are not legally created because not contemplated in the Constitution.

Governor Tener has re-named the State Industrial Accident Commission. To this body he will intrust the important duty of framing a workman's compensation and employers' liability act for submission to the next session of the Legislature.

The Commission will be instructed to get the views of all interests on the subject and to frame a bill that, if possible, will meet with less opposition than that which failed during the last session because neither labor nor capital could come to an agreement as to its provisions.

Morris Williams, president of the Pennsylvania Coal Co., and Francis Feehan, a former district president of the United Mine Workers, are among those appointed on this commission.

PENNSYLVANIA

Anthracite

Scranton—Workmen in the Greenwood mine of the Delaware & Hudson Co. had a narrow escape from death on July 29, when lightning entered a chamber by means of an electric feed wire and fired three sticks of dynamite that had been placed preparatory to a blast. Three men had just left the chamber when the charges went off. The battery wires were burned out and the trail of the bolt could be followed from the surface through a slope to its entrance into the chamber. The accident is the first of its kind in this end of the anthracite coal fields.

Wilkes-Barre—A suit in trespass against the Wilkes-Barre Anthracite Coal Co. has been filed, asking $25,000 damages. The suit grows out of a case where a pumprunner had his clothing caught in the gears of a machine in the company's mine.

The Kingston Coal Co., on Aug. 1, filed a cross bill in equity against the Delaware, Lackawanna & Western R.R. Co. over the ownership of coal lands, in which over $1,000,000 is involved. The case grows out of an agreement made in 1862 when the Lackawanna Co. leased certain coal lands, and then entered into an agreement with the Kingston Coal Co., whereby the latter company was to mine the coal, it being cheaper for the railroad company to have the coal mined by the Kingston people than erect its own collieries.

Pittston—The Pennsylvania Coal Co. has just completed a modern electric plant at the old Schooley shaft, and expect to supply the various collieries in the south district with electricity in the near future. The culm bank at the old Schooley plant will be utilized for fuel. Electricity will be furnished in the beginning to old No. 2 shaft and to No. 9.

Shenandoah—Six miners and laborers were entombed for some hours on July 29 at the William Penn colliery near here shortly after they had started work in No. 2 Lift. After the fall of rock occurred shutting them off from the rest of the mine, other employees lost no time in starting a rescue party, and by 2 o'clock in the afternoon all of the men were brought out alive and apparently little the worse for their experience.

Tamaqua—Sparks from an electric motor in the No. 4 mine of the Lehigh Coal & Navigation Co. set fire to a body of gas on July 29, as a result of which three men were badly burned. The men were employed on the gangway when the explosion occurred and were hurled a considerable distance by its force.

An explosion of gas at the Buck Ridge Colliery of the Philadelphia & Reading Coal & Iron Co. at Shamokin on the same day seriously if not fatally burned two miners.

Bituminous

Beaverdale—The Beaver Run Coal Co., on July 1, formally opened a new stone club house for its employees. This is equipped with gymnasium apparatus and is generally similar to a Y. M. C. A. F. B. Cortright, secretary of the company, of Philadelphia, presided at the opening of the new building.

Johnstown—Judge M. B. Stephens has granted an injunction to the Morrellville Coal & Coke Co. against the Morrellville Coal Mining Co., restraining the latter from mining further coal. The case is an unusual one, involving the designation of the amount that is to be allowed the operating company for faults in the coal. The holding company maintains that the operating firm is in arrears with the royalty, while the operating company maintains that it has paid excess royalty amounting to $50,000. Another injunction was applied for some time ago in the Blair County Courts and Judge Stephens will hold a hearing in that case soon to receive testimony growing out of the dispute.

Kaylor—The mines at Kaylor, formerly operated by the Great Lakes Coal Co., but now owned by the North Penn Coal Co., recently resumed operations under new management. Two of the mines are now working and as rapidly as men can be secured the others will be again opened. It is the intention to again operate this group of mines to their full capacity.

Pittsburgh—Three separate answers of the Monongahela River Consolidated Coal & Coke Co., the Pittsburgh Coal Co. and the Union Trust Co., of Pittsburgh, trustees, defendants in a bill in equity, filed by Alexander Dempster, were filed in the local court at Pittsburgh on July 31. All three answers declare that Dempster has no standing in a court at law under the equity proceedings and ask that the bill be dismissed.

The answer of the Pittsburgh Coal Co. declares that Dempster, a minority stockholder of the Monongahela Co., without averments of fraud or danger of insolvency and sufficient facts in support thereof, seeks by a decree of court to control the corporate property of the company and personally dictate its management. By comparison of the defendants' holdings of stock in the company and the stock held by the plaintiff it is alleged that the acts complained of do not warrant or justify a decree in his favor.

A statement of the affairs of the company shows that in 1909 they lost $376,155.43 through the loss of coal fleets sunk in the Mississippi River by storms. In 1910, the profits are given as $231,222; in 1911, $355,789; and in 1912, $708,539; and it is asserted the profits of the present year will exceed those of last year.

WEST VIRGINIA

Charleston—With but one exception every local miners' union on Cabin Creek reported Aug. 1 that they had ratified the terms of an agreement by which the long coal strike will be officially ended.

Fayetteville—A strike was recently declared at the Cranberry mines in Raleigh County at a property of the New River Co. The cause of the disturbance was a controversy between a union and non-union employee, the non-union man refusing to join the miners' organization, and when urged too strongly by the union man, defending his stand with his fists. The matter is to be submitted to arbitration and the striking men have gone back to work.

Morgantown—The mine rescue course given in connection with the department of mines of the college of engineering at the State University of W. Va. is an accredited training course of the Federal Bureau of Mines. Summer school students in mining engineering have received certificates from the Federal Bureau for their mine rescue studies.

KENTUCKY

Fleming—The Elkhorn Fuel Co.'s new town of Fleming has filed application in due form before the Circuit Court of Letcher County for incorporation under the laws of the state. The court is asked to appoint five trustees, a marshall and an assessor, the petition being signed by the due two-thirds of the qualified voters of the town.

Harlan—The Harlan Coal Mining Co. is one of the eastern Kentucky operators which has been so crowded with orders from the territory north of the Ohio that it has had difficulty in keeping up with its regular business. On this account it has been forced to decline all orders or offers from others than its established customers, and to limit the amount of coal that even these favored customers may take at this time. The company has in several cases had to buy outside coal to take care of orders, nearly always at prices as high as it received, and in some cases higher.

TENNESSEE

Knoxville—Considerable interest is already being manifested by Kentucky mine operators and their employees in the great miners' field day, to be held at Knoxville, Sept. 20. Between 30 and 40 teams have been entered, and are receiving minute instructions and hard training to fit them for their contest for the rich prizes to be awarded. An unusual feature of the meeting will be a demonstration of the manner in which coal-dust explosions occur, and their danger. A big steel tube made for that purpose will be used by the Bureau of Mines in this demonstration. Twenty-five thousand miners are expected to be present. The exercises on Miners' Day will be held under the auspices of the Tennessee Mine Foremen's Association, the American Mine Safety Association and the American Red Cross.

OHIO

Martin's Ferry—The mine of the Powhattan Coal Co., which was to have been opened shortly, will not be started until about the first of the year. The principal reason for this postponement of operations seems to be that all bids received for building tracks, tipples, power house, etc., were considered too high on account of the scarcity of labor. It is believed that labor conditions will be easier in a few months.

New Lexington—Referee in Bankruptcy E. R. Mayer has made public his finding in the bankruptcy case of the Saltillo Coal Co., showing that the company is insolvent. The finding shows the company's indebtedness to be about $33,050 and the assets $23,500.

Columbus—Senator William Green, author of the bill to require the weighing of coal to determine the wage of miners, before screening, addressed the state commission appointed by the governor to investigate the subject recently in the senate chamber at Columbus, Ohio, giving his reasons for introducing the bill.

The introduction of the bill, he said, naturally followed the adoption of the amendment to the constitution making such a statute proper, and valid, and the vote on the amendment showed that the people were in sympathy with the proposition. In 1898 such a law was enacted, but the supreme court set it aside. If the organic laws of the state had been in 1898 as they are now, this dispute would not be in progcess. It would have been settled long ago.

INDIANA

Boonville—Several convictions have been secured recently at Boonville, Ind., by John C. Wright, a deputy state mine inspector, under the mining law of Indiana. The charges were various, including failure to provide ventilators, make break-throughs and furnish timbers.

Hymera—Five men were probably fatally burned, and 18 others severely injured in a dust explosion at Jackson Hill mine No. 2, three miles east of here on Aug. 1. Rescuers succeeded in bringing out all of the injured miners alive, but the mine property was heavily damaged. It is believed the dust was fired by a windy shot.

ILLINOIS

Watson—Leases are sought on 10,000 acres of coal land in a contiguous body near Watson on either side of the Illinois Central R.R. These leases are drawn for two years and represent the Consolidated Coal Co., of St. Louis and Chicago. It is believed from oil-well drillings that coal in paying quantities underlies Watson and the surrounding country.

Clinton—An inspection was recently made of mine No. 4 of the Big Creek Coal Co. looking toward the installation of electric machinery therein. Many of the larger mines in Fulton County have adopted electric power systems and those who have not done so are making preparations therefor.

Hillsboro—The Peabody coal mine after being shut down to make extensive improvements for several months has recently resumed operations. Inside of a month it is expected that this mine will employ about 350 men. This number will be increased constantly for several months.

OKLAHOMA

McAlester—As the result of injuries received in a gas explosion in mine No. 4 of the Union Coal Co., at Adamson, on July 25, Jake Blevins, a coal miner, died in the local hospital here on July 28.

FOREIGN NEWS

Juneau, Alaska—The commissioner of the general land office has canceled the Alaska coal claim of James Wardell, of Juneau, on land adjoining the Cunningham group in the Bering River region. This is the first Alaska coal cancellation since the voiding of the Cunningham claim in 1911. Forfeiture was on account of failure to open and improve the land.

Antofagasta, Chile—J. Bartman Coleman and J. Yeams, of the Caledonian Collieries Co., Ltd., of Australia, have left on an extensive inspection trip in the interior. They expect to look at a number of coal prospects before returning. They also will study the fuel question at various nitrate concessions, where the increasing use of fuel oil is making considerable inroads in the coal tonnage consumed.

Glasgow, Scotland—Twenty-two coal miners perished in the fire which broke out Aug. 3 in the Mavis Valley pit of the Cadder Colliery near here. Their bodies have been recovered. Only one man escaped alive of the shift of miners in the pit at the time of the fire. A widow lost three of her sons. The rescuing parties passed through a severe ordeal, owing to the intense heat and poisonous gases, and many of them were brought to the surface unconscious.

COAL AND COKE PATENTS

Improvements in Collapsible Wooden Mining Props, H. Heidkamp, 117 Blüthenstrasse, Hamborn-Neumühle, Rheinland, Germany, 17,557 of 1912.

Apparatus for Discharging Substantially Vertical Retorts for the Destructive Distillation of Coal, H. W. Woodall and A. McD. Buckham, assignors to Isbell-Porter Co., Newark, N. J., 1,065,572, June 24, 1913, filed Feb. 1, 1913, serial No. 475,474.

Steam Boiler Furnace, J. McMillan, Chicago, Ill., 1,065,702, June 24, 1913, filed Mar. 23, 1912, serial No. 685,745.

Means for Securing Combustion of Coal, J. H. Parsons, assignor to Parsons Engineering Co., Wilmington, Del., 1,066,044, July 1, 1913, filed Apr. 15, 1908, serial No. 427,119.

Method of Securing Combustion of Coal, J. H. Parsons, assignor to Parsons Engineering Co., Wilmington, Del., 1,066,043, July 1, 1913, filed Nov. 1, 1907, serial No. 400,169.

Mechanical Stoker, E. C. Cramp, Harrisburg, Penn., 1,066,254, July 1, 1913, filed May 2, 1912, serial No. 694,656.

Method of Regulating Generation in Gas Producers, L. R. C Chowning, Corning, N. Y., 1,066,252, July 1, 1913, filed Jan. 25, 1913, serial No. 744,256.

Miners' Emergency Case, E. M. Johnson, Bishop, Penn., 1,066,449, July 1, 1913, filed Aug. 12, 1912, serial No. 714,568.

Soot Boiler Cleaner, L. J. Bayer, assignor to Bayer Steam Soot Blower Co., St. Louis, Mo., 1,066,244, July 1, 1913, filed Oct. 9, 1912, serial No. 724,757.

Mine Car Wheel, W. J. McDonald, assignor to American Car & Foundry Co., St. Louis, Mo., 1,066,638, July 8, 1913, filed Dec. 21, 1912, serial No. 737,034.

Coal Leveling Machine for Bee-Hive Ovens, W. Sangster, J. S. Ham, assignors to Covington Machine Co., a corporation of Virginia, 1,067,221, July 8, 1913, filed Aug. 24, 1908, serial No. 450,115.

Gas Producers, H. L. Douherty, New York, N. Y., 1,066,717, July 8, 1913, filed Dec. 27, 1909, serial No. 535,037.

Coal Leveling Machine for Bee-Hive Ovens, W. Sangster, assignor to Covington Machine Co., a corporation of Virginia, 1,067,199, July 8, 1913, filed July 7, 1908, serial No. 442,305.

Smoke Preventer, G. H. Maynard, New York, N. Y., 1,067,826, July 22, 1913, filed July 25, 1912, serial No. 711,607.

Self-Coupling Mine-Car Bumper, E. Stark, Munger, Mich., 1,067,384, July 15, 1913, filed Sept. 12, 1912, serial No. 720,035.

Coal Leveling Machine, P. H. Douglas, assignor to Wellman-Seaver-Morgan Co., Cleveland, Ohio, 1,067,240, July 15, 1913, filed Dec. 20, 1911, serial No. 666,948.

Coal Transferring Apparatus, Charles Marcello, Pickayune, Miss., 1,067,615, July 15, 1913, filed May 8, 1912, serial No. 695,921.

Smoke Purifier, J. Delaney, Milwaukee, Wis., 1,067,321, July 15, 1913, filed Sept. 8, 1911, serial No. 648,271.

PERSONALS

James Bagley has been appointed state inspector of coal mines at Seattle, Wash., taking the place of D. C. Botting, resigned.

John Reynolds, of Eagan, Tenn., has resigned the position of superintendent of the Eagan mine of the Campbell Coal Mining Co. of that place.

J. J. Rutledge and J. M. Jones, of the Federal Bureau of Mines, have been making an inspection of the Birmingham district with the purpose, it is believed, of preparing a report upon the explosibility of coal dust for the Bureau of Mines.

Hugh McDonald and W. W. Smith, of Minot, N. D., have been inspecting various coke plants in the Connellsville region, with the idea that they will shortly construct a coking plant at their mining property near Minot and produce a domestic coke from North Dakota lignite.

The Chief of the Department of Mines, of Philadelphia, Hon. James E. Roderick, has appointed Harry Phythyon, of West Middlesex, and Thomas H. Thompson, of Finleyville, to be inspectors of mines in the bituminous region. Mr. Phythyon will have headquarters at Belle Vernon, Fayette County. Mr. Thompson will have headquarters at Punxsutawney, Jefferson County.

Governor Tener announced on Friday, Aug. 2, that he had named the following men to constitute the new Public Service Commission of Pennsylvania: Nathaniel Ewing, Fayette County, head of the State Railroad Commission, which is supplanted by the new commission, chairman; ten-year term. S. Larue Tone, Allegheny County, general manager and chief engineer of the Pittsburgh Railways Co.; nine-year term. Samuel W. Pennypacker, Montgomery County, ex-governor and member of the old Railroad Commission; eight-year term. Emory R. Johnson, Philadelphia, professor of transportation and commerce expert, University of Pennsylvania; eight-year term. Milton J. Brecht, Lancaster County, member of old Railroad Commission; six-year term. Charles F. Wright, Susquehanna County, ex-state treasurer; five-year term. Frank M. Wallace, Erie, treasurer of the Pittsburgh Coal Co.; four-year term.

CONSTRUCTION NEWS

Whitesburg, Ky.—The Elkhorn Mining Corporation organized for the purpose of developing land in the Boone's Fork and Beaver Creek field has made the announcement that actual development work is to be started immediately.

Peoria, Ill.—The Chicago and Northwestern Ry. has started the laying of rails upon its new coal road now being built from Peoria south, to tap the coal field in Macoupin County. Winston Bros., of Minneapolis, have the contract for the work. For several years the Northwestern has had this project in mind, but because of adverse conditions in the Northwest it was not deemed feasible until the present year to begin actual operation.

Punxsutawney, Penn.—With 11 new openings supplementing the six old ones, a new tipple under construction, a power plant and a two-mile extension of railroad being built to a 17,000-acre tract of coal land, the Madeira-Hill Coal Mining Co. has improvements under way which promise to revive in a large extent the mining industry of Clover Run. This operation is located in Clearfield County on the road from Mahaffey to DuBois, about six miles from Hillman.

Fairmont, W. Va.—It has been announced that the Elkhorn Fuel Co. is about to begin the extensive construction necessary in connection with its plant for developing 300,000 acres of coal land in Kentucky and West Virginia. This corporation has awarded a contract to the Nicola Building Co., of Pittsburgh, for the construction of 1000 buildings in connection with the plan for a modern mining town in Letcher Co., Ky., where developments will begin.

Birmingham, Ala.—The Tennessee Coal, Iron & R.R. Co. have recently announced five distinct improvement projects, which involve the expenditure of a considerable appropriation. These improvements embrace: One school house at Edgewater, and 100 dwelling houses at the same place. A domestic water supply at Iskooda Mine. Sanitation at Muscado, Fossil, Iskooda and Patten. Electric pumping improvements at Pratt No. 1 division. Opening No. 9 slope at Blocton to take the place of the old slope being exhausted or worked out.

NEW INCORPORATIONS

Indianapolis, Ind.—The Sedalia Lumber & Coal Co., of Clinton County, has dissolved.

Chicago, Ill.—The Benton District Coal Co. has increased its capital stock from $20,000 to $30,000.

Stephens, Tenn.—The Stephens Land & Coal Co. has been incorporated with a capital stock of $20,000 to develop coal deposits.

Connellsville, Penn.—The Margaret Smokeless Coal Co. has been chartered by Henry C. Mills, Patton, Penn., Geo. S. Good, Lockhaven, Penn., and F. J. Dixon, of Blairsville, Penn. The capital stock is $10,000.

Indianapolis, Ind.—The Ayrdale Coal Co., of Terre Haute, has been incorporated with a capital stock of $5000 to operate a mining company. The directors are: W. J. Freeman, C. J. Freeman, Jasper Schloat, W. A. Craig and Walter Bledsoe.

Columbus, Ohio—The Bell Block Coal Co., of Columbus, Ohio, has been incorporated with a capital stock of $10,000 to mine and deal in coal. The incorporators are: P. W. Barricklow, W. H. Barricklow, W. O. Copeland, Ethel E. Plant and W. H. Plant.

Madison, Wis.—The Elkhorn Gas Coal Mining Co. has been organized in West Virginia and incorporated by Milwaukee men. The capital stock is $2,000,000, of which $1000 represents the property owned in Wisconsin. Ferdinand Schlesinger is president; Henry J. Schlesinger, vice-president; Armin J. Schlesinger, treasurer, and Edward G. Wilmer, secretary.

INDUSTRIAL NEWS

Birmingham, Ala.—The operations of the Dayton Coal & Iron Co., at Dayton, Tenn., have all closed down recently for an indefinite period.

Pittsburgh, Penn.—The Hirsch Electric Mine Lamp Co. has moved its factory to the corner of 12th and Wood Sts., where its manufacturing facilities are greatly increased.

Connellsville, Penn.—The H. C. Frick Coke Co. has shut down three Leisenring plants indefinitely, throwing 1500 men out of employment, and blowing out 2000 ovens. Some other operators are also putting ovens out of blast.

Fairpoint, Ohio—It is reported that a new coal mine will be opened at Fairpoint in the near future. It is rumored that the mine will be opened by the owners of the Edghill mine north of Bellaire. No definite information can as yet be had upon this point.

Peoria, Ill.—Walter Ohlander and John Kietzler, of Pekin, have leased the Lake Erie coal mine between Wesley City and East Peoria. At present they are getting the mine into shape and are giving work to 25 men. They expect to employ a force of from 75 to 100 men during the winter.

Battle Creek, Mich.—Intending to take no chances of a possible strike the Grand Trunk R.R. is stocking 66,000 tons of coal on the flat below the Verona road crossing. The railroad has already 22,000 tons of coal in its regular storage yard near the locomotive shop, but this is only a small part of what may be needed.

Parkersburg, W. Va.—The United States Lumber Co. and the Tri-State Investment Co. have just closed a deal with Philadelphia and Scranton capitalists whereby they disposed of their combined interest in the coalfields of Highland, Bath and Augusta Counties in Virginia, and Pendleton County, in West Virginia, for a sum aggregating $320,000.

Six Mile Run, Penn.—Schipper Bros. Coal Mining Co. announces that it has just completed a tipple at its Broadtop Mine, on Six Mile Run, containing screens and picking belts for coal preparation. This company has also begun shipment from its new Crescent No. 7 Mine, on the Barnett seam, and has installed at its Ladysmith No. 5 Mine a new 10-ft. Brazil fan.

Columbus, Ohio—The Hocking Valley Ry. Co. was recently granted permission by the Ohio Public Service Commission to issue $1,000,000 of equipment trust notes for the purpose of buying new rolling stock and immediately upon the request being granted the company placed an order with the Ralston Steel Car Co. for 1000 steel battleship coal cars, which will be delivered about Oct. 1.

Washington, D. C.—One of the largest petitions ever presented to Congress from a single congressional district has been submitted to the House by Representative W. N. Carr, of Uniontown, Penn., in behalf of 13,500 employees of the H. C. Frick Coke Co. These men ask Congress to prevent a proposed dissolution of the U. S. Steel Corporation, of which the H. C. Frick Coke Co. is a subsidiary.

Columbus, Ohio—It is reported in railway circles that the Baltimore & Ohio, owner of the Cincinnati, Hamilton & Dayton Ry. system is planning to take up the southern end of the Detroit, Toledo & Ironton Ry. between Jackson and Ironton. The Baltimore & Ohio has been seeking an outlet through that locality for some time and has already had such a route surveyed. The purchase of the southern division of the Detroit, Toledo & Ironton will eliminate the building of a new road.

Philadelphia, Penn.—The Manor Real Estate & Trust Co., of Philadelphia, representing purchasing and holding companies of the Pennsylvania R.R. have concluded the purchase of seven tracts of coal land in Greene and Cherryhill Townships, Indiana County, the average price paid per acre being $70. The coal here purchased adjoins a large tract of nearly 15,000 acres recently taken over by the Manor Co. from the Greenridge Coal Co. Total payments in Indiana Co. aggregated $45,000.

Mobile, Ala.—The collier "Blossburg," owned by the Pratt Consolidated Coal Co., which was constructed at Pascagoula and Mobile has been put into service. This vessel is the only collier of its kind and is 150 ft. long, 36 ft. beam and 11 ft. deep. It has a carrying capacity of 1600 tons of coal and can bunker a steamer at the rate of 200 tons per hour. Furthermore, all classes of vessels from the smallest tug to the largest steamer can be more economically bunkered than from coal barges of the old type.

Pittsburgh, Penn.—It has been announced that the J. H. Hillman & Sons Co. has bought a controlling interest in the Bessemer Coal & Coke Co., which owns approximately 3300 acres of coking coal in the Connellsville and Klondyke region. By acquiring the controlling interest in the Bessemer Coke Co., the J. H. Hillman & Sons Co. now becomes the largest shipper of coke in the country. This firm now has an annual shipment of 3,500,000 tons of coke, and a large quantity of bituminous coal to all parts of the United States and Mexico.

COAL TRADE REVIEWS

GENERAL REVIEW

Heavy demand for bituminous continues unabated. Consumers, however, are becoming more cautious about future commitments. Buying more scattered. Anthracite moderately dull, but normal under the curtailed production.

With the August anthracite circular now in effect, there is little interest shown in getting coal forward, although there is a large tonnage moving at the full circular, and any further curtailment in production is unlikely. The companies appear to be disposing of the restricted production without any serious trouble, although there is considerable individual coal being sold down to the regular April circular, or less. The steam grades are showing some indication of improvement.

The broad heavy consumption of bituminous continues unabated, and the trade is now beginning to contemplate what the situation will be in the fall. Indications are that the current month will be the best August in the history of the soft-coal market, but the situation will turn entirely on the production. While the outlook for increased shipments is not encouraging at the moment, the possibility of a heavier movement is tending to give an easier tone to the market. Spot tonnages have not been particularly strong, especially where accumulations have occurred; buying is also more scattered and of an emergency kind, but prices continue firm. Consumers are becoming more cautious about orders into the future, and there is a feeling developing at some points that there is a possibility of a temporary slump.

Railroads in the Pittsburgh district are moving coal better than was expected, but there is sufficient congestion to cause some anxiety over the future. There is little new demand, but it is also doubtful if any important tonnage could be contracted for at the circular; production is up to full capacity. Outlying districts appear to be only waiting for Pittsburgh to take the initiative in the matter of advancing quotations. The only uncertainty in the situation at the present moment appears to be the contradictory conditions of the iron and coal markets. Ordinarily, these act in perfect sympathy with each other, but the reverse obtains now and the situation is highly puzzling to those effected.

The increased circular, effective the first of the current month in Ohio, is being strongly held, and the demand remains insistent. Production has been curtailed during the week by the restricted car supply which is now becoming a feature of the situation. There is no further doubt that the Lake shipping for the year will exceed all previous records. The companies at Hampton Roads are catching up on the contracts, because of heavier shipments from the mines, and there is also a larger movement in the coastwise and foreign trade. The tonnages in the West and Northwest, from West Virginia are unusually large.

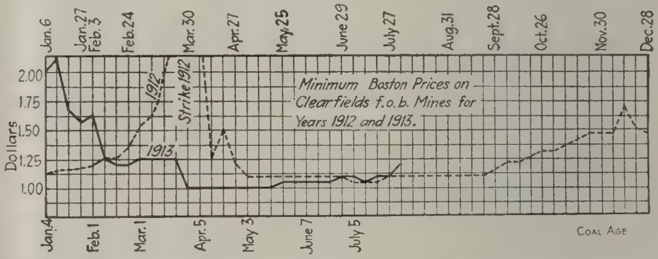
The car shortage in the extreme Southern market is causing a great deal of anxiety over what the situation will be this fall; coke is somewhat weaker because of the closing of a number of the iron furnaces. Prices in the Middlewest are being firmly held with some advances occasionally recorded. It appears to be doubtful if the operator can produce sufficient coal to meet the demand, particularly with the car and labor shortage which is becoming steadily worse.

BOSTON, MASS.

Generally a milder tone to bituminous, but it is considered only temporary. Interest still active in the probable output of West Virginia the next three months and prices continue firm. Difference among companies in charging Pennsylvania state tax.

Bituminous—The situation here continues without marked change, and what interest is shown is apparently confined to conjectures over what are likely to be the developments later. In that respect, there has been no pronounced trend, and the fall market will turn on the size of the output of Pocahontas and New River the next two or three months. Gains so far, since the resumption of mining, July 7, have been slow, but better loading is promised at all the Hampton Roads piers the next fortnight. On the whole, clear weather and the good movement of transportation coastwise help give the situation just now a milder tone, although it is recognized that there are other factors that are almost sure to make the outlook serious before many weeks. Prices are as firm as at any time since July, but buying is scattered and on Pocahontas and New River, only of an emergency character. There is a feeling in some circles, however, that within the month there will be a quiet time when prices will recede for a little, even though still later there is an upward movement that will extend into the winter.

From Pennsylvania shipments have lately been coming more slowly and there are further reports of labor shortage, of a surplus of business, and in some sections even of a limited car supply. Prices are without change, and few shippers are lacking an abundance of August business. A cautious policy is still being observed with regard to deferred deliveries. In Georges Creek the same condition is true, only with more emphasis. Practically no shipments are being made except on contract obligations, and then only in relatively small allowances to each consignment.



Water Freights are still easy, with few vessels offering. Steamer charters have been made for a series of trips on the basis of 70c. Hampton Roads to Boston points. That is about the rate on sailing vessels and barges, but dispatch has been so poor that shippers have hitherto been disinclined to charter beyond what they were obligated to take.

Anthracite—With August prices in force, there is little interest in getting hard coal forward. The advance of 25c. at retail in Boston, Aug. 1, making egg, stove and chestnut respectively $7.50, $7.75 and $8, has stimulated the demand from consumers and this will be reflected later in the month in orders filed with the companies. August will probably show a heavier tonnage movement than July and the fact that some consignees were too late in entering requisitions then, will influence retailers to get started earlier this month. Broken and screenings are notably in short supply.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.15@1.50	$1.35@1.65	$1.67@1.77	
Philadelphia*	2.40@2.75	2.60@2.90	2.92@3.02	
New York*	2.70@3.05	2.90@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.10
Providence†				3.95@4.10
Boston†				4.05@4.15

*F.o.b. †On cars.

NEW YORK

Bituminous is still in heavy demand, but the trade is inclined to be spasmodic and uncertain. Prepared sizes of hard coal are holding their own and trade is about normal for this period.

Bituminous—The strength in the local soft-coal market continues unchanged, but is more of a spasmodic nature now. Inquiries will be numerous one day, and then followed by possibly several days of no business whatever. However, in a general way there has been no easing off in the situation, and the prices continue as firm as ever. One of the reasons advanced for the unusually strong market is a heavy stocking movement on the part of the railroads. Last year the roads were forced to pay a comparatively good price for their coal requirements during the winter; this is the first time this had occurred for a number of years, and they do not propose to contend with the same condition this winter.

It would be a difficult proposition to place any important contract running to the end of the year now, and almost, if not quite impossible, to contract up to Apr. 1, 1914. The car supply has begun to tighten up on the Baltimore & Ohio, this road now supplying only about 50 per cent. requirement; there is some indication of a tightening in this respect on the Pennsylvania, but less on the New York Central, and both of these roads are handling the situation in excellent shape so far. The New York market is not quotably changed, and we continue prices as follows:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.75@2.80; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.25@3.30.

Anthracite—The hard-coal market continues rather dull and uninteresting, but in probably better condition than normally at this period of the year. The demand is still holding good, and although there is considerable price cutting, there is at the same time a large tonnage moving at the circular figure.

Production is being still further restricted, most of the large operations now probably working on a basis of about four days per week. As a result of this curtailed output, there is little coal going into storage, although some of the smaller steam grades continue to accumulate. Stove coal is still the shortest in supply. The market is quotable as follows:

		Individual	
	Circular	Lehigh	Scranton
Broken	$4.70	$4.45@4.85	$4.50@4.90
Egg	4.95	4.95@5.10	5.05@5.15
Stove	4.95	5.10@5.20	5.15
Chestnut	5.15	5.25@5.35	5.40
Pea	3.50	3.30@3.45	3.35@3.50
Buckwheat	2.75	2.15@2.45	2.55@2.75
Rice	2.25	1.70@1.95	2.25
Barley	1.75	1.30@1.70	1.75

PHILADELPHIA, PENN.

The anthracite trade, under restricted mining, still holding fair. All sizes moving off with possible exception of chestnut. Individuals still cutting prices, with concessions below April circular on some sizes. Bituminous continues on the high wave of prosperity.

The anthracite coal trade during the past week has developed nothing new, although operators claim that, with the restricted mining, they are able to dispose of most, if not all of the production. There is even a little better tone to the market as regards the small sizes. Chestnut seems to be about the only slow grade and broken is far in excess of the supply; this latter size is apparently coming into greater demand, or else there is less being made, for the companies sometimes find themselves hard pressed to cover current requisitions, and in some cases, are compelled to turn down new business.

The retail trade is in about the same condition as reported last week, and is not likely to show any improvement during the present month. There is some talk of a further restriction of mining during August. It is understood that most of the companies are now operating on the four days per week basis, but if the present demand keeps up, it is more than likely that further restriction will not be necessary. The individuals continue quoting exceptionally low prices, in some cases less than the April figures having been made, and there is also a great deal of jockeying with the Pennsylvania State tax. Nevertheless there is a large tonnage moving at the full circular prices.

The bituminous industry is on the end of its second month of prosperity. It is confidently expected, in fact, the condition already actually exists at some points, of quotations at least forty-five to fifty per cent. over those of last year at the corresponding period, and the trade is even looking for better things in the way of prices, although a conservative attitude is maintained by many.

PITTSBURGH, PENN.

Shipments close to actual capacity. Movement good so far but sufficient congestion to make the outlook disturbing. Coke situation uncertain. Furnaces appear less averse to meeting the producers' figures.

Bituminous—Coal shipments continue heavy, mining being very close to actual capacity. There is some congestion on the railroads, not a great deal, but sufficient to make a somewhat threatening situation for the future. On the whole, the railroads are moving the coal more expeditiously than was expected, shippers having seriously contended that the railroads were quite short of motive power. Fresh demand is relatively light but capacity is so well taken up that it would be difficult, if not impossible, to place fresh contracts at the regular circular prices, which we continue to quote as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district. Slack is bringing the full circular price as a rule, though on one or two divisions slight concessions can be obtained on prompt lots, say 10@15c.

Connellsville Coke—Authentic information is relatively meager as to progress being made by the coke operators in closing out August furnace coke. It is understood that the Producers' Coke Co., which handles the output of a number of operators, has made several sales, at the $2.50 price. Independent operators have made at least two sales, aggregating 15,000 tons, at that price, not guaranteed against decline. Furnaces are less averse to paying the operators' price than they were in the case of July coke, chiefly because they find the pig iron market has been picking up, and a break in coke prices at this time would disturb pig iron. We quote: Prompt furnace, $2.50@2.60; contract furnace, $2.50; prompt foundry, $2.85@3; contract foundry, $2.85@3.

Since the beginning of July there has been restriction of production by operators who did not have all their coke sold, for a month or longer periods, in order to avoid possible price cutting in the prompt market which would disturb the contract market. In the past few days the claim has been made by some operators that the men are so averse to working full time that they could not increase their output if they tried. These statements are doubted in many quarters. As reported by the "Courier," shipments in the week ended July 26 aggregated 393,634 tons, a decrease of 6214 tons, the production being given at 393,333 tons, a decrease of 6371 tons.

BALTIMORE, MD.

The best summer trade in years. Little probability of any easing off before the fall demand opens up. Shipments continue heavy and consumers are asking for tonnages in excess of their contracts.

This is the best August in the history of the coal trade for years. The time has now come when the trade feels there will be no break in the good prices for bituminous coals that have held so far the present season. Most of the companies that handle soft coal are pretty well filled with orders, and at figures considerably above those of a year ago.

Inquiries are now coming in also, for business above the contract call, which, by the way, is excellent. Shipments continue heavy over the piers and the local call for fuel is also good. The rush of contract coal continues in the Lake trade and there will probably be no abatement in that direction until navigation closes. While spot tonnages have not been overstrong at some points where there has been an overaccumulation, still the mine prices are showing no signs of weakening. Poorer grades of Pennsylvania coal readily bring $1, and the better qualities are being quickly absorbed at from $1.25 to $1.40. The off quality West Virginia fuels are commanding 90c. to $1 at the mines, with the better grades at $1.15 and $1.20.

The anthracite business here continues rather dull. There will be the usual awakening about the middle of the next month, however. The export trade from this port continues heavy. Egypt is still figuring largely in the amount of coal sent out, the Consolidation Coal Co. handling most of the tonnage to Alexandria.

BUFFALO, N. Y.

Bituminous trade seriously considering an advance in the circular. Strong position of the coal market, as compared with iron, is puzzling business interests. Car supply much improved.

The bituminous trade is so strong that dealers believe they could hold an advance of 15 to 20c. a ton. A few notices have been sent out from certain mines to the effect that an advance of 5c. might be expected on Aug. 1, but as a rule the trade here is waiting for the big companies in Pittsburgh to take the lead. Other branches of business appear to be watching bituminous coal and wondering how it manages to hold so firm when iron is dull. There was never so much iron ore moving on the Lakes as now and yet the tone of the iron trade is as uncertain as ever. Consumption is heavy at least, and users of manufactured iron are complaining that they cannot get anything like prompt deliveries.

Still there are quite a good many furnaces in the vicinity of Buffalo shut down on the complaint that there is no profit in pig iron. Everybody is puzzled over the contradictory condition in business, but the coal interests continue producing at maximum all their full capacity. Coal sells itself, and there would be no salesmen out if it was not expected that old conditions would return. The only drawback to the trade is the scarcity of money. Canada is much more poorly supplied than this country, especially since the government promised to release a large amount for general use. There is no complaint of car scarcity, though they are not plenty; the main difficulty is that the loaded cars move so slowly. Only after a shipper has made serious complaint that the consignee of a stranded car is running out of coal, does it begin to move again. Quotations of bituminous will, therefore, be $2.90 for Pittsburgh select lump, $2.80 for three-quarter, $2.65 for mine-run and $2.15 for slack, all very strong. Coke is still weaker than coal and sells on the basis of $4.65 for best Connellsville foundry, f.o.b. cars at Buffalo.

There is no stir in the anthracite trade and none is looked for right away, as consumers are either hard at work in the field or off on vacations. Anthracite is in long supply and there is an excess of lake tonnage; some days more than a dozen big freighters leave this port light. The shipments of hard coal from this port for the week were 158,000 tons; for July, 780,632 tons and for the season, 2,566,206 tons. Last season to August the shipment was only 1,087,385 tons, owing to the late start, due to the mining suspension.

TOLEDO, OHIO

Toledo docks will undoubtedly establish a new high record during the current year. Car supply good so far. Steam and domestic grades in good demand and prices are strong.

The coal trade continues to be a rushing business in Toledo, especially in Lake shipments. This will undoubtedly prove a banner year for the Toledo Lake coal trade, although next year when the new Hocking docks are completed it is expected that a much greater tonnage will diverted to this port. The demand continues good for both domestic and steam coal and also for the fine grades. Thus far there has been no shortage of cars, although some dealers are fearful that there will be a little later on when crops begin to move, as this section has had a record yield. There has been plenty of coal thus far to supply the trade and much of it is now going up the Lakes.

The C. H. & D. docks have loaded 100,000 tons of coal during the past year and there are now four boats loading, each of from eight to ten thousand tons capacity. The Hocking and T. & O. C. docks have been loading to the limit of their capacity.

Prices quoted here are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$1.60	$2.50	$1.75	$2.50	$1.35	$1.35
Egg	2.50	1.20	2.50	1.50	2.50	....	....
Nut	2.00	1.20	2.25	1.50	2.50	....	....
¾ lump	....	1.35	....	....	....	1.20	1.20
Mine-run	1.60	1.15	....	....	....	1.10	1.10
Slack	....	0.70	....	....	....	0.80	....

LOUISVILLE, KY.

The heavy movement into the West and Northwest continues unabated. Storing of winter coal is strengthening the domestic market. Some producers so rushed they are unable to supply their regular trade.

After an almost imperceptible slackening up, the market has again resumed its former activity and is even stronger than before. The most important feature is the continued heavy movement into the Northwestern market, principally through Chicago, although there are numerous orders from points west of the Mississippi. Eastern Kentucky operators, especially those in the Harlan field, are obtaining the greatest benefit from this heavy demand; many of them are so rushed with orders that they are unable to supply their regular customers. This is the general condition throughout eastern Kentucky, and no relief is in sight until the production is much improved, there being considerable development now under way.

The generally firm condition of the market has naturally had a stiffening effect upon prices. The good grade domestic coals from eastern Kentucky are selling at $1.85 to $2 a ton, f.o.b. mines, for block, with block and lump at 10 to 15c. less, and round 25 to 35c. less. The September selling basis will be $2.10 to $2.25 for block, with the other grades in proportion as indicated. Nut and slack is in fairly good supply at 60 to 75c. for the better grades, the off qualities being from 40 to 50 cents.

COLUMBUS, OHIO

Demand is good for all grades. The feature of the trade is the advance in the circular, effective Aug. 1, which is being well maintained. Production is curtailed by a growing car shortage. The tone of the market is good.

Demand for all grades of coal has been good during the past week. The tone of the market is satisfactory and the advanced circular, effective Aug. 1, is being well maintained. Price cutting is not common and is only done in a few instances. The outlook for the future is considered good in every way.

Car shortage is making its appearance and as a result the output from the various mining districts is being curtailed to a certain extent. In eastern Ohio the car shortage is the worst and consequently the production is estimated at only about 65 per cent. of normal; it has also appeared in the Hocking Valley and the output is about 80 per cent. of the average in that section. In the Pomeroy Bend district some trouble over lack of cars is reported and the same is true of the domestic fields of Jackson.

Domestic business is holding up well despite the extremely hot weather. Dealers' stocks are pretty large and they are not buying for immediate delivery at present. Municipal and school contracts are requiring some attention and there is a good demand for Pocahontas in this territory at prices considerably higher than a year ago. Some of the larger householders have placed their contracts for the coming season. Retail prices are higher, in conformity with the advanced circular.

Lake trade is good although there is a slight falling off in the volume, due to car shortage and scarcity of labor. No congestion of consequence is reported from the docks at the upper lake ports. The movement to the interior has started and there are no indications of a congestion. There is a good demand from plants making iron and steel and also from factories in many other lines. There is no disposition to stock up at this time although it is believed some stocking will be done soon to guard against a possible suspension after Apr. 1, when the present mining scale expires. Railroads are using a fair amount of fuel.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburg	Pomeroy	Kanawha
Domestic lump	$1.70 @ 1.65	....	$1.70 @ 1.65	$1.70 @ 1.65
3-4 inch	1.55 @ 1.50	$1.35 @ 1.30	1.45 @ 1.40	1.50 @ 1.40
Nut	1.30 @ 1.20	....	1.35 @ 1.30	....
Mine-run	1.35 @ 1.25	1.15 @ 1.10	1.30 @ 1.25	1.25 @ 1.20
Nut, pea and slack	0.65 @ 0.60	....	0.60 @ 0.55	0.60 @ 0.55
Coarse slack	0.55 @ 0.50	0.70 @ 0.65	0.50 @ 0.45	0.50 @ 0.45

HAMPTON ROADS, VA.

Shippers well caught up on contracts, although dumpings for the week were light. Movement from the mines was heavy and also the shipments in both the foreign and coastwise trade. Prices firm.

Dumpings over the Hampton Roads piers during the week have fallen below expectation. However, there has been a continued heavy movement in from the mines, and wholesalers have caught up on their contracts, some even having free coal remaining on track in the yards, although this will no doubt find a ready application on contract. The export and coastwise movement still continues heavy with prices firm at $2.95 to $3 for Pocahontas and New River, and $2.60 to $2.75 for Kanawaha for deliveries during the current month and early in September.

The dumping over the Hampton Roads pier for July amounted to 934,672 tons. The Norfolk & Western R.R. led with a tonnage of 513,951 tons, at the Lambert Point pier, the Virginia Ry. being second, with 221,064 tons at Sewalls Point, while the Chesapeake & Ohio Ry. dumped 199,747 tons at Newport News.

BIRMINGHAM, ALA.

Operators complaining vigorously about the inadequate car supply. Indications point to an acute situation when the fall demand opens up. Optimistic outlook for the winter trade.

The most interesting feature in the local market is the vigorous complaints from the operators about the inadequate supply of cars, which they claim is worse than for some months past. The lack of equipment at this time when the shipments are comparatively light is causing considerable apprehension over what the situation will be when the fall demand opens up.

Furnace coke is slightly weaker, due to the closing down of a number of blast furnaces, but foundry coke appears strong with prices being well maintained. Smithing coal is experiencing the customary summer dullness, and the price level has been reduced in order to stimulate buying. Business conditions generally in the South are excellent and the trade is inclined to take an optimistic view over the immediate future of the coal business.

DETROIT, MICH.

Shortage in the car and labor supply is restricting production and causing uneasiness. Pocahontas grades are stiff and becoming more difficult to obtain.

Bituminous—The car supply is becoming steadily worse and operators are seriously handicapped in their efforts to produce sufficient coal to meet the heavy demand. There is also considerable apprehension expressed over the inadequate supply of labor and indications are that high quotations will prevail locally before the end of September, with coal difficult to obtain at that. Prices on contracts are being maintained in every respect, several large tonnages being closed during the week.

Anthracite—All of the big hard coalers, with the exception of the D. L. & W. have announced a uniform advance of 10c. per ton on the circular to cover the new 2½ per cent. Pennsylvania state tax on anthracite.

Coke—Coke is becoming somewhat stronger and will apparently continue to improve from now on. Semet Solvay is quotable at $3.75 with gas house at $3.50 and Connellsville at $3 all f.o.b.

The local market is now quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.50	....	$1.60	....	....	$2.50	$2.25
Egg	1.50	....	1.60	....	....	2.50	2.25
Steam lump	1.30	....	....	....	....	....	....
¾-in. lump	1.15	$1.15	1.10	$1.10	$1.10	....	....
Mine-run	1.10	1.10	1.05	1.05	1.05	1.50	....
Slack	0.90	0.95	0.60	0.70	0.70	....	....

ST. LOUIS, MO.

The anticipated advance in the Carterville and Franklin County coals took place Aug. 1. Standard grades are moving more freely. Anthracite and coke are completely demoralized.

As had been anticipated, Aug. 1 brought a surprise in the way of an advance on Carterville and Franklin County coal, although there are indications that some of these may only be temporary, as the local demand has been caused largely by a lot of speculation on the part of jobbers who figured on having a good demand in the first half of the month. The country demand is fairly good from points in Missouri and the North, but in the South there is nothing as yet.

Standard coal is moving a trifle more freely, but the same old proposition exists where it is being sold for less than cost. Standard screenings are down from 40c. to 45c. and, of course, this means that 2-in. lump is hovering around 90c. to 95c.; 6-in. has advanced to about $1.10, and everything indicates that Standard lump will continue to advance because it is a certainty that screenings will continue to drop.

Very little anthracite moving in, and the market is in a demoralized condition and the same thing applies to coke.

The prevailing circular is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.90
3-in. lump	....	....	$1.25	....
6-in. lump	$1.35 @ 1.50	....	1.35	1.10
Lump and egg	....	$2.10	1.30	....
No. 1 nut	1.15 @ 1.30	....	1.05	0.87½
Screenings	0.65	....	....	0.80
Mine-run	1.10	....	....	0.75
No. 1 washed nut	1.50	....	....	....
No. 2 washed nut	1.30	....	....	....
No. 3 washed nut	1.20	....	....	....
No. 4 washed nut	1.10	....	....	....
No. 5 washed nut	0.80	....	....	....

PORTLAND, ORE.

Trade holding up good for this period of the year. Considerable Utah coal coming in because of the British Columbia strike.

There is nothing of particular significance to report this week from the coal trade in this section, except that business is keeping up quite steady for this time of year. Utah coal is being sold here in considerable quantities, with less Washington fuel owing to the home demand which has been heavy for some time on account of the strike in the British Columbia mines.

While prices increased 25c. per ton at the mines on Aug. 1, dealers here are of the opinion that the increase will not affect retail prices, but will be absorbed by themselves. A fair volume of business is looked for this winter.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a comparative statement of the coal and coke movement over this road for June and the first six months of this year and last year:

	June		Six Months	
	1913	1912	1913	1912
Coal	3,061,929	2,591,318	16,665,968	15,148,448
Coke	396,920	424,009	2,447,888	2,284,892
Total	3,458,849	3,015,327	19,113,856	17,433,340

VIRGINIAN RAILWAY

Total shipments of coal over this road for June of the current year were 304,030 tons as compared with 256,070 tons for the same month last year. For the five months to June 31 of the current year, the shipments were 2,201,033 tons as compared with 1,662,917 tons for the same period last year.

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for May, 1912-13, and for the eleven months ending May, 1911-12-13, in long tons:

	11 Months			May	
Imports from:	1911	1912	1913	1912	1913
United Kingdom	13,186	6,691	8,750	600	200
Canada	1,392,770	963,033	1,255,854	112,682	74,638
Japan	14,481	13,165	78,812	230	12,315
Australia & Tasmania	259,791	182,266	140,825	19,399	10,840
Other countries	4,821	1,992	3,257	48	....
Total	1,685,049	1,167,147	1,487,498	132,959	97,993
Exports:					
Anthracite	2,805,724	2,677,133	4,206,746	18,019	505,305
Bituminous,					
Canada	7,554,140	9,613,219	10,563,330	1,048,155	1,470,590
Panama	470,297	447,412	443,249	57,769	49,800
Mexico	590,976	306,072	406,249	39,536	56,048
Cuba	860,239	1,032,532	1,167,681	113,785	132,571
West Indies	481,534	649,226	550,055	71,681	47,164
Other countries	570,816	1,300,897	1,059,036	155,288	147,737
Total	10,528,002	13,349,358	14,189,600	1,486,214	1,903.910
Bunker coal	5,920,979	6,525,093	6,666,494	693,063	690,228

NORFOLK & WESTERN RY.

The following is a statement of the tonnages shipped over this road during June, 1913, and for the six months ending June 30, as compared with corresponding periods of 1912 in short tons:

	June		Six Months	
Destination	1912	1913	1912	1913
Coal				
Tidewater, foreign	121,972	175,414	834,554	876,320
Tidewater, coastwise	297,636	262,574	1,814,298	1,903,318
Domestic	1,569,697	1,623,923	8,417,511	8,651,814
Coke				
Tidewater, foreign	3,070	......	40,904	22,841
Domestic	97,527	123,941	701,308	817,801
Total	2,089,902	2,185,852	11,808,575	12,272,094

FOREIGN MARKETS

GREAT BRITAIN

July 25—The demand is more active for Admiralty large coals, which are firmly held both for prompt and forward delivery. Prices for other qualities are, however, irregular for immediate shipment.

Quotations are approximately as follows:

Best Welsh steam	$4.80@5.04	Best Monmouthshires	$4.08@4.20
Best seconds	4.56@4.68	Seconds	3.96@4.02
Seconds	4.32@4.50	Best Cardiff smalls	2.46@2.52
Best dry coals	4.32@4.56	Seconds	2.34@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

GERMANY

Exports and Imports of fuel in Germany for May and the first five months were as follows:

	Exports			Imports		
	May		5 Mos.	May		5 Mos.
	1912	1913	1913	1912	1913	1913
Coal	2,480,522	2,288,587	13,687,651	882,846	952,624	4,071,183
Lignite	4,172	3,093	26,703	503,825	528,573	2,911,166
Coke	512,026	596,424	2,868,838	48,767	53,036	235,150
Coal briquettes	193,907	202,171	1,023,580	3,372	1,713	9,033
Lignite ditto	37,084	61,034	374,660	7,399	7,620	51,869

Production for May and the first five months of this year and last year was as follows:

	May		5 Mos.	
	1912	1913	1912	1913
Coal	14,734,098	14,268,674	66,938,122	73,414,129
Lignite	6,742,672	6,865,438	27,137,136	28,309,207
Coke	2,378,226	2,673,104	11,376,863	13,266,336
Coal briquettes	438,477	451,087	2,044,311	2,365,154
Lignite ditto	1,389,169	1,710,005	6,407,057	7,146,051

BRITISH WEST INDIES

The "Iron and Coal Trade Journal" (London, England), says in a recent issue:

> The way in which coal from the United States has ousted British coal in the British West Indies is shown by the fact that supplies of bunker coal, representing approximately 40 per cent. of the imports, are drawn entirely from the United States. The last importation of bunker coal from the United Kingdom was in 1909.

FINANCIAL DEPARTMENT

The Elk Horn Fuel Co.

Character and Value of Properties—"The Elkhorn Coking Coal Field," in eastern Kentucky, has long been known to contain fuel of exceptional quality which has been unavailable to the market through lack of railway facilities. The land owned and under option by the Elk Horn Fuel Co. is about 60% of "The Elkhorn Coking Coal Field," and lies principally to the north of the recent development in the same field by the Consolidation Coal Co., and occupies mainly the watersheds between the Kentucky and Big Sandy Rivers and extends north along Beaver Creek and other tributaries of Big Sandy, Kentucky and Licking Rivers. It produces the highest grade of coking, gas-producing, openhearth malleable, and byproduct coal, and has proven to be one of the most valuable and uniform coals ever mined in this country. The lands are underlaid by the Elkhorn seam to the extent of 75% to 80% of the entire area; the barren area being caused by erosion of streams. The region will yield in recovery an average of 5500 net tons per acre, the seams running from 4 to 8 ft. in thickness. This coal is remarkably uniform in quality throughout the entire coking region

Mr. d'Invilliers in his report (which covers only a portion of the coal properties owned or controlled by the Elk Horn Fuel Co.) places a present valuation of $10,000,000 upon 110,133 acres of land and mineral rights owned by the Elk Horn Fuel Co. in "The Elkhorn Coking Coal Field," and 14,750 acres (represented by its stock ownership in the Beaver Creek Consolidated Coal Co.) and 4500 acres (represented by its stock ownership of the Mineral Fuel Co.) each in the same field. Messrs. Haas, Mayo and Fleming in their report place a realizable value at forced sale in excess of $15,000,000 on all of the property of the Elk Horn Fuel Co. (exclusive of the stock of the Consolidation Coal Co. owned by it). It is probable the value of the properties of the company largely exceeds the above figures, the property owned in fee and mineral rights, upon which the mortgage is a direct first lien, alone largely exceeding the value of $10,000,000.

Transportation Facilities—"The Elkhorn Coking Coal Field," hitherto inaccessible for lack of transportation facilities, now enjoys special advantages in this respect as the Louisville & Nashville, Chesapeake & Ohio, Baltimore & Ohio and the Carolina, Clinchfield & Ohio are now recognized factors in the development of this field.

The Louisville & Nashville is now in actual operation through the land of the Mineral Fuel Co. (all of the stock of which company is owned by the Elk Horn Fuel Co. subject to its mortgage), and is providing 5000 steel cars for its service. The Chesapeake & Ohio is constructing a branch approximately 22 miles long up the right fork of Beaver Creek, completion of which is guaranteed by contract for Jan. 1, 1914. This railroad is also under contract to construct, at its own expense, spurs aggregating 11 miles in length, as soon as the traffic conditions warrant. The railroad company has further agreed to build extensions necessary for the development of tonnage on Mud Creek. The Baltimore & Ohio has purchased a survey extending up the left fork of Beaver Creek, and its president states that they will commence the construction of this line at once. It has also acquired what is known as the Rockcastle survey (including considerable rights of way). The completion of these branches will afford ample transportation facilities for the development of this company's holdings in the Elkhorn field. The Carolina, Clinchfield & Ohio is now building a connection between Dante, Va., and the Chesapeake & Ohio at Elkhorn City, which line is expected to be in operation within a year and will give an important connection to Atlantic ports. The great value of this field is demonstrated by the interest the railroad companies are taking in its development, the expenditures made in this territory and those provided for by these companies representing a total investment of more than $55,000,000.

Market Conditions—There is a large and steadily increasing demand for Elkhorn coal, particularly by gas-producing plants. It is also used in large quantities in byproducts and coke plants, having demonstrated its superiority in the manufacture of metallurgical coke. The president of one Western company, of unquestionable financial responsibility, using large quantities of byproduct coal, states that within three years his plants alone will consume three and a half million tons of this grade of coal per annum.

There is a great and steadily increasing demand by malleable-iron plants which require a long, hot flame, practically free from sulphur. The expenditures of the railroads to reach this field and the greatly increased production are indicative of the marketability and rapidly increasing demand.

(For a further description of this property see Vol. 4, No. 2, page 74.)

⁂

The Clearfield Bituminous Coal Corporation—This concern was incorporated Oct. 7, 1886, under the laws of Pennsylvania. It owns land and mineral rights in Clearfield and Indiana counties, Penn., and has a capitalization of $825,000, all of which is owned by the New York Central and Hudson River R.R. On June 23, 1911, it foreclosed its mortgage on the properties of the Pennsylvania Coal & Coke Co., controlling about 106,000 acres in Blair, Cambria, Clearfield and Indiana counties, and has leased these properties to the Pennsylvania Coal & Coke Corporation.

Metropolitan Coal Co.

The Metropolitan Coal Co., incorporated under the laws of Massachusetts, has filed with the Massachusetts secretary of state a statement of its financial condition, dated Mar. 31, 1913, which we compare as follows:

Assets	1913	1912
Real estate and machinery	$800,041	$632,012
Material, stock in process	402,899	475,563
Steamers, tugs, etc	162,600	162,600
Cash and debts receivable	511,800	541.444
Horses and vehicles	159,893	164,704
Good-will	400,000	400,000
Securities	469,594	393,425
Total	2,906,829	2,769,750
Liabilities:		
Capital stock	1 500,000	1,378,400
Accounts payable*	716,829	751,350
Funded debt	250,000	200,000
Surplus	125,000	110,000
Floating debt	310,000	330,000
Reserve for bad debts	5,000	......
Total	2,906,829	2,769,750

*Including $400,000 special stock.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending Aug. 2:

No Important Dividends were announced during the week.

Reading Co.—The earnings of this corporation for the five months to Nov. 30, 1912, amounted to $12,000,000, as against $7,350,000 in the same period of 1910, or about 1¾ times as much. That a great deal of this is due to the anthracite coal business is illustrated by the figures of the Coal & Iron Co., which showed $2,244,220 net for the five months of 1912, as compared with a deficit in 1910, and less than $275,000 profit in 1911 and 1909.

The Sunday Creek Coal Co.—This concern was incorporated in New Jersey, in June, 1905, taking over the property of the Sunday Creek Coal Co., which owns 16,300 acres of coal land and leases 250 acres. The new Sunday Creek Co. also leased properties allied to the Hocking Valley Ry. namely, the Kanawha & Hocking Coal & Coke Co., and the Continental Coal Co., which together control about 59,500 acres in West Virginia and Ohio, and the Buckeye Coal & Railway, and the Ohio Land & Railway, controlling 24,350 acres. The total acreage leased by the Sunday Creek Co. is 84,100 in addition to which it owns 16,300.

What Is Real Economy?

There are more boilers ruined in the coal mine power plants—due to bad water—than in any other industry.

Many managements consider it permissible policy to operate boilers just as long as they can without acids eating them up or scale allowing them to burn up. This year, they will adopt one make-shift. Next year, another. When forced to they will put in a reservoir system.

Is this economy? Hardly. The cost of these various half-way methods—added to the upkeep of boilers—will in one or two years pay for a simple dependable system that will do away with the whole problem permanently. In fact, the half-way method is losing game from the start.

Are you in this class?

We do not believe you realize the reliability of a good *purifying* system. Such a system once in, you are free to use any water that comes to hand for *all* mine purposes —without fear of corrosion, scale, boiler explosion, interruptions in service.

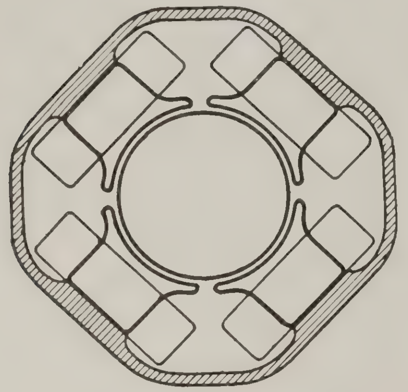
And the last is the most vital point—much more important than the cost of equipment destroyed by bad water.

Good water always available for boilers is the biggest guarantee toward continuous operation of your plant. Think it over—then

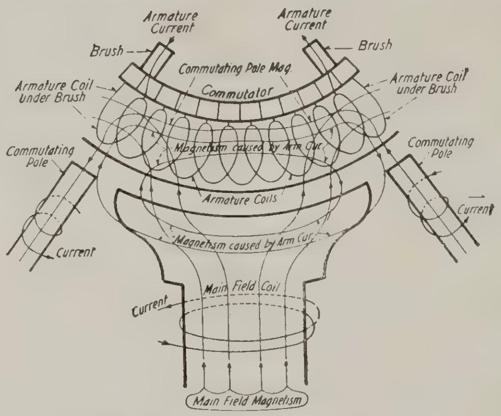
Write to us. Without the slightest obligation, we will describe our water purification systems "Scaife and We-Fu-Go"—and what they do. Dozens of mines have adopted them. Think—and write now.

Wm. B. Scaife & Sons Co.
Pittsburgh, Pa.

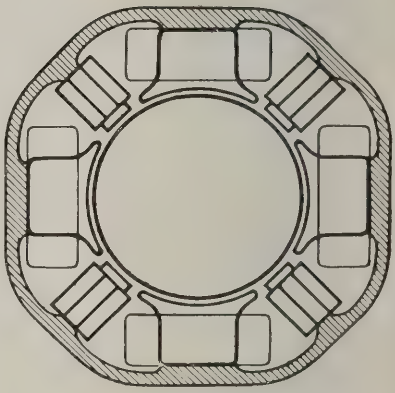
The Reason for the Commutating Poles
In the Motors Used on
Baldwin-Westinghouse
Electric Mine Locomotives



The above sketch shows the general arrangement and proportions of a non-commutating pole motor.



Diagrammatic Sketch of Magnetism and Current in a Westinghouse Mine Motor.



This sketch shows general arrangement and proportions of a commutating pole motor.

In the non-commutating pole machine, the armature current generates magnetism which passes through the armature iron and the pole, as shown in the drawing. Part of the magnetism caused by the armature current passes through the two armature coils under the brushes and through the pole tips. This is the magnetism that makes the machine spark, and is strongest when the armature current is strongest, so the machine sparks the worst on heavy loads.

In the commutating-pole motor, the commutating coils are designed to send magnetism through the armature, which will kill the magnetism caused by the armature current and furnishes enough additional magnetism to give perfect commutation of the armature coil under the brush. The same current flows through the armature and the commutating coil, so that the magnetism of the commutating pole kills the armature magnetism at all loads and just furnishes enough additional for perfect commutation. This is the reason why the commutating pole machine does not spark on heavy overloads.

The motor will operate without sparking at all loads and voltages found in service. The commutator is always bright and polished. All bucking or flashing is eliminated. The commutator shows hardly any wear at all. Brushes wear very slowly, often lasting for years. Brush-holders do not deteriorate from flashing. Commutators do not burn out from short circuits due to flashing. There is less likelihood of breakdowns of insulation in armature, fields and brush-holders, as the carbon or copper dust in the motor is practically eliminated.

The commutating-pole motor is one of the most important factors entering into the success of Baldwin-Westinghouse Mine Locomotives. There are many other desirable features, full information on which may be obtained by addressing either Company.

Advertising vs. Good Advertising

The Weekly Ad-Talk Page

"Advertising is something catchy

This is a popular fallacy which, having fastened itself onto advertising, persistently clings. We venture to suggest that you have some such idea in your mind now.

If you were asked to mention some *good* advertising you would rack your brain for some *clever* stuff and you would probably light on—

"Spotless Town" or,
"Sunny Jim" or,
"The Smile That Won't Come Off" or
"Phoebe Snow" or,

One of the hundreds of other "catchy" advertisements that have been produced and backed by hundreds of thousands of dollars.

And, strangely enough, you would have some difficulty in connecting these national characters and slogans with the *product* they are intended to advertise.

It is a fact that whenever the general public is asked to tell which advertisement in a magazine is the best one they invariably name those which are the most "catchy" or the "prettiest" or "cleverest"—never the one which moves unconcerned people to purchase.

We remember very well being called into consultation upon the advertising of a fine old reputable concern manufacturing engineering devices.

The president thereof, who was a good many years short of being an old mossback, greeted us with, "Well, I suppose you will advocate that we stand on our heads and kick our heels in the air."

You see, that was his impression of advertising, and probably his impression of an advertising man was a spouter of "clever" ideas surrounded by a pink striped shirt, a red necktie and spats.

As a matter of fact what this concern needed—and got—was advertising that *informed.*

They had been content with showing a picture, their name and their address. Occasionally, in a spasm of self-righteousness, they boasted about their virtue, reputation and age. But never a word of what the buyer needs to know.

Now their advertising is full of valuable information about their machinery It gives facts that are essential to the man who purchases or recommends.

It performs no "stunts" and in nowise lessens them in the eyes of their customers. Now it produces *results.* It is *good* advertising.

Two things are responsible for advertising failing to reach 100 per cent. efficiency. One is this popular misconception of what advertising is and the other is a popular belief that it is intended entirely for the benefit of the advertiser.

Neither premise is based upon facts The really great advertising successes have been free from froth. Good advertising is as beneficial to the buyer as the seller.

For good advertising keeps the buyer posted, abreast of developments in a fast-moving age.

No man in your line of endeavor, unless he were bent on commercial suicide, would choose to wall himself up where no news of the progress of events could reach him. He would not deliberately choose to remain ignorant of the development of the machinery of this industry.

On the contrary, he would welcome all the information at his command.

Which is simply another way of saying that he would read the advertisements in papers devoted to his industry.

COAL AGE

Vol. 4 NEW YORK, AUGUST 16, 1913 No. 7

The Blight Of Waste

BY BERTON BRALEY

Written expressly for Coal Age

The trees are black with dust and smoke,
The grass is burnt and sere,
The noxious gases from the coke
Pollute the atmosphere,
The valley droops as with a blight,
There is no vivid green,
And reeking ovens day and night
Make desolate the scene.

The land is dull and drab and bleak
And overcast the sky,
With heavy choking fumes that reek
And make the throat turn dry,
—Yet all the beauty that's defaced
And wearisome to see,
Is but the fruit of careless waste
A waste that need not be.

The smoke that pours into the air,
The dust that settles thick,
To make the valley grim and bare
The heart grow sore and sick,
This smoke and dust are golden gain
All lost before our eyes,
Because we will not take the pain
To have it otherwise.

"Byproducts"—what care we for these?
We only want our coke,
We'll go on flinging to the breeze
Our wasted wealth in smoke,
And though we know how much is lost
In soot and gas and flame,
We'll still refuse to count the cost
And waste it just the same.

For all the fumes and all the dirt
Which make the land so black,
Which float above it to its hurt
And leave it smirched and slack,
Are wasted wealth that won't return
But flees beyond recall,
And yet we cannot seem to learn
The pity of it all.

For if we ceased to foul the air
With murkiness and smoke,
We'd have our rich byproducts there
And also have our coke,
It would not prove a huge expense
The profits would be fat,
But it might need some common sense
—And who could hope for that!

Coal Shipping on the Great Lakes

By J. W. Chamberlin*

SYNOPSIS—The second installment of this article. The different types of coal-loading apparatus are discussed and a general description of the growth of the Lake shipping given. A comparison of the trestle and car dump.

⁂

A good indication of the trend of the coal trade on the lakes is shown by the following report of the Buffalo shipments in 1857: To Chicago, 24,879 tons; to Milwaukee, 2898 tons; to Detroit, 4567 tons; to Toledo, 1963 tons; to Cleveland, 2679 tons. The entire traffic in coal to the last three ports was cut off sometime ago by the railroads (with the exception of a few small cargoes to Toledo) in spite of the fact that the long-distance traffic is so great and still growing. As lately as 1865 only 973 vessels passed through the Sault to Lake Superior, having a tonnage of 409,062 tons. The coal tonnage through that passage in 1912, not to mention other freight, was 14,931,594 tons, of which 12,789,109 tons was bituminous and 2,142,485 tons was anthracite. Of this amount 11,992,395 tons passed through the American or Poe lock and 2,939,199 tons through the Canadian.

There are about 350 coal docks on the Great Lakes, scattered all the way from Oswego on Lake Ontario to Chicago at the head of Lake Michigan and the twin ports of Duluth and Superior at the head of Lake Superior; this does not include the smaller docks on the north shore of Lake Ontario and the St. Lawrence River, which are not regularly listed, and which would probably round out the number to an even 400. Of these practically all are receiving docks from lake vessels except those located on the southern shores of Lakes Ontario and Erie (including Toledo), which receive from cars and deliver to vessels.

Besides the shipping trestles already mentioned as far west as Erie, practically all for anthracite handling except the one at Sodus Point, there are eight Lake Erie ports that ship bituminous more or less extensively, Ashtabula, Cleveland, Conneaut, Fairport, Huron, Lorain, Sandusky and Toledo, all in the State of Ohio. Being in easy shipping distance from the bituminous mines of Pennsylvania, West Virginia and Ohio they all load soft coal quite heavily in the lake trade, the railroads generally making a lower rate on such shipments, both from a desire to stimulate the trade and as a matter of competition with each other. The Lake Erie ports, including Erie, Penn., ship about 16,250,000 tons of bituminous coal, of which Ashtabula and Toledo are credited with more than half, with Cleveland and Lorain each running above 2,000,000 tons.

Erie Railway Coal Dock at Cleveland, Operated by the Pittsburgh Coal Co.; Capacity, 1200 Tons per Hour

Methods of Handling

The methods of loading this coal have steadily developed from the wheelbarrow to the horse dock and thence to an elaborate and quite varied system of steam handling. In this connection it may be sufficient to mention the equipment at each port by name only. At Ashtabula there are four McMyler car dumps; at Cleveland, six McMyler and one Wellman-Seaver car dumps; at Conneaut, one car dump; at Fairport, one McMyler; at Huron, two car dumps; at Lorain, two McMyler car dumps; at Sandusky, one car dump, one trestle; at Toledo there are seven docks, equipped with eight masts and booms (for receiving anthracite by lake) and for loading bituminous from car to vessel, three car dumps, one five-ton McMyler and one McMyler locomotive crane.

---

*90 Johnson Park, Buffalo, N. Y.

This immense bituminous traffic, being more than the entire output of all the bituminous mines of the United States in any year prior to 1871, is supplemented, and, in fact, made possible at present low rates (which do not average 40c. a ton) by the great iron-ore trade in the opposite direction, which reached 48,211,778 tons in 1912. In former seasons, when ore was not so entirely in command of the situation, vessels easily obtained cargoes both ways, but now, with the ore tonnage nearly three times that of the coal, it is often found necessary to pay the vessels a living rate on ore alone, so that they can hurry back light for their ore, as there would be a loss of a matter of five days a trip in the case of the larger steamers should they load coal for the westbound trips.

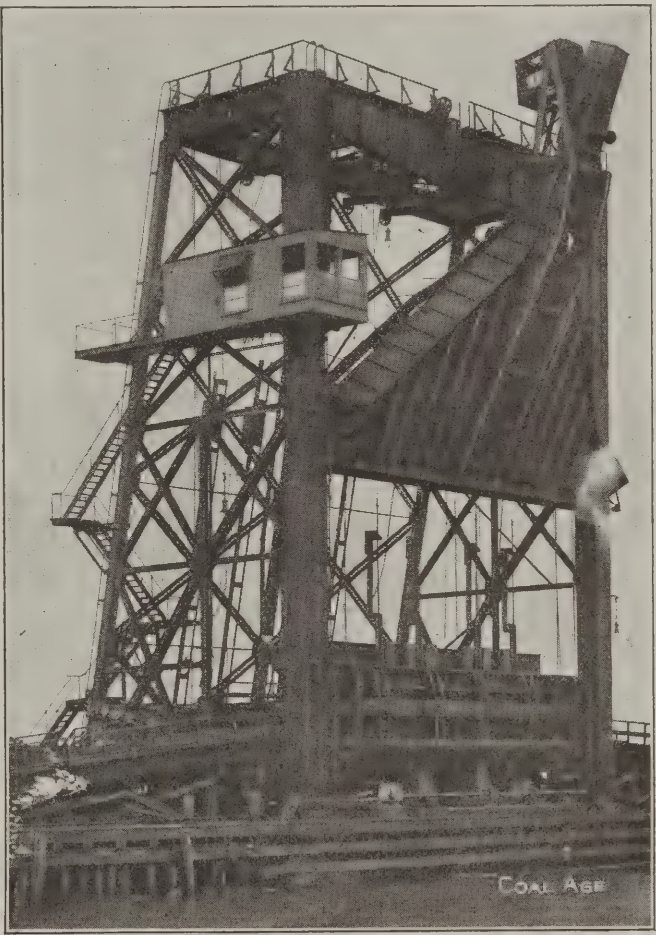
Loading Apparatus Installed at the Harbor in Erie, Penn.

When Shipper Owns His Vessels

Where the ore shipper owns his own vessels he looks on the straight ore trade as easier to manage; the vessel owner without other lake interests, however, prefers to carry cargoes both ways. A good steamer will make about 31 round trips in a season between Lake Erie and the Lake Superior iron mines, carrying coal up to the head of Lake Michigan or Lake Superior and bringing down ore. If the ore goes to Chicago the distance is less, but there is no return cargo. Distance by lake from Buffalo to Duluth is 980 miles and from Cleveland to Duluth, 830 miles, while from Chicago to the mines at Escanaba the distance is only 274 miles.

Car Ferries

There are a good many car ferries on the lakes but only the two on Lake Erie and the one on Lake Ontario can be classed as coal carriers. The one running between Charlotte (near Rochester) and Coburg, Ont., and controlled jointly by the Grand Trunk Ry. and the Buffalo, Rochester & Pittsburgh R.R., is the most active of them all. Ice interferes sometimes, but Lake Ontario is very deep and does not freeze over readily. Charlotte shipped last year 1,107,436 tons of coal, nearly all bituminous, of which 324,814 tons went to domestic ports. It is expected that anthracite shipments from that port will increase steadily. Lake car ferries experience many storms and in winter are sometimes much hindered by both slush and heavy ice.



The Pittsburgh Coal Co.'s Car-Dumping Machine on P. R.R. Tracks, Cleveland, Ohio

There are two coal-car ferries on Lake Erie. They were established in connection with the coal trade of various railroads. One runs between Conneaut, Ohio, and Port Burwell, Ont., and was established some 20 years ago by the Lake Erie & Detroit River R.R.; this company was absorbed by the Pere Marquette R.R., and the ferry is owned jointly by that interest and the Bessemer & Lake

Erie R.R. The other runs from Ashtabula, Ohio, to Port Burwell and Rondeau, Ont. It is owned by the Canadian Pacific Ry. The ferries carry about 25 cars at a trip and cross back and forth as fast as possible. The Pere Marquette ferry has also a collier in connection, which carries in bulk, as most lake vessels do. Lake Erie is shallow and it is impossible in ordinary years to keep navigation open all winter. It was tried at the outset, but the ferry steamers were too often caught in the ice for either safety or profit. One steamer was lost two or three years ago with all on board.

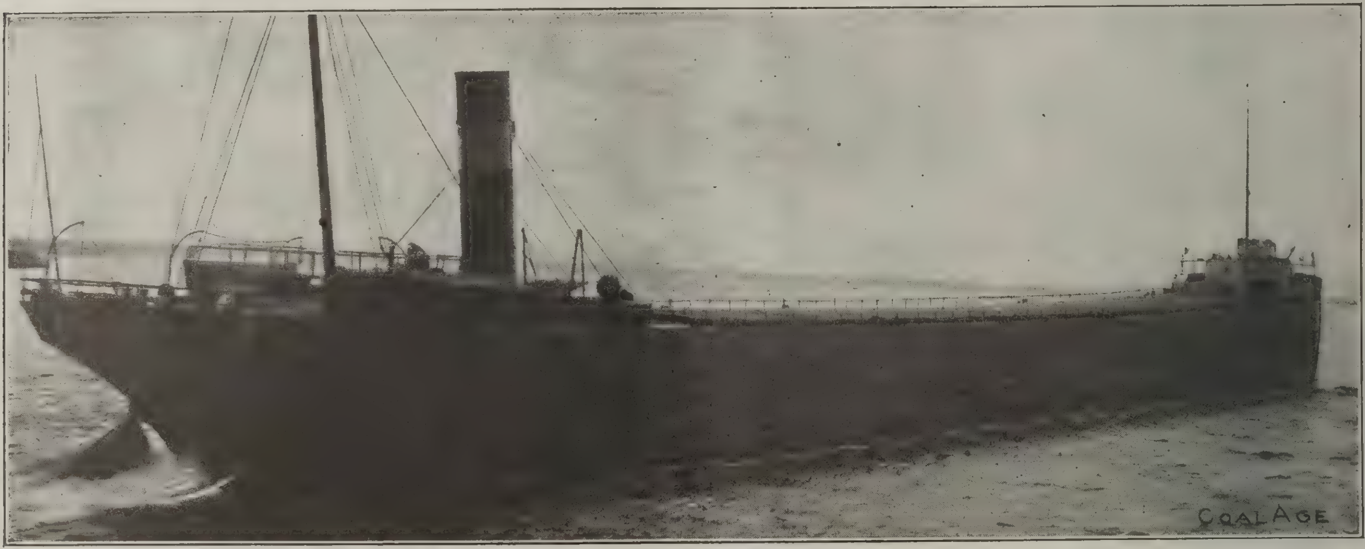
There is also a car ferry on the St. Lawrence River between Ogdensburg and Prescott, that is, at least, indirectly connected with the lake trade, and formerly the ferries of Detroit River carried considerable coal into Canada, but the tunnels in that district are absorbing that business. The car ferries of Lake Michigan are active and run all the year, but they do not carry much coal. The object of these ferries is, of course, to shorten the distance between the mines and the consumers and also to get around blockades all-rail. As to the freight charges it is found that the Ogdensburg ferry rate is 15c. a ton, the rate from the Reynoldsville district, the source of the coal handled by the Lake Ontario ferry, is $1.25 to Rochester, at one end of the route, and $1.75 to Coburg, at the other end. The rate from Pittsburgh to London, Ont., is $1.83 by ferry route and $2.13 all-rail via Buffalo. These ferries often shorten the time between shipping point and destination considerably by avoiding the delays at junction points, as well as shortening the actual distance traveled.

The coal-car ferry idea has always been a favorite one on the lakes, where there is a large amount of coal passing around the end of any of the large lakes to the other side. The Grand Trunk Ry. took steps some time ago to provide itself with coal in Ohio and proposed establishing a ferry line from some Ohio point, perhaps Cleveland, to the Canadian shore. Preliminary arrangements were concluded and President Hays went to London and obtained the proper signatures authorizing the full carrying out of the plan; the contract went down with him in the "Titanic," on Apr. 15, 1912, and the new management has not again taken it up. The Canadian ports of Lake Erie are mostly shallow and require a great amount of deepening; there is also much drifting sand so that constant dredging is often necessary. This sand appears to originate on the north shore, but it often crosses to the south shore. Before the long breakwater was built at Buffalo the sand piled up on the south beach so that a special sand-catch pier had to be built.

Apparatus Used in Loading and Unloading

Mention has already been made of the apparatus for handling coal from car to vessel at the lower-lake shipping ports. These equipments are practically all efficient and ample, but such can hardly be said of that used at the docks on the upper lakes and the farther side of Lake Ontario. Some of it is very extensive, efficient and capable of taking 1000 tons an hour from the hold of a properly constructed vessel. There are 350 regularly listed coal docks on the lakes for unloading vessels and this list does not include the minor docks on Lake Ontario, some of which are hardly worth mentioning, as they receive only a hundred tons or so of coal in a season, and perhaps have no apparatus at all. The complete list is about 400.

A "Whaleback" in Conneaut Harbor



Freighter "J. C. Wallace" (the Yellow Kid). Capacity, 10,300 Tons; Length, 530 Ft.; Beam, 56 Ft.

Some of the big upper-lake coal ports are lavishly equipped for coal handling. Milwaukee, for instance, has 28 sets of handling apparatus, Duluth and Superior have together 29 and Chicago and South Chicago, 21. Some of these, of course, do not represent separate interests and some are massed more than one on a single dock, as where one dock in Milwaukee has 11 Brown hoists, but they are commonly one at a dock. Included in the list of nearly 50 styles of hoist are rigs, whips, steam hoists, whirlies, McMylers hoists, derricks, Mead hoists, hoisting boats, Mead-Morrison hoists, horse rigs, donkey engines, rigs with clams, Brown hoists, McMyler whirlies, Coney rigs, Hunt towers, clam-shell hoists, Heyl & Patterson fixed timber masts, Pittsburgh rapid bridges, no equipment, Robbins hoists, Hulett machines, masts and booms, swinging booms, Haiss hoists, friction hoists, booms and blocks, figure-four rigs (numerous), horse docks, hoist with clam, industrial rig, portable towers, nonportable rigs, Ellington hoists, steam drum, electric cranes, Fairbanks-Morse towers, Dodge rigs, McMyler bridges, Lockport whirlies, steam A-shaped rigs, hoisting boats, Parker derricks, Wellman-Seaver-Morgan hoists, dredges, revolving cranes and fixed masts.

These names, of course, run into each other in a way that would make it impossible to say just how many styles there are. In addition to these there are a few lake vessels that carry a simple hoisting apparatus on the deck for use where there is nothing available on the dock. They charge an extra freight and have a monopoly of nonequipped docks. The capacity of these rigs varies almost with every dock on which they are found. The lowest capacity for mere bucket dock rigs is given at 250 tons per ten-hour day and the highest is 8000 tons. The fast docks are usually provided with several rigs of the same sort.

Loss in Breakage

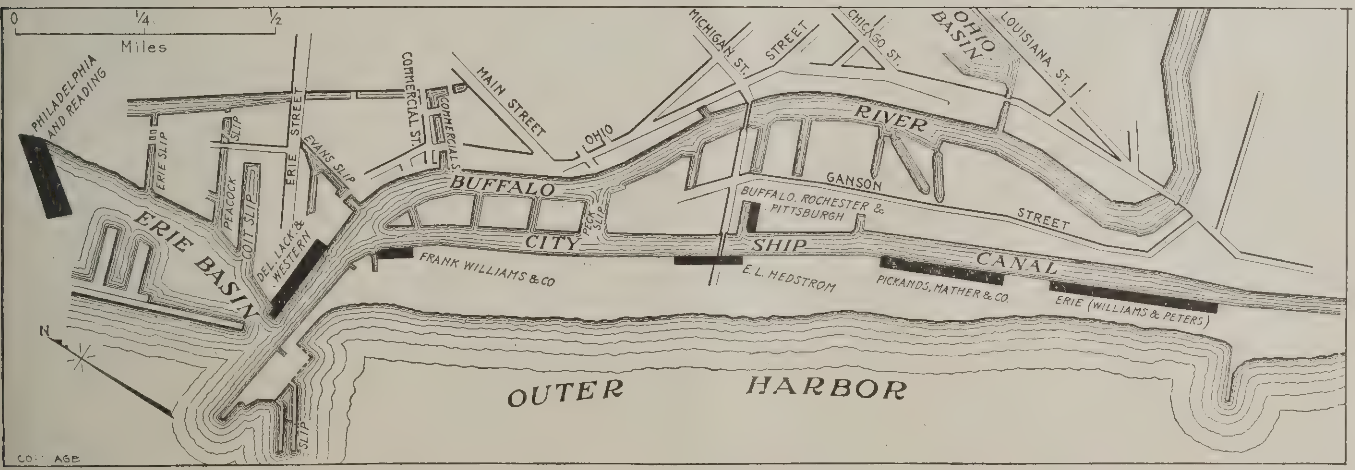
In connection with all the methods there is always the vexed question of breaking up or degradation of the coal, as it is called. The lake coal trade falls under the disadvantage of two or more extra handlings. If the coal, as is sometimes the case with anthracite, must be put into stock, at or near the shipping port, there is another handling to the stock pile and back to the car before it goes on board the vessel. The Delaware, Lackwanna & Western Co. has a stocking and transfer trestle at Cheektowaga, near Buffalo, a mile in length, and the Lehigh Valley Co. has a large one a few miles further east.

In case of most bituminous coal the loss from breaking up is not very great, as the slack is often worth nearly as much as mine-run and is generally within 50 to 75c. a ton of the large sizes. Anthracite, however, depreciates by breaking, as screenings are worth only about $1 a ton. Everybody in the business has figured on this loss, but the problem remains unsolved, as some coal breaks easier than others and some cargoes are also dumped further, while dry coal breaks up more readily. One shipper estimates that he gets only 86 tons of full sizes out of every 100 tons of anthracite shipped by lake; 7 tons is degraded into pea size, worth not much more than half its original value and 7 tons into screenings. A shipper once kept an estimate of a cargo of anthracite shipped from Buffalo to the Canadian Northern R.R. dock at Port Arthur, Lake Superior. It consisted of one-third egg and two-thirds stove and it came out 30 per cent. egg, 34 per cent. stove, 21 per cent. chestnut, 10 per cent. pea and 5 per cent. screenings. The change of size looks a trifle odd in some respects. However, every experiment of this sort will inevitably produce a new set of figures.

The Car Dump

It is becoming evident that the end of the high shipping trestle is near; it has been an institution at lower-lake ports for a long time, but the car dump is now superseding it. A trestle has lately been torn down at Erie and a dump put in its place. Buffalo is already considering the change, one company having about concluded to give up its trestle and other shippers agreeing that they must go. The wooden trestle is cumbersome, taking up a large amount of expensive waterfront, which is all the time becoming more valuable. Then the expense of upkeep is large. After such a structure begins to get old it has to be fairly rebuilt every year or two to keep it in good working condition.

The dump is a new dock appliance and it did not work in very fast at first. The machinery must be heavy and is somewhat complicated, while the power required must be large to pick up a big steel car and its freight of 50 tons or more; the problem of dumping the coal where it is wanted is also a delicate one. The first dumps did little but turn the car over and empty it upon an apron, where the coal ran down into buckets, to be hoisted to the vessel afterward. The one used in Buffalo for handling the soft coal of the Rochester & Pittsburgh Co. was rigged so that the buckets were hoisted by the weight of the car as it came back to place. This made too many handlings of the coal and it was not long afterward planned to dump the car into the vessel direct.



Plan of Harbor at Buffalo, N. Y., Showing Coal-Shipping Piers

Besides the relative cost and efficiency of the trestle and car dump, there is also the rapidity of handling and the breakage of the coal to be considered. All coal will break up considerably with any sort of handling, though in case of an empty vessel-hold the breakage is much more than after the cargo is nearly all in. Bituminous coal ships most satisfactorily in three-quarter size, though the preparation also involves the production of a large amount of slack. The problem is also complicated by the action of the stokers, who sometimes refuse to handle anything but three-quarter in feeding their fires.

Shipments

Lake Ontario—	Tons	
Charlotte	185,000	Bituminous, to Coburg only
Sodus Point	6,000	Anthracite, to Lake Ontario and St. Lawrence Ports.
Sodus Poin	70,000	Bituminous, to Lake Ontario and St. Lawrence Ports.
North Fair Haven	150,000	Anthracite, to various ports, including the upper lakes.
Oswego	675,000	Anthracite, to various ports, including the upper lakes.
Lake Erie—		
Buffalo	3,925,000	Anthracite, to upper lakes.
Erie	275,000	Bituminous, to upper lakes, and to Lake Ontario.
Erie	543,000	Anthracite, to upper lakes.
Conneaut	165,000	Bituminous, to upper lakes and Lake Ontario.
Ashtabula	4,370,000	Bituminous, to upper lakes and Lake Ontario.
Fairport	375,000	Bituminous, to upper lakes and Lake Ontario.
Cleveland	2,100,000	Bituminous, to upper lakes and Lake Ontario.
Lorain	2,250,000	Bituminous, to upper lakes and Lake Ontario.
Huron	735,000	Bituminous, to upper lakes and Lake Ontario.
Sandusky	1,349,000	Bituminous, to upper lakes and Lake Ontario.
Sandusky	17,000	Bituminous, to Buffalo.
Toledo	4,630,000	Bituminous to upper lakes.

The use of the car dump has been much facilitated by the modern vessel hatch, which is so large that the deck seems to be practically all hatch, in place of the old-fashioned style, which merely provided for an opening big enough for hoisting out a barrel or two. In all this improvement of late years it must be confessed that the lake coal trade has followed the iron-ore trade, which demanded rapid handling if costs were to be kept down. It is claimed that handling appliances on the lakes are usually far in advance of anything known on salt water and with good reason, for the trip never exceeds 1000 miles, so that time lost in port is fatal. In case of ocean vessels there must be time in port for repairs and speed in handling is not so essential.

The Coke Made from West Virginia Coal

The quantity of coke made in West Virginia in 1912, according to E. W. Parker of the U. S. Geological Survey, was 2,465,986 short tons valued at $4,692,393. In 1911 the production was 2,291,049 tons valued at $4,236,845. The increase in 1912 was 7.64 per cent. in quantity and 10.75 per cent. in value. In spite of this increase the production of coke in West Virginia in 1912 was smaller than that of any year from 1905 to 1910. The smaller production in the last two years is attributable simply to the larger production of coke from West Virginia coals by plants in other states.

In 1912 the quantity of coal made into coke in West Virginia was 4,061,702 short tons, while it is probable that the quantity of West Virginia coal made into coke outside of the state exceeded 5,000,000 short tons. In coke making as in the coal-mining industry, West Virginia suffers from having relatively little home consumption for her products; 80 per cent. of the coal mined in the state and nearly all of the coke made there is sent to consumers outside of her boundaries.

Next to Pennsylvania, West Virginia possesses more wealth in supplies of high-grade coal than any other state in the Union, but as long as both coal and coke continue to be shipped out of the state, West Virginia will not attain the position she should occupy as a manufacturing commonwealth. At the present time ranking second in the production of coal and third in the production of coke, West Virginia stands thirty-fourth in the value of her manufactured products.

Richmond Basin in Virginia

The presence of coal in the Richmond basin of Virginia was known as early as 1700 and mines were opened and worked in 1750. In 1789 shipments were made to some of the Northern states. In 1822, according to R. C. Taylor in his "Statistics of Coal," the production amounted to 54,000 short tons. For nearly a century the Richmond basin maintained some prominence as a coal producer, but in 1882 when the Pocohontas district was opened, followed shortly afterward by the development of the New River field in West Virginia, the mines in the Richmond basin were put at a disadvantage, and operations were for many years practically suspended.

During the last four years, however, new life has been introduced into the Richmond basin areas by the reopening of the old Gayton mine in Henrico County. This region is the only area producing free-burning coal which lies immediately adjacent to the Atlantic seaboard.

Large Coke Production in Indiana

The production of coke in Indiana in 1912, according to E. W. Parker of the U. S. Geological Survey, amounted to 2,216,339 short tons valued at $12,528,685.

With the completion and puting in operation of the 560 Koppers ovens by the United States Steel Corporation at Gary, Indiana in 1912 advanced to third place among the coke-producing states, displacing West Virginia, Illinois and Colorado. Indiana's production in 1912 exceeded that of West Virginia by about 150,000 tons and was only 350,000 tons or thereabouts less than that of Alabama.

It is probable that within two years if not in 1913 Indiana will surplant Alabama as the second coke state as at the close of 1912 there were 169 retort ovens in course of construction.

In addition to the ovens at Gary there were 50 Otto ovens operated by the Citizen's Gas Co. at Indianapolis, and during the year 22 ovens were completed by the Central Indiana Gas Co. at Muncie. These latter ovens are heated by producer gas made from the coke in producers in front of and below the ovens. Gas coal from the Youghiogheny region of Pennsylvania is used in these ovens and the coke is marketed for domestic consumption. The coal used at Gary and Indianapolis is chiefly from West Virginia.

⁂

Maryland's Coal Output

Maryland's coal production has been fairly constant for the past 15 years, during which period it has averaged about 4,860,000 short tons. The smallest annual output was 4,023,241 short tons, while the maximum was 5,532,628 tons in 1907. The production in 1912 was 4,964,088 short tons, valued at $5,839,079. These figures were compiled by E. W. Parker, of the U. S. Geological Survey, having been obtained in coöperation with the Maryland State Survey.

This production was about 100,000 tons over the average for the 15-year period, but more than 600,000 tons less than the maximum; compared with 1911, the production in 1912 was a gain of 278,243 short tons in quantity and $642,013 in value. In sympathy with the generally higher values throughout the country in 1912, the average price per ton for Maryland coal advanced from $1.11 in 1911 to $1.18 in 1912.

The coal deposits of Maryland are confined to a small area in the two western counties of the state, Allegheny and Garrett. Most of the production in the past has been made in the Georges Creek basin, which, in Allegheny County, contains a detached portion of the Pittsburgh seam, known generally as the Maryland Big Vein. This bed has been worked for nearly a hundred years and is now approaching exhaustion. The greater prominence of this basin as the source of Maryland's coal products has given the name Georges Creek to most of the coal shipped from the state.

Georges Creek coal has a high reputation as a steam and blacksmith fuel. The gradual exhaustion of the big vein has led to the exploitation of some of the smaller beds in the Georges Creek basin, and many companies that formerly worked the Big Vein only are now mining the thinner beds, either independently or in conjunction with the Big Vein.

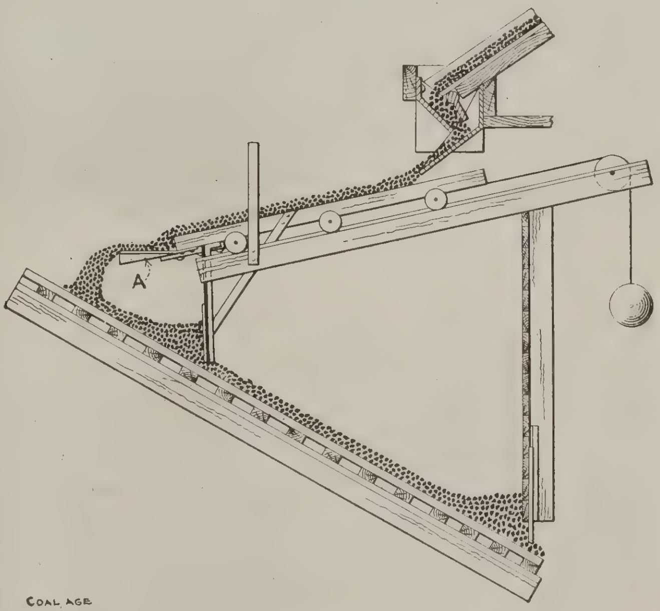
The total amount of coal recoverable from the numerous small beds far exceeds the original contents of the Big Vein, but they cannot be so cheaply worked, and it appears doubtful if in annual production they will do more than make up the deficiency caused by the exhaustion of the larger deposits.

The U. S. Bureau of Mines reports a total of only 13 men killed in the coal mines of Maryland in 1912, a decrease of two from 1911, when there were fewer men employed and fewer tons mined. Maryland also presents an excellent record in regard to labor troubles, of which there were only three in 1912, the longest one lasting for 12 days. No strike of any kind was reported in either 1910 or 1911. Most of the mines are operated ten hours per day.

⁂

Traveling Chute for Coal Pockets

One of the objects of the device shown in the accompanying figure is the provision of a traveling or movable chute operative upon an inclined track, the chute being provided at the lowest end with a spreader plate *A* for evenly spreading the coal in the upper portion of the pocket, against a regulating plate projecting downwardly from the under surface of the lowest end of the movable chute. As the coal piles up against the regulating plate the chute is moved upwardly upon the inclined track, so as to gradually regulate the coal down the incline of the pocket, where it passes through a gate opening.



THE CHUTE IN OPERATION

In practice there is a series of pockets, and each gate opening of each pocket is opened or closed by means of a gate, there being an attendant, known in practice as a "loader," for operating each gate. When it is desired to load a car at the gate opening, the "loader" gives a signal, and the coal is allowed to pass from the coal regulator, upon the traveling chute, from which it is spread into the pocket, then the "loader" opens the gate, thus allowing the coal to flow into the car. A patent (1,061,151, May 6, 1913) was granted on the above chute to W. N. White of Fortyfort, Penn.

The Industrial Importance of Coal

By Frederick W. Saward*

SYNOPSIS—An interesting paper in which some facts and figures on the importance of coal are presented. It has been quite pertinently said the coal production must continue so long as a wheel is to turn any place. The possible results of a general and abrupt cessation in production are discussed and the gradual development of the industry reviewed.

⁂

The consumption of fuel is the best measure and truest index of a nation's industrial status, but notwithstanding the extent of the coal trade today, which statistics available to all plainly make evident, it is a lamentable fact that the industry has had much to contend with in past years in the way of adverse public sentiment and lack of esteem. Too often even now the personnel of the trade is collectively regarded either as a robber baron swollen with ill-gotten gains or a more or less prosperous peddler delivering his tonnage with a horse and cart, while only some vague ideas of dust, dirt and a deep hole give shape to the more general features of the trade.

Little Early Incentive to Development

With little in the way of incentive to development, and with such limited opportunities for traffic in coal as existed a century or more ago, it is easy to believe that the industry appealed only to a nondescript element of the population and there was not the opportunity for anything like the facilities that we see in common use today. We may well shudder to think of the severe underground work performed by women in the old coal mines of Britain. Their tasks would be put today under the heading "cruel and unusual," and the men indeed were little better off, for such work as carrying coal in baskets up crude ladders lining a shaft may well appall the workingman of today, who insists upon no more than eight hours of work that is none too severe. Even the employment of dogs today in such underground work as then prevailed would call forth protests from a certain society with a long name.

How little the industry was esteemed may be gleaned by a few lines taken from Adam Smith's celebrated work on "The Wealth of Nations," the great classic among economic writings. This was written, I might say, at Kircaldy, whence (including Methill) the largest export of Scotch coal is now made. Professor Smith stated: "Coals are a less agreeable form of fuel than wood, and they are said to be less wholesome. The expense of coal, therefore, at the place where it is consumed must generally be somewhat less than that of wood."

Thought Coal Could Not Compete at a Distance

The production of distant coal mines can never be brought into competition with one another. He, however, condemned the duty on their exportation, which was then in most cases more than the value of the commodity at the pit, or even at the shipping port, on the ground that it is always inexpedient to restrain the export of "the instruments of trade."

Charles Dickens made light of the coal trade as the last resort of the unsuccessful man, and even our own Chauncey M. Depew, in later life identified with coal companies, in one of his earlier addresses supported in a measure the Dickens view of the coal man. Also, the railroad people of the early days were slow to see the possibilities of coal as a traffic producer. At the time of the English coal development—and, as you all know, it was in that country that the mining of coal first became an established industry—shipments were made largely by water, short tram roads affording access to navigation.

Even when the railroad era was well under way coal was not considered in the light of legitimate traffic, though a supply of it was provided at terminals for locomotive purposes. It is one of the traditions of the English trade that when a pioneer coal-mining company made application for a freight rate on coal the officials of the road approached were so much surprised at the novel proposition that they submitted it to the board of directors, causing one of these worthies to exclaim with astonishment and indignation: "Carry coal; next they'll want us to carry dung!"

Presuming, then, that the coal trade as an important industry started with the utilization of steam power on a large scale, it ranks as distinctively a modern enterprise, and considering the relatively short period of its growth the achievements have been remarkable. Statistics show that the coal tonnage of the world approaches a billion and a half tons a year, while the tonnage of the United States alone is over half a billion and growing at such a pace as to be pretty certain of passing the billion mark ten years hence.

The Great Importance of Coal

Whenever there is a stoppage of industries or public utilities by scarcity of coal it is indeed a calamity. Fortunately, there has never been at any time a shortage of coal of such degree as to interfere generally with public utilities, and probably only a failure of food and water would compare with an actual coal famine. In fact, in many localities absence of a coal supply would in itself speedily cause a water famine in view of the constant pumping that is requisite to meet requirements, while the food supply of cities would be exhausted in a few days, for without coal no trains could run, no steamboats ply our lakes and rivers.

With all means of transport devoted to the single matter of keeping the populace alive, and, of course, that would be the first requirement, there would be no transit facilities available for mail service and any journey, however important, would have to be deferred if it could not be performed on foot. All our electric service not derived from water power would soon terminate, we would have no gas and no oil—not even candles—for such an inconvenience as darkness, with all its evil potentialities, would have to be endured while all efforts were made to expedite the carrying of the most necessary articles of food to starving cities. In some places a catastrophe would develop through the absence of power by which to dispose of sewage and indeed the opportunities for misadventure might be narrated at such length as to tax your patience.

---

*Editor, "The Coal Trade Journal," New York.

Note—Abstract of paper read before the joint annual convention of the M. O. I. Coal Association and the Kokoal, at Cedar Point, Ohio, June 17, 18 and 19.

With the development of the business many of the shortcomings of the past have been remedied, and today coal is produced for the most part at mines equipped with mechanical installations representing great fortunes. Without these equipments the tonnage required could not be turned out. And in the transportation and in the retail distribution of tonnage great investments are to be seen at every hand. The trade is becoming a business of large units and the conditions as regard capital investment, the safeguarding of market interests, and so on, are such as to cause it to become a business of relatively few factors. Consolidation is eminently the order of the day. In the anthracite field, in the Pittsburgh territory and elsewhere we have seen mining companies merged into large organizations, and in the retail trade a similar development is in progress.

The Retail Trade

Originally, it would seem, the retail distribution of coal was taken up as a personal enterprise by a man with a horse and a cart—a business descendant, as one might say, of the old-time carman with his long jacket or leather apron, who distributed wood throughout the Eastern cities. But the circumstances of the times, to narrate which would take more time than I have at command, have operated steadily in favor of the concerns with large facilities and capable equipment. The mere matter of being required to take care of 50-ton steel cars that are becoming the standard railroad vehicle has made demands upon the retail trade which have had a conspicuous effect upon the personnel and the general type of the coal yard in towns and cities.

So while the number of people in the coal trade is probably not increasing, they are all becoming more important business factors, collectively, and as such will make their mark in the community and be more highly regarded than the one-horse operator and the one-horse dealer ever could be. This will redound to the advantage of the trade, for the big business enterprise is pretty sure to command respect when properly managed. And surely there is little to complain of with regard to the management of the coal trade so far as the public welfare is concerned. Far and wide coal has been sold at a price representing a very small margin of profit to anyone engaged therein.

Substitutes for Coal

Having achieved its present position, it is practically certain that coal will continue to grow more important, both with regard to the volume of tonnage and its recognized place in the community. One could scarcely go so far as to say that no substitute for it will be discovered, but certainly there seems to be nothing in view at the present time. Oil is frequently alluded to as a rival fuel possessing great possibilities, but as a matter of fact the whole oil production is not equivalent to more than the annual increase alone in soft-coal requirements. Any changing of large classes of steam users from coal to oil would cause such an increase in the market price of the latter as to quickly eliminate all possibilities of economy save in exceptional cases.

Natural gas has played a large part in certain sections of the country roundabout us, but I need not remind those of you who come from the natural-gas towns what a difference there is in the gas situation today compared with the situation 20 to 25 years ago. The limitations of the supply are only too evident.

Therefore, as the country develops and modern conveniences and improvements are introduced in one place and another, more steam power becomes necessary and more coal is called for. In fact, it might be said that the possibilities of the trade are such as to give pause to the most heedless. The growth to a billion tons and more which I have referred to as something to be anticipated ten years from now, signifies two billion tons output a little more than 20 years hence, for the growth is at the rate of nearly 10 per cent. a year. Recent progress has accomplished this, notwithstanding the setback following the 1907 financial difficulties, and there is no prospect of this growth being suddenly checked or impeded. Such slowing down in the rate of increase (as distinguished from the absolute increase) will, no doubt, come about gradually.

Looking into the Future

There is lots of coal, but so far as regards the accessibility of tonnage convenient to the Eastern and Middle Western states, so far as regards its availability with respect to men to dig it and cars to carry it, the supply is by no means so superabundant as to cause coal to be lightly regarded. In fact, I venture to say that with the demands of the country approaching a billion tons a year, and later two billion tons, the coal man will be looked up to with a great deal of respect and it will be thought that he is accommodating the public in furnishing fuel, for as the years go by the important, all-essential merit of an adequate coal supply will be better recognized than it is today, now that we are scarcely more than emerging from the crude and plentiful era of the industry.

With such facts before us, with a future perhaps better assured than any other trade has, since the control of the industry rests definitely with the comparatively few owners of large coal areas, should we not all consider this a great industry that we are connected with?

I have pointed out to you that the change in railroad equipment has been a factor in improving the individual status of the retail dealer, and with the growth of the trade in general we may expect to see the best minds in our several communities giving attention to the coal trade and having no hesitancy, as they did in past years, with regard to being connected with something once looked upon as a dirty, dusty enterprise of slight importance.

It is well known that some of our greatest capitalists are among the investors in coal properties. Banking interests in all the coal-producing centers have been quick to recognize the prospective value of coal lands. Steadily the business is getting into better, firmer control, and I venture to say that the time is not far distant when practically throughout the year the buyer will have to seek the seller, and surely such a condition will serve to convince us, if we are still reluctant, that coal is an important article, that it is the all-essential element of progress in this age, and that the industry which we represent stands second to none in the affairs of the country. I submit this, gentlemen, to your careful consideration. May these remarks prompt you to stand up all the more strongly for the interests of the trade.

Hand Hammer Drills in Shaft Sinking

Special Correspondence

SYNOPSIS—At Nokomis, Ill., hand hammer drills were employed in sinking two shafts. In soft rock the bits tended to bury themselves. Although it may seem paradoxical, greater speed was made when larger holes were drilled. The saving effected over hand work is also shown.

⁂

The Nokomis Coal Co., with headquarters at St. Louis, is opening a new mine on the No. 6 seam, at Nokomis, Ill. At this point the coal is 631 ft. below the surface and is reached by a main hoisting shaft 17 ft. 5 in. by 11 ft. 5 in. inside the timbers, and an air shaft of equal dimensions located 500 ft. distant.

In sinking these shafts, the company employed eight Sullivan air-jet sinkers or hand-feed hammer drills, class DB—19, weighing 40 lb. each, and one Sullivan single-stage, steam-driven air compressor, class WA—3, size 9x10x12 in., providing 174 cu.ft. of free air per min. at a terminal pressure of 100 lb. per sq.in.

It was found that in trying to bore holes in the soft shale with these hammer drills, the tool cut so rapidly as to choke the passage in the bit with muck, stopping the flow of exhaust air and preventing proper cleaning of the drill holes. Hand drilling was temporarily substituted, but on adopting certain recommendations of the manufacturers, the hammer drills worked satisfactorily, and their use was resumed with a marked increase in speed over the hand work.

The change made was in the gage of the bit, which was increased from 2 to 2½ in. on a 3-ft. length, and from 1⅞ to 2¼ in. on a 6-ft. steel. Later on, three steels were employed instead of two, their lengths being 2, 4 and 6 ft., and their gage 2¾ in., 2½ in. and 2¼ in., respectively. It is but natural to suppose that steel of the small gages intended for use in hard rock should travel too fast in soft formations, and in this way give the air insufficient chance to properly clean the drill hole. The wide gages finally employed gave large openings between the wings of the bit and allowed free escape of air around the steel from the center hole.

Power House and One of the Shafts during Sinking

The type of drill above mentioned has a double-grip, push-throttle handle, a cushion valve for reducing vibration, and the exhaust ports are so connected as to permit any desired portion of the expanded air to be discharged through the hollow drill steel to clean the hole of its cuttings. Six-point rose bits were employed.

After passing through the upper capping of hard rock, shale of various degrees of hardness was encountered with an occasional layer of limestone 10 or 12 ft. thick. The rock at times consisted of slaty bands, sandy shale or soft gray material, more like indurated clay than shale.

In sinking through limestone, from 28 to 32 holes constituted a round, the corner holes being bottomed 2 in. outside the line of curbing. As the shafts were timbered throughout, the break lines were 12 ft. 5 in. by 18 ft. 5 in. The holes were 4½ ft. deep and were connected and fired with an electric battery in the ordinary manner. Three 8-hr. shifts were worked, a round being drilled, blasted and mucked out on each shift. Four drillers, four muckers and a shift leader or boss constituted a sinking crew.

The throttle was next fastened open, the air being regulated by the valve on the hose. A device was added for holding the drill steel fast to the tool. These changes enabled the operator to move the drill, bit and all up and down in the hole with the piston running, thus keeping it cleaner and preventing the exhaust-air passage in the steel from clogging with muck, so that the tendency to bury the bit was diminished.

The holes were kept full of water to assist the action of the exhaust air from the drill bit in keeping the cuttings stirred up. The exhaust opening at the top of the cylinder was also plugged, thus enabling the entire exhaust to be discharged through the steel when desired.

These changes gave the following results in soft shale, as compared with hand drilling. Hand drillers using 2¼-in. steel worked at the rate of 4½ ft. per man per hour, or four men put in a round of 54 ft. in 3 hr. With the air drill, four men drilled 18.9 ft. per man per hour, or a round of 54 ft. in about 45 min., thus accomplishing a saving of 2 hr. and 15 min. per 54-ft. round.

Owing to the variation in the time required for shooting and mucking, this increase in drilling speed meant an increase in depth per day of 1 ft., or 4½ ft. per 24 hr., as compared with 3½ ft. per 24 hr., with hand drills.

Sinkers, including drillers and muckers, were paid $3.39 per 8-hr. shift, the shift leader receiving $4, making a total labor cost per day of roughly $93, or $26.50 per foot by hand drilling. The saving by using the hammer drills, therefore, amounted to one foot in each shaft; or $53 per 24 hr. for both shafts.

A Nearer View of the Temporary Headframe

The device for holding the hollow drill steel in the chuck of the hammer drill, as described above, was a home-made affair. A more scatisfactory and permanent device has just been worked out by the makers of the drills, as shown in the accompanying sketches. This consists of a yoke and side rod fastened by means of a clamp on the nose of the tool. A retaining spring is arranged to pass half around the drill steel just below the collar, exerting a spring grip upon it and holding it firmly.

On the upper end of this retaining spring are forged trunnions, which are held in place on the side rod by spiral springs, which exert a constant pressure upon them. When changing steels, it is merely necessary to bear down on the retaining spring, where it half circles the steel, until the collar on the steel can slide past this spring. The spring will snap back into position when released because of the tension on the side-rod spring and the action of the trunnions. The device may be easily removed from the drill by taking out the transverse bolt.

⁂

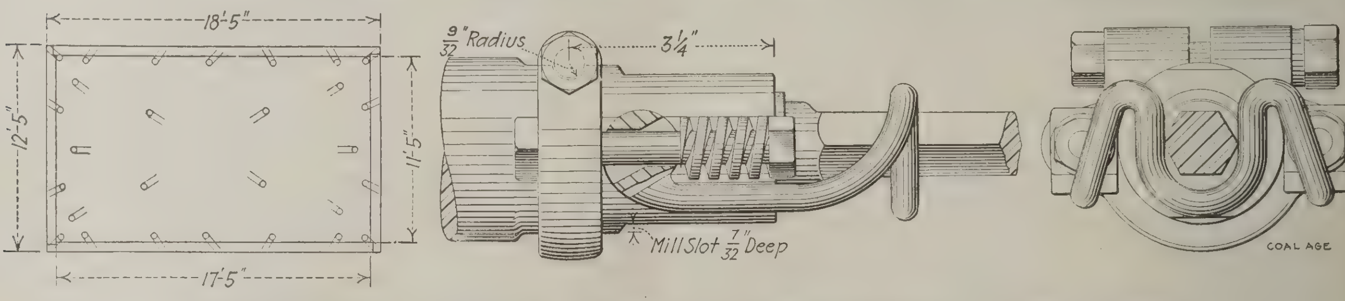
Anthracite both Prepared and Mined

The ignorance of retail coal dealers of the details of the production of anthracite coal has been a subject of comment among the operators since several of the large companies entertained the retailers at the mines in northeastern Pennsylvania recently. The lack of knowledge which the operators chiefly deprecate is in regard to the preparation processes after the coal has been mined.

"It is hard enough to have the general public think that we merely dig the coal out of the ground and sell it at an enormous profit," said one of the operators, "but when we find some of the men who are the intermediaries between us and the general public cherishing the same delusions it is most discouraging. Of course, there is a certain number of them who are well informed.

"Some of them seem to think, however, that we just back up a wagon to a hole in the ground and haul the coal away. Few of them realize that this is a manufacturing as well as a mining proposition, and that 20 per cent. of the cost of mining and preparing the coal is incurred above ground.

"The big breakers in which the coal is prepared cost on an average $200,000 each. In recent years two concrete breakers have been built, each of which cost approximately $300,000. The preparation of anthracite consists primarily of sizing it into the various grades furnished to the retailer and eliminating the slate and rock.



The Bit-Holding Device and Diagram, Showing Location of Holes in Shaft

"The sizing of coal first requires a breaking down of the large lumps by rolls which are equipped with teeth so arranged as to crush the fuel with the production of the least amount of small sizes. Another delusion cherished by the retail dealer is that we can break all of the coal into any size we please. This is not true. The best machinery we have been able to devise produces a large proportion of the small and unprofitable sizes.

"The contents of a car of coal as produced in a mine with heavy pitching breasts consists of everything from dirt to lumps of slate and rock weighing as much as

500 lb. Under the best conditions of mining there is always a percentage of foreign substances. These must be eliminated by the big shakers and by hand picking. After that the coal must pass over screens, down spiral separators and through a water jig before it is ready for loading. The cars are loaded by special machinery, and are carefully inspected before they are allowed to leave the breaker yards.

"In addition to all this, vast quantities of coal of the sizes not marketable during the summer must be stored in order to keep the mines in operation during the dull season. The storage yards range in capacity from a hundred thousand to a million tons. All of this is tremendously expensive, and if the retail operators would only realize that the production is physically limited to from five and a half to six million tons a month, and that it is utterly impossible for us to supply them with all the sizes they want when and in what quantities they order them, it would do much to simplify our relations."

⁂

Farmers' Right vs. Coal Operators' Right in Cherokee County, Kan.

The suit of a farmer vs. a coal operator in Cherokee County, Kan., was recently decided in the Federal Court of Kansas City, and the decision which directly affects 160 acres of land and indirectly more than a million dollars' worth of real estate was decided against the operator.

The suit was an injunction brought by the J. R. Crowe Coal & Mining Co. against William P. Daugherty owner of the 160 acre tract, and his agent William Humble.

Several years ago the St. Louis & San Francisco R.R. sold Daugherty the land, retaining the mineral rights. Recently the railroad leased the coal to the Crowe Co. and this spring the latter started to move a steam shovel onto the land with the intention of mining the coal by the stripping process. Due to the shallowness of the coal measure, this is the only means by which the coal may be secured.

Daugherty objected so strenuously to having his farm ruined that the coal company finally had recourse to an injunction suit. Judge Pollock, before whom the suit was brought, appointed J. S. Dean, of Topeka, Special Master in Chancery, to hear the testimony, report and recommend judgment. His decision was to the effect that the coal company had no right to mine by the stripping process to the detriment of the land.

Fifteen hundred acres of coal land becomes involved by this ruling. Under this area the coal bed cannot be mined by the ordinary process and the operators must turn to stripping. This is a method of which the farmers did not know when the land was leased to the operators, and many of them have been compelled to stand by and see the shovels tear huge furrows across their level acres.

It is now believed that all men who leased their land with the idea that the coal would be mined by the old method, will endeavor to protect themselves. However, since it is believed that the land, after it has been stripped, is much more valuable agriculturally than before, the most stringent action which many farmers will take, will be to require the operators to level down the ground after the coal has been removed.

Pennsylvania Smashes Coke Record

Pennsylvania stands pre-eminent among the states in the production and manufacture of coke. According to the figures of E. W. Parker of the U. S. Geological Survey the quantity of coke produced in the state in 1912 was 27,372,018 short tons valued at $56,054,478. In 1911 the production was 21,923,935 tons valued at $43,053,367. The increase in 1912 was therefore 5,248,083 short tons or 24.85 per cent. in quantity and $13,001,011 or 30.2 per cent. in value. The quantity produced in 1912 was the largest on record, exceeding the previous maximum of 26,513,214 tons in 1911 by 858,804 short tons, but falling behind the earlier year in value by $11,583,546.

As a producer of coke Pennsylvania is relatively of greater importance than as a producer of coal. Including the production of anthracite Pennsylvania contributes less than one-half of the entire output of coal in the United States, while nearly two-thirds of the total production of coke comes from within her boundaries. The state has, however, not progressed as rapidly as some others in the matter of conserving the byproducts of coke making. All but a very small quantity of the state's coke is made in beehive ovens or in those of rectangular sections without the recovery of any byproducts or the utilization of the heat generated in the coking process.

⁂

Increased Coke Production in Alabama

Alabama's output of coke in 1912 amounted to 2,975,489 short tons valued at $8,098,412 against 2,761,621 short tons valued at $7,593,594 in 1911. According to E. W. Parker of the U. S. Geological Survey, the increase in 1912 was 213,968 tons and $504,818 in value.

Alabama retained second place in the rank of coke-producing states in 1912, having superseded West Virginia in 1911. The average price per ton for Alabama coke has declined from $2.82 in 1910, to $2.75 in 1911, and $2.72 in 1912. This does not necessarily indicate an actual decline in the price of coke. A large proportion probably over 90 per cent. of Alabama coke is consumed in furnaces which are owned by the same interests owning and operating the coal mines and coke ovens, and the placing of a value on the coke is largely a matter of accounting. The value per ton of the coke produced in 1912 was lower in spite of the fact that the value of the coal used advanced from $1.28 in 1911, to $1.35 in 1912.

That this state has developed her coking industry along the lines of modern practice is evidenced by the fact that in each of the last three years the only new ovens under construction were those of the retort variety. Moreover during 1912, there were 191 beehive ovens abandoned.

⁂

Petroleum Production in 1912

According to the U. S. Geological Survey the great production of petroleum in 1911, which was 220,449,391 barrels, was surpassed in 1912, when the total reached 222,538,604 barrels. Higher prices were the rule in 1912, except in California, and even in that state there was no material decline. The total value increased markedly, reaching $164,087,342, or 22.41 per cent. above the value of 1911.

POWER DEPARTMENT

A Large English Air Compressor

Special Correspondence

SYNOPSIS—The essential points of efficient air compression with particular reference to the type and placing of valves is first discussed. A new kind of valve is then described as is also a large-capacity machine in which they are employed.

⁂

Although the use of electric power has been a serious competitor with compressed air in colliery work during the last few years, there is a feeling, which has a strong foundation in fact, that in some of the more gaseous mines at any rate, electric power is not as suitable for the work required as compressed air. The endeavors of compressor manufacturers have, therefore, been directed toward the production of machinery which would give the maximum economy in operation.

The Requisites of a Good Compressor

As regards the compressor itself, the conditions which have to be fulfilled are that on the suction stroke the cylinder should be filled with air at atmospheric pressure throughout the entire piston travel. When the compression stroke is made there should be no loss of any portion of the air previously drawn in either by return to the atmosphere or by leakage, but the whole contents of the cylinder, with as little deduction for clearance space as possible, should be discharged through the outlet valves.

Moreover, in a good compressor, the outlet valves should have large discharge area and should open automatically when the pressure in the receiver has been reached in the compression cylinder. These valves should also have sufficient width of seating to insure their being kept tight, so that there be no loss by leakage back into the cylinder; they should be self-adjusting under all speeds and pressures. The piston should be easily accessible for examination and renewal, and wear and tear should be minimized as much as possible.

The key to the situation appears to be in the kind of valve used, inasmuch as leakage during both intake and discharge depends on their design and efficiency. The clearance space is governed by the type and position of the valves and air passages, while excess pressure in both suction and expulsion is directly attributable to their area and durability.

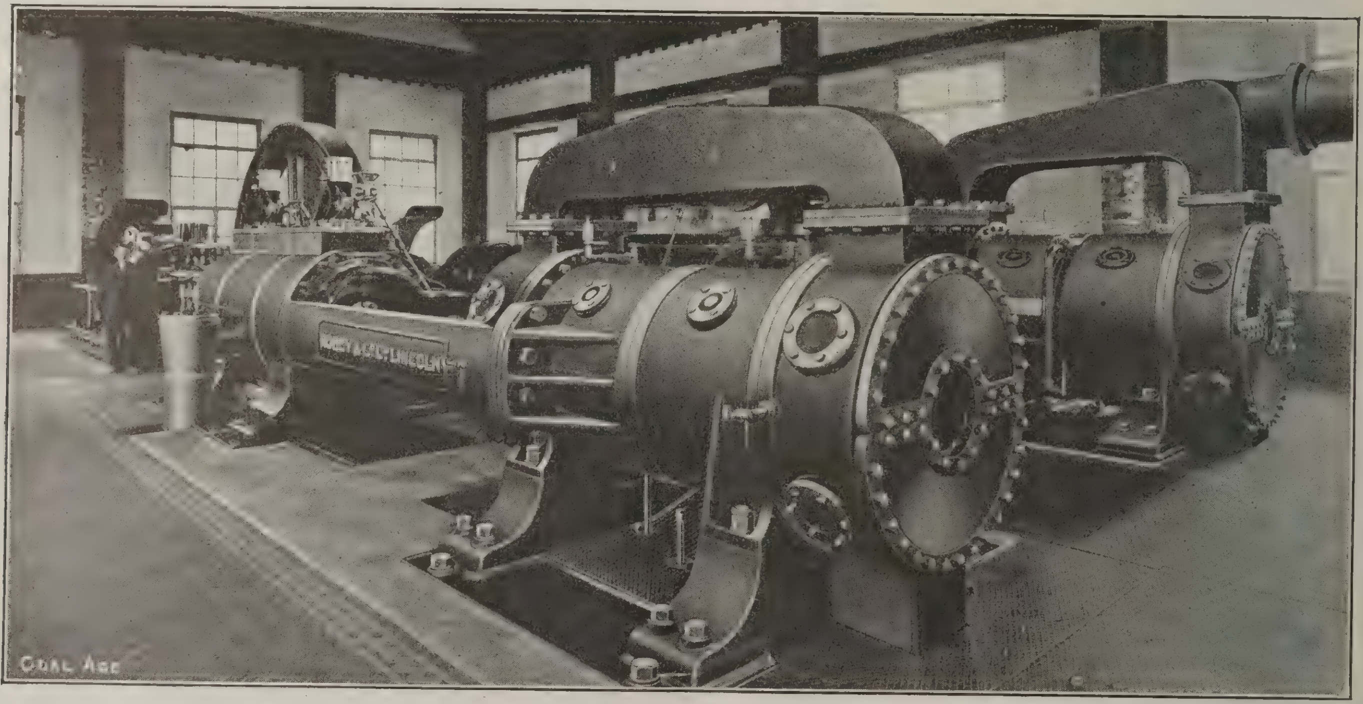


Fig. 1. A 6300-Cu.Ft. Air Compressor, Using New Type of Valve

Examining the valve systems which are adopted in air compressors as made today, it will be seen that these systems fall into series or groups. In the first, poppett valves are used, both on the inlet and discharge. In another group may be classed compressors having large flat hinged valves in the cylinder covers, actuated similarly to poppett valves. Yet another type of compressor has mechanically operated inlet and discharge valves, which open and close by means of direct mechanical connections. Still another modification adopts inlet valves mechanically operated and poppett discharge valves.

The remaining groups consist of compressors using direct air controlled and balanced inlet and discharge valves, which lend themselves to increased piston speed and efficiency, but are somewhat expensive in first cost and have to be maintained in a careful manner; and compressors using light disk valves with a small lift. This latter appears to be the latest word in compressor design, and it may therefore be well to briefly refer to details.

An interesting type of this valve is shown in Figs. 2 and 3, the former showing an automatic disk valve in its assembled condition as made by Messrs. Robey & Co., Ltd., of Lincoln, Great Britain, the latter showing the valve disk itself. The inlet and outlet valves and their seats are complete in themselves and are secured to the cylinder by means of three lugs. The seating is a metallic contact joint and can thus be made and broken many times without damage. The valves are multi-ported, thus requiring only a small lift. They are therefore silent in action and practically free from wear.

As seen in Fig. 3, the valve disks themselves are corrugated, and, being made from special mild steel they are extremely strong and elastic. They are held in position by coiled springs of square section, fitting into the flanges on the outside and inside edges of the valve, the springs being held at the other end by the guide plate. Hence the valve is pressed firmly into position on its seating, but can move in all directions without the use of guide studs or other supports. It is thus free to seat itself accurately and noiselessly at each stroke, lubrication being rendered unnecessary.

An Illustration of Application

These valves are now being adopted in connection with the Robey horizontal, two-stage air compressors which are coming into considerable use in colliery work. A typical installation is shown in Fig. 1, it being the compressor supplied to the Altofts collieries of Messrs. Pope & Pearson, Ltd., of Normantown. This compressor is capable of handling 6300 cu.ft. of free air per min. when running at 56 revolutions under a boiler pressure of 120 lb. per sq.in. The high- and low-pressure steam cylinders are 27 in. and 46 in. in diameter, respectively. The corresponding air cylinders are 30 in. and 46 in. in diameter. The piston rods are 5 in. in diameter and the stroke is 60 in. The machine is provided with a flywheel of 16 ft. diameter. Between the two air cylinders is placed an intercooler. The cylinders themselves are water-jacketed and fitted with an improved type of piston, which provides for the use of the whole of the depth of the piston body and rings for bearing surfaces.

The control of the engine, while being dependent on the ordinary centrifugal governor, is also carried out by means of the air itself. Should the pressure in the receiver fall, the air governor lengthens the cutoff of the steam valves while if pressure rises it shortens it. The speed of the engine varies therefore with the amount of air required, and the pressure in the receiver is maintained within very fine limits.

The steam drop valve employed on this machine represents the highest class of gear that can be applied to steam cylinders, especially when high pressures and superheating are adopted. The gear is actuated from a lay-shaft driven by skew gears from the main crank shaft. The eccentrics operating the admission and exhaust valves are small, as the work they have to do is light.

Both the admission and the exhaust valves are in equilibrium and as soon as the admission of the steam has been carried far enough to do the work required, the admission valve is immediately closed. The governor, when rising, actuates two cams, which regulate the length of time in which the trippers are in contact.

This gear, controlled by the governor in combination with the automatic air-pressure regulator, insures that the supply of air is kept constant without waste and without attention on the part of the driver.

The Ball Bearing on Locomotive Armatures

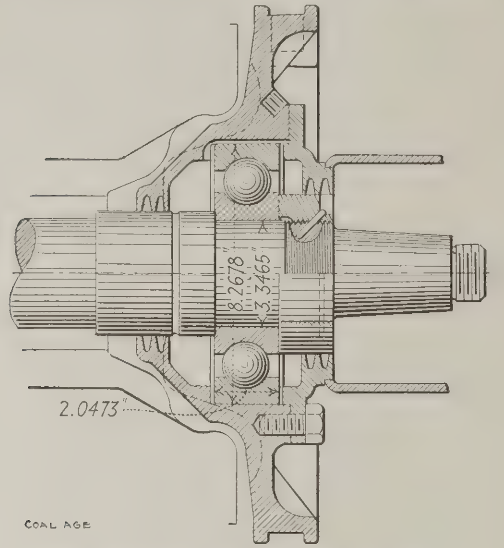
From their use in bicycles and automobiles there are but few people who do know something at least of ball bearings and their application. But compared with the present-day development of this device the bicycle bearing of one or two decades ago was an extremely crude and inefficient affair.

The general impression regarding this type of journal is that its use is justifiable only where a great reduction in friction is necessary or desirable. This may or may not be the case. Other considerations and characteristics may enter into the selection of a ball bearing which are vastly more important than a lessening of resistance to rotation.

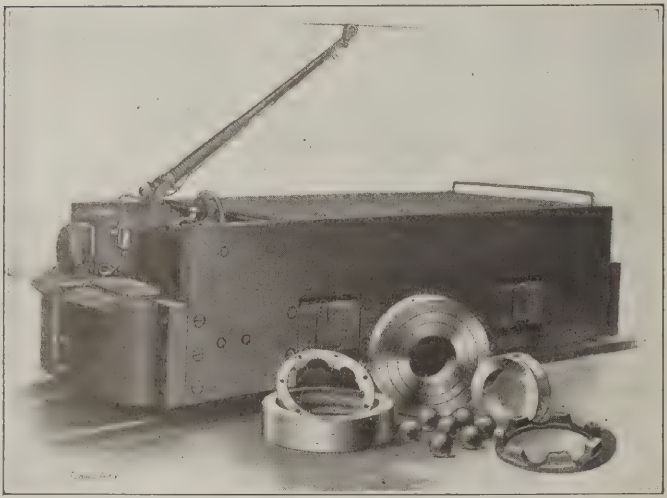
It has been now about five years since the Jeffrey Mfg. Co., of Columbus, Ohio, placed the first ball bearing upon the armature shaft of one of their electric mining locomotives. So satisfactory were the results obtained, not so much because of any reduction in friction as from the standpoint of durability that at the present time ball bearings are the standard journal for all armature shafts upon this company's mine motors. Other manufacturers of this class of machinery also are rapidly adopting this means of armature-shaft support.

There are two principal advantages gained in the use of this type of bearing upon armature shafts. First the wear and consequent lowering of the armature toward the pole pieces is practically a negligible quantity. The armature is consequently at all times subjected to a uniform action from the field.

The second advantage is perhaps less immediately apparent, although it depends upon exactly the same cause. The armature pinion and gear with which it meshes are carefully machined. Their efficiency in power transmission therefore largely depends upon the accuracy with which they mesh. If a bearing wears rapidly this allows these gears to spread apart and their center lines to recede, allowing excessive backlash, which causes the gear teeth to wear rapidly at or near the point giving rise to the grinding sound so well known by those familiar with this type of machinery. This improper meshing soon cuts out the pinion and renders frequent renewals necessary. The ball bearing removes the cause of this trouble.



Cross-Section of Pinion Bearing of Armature Shaft



Mine Locomotive and Enlarged View of Armature Bearing

The Hess-Bright Mfg. Co., of Berlin and Philadelphia, have perhaps done more toward the commercial development of the ball bearing in this country than any other one firm. In the construction of their bearings a high-grade composition steel is used for both balls and races. This material requires a heat treatment exactly similar to the "silver steel" so well known in this country and employed in the manufacture of edge tools for cutting both wood and metal. The hardness and toughness of this steel in the finished state is well shown on crushing test. When three 1-in. balls are placed one above the other between the stationary and moving heads of a Riehle testing machine they withstand between 65,000 lb. and 70,000 lb. before failure. Furthermore, when finally split by this enormous stress the fracture shows an extremely fine, silky texture such as may be seen in the best of steel springs or edge tools. This size of ball is that ordinarily employed on the pinion end of a 15-hp.-motor aramature where the bearing is subjected to a maximum working load of 1400 lb. It will thus be seen that the factor of safety is extremely high.

It is probable that this high factor of safety has had much to do with the good results obtained with these bearings when given even reasonable care. An operating company in the bituminous region of Pennsylvania some years ago purchased some very heavy locomotives equipped with plain or ordinary bearings. In the first year's operation this firm spent $760 in repairs to two machines, all of which was directly traceable to armature-bearing wear or failure. Ball bearings were then substituted for the plain ones with the result that in the ensuing year not one cent was expended for armature repairs.

The use of ball bearings in heavy industrial machinery although demonstratedly practical is as yet relatively only in its infancy. Nor is it strange that among engineers, mechanics and locomotive drivers generally there may be found many skeptics and men "from Missouri." In the face of such an experience as that given above—which has been related because it was typical—there is but one conclusion that may be drawn.

⁂

The Steam Turbine in Mine Pumping

The peculiar adaptation of a well designed steam turbine to mine pumping is worthy of careful consideration. The essential characteristics of a mine pump are, simplicity in construction and operation; durability of all working parts; and compactness and efficiency.

The centrifugal pump, unquestionably, combines some of these features to a remarkable degree. It is compact in size and when well designed is simple in construction and durable. It possesses the marked advantage of continuous action, in contrast with the reciprocating motion of pumps of the piston or plunger type. The construction of the centrifugal pump admits of its being directly connected with an electric motor or steam turbine, which feature alone insures no loss of power between the motor and the pump. The continuous action of the pump eliminates the question of water-hammer.

The turbine, also, possesses features that recommend it particularly to mining use. It requires less steam than a direct-acting reciprocating pump of equal power. It possesses an advantage over the electric motor, in being free from injury by dampness. This is an important feature in mine work. The statement is made that a low-pressure turbine-driven centrifugal pump can frequently be installed in conjunction with suitable condensing apparatus to operate on the exhaust steam of the power plant, which would mean a saving in power.

In the selection of a steam turbine or a centrifugal pump, for mine work, it is extremely important to give due regard to the detailed construction of each machine as being such that the working parts are easily accessible and that all parts subject to wear or corrosion are readily replaceable.

EDITORIALS

What about Ohio?

During the past year, developments in Ohio, in respect to state government, have assumed some proportions. Things have been doing that keep one guessing as to their ultimate outcome. That the pronounced changes growing out of recent enactments by the legislature are in the nature of an experiment, none can doubt, and the result will be watched with interest.

Probably the most important and far reaching in effect, of the many bills before the last legislature, is Senate Bill No. 137, passed Mar. 12, and approved by Gov. James M. Cox, Mar. 18, 1913. This is a bill creating the Industrial Commission of Ohio, superseding the State Liability Board of Awards, abolishing the departments of Commissioner of Labor Statistics, Chief Inspector of Mines, Chief Inspector of Work Shops and Factories, Chief Examiner of Steam Engineers, Board of Boiler Rules, and State Board of Arbitration and Conciliation; and merging certain powers and duties of said departments in and transferring such powers and duties to the said Industrial Commission of Ohio. Besides granting the commission certain other powers, the bill has repealed 38 sections of the General Code and modified seven other sections.

The enactment provides that the Industrial Commission of Ohio shall be composed of three members, to be appointed by the governor within thirty days after the act goes into effect. The first appointment under the act, will be one commissioner for two years, one for four years and one for six years; and, thereafter, one member of the commission will be appointed biennially, for a term of six years. Not more than one of the persons so appointed can, by previous vocation, employment, or affiliation, be classed as a representative of employers; and not more than one, a representative of employees; and not more than two of the members of the commission shall belong to the same political party.

This act of the Ohio legislature goes into effect Sept. 1, 1913. In accordance with its provisions, Gov. Cox has appointed the following named persons to constitute the commission: Wallace D. Yaple, Chillicothe; Thomas J. Duffy, East Liverpool; and Prof. M. B. Hammond, Ohio State University, Columbus.

The act provides for the removal by the governor of any member of the commission for inefficiency, neglect of duty, malfeasance, misfeasance, or nonfeasance, in office. No commissioner shall hold any position of trust or profit, or engage in any occupation or business interfering or inconsistent with his duties as commissioner, or serve on any committee of a political party. The commissioners are to receive each an annual salary of $5000, subscribe to the usual constitutional oath of office, and give a $10,000 bond, approved by the governor.

It is further provided that, within thirty days after the act goes into effect, the commission shall meet at the seat of government and organize by choosing one of its members as chairman; the majority of the commission to constitute a quorum to transact business, and no vacancy to impair the right of the remaining commissioners to exercise all the powers of the commission.

The scope of the commission is shown by the following:

> Sec. 11. On and after the first day of September, 1913, the following departments of the state of Ohio, to wit: Commissioner of Labor Statistics, Chief Inspector of Mines, Chief Inspector of Work Shops and Factories, Chief Examiner of Steam Engineers, Board of Boiler Rules, and the State Board of Arbitration and Conciliation shall have no further legal existence; except that the heads of said departments and said boards shall, in ten days after the said date, submit to the governor their report of their respective departments, for the portion of the year 1913 during which they were in existence; and, on and after the first day of September, 1913, the Industrial Commission of Ohio shall have all the powers and enter upon the performance of all the duties conferred by law upon the said departments.
>
> Sec. 12. The Industrial Commission shall supersede and perform all of the duties of the State Liability Board of Awards. . . . etc.

The State Liability Board of Awards was provided by Act of General Assembly, May 31, 1911, to administer the state insurance fund for the benefit of injured workers and the dependent survivors of those killed in the performance of their duties, in industrial operations.

In connection with the practical working of the new law creating the Industrial Commission of Ohio referred to above, several grave questions present themselves that the future alone will determine. The wisdom of committing so large a portion of public trusts and interests to the charge of three individuals is yet to be proven. While such a concentration of power will undoubtedly be beneficial in a supervisory sense, there would be *positive danger* in the abolishment of the offices of the heads of the several state departments whose responsibilities demand an intimate knowledge and acquaintance with the work of the department. We understand that, for the most part, these departmental heads or chiefs, though deprived of their titles, will be retained in charge of their respective divisions.

In the opinion of Coal Age, good results can only be obtained, in mine inspection, by organization of an efficient corps of inspectors under a Department Chief, who in turn is held accountable to the governor or a supervising commission. We do *not* believe any commission of three members, whatever their intelligence, can assume to personally direct the work of the numerous state departments.

Another question that presents itself is in reference to the legality of this act of the legislature by which it presumes to summarily terminate a state office, though only appointive, during the term of its incumbent.

There is grave doubt of the legality of any enactment of legislature that curtails or limits the will and voice of the people. On this account, we may seriously question the legislative right to abolish, by enactment, any *elective* office, during the incumbency of a regularly elected officer. In respect to an *appointive* office, as in the Ohio cases, however, the illegality of such enactment is not as clear, but is debatable. The office of chief mine inspector is an *appointive* office.

The legislature is an instrument of the people and, as such, is subordinate to the will of the people. The creature is never greater than its creator. Many will question if the *appointments* of an officer elected on a certain platform, are not as much the expression of the will of the people as the officer elected. This is an open question.

⁂

That Mysterious Physician

The remarks of the physician which recently appeared in our columns regarding the American Mine Safety Association, have created some little unfavorable comment. It has been thought by some that it is inexcusable that *anyone,* without making his name public, should criticise, an association having such a laudable purpose, but we cannot feel that he is unentitled to his incognito.

The "physician" attacked specifically the constitution of the advisory or executive committee on first-aid methods on which the duty of accepting or rejecting new dressings, which may be offered in any field contest, is imposed. This committee was to contain two first-aid men, two operators, two physicians and one representative of the Bureau of Mines.

In the end, this body was not formed according to the recommendations of the committee on first-aid methods, it being left to the executive committee proper to make its own selection. But we are obliged to take up the cudgels for this unnamed physician and defend him against the suggestion of Dr. Rountree, who characterizes him as "a person ignorant of the facts or else intentionally misrepresenting them." The unknown author of the article depended on Coal Age for his information and this journal was misled into publishing the statement as it was furnished by the American Mine Safety Association, several days after the meeting closed. In future, we shall be more careful and not rely so confidently on uncertain sources for fear the parent may fail to recognize its own child.

Even Dr. Knoefel, the chairman of the original committee on first-aid methods carefully avoids admitting that his committee introduced resolution 27, which proposed to put laymen on the board appointed to discuss first-aid methods. He fails to state that he rose to object to the submission of this specific resolution to the action of the main executive board, though it must be conceded that his reasons for the objection did not arise from his desire to confer on this subject with the said laymen.

It appears in a later publication that the association did not approve the resolution though the report of the meeting as it reached us overlooked this fact and mentioned only that it was *presented,* naturally leading our "ignorant" friend into a misapprehension. From Dr. Rountree we learn that about two dozen physicians were afterward appointed; 13 more, it is to be noted, than were to be found at the Pittsburgh meeting, in which the medical profession was inadequately represented, the inadequacy being rather in numbers, however, than in quality of representation. The author of that much debated article, "The First-Aid Muddle," probably does not even *now* know that criticisms, such as his, were admitted to be so valid that the committee was entirely rebuilt. How could he learn that fact without being a member of the Committee of Seven, which contains ten members? Though but seven were mentioned in the report of the meeting forwarded to this paper, we see now there is really a decemvirate in control of its destinies. A belated bulletin has cleared up this difficulty among many others.

Whatever was the constitution of the final advisory committee, the fact remains that the first body on first-aid methods did contain several laymen: E. B. Sutton, W. A. Raudenbusch, W. D. Roberts, Atherton Bowen and J. E. McDonald. We do not think that the committee was the weaker for these lay members, but a physician might feel that such men should be excluded and surely he is permitted to say so without giving his name.

The physician judged the committee incompetent because it ordered that the Sylvester methods were to be approved in all cases, unless an injury made their use inadvisable. Trained physicians and physiologists know that the "tidal" air passing in and out of the lungs is greater when the Schaefer method is employed than when the Sylvester treatment is practiced and they believe there are six or seven other arguments against that method of operation, and, as the unnamed physician states in his article, an important body of surgeons and physicians has given the Schaefer method preference.

The critic also judged the reliability of the association by its rating of demerits. We, ourselves, cannot understand how aseptic treatment can be so important as the members at that meeting appeared to deem it, and we know physicians who agree with that view. The hands of the first-aid man in the mines are sterilized with acids and alkalis and at worst they are not likely to be more harmful than the dirt ground into the wound. The air itself is sterilized by mine gases, falling moisture and cooling and tetanus almost never sets in as a result of mine injuries.

Grossly septic treatment is not likely to occur at the hands of trained men. We hardly believe that the first-aid man at a meet will remove a tobacco quid from his jaws and revert to the barbarisms of the past. But if a helper should pass a hand, supposedly sterilized by mine acids, over the face of a bandage, we agree with the "physician" he has not done the patient five times as much harm, as another man who, by wrongful methods of respiration, has permitted a victim to perish under his charge. Because he has pointed out this folly, the unknown "physician" has been the butt of criticism which seems to us by no means fair. Almost any part of first aid can be done so badly as to entitle the team which is guilty of it to 10 demerits or even total disqualification.

The Bureau of Mines and H. M. Wilson are to be commended for the forming of the association. It cannot at once attain to the position in which it will ultimately stand, but we think that if it is not querulous under criticism, it will grow in strength and in numbers. If at its start it may have put the cachet of its approval on the wrong treatment, if it has made the judgment of a few appear as the counsel of the many, if it has unsettled some minds which argued that first aid was a shallow study on which at best 200 pages could be written, no one should be discouraged.

The American Mine Safety Association is experiencing the trials of the beginner. The student who finds he has been wrong, that there are several mathematical solutions of the same problem, that quadratics do not end algebra, soon plucks up spirit to go ahead with a study which is only the more valuable because it requires judgment, plodding and continued effort.

SOCIOLOGICAL DEPARTMENT

The American Mine Safety Association

By August F. Knoefel*

The May 17 issue of Coal Age contained an article entitled the "First Aid Muddle" from a "Physician." When I read these remarks my first thought was to reply but I was deterred from so doing by the fact that the "physician" was not honorable enough to sign his name to his remarks, but after reflecting upon the matter and realizing that Coal Age holds a prominent place in the mining industry and that whatever it presents to its readers is received by them as the fact, I would like to make the following statements.

Need for First-Aid Standards

The American Mine Safety Association had its inception in the crying need for standardization of first-aid methods. The Bureau of Mines, being better acquainted with this need than any other organization or individual, called together last September those who were directly interested. At this meeting plans were laid to bring together officially all those who knew anything about or who practiced first aid and mine rescue. This being the first meeting, all plans and suggestions were tentative until standards could be evolved.

It is rather surprising that a physician would permit himself to be the author of the remarks made in your issue of May 17. Medicine is centuries old, has always been the subject of criticism and always will be. With all the investigations and researches, the treatment of typhoid fever is as variable as the winds. One can go to one hundred doctors and find each treating typhoid differently. If a student would collect the remedies recommended for that disease in the standard textbooks of medicine, he would have an apothecary shop on his hands.

I feel that I am perfectly safe in the assertion that it will not take the American Mine Safety Association nearly as long by several hundred years to standardize first aid. The St. John's Ambulance Corps was not established in a year or its methods evolved at one meeting of two days' duration.

Surgeons Do Not Practice First Aid

As to the need of the advice of leading surgeons, it may be replied that there are but few surgeons with all hospital facilities at hand who could apply a triangular bandage neatly and properly. The practical suggestions will come from those whose daily occupation is at the mine and at the scene of the accident. The purpose of first aid is not to make a surgeon or a hospital attendant out of the coal miner, but to teach him what are suitable, efficient and safe dressings and to instruct him as to what he should not do.

The matter of standardizing first-aid methods and dressings was not referred to the committee mentioned but to one made up of surgeons, these being men who are not only acquainted with the work but also practice it. This is the class of experts who will receive and pass upon all suggestions. To do this intelligently will take time because all proper investigations will have to be made and evidence produced as to the worthiness and efficiency of the methods adopted. Nothing will be rejected which will promote the ends sought, and anything adopted must be simple, yet efficient.

Bacteria of the Mouth

As to remarks upon asepsis, the writer evidently has overlooked that there are numerous forms of infection, and because you have one form of bacteria present there is no reasonable excuse for adding another of a different type. It is a common procedure among miners to use a quid of tobacco upon a wound. Within the last month I attended a miner who adopted the above treatment upon a laceration of the leg with the result that he had an infection from bacteria such as inhabit the mouth and was incapacitated five times longer than if he had not adopted this treatment. It is such instances as these which lead the instructors to impress on their students the need of asepsis.

The value of the Schaefer method of resuscitation will receive from the committee appointed the consideration it deserves. All the association asks is the assistance of all parties interested, and I trust that those who differ from its views will make them known in an honorable manner. Furthermore, if they are vitally interested as I believe the writer of the article on "The First Aid Muddle" is, let them attend the next meeting in September and add their opinions to ours.

*Member of the Executive Committee, American Mine Safety Association; mine physician, Vandalia Coal Co., Linton, Ind.

⁂

Occupational Schools

The annual report from the Lost Creek school of the Lehigh Valley Coal Co. shows that the school held 140 sessions between Sept. 9, 1912, and June 10, 1913, and the number of students increased during this time from 72 to 113. Since the school opened 191 students have been enrolled. This year an average attendance of 29 was maintained. Twelve of those instructed were not in the employ of the Lehigh Valley Coal Co., and seven were not engaged by any of the mining corporations. Since the beginning of the school in 1910 two students have been granted mine foremen's certificates and fifteen have qualified for assistant mine foremen. The number of students who have partly completed courses is 153, and 102 final certificates have been granted.

There were 143 sessions of the Centralia school, and the number of students increased from 143 to 209. Eighteen of the students were in the employ of other coal companies, and twelve were not employed by any coal corporation. The average attendance this year was 35. Since the opening of the school in 1910 twelve students have been granted mine foremen's certificates and sixteen have received papers qualifying them to act as assistant mine foremen. The number of students who have partly completed their various courses is 74, and 32 final certificates have been granted.

The Michael Lavelle Burke Gold Medal for the student of the graduating class at Lost Creek who attains the highest proficiency in his studies was won this year by Patrick J. Kelly. This solid gold medal is given by the E. J. Burke Co. in commemoration of the son of Edward Burke, a former employee of the company. Edward Burke is well known as one of the pioneer miners of the Packer collieries.

The Commissary: Its Indispensability and Purposes

By B. F. Roden*

SYNOPSIS—The commissary serves the lawful interests of both operator and employee and should not be discontinued. It should not, however, be used as the main source of profit while coal is sold at less than actual cost.

⁂

The commissary is a legitimate department of the mining business, a species of byproduct in the process of mining. A mining company has a right to enter into the business of selling necessities and luxuries to the population assembled and maintained as a result of its industrial developments. There is no reason why these profits should be turned over to outside parties; but it is quite essential that the store operated by the employer should be properly conducted. A high standard of quality should be maintained.

Dishonest Merchandise

Canned goods may be purchased which have been packed with water at a lower price than is asked for a standard quality of goods with the proper proportion of solids to the can. A 3-lb. can of tomatoes does not always contain an equal amount of the vegetable. Sirup is supposed to consist of cane sugar and molasses, but a cheaper article may be sold composed of a mixture of the latter with glucose. Pickles and other canned goods may be packed with preservatives which are injurious to health, and vinegar may be manufactured with a barrel, a hose and some acid, but commissaries should not handle such goods.

Dry Goods Department

Grocery Counters and Shelves

The Alabama law specifies that all food stuffs sacked in the state shall be of full weight, but the same merchandise can be purchased across the state line packed in 70- or 80-lb. sacks, and they can be sold as containing 100 lb., if the merchant sells by the sack and makes no statement as to the weight which a sack is supposed to contain. Off-grade, damaged or remanufactured goods such as redyed ribbons can be sold as first-grade merchandise. Second-grade cloth can be palmed off as first. Poor thread, and shoes with parts of cardboard instead of leather, treated meats, and "all-wool" clothes which are three-quarters shoddy can be made to pass muster as good materials and the public can be fooled into the belief that it is securing first quality or goods at cut prices. While this dishonesty is common in the open market the commissaries are usually above such tricks.

All the Public Will Stand

Commissary customers should receive full weight and good value, and every sale should be made at a reasonable profit above the cost of handling. Reasonable profit is a flexible term and depends on the disposition of the man using it. But the limit is certainly not to be placed as high as "all that the customer will stand." Miners, like operators, do not feel well disposed when they find they have paid a price for merchandise higher than they would have been charged for the same article elsewhere.

The Roden Store Has No Show Windows

A department store rarely handles groceries, as little profit can be made on these staples. The commissary trade is largely in such articles and so some profit must be made on them if any is to be obtained.

Courtesy from clerks should be enforced in the commissary as much as in a store which is dependent on the trade of the general public. Because the clerk has a cleaner job, his work is not in any way more honorable. He is employed to sell and not to comment on the customers. Some miners have been farmers and small dealers or have been in other lines of work, but they have engaged in mining because it is more profitable. They have accumulated savings, have education and breeding, and the commissary clerk has no reason to believe he has any measure of superiority.

But, as an excuse for the brusqueness of the store clerk, it must be remembered that business is confined mostly to the early morning and the late forenoon. The trading is done in three or four hours, and in the rush that results, impatience which engenders ill-feeling often arises.

---

*President and general manager, Roden Coal Co., Marvel, Ala.

Note—Abstract of article read before the Alabama Coal Operators' Association at the session held July 26, at Marvel, Ala.

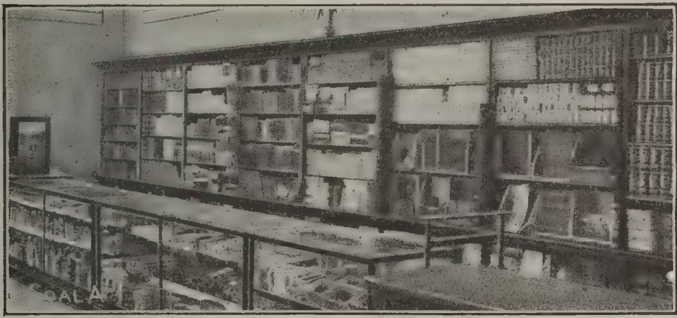
The Interchangeable Store Check

The practice of paying off daily in store checks which are redeemable on pay day, is bad. It saves some clerical work, but the men tend to spend more than they can afford when the checks are so handy. Moreover many are lost and never redeemed. When this scrip is exchangeable, it promotes drunkenness and gambling.

The operator owes it to the public to abolish the interchangeable store check, which may be sold to the speculator for 60 or 80c. on the dollar. With it the storekeeper can purchase goods in the store, selling them at prices below those at the commissary. The effect such sales have on the minds of the men is easily realized; they cannot understand how an outsider can sell for cash at a price considerably below the commissary store and yet make money. The interchangeable check is also a boon to the bootlegger.

At some mines, the right to buy checks is restricted to the superintendent, store and office force, and they purchase them at a discount to pay their store bills. This justly creates dissatisfaction among those who are not permitted to engage in the lucrative business.

I realize that the boarding houses must have some way of securing their board money, but the use of interchangeable store checks is not the method I prefer. At Marvel, we allow each boarding-house keeper to turn into the office his charges against the boarders. This amount is charged to the men and credited to the boarding-house keeper who can then draw checks bearing their name. In this way he does not accept the boarders' checks in payment and use them in trading at the store.



Drugs, Candy and Tobacco Department

Millinery Section with Appropriate Fittings

Many managers and store clerks claim that they cannot remember their customers' names. This is because they do not wish to take that trouble, and I would recommend that in such cases, the commissary force be changed.

Advantages of the Commissary to the Employee

When a man is improvident or a heavy drinker, though he may be a good worker when sober, the commissary prevents hunger and want. His wife can always draw a check if the man has any credit for time at the office. If there is one pay day or even two a month, his earnings if paid to him in bulk would be spent in a day or two and there would be nothing for the remainder of the month or fortnight. Many wives and mothers declare that the commissary is a blessing to them. The ability to secure food and clothing if the husband works only a few days in the week lessens the loan-shark evil. Much time is saved to the busy housewife by having all the places in which she must shop under one roof.

As a rule, the goods sold in a commissary are of better quality than those to be found in the small competing store. This is made possible by the mining companies buying larger quantities of merchandise each month, thus securing a fresh supply. The small store does not keep perishable merchandise because the profit is small or the business is entirely unremunerative. Thus bread, meats, vegetables, fruits, ice, pure candy, fish and fresh eggs are only purchasable at the commissary.

Of course, some of the companies are near farming districts or towns, and the men can buy elsewhere and do not have to rely on the commissary for such articles. Some of the mining villages are so placed that unless the commissary supplies these articles, the men must do without them. It would be a surprise to some of our city friends to know that the company-store customers often have peaches, watermelons, canteloupes and other fruits and vegetables before they do.

A 30- or 40-Per-Cent. Saving

Commissaries pay no rent, do no advertising, should have no losses on bad credits and have small delivery charges, all of which cost usually from 8 to 10 per cent. of the gross profit. They are thus enabled to sell goods of the same quality at lower prices than competing stores having the same freight rates. These advantages have made the company store so successful that unsuccessful competitors have been great agitators against the commissaries.

The employer gets many benefits from his store. It enables him to become acquainted with the men and by giving them a square deal he breaks down the old idea that the mine owner has no interest in his employees other than the profit he can make out of their labor. The store prices can be made one of the attractions of the town.

How the Commissary Helps the Operator

The garnishment of the goods of the employees would swamp the companies if they did not have their own commissaries to provide the necessaries of life. A garnisheed man is always on the move. He appears to get the habit, and many railroads discharge the chronic garnishee because he cannot be relied on.

Coal should be sold at a profit, and the commissary should not be regarded as the main profit maker. The Federal census report for 1909 shows that the Alabama mines made only 1.5 per cent. on the capital invested. This is a ridiculous return for a business which is so short-lived and hazardous. The same report showed a net profit on other lines of business of from 8 to 15 per cent. It must be remembered that this report did not include any allowance for depreciation on mines or equipment. On the other hand, store profits and house rents were not included in the mine balance. This clearly shows where the profit was made, if any, and I do not regard such methods of obtaining a surplus necessary or desirable.

Salesmanship Is Necessary in Commissaries

The goods in a store should be prominently displayed. Counter show-cases are silent salesmen and big earners. Several trips a day are often saved by having goods in full view, and in rush hours customers may see and select their goods while the clerk is waiting on others. This tends to save the clerk's time.

Do not let your goods get shopworn. Sun, flies, dust and excessive handling consume much profit, as no one wants shopworn goods. Fresh goods are the best sellers, with the result that you are less liable to have odd sizes and old patterns in your stock. Have a clearance sale at least every season, as it does not pay to carry over the majority of season goods. This is particularly important in the shoe department, as styles change and our men are quick to learn which are the latest.

Do not allow the traveling salesman to do your buying. Remember his is the selling end, and his knowledge of the wants of one mining town may not fit another. There are some who are not averse to selling all the store manager will buy.

Padded Inventories

Commissary managers are only human; if the management requires a certain per cent. of profit on each year's business, it is only natural for him to prefer to inventory old stock at full value, than to sell below cost, thus making a poorer showing. Often a new manager finds himself saddled with a quantity of outofdate or spoiled merchandise. If he cleans up this, his first year's earnings may possibly show no profit; yet the owner is the gainer by such bargain sales as this old stock decreases in value rapidly after the first year.

I have known some articles to be kept in stock and on the inventory as many as ten years, at the original cost; when, as a matter of fact, much could hardly be given away. The only remedies which occur to me for these conditions are to have the date of purchase put opposite doubtful articles on inventory, or, better still, to have personal inspection by a competent higher official.

How to Increase Business

Do not look so much at the per cent. of earnings as compared to sales, but lay more stress on the total net profit. Very often a reduction in price will increase the volume of trade, so that there is a greater profit on the year's business. This is the method followed by the department stores. Too many of the goods we sell are staples, and only small profits can be made on them. Consequently a good business man would consider the introduction of other lines of merchandise on which there are larger profits.

Do not ask your superintendents, mine foremen or office force to solicit business. Have it distinctly understood that there is no compulsion to trade in your store. A man's place in the mine must not be dependent, either directly or indirectly, on his trade. It is the better way to encourage salesmanship by keeping separate records of each clerk's sales, and by paying him accordingly. By this method the good men do not have to average with the lazy clerk, and you can weed out the latter. Cash registers both save honest clerks from suspicion and protect the owners from their dishonest salesmen.

Educate your customers, by your prices, to buy in bulk, not for each meal. Do not substitute, and do not let the houses from which you buy foist substitutions upon you. One of the hardest things we had to do was to break our wholesale men from shipping the wrong brand and more merchandise than was ordered.

Let your competitors handle articles for which you have few calls, such as odd-sized shoes. Much money can be tied up in this class of merchandise. Let us all keep open to new ideas and search for new devices which will lessen labor and legitimately increase profits.

⁂

The New Ohio Law

A new law goes into operation in Ohio, Sept. 1, to which we have made reference editorially, in another column. The law makes some sweeping changes in the operation and control of seven state departments.

That the provisions of this enactment are drastic, in many respects, is shown by the following brief synopsis of the powers and authority it confers on the commission, as taken from Sec. 22 of the act; namely:

(1) To appoint advisors, who shall without compensation assist the commission in the execution of its duties. To retain and assign to their duties any or all officers, subordinates and clerks employed in the several departments absorbed by the commission.

(2) On and after the first day of September, 1913, to administer and enforce the general laws of the state relating to mines, manufacturing, mechanical, electrical, art and laundry establishments, child labor, employment of minors, etc., going through the entire list of industrial employment.

(3) To investigate, ascertain and, on and after the first day of September, 1913, to declare and prescribe what hours of labor, safety devices, safeguards and means or methods of protection are best adapted to render the employees of every employment safe and to protect their welfare, etc.; and (4) to fix reasonable standards and prescribe, modify and enforce reasonable orders for their adoption; and (5) to fix and order such reasonable standards for the construction, repair and maintenance of places of employment as shall render them safe; and (6) to investigate, ascertain and determine such reasonable classifications of persons, employments and places of employment as shall be necessary to carry out the purposes of this act.

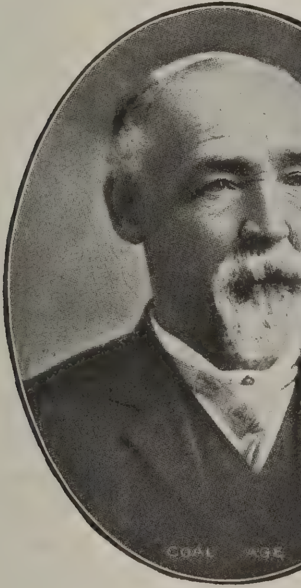
(8) To do all in its power to promote the voluntary arbitration, mediation and conciliation of disputes between employers and employees, etc. (9) To establish and conduct free employment agencies; and to do all in its power to bring together employers seeking employees and working people seeking employment, etc. (10) To collect, collate and publish all statistical information relating to employees, employers, employments and places of employment, etc. (11) To examine and license persons who desire to act as steam engineers, * * * to operate steam boilers, * * * to act as inspectors of steam boilers * * * and to renew or revoke such licenses.

In addition to other specifications, the act provides, for the neglect or refusal of any person to obey any lawful order of the commission or to conform to the requirements of the act, a fine, for such violation, failure or refusal, of not less than $50 or more than $1000, for the first offense; and not less than $100 or more than $5000, for a subsequent offense.

In this connection, we note that a petition has just been filed with the secretary of state, at Columbus, asking for the submission to popular vote, of an amendment providing for a smaller general assembly. The petition proposes to reduce the House membership from 123 to 50, and that of the Senate from 33 to 22, basing the representation entirely upon population. This is the first attempt to amend the Ohio constitution by the initiative and referendum.

Loss to the Coal Industry

Richard Newsam, familiarly known to the mining fraternity throughout the United States as "Uncle Dick," died at his home, Peoria, Ill., early Tuesday morning, Aug. 5. Although Mr. Newsam had been failing in health for somewhat more than a year, it was not but a week previous to his death that his illness became serious. Blessed with a rugged constitution, he had for some time successfully fought the disease that caused his death.



Richard Newsam

Richard Newsam was born Nov. 11, 1843, in Chorley, Lancashire, England. He went to work in the mines when a mere lad. Possessed of a natural genius but limited education, he was essentially a self-made man. He was married in Hindley, Lancashire, England, May 20, 1866, to Miss Frances Wolstenholme. He rose rapidly to the position of superintendent of the mine where he was employed. His ambition early led him to this country, and he arrived in Peoria County, Ill., Sept. 28, 1869. He at once engaged in coal mining, at Kingston Mines, assuming charge of the Lowry mine, as superintendent. Five years later, 1874, Mr. Newsam, with his brother Frank, leased the mine and, later, acquired interests in 16 other mining properties in the same county, thereby becoming the largest coal operator in that section.

Mr. Newsam was indefatigable, and applied himself so diligently that, in spite of his limited education, he became recognized as a leading authority in all coal-mining matters, in his state. He was appointed a member of the State Mining Board, by Gov. Tanner, in 1897, and held that position, being elected as president of the board, until the fall of 1912, when, owing to declining health, he was compelled to resign both this position and that of manager of the state Mine-Rescue Station, which position he had held for nearly a year.

Mr. Newsam spent much energy, time and money in the effort to better the condition of mine workers, and his efforts in that direction had often received recognition in the press. He was appointed by Gov. Deneen to take charge of the rescue work at the time of the Cherry Mine disaster, in the fall of 1909. Immediately following that disaster, he presented recommendations that met with the hearty approval of the governor, and resulted in the early establishment of three mine-rescue stations in the state, at La Salle, Springfield and Benton, respectively.

Mr. Newsam was a thirty-second degree Mason, having joined that fraternity as a member of the Phœnix Lodge, at Mapleton, and later transferring to the Temple Lodge, at Peoria. He was a member of the Peoria Consistory, also the Nobles of the Mystic Shrine. Though the best years of his life were spent in this country, Mr. Newsam never lost the love of his native land, and once each year made a trip to his old home in England. He had crossed the ocean 47 times, returning from his last trip only six weeks previous to his death. He had 13 children, of whom six are still living. He is also survived by two brothers, John and Thomas, who were associated with him in the coal business, and a married sister, Mrs. Martha Harris, Hanna City. Mr. Newsam was buried Friday, at Kingston Mines, which had been his home up to April, 1900.

Telephones for Oklahoma Mines

The Oklahoma Coal Operators' Association, through its representative, Carl Scholz, president of the Coal Valley Mining Company, has awarded a contract for 800 Western Electric mine telephones, with complete wiring and installing material. This is the largest order ever placed at any one time for such equipment.

The various mines, whose operators are members of the association, will be furnished with sufficient telephone equipment to properly safeguard the lives of the miners at work underground. Telephones will be installed in the shotfirers' refuge holes, in entries and shafts, so that constant communication with the offices at the surface will be possible and accidents can be reported promptly, proper aid being sent to the danger point at once. The shotfirers will report their progress according to a prearranged schedule and failure to report from any one refuge hole on schedule time will serve as an indication of a possible accident.

The installation of the large quantity of mine telephones is made primarily as a result of a law enacted a short time ago by the legislature of Oklahoma making it compulsory for operators to equip their mines with telephones. It will, however, undoubtedly be instrumental in increasing the efficiency of supervision as well as safeguarding the lives of the workers.

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 9—Mining men everywhere urge safety lamps; inspectors have advocated their use; former mining laws have read, where gas has been discovered, safety lamps shall be used exclusively; records of explosions have been quoted to prove that the use of mixed lights was the primary cause of the explosion; professional and scientific men have declared, with one voice, that the exclusive use of safety lamps affords a great deal more safety than where mixed lights are employed.

During the past three years, while "Safety First" has been the slogan throughout the United States, the bituminous mine law of Pennsylvania has been changed and the standard lowered, from the highest degree of safety secured under the old law, to the questionable safety that the present law affords, by authorizing the manager or foreman, with the inspector's approval, to employ either open lights or safety lamps. It is quite certain that such discretionary power will be used more or less, according to the cry for coal. This is undoubtedly a step backward instead of forward.

In respect to lamps for general work, it seems to me that the safety lamp offers 100 per cent. of efficiency in respect to safety, where the use of the open light materially reduces that percentage. This statement should, of course, be modified according to the amount of gas generated in mines.

It is a fact worthy of note that legislation in some states is increasing the safety of the mines, while in other states the direct reverse is true. This is a serious mistake, and cannot fail to reflect discredit on much mine legislation of the present day. In my opinion, it is an error to replace a law by which the highest percentage of efficiency is obtained in respect to safety, by a law which makes the safety of a mine depend on the judgment of one or two men, or the truthfulness and trustworthiness with which mine workers will obey the mine regulations. To permit the use of open lights, in a portion of a mine requiring the use of safeties in certain other portions or districts, is like courting danger, to see how far one can approach the danger line and still be safe.

For the sake of illustration, suppose a mine is working exclusively with safety lamps; and, after a considerable period, no gas having been discovered, the foreman, with the authority of the mine inspector, discards the safeties and installs open lights throughout the whole mine. After a time, a gas feeder or a clay vein is cut, and gas is generated in quantities not expected or previously known in that section. As a result, an explosion occurs, which the press states was caused by striking "an unexpected pocket of gas"; and this is the reason given for the sacrifice of some 50 to 100 lives. To the public, the accident, which was unforeseen, was unavoidable; whereas, the disaster would never have occurred if the mine had continued to work on safety lamps exclusively. The mine was in a section not devoid of gas, and the risk assumed was too great.

An experience of 27 years in bituminous coal mines, in many positions of greater or less importance, has convinced me that the use of mixed lights is a pernicious practice. It is true the miner is willing to work, and generally prefers to work, with an open light; but the average miner has not the intelligence of the average foreman, and, as a result, the miner assumes many unwarranted risks. In a district where gas is known to exist, there is no certainty of a mine being exempt from its appearance in the workings at any time, although a long period may elapse in which no gas is discovered. The mine may develop gas in dangerous quantities, with little warning.

The use of open lights in one section and safety lamps in another section of the same mine is similar to permitting the use of pipes and open lights in the offices of a powder factory, within the same inclosure as the mill itself. There are no explosive ingredients in quantity in the office, but safety lies in the exclusion from the office and the mill of these elements of danger. The open-light section of a mine bears the same relation to the safety-lamp section that the office bears to the mill, it being often necessary for employees to pass from the one into the other.

In my opinion, safety lamps should be used in most mines whether these are classed as gaseous or nongaseous. By adopting this practice, we follow the slogan "Safety First." The old proverb, "An ounce of prevention is worth a pound of cure," may well be applied in respect to the safety of mine operations.

I have had charge of several safety-lamp mines, and cannot agree with the statement that the constant and exclusive use of safety lamps curtails the output of the mine. On the Monongahela River, in the Pittsburgh seam, the miners produce as much coal per man in the safety-lamp mines as they do in the open-light mines. Likewise, in the Connellsville region, where the coal is coked and mined in a different manner, the miners produce as many bushels of coal per man, in the safety-lamp mines as they do in the open-light mines, and the same is true in the soft-coal regions of central Pennsylvania.

As far as I have observed, the constant use of safety lamps does not impair the eyesight of miners; and in the safety-lamp mines the air is clearer, there being less smoke from inferior oil. Judging from my own experience, I fail to see where there is any excuse for the use of mixed lights in mining if we have proper regard for safety.

R. Z. VIRGIN, Supt.
West Virginia-Pittsburg Coal Co.

Colliers, W. Va.

Letter No. 10—After all that has been written and said with reference to safety in mining operations, the conservation of mining property, and the protection of human life, it is surprising that a number of men, whose position and influence give to their opinions greater weight than is attached to the opinions of men of lesser rank, continue to justify the practice of using mixed lights in gaseous mines, claiming that this, in their opinion, is consistent with safety. Although this practice is sanctioned by law in this state, it is not, in my opinion, an evidence of good judgment; nor do I see how the management of a mine operated in this manner can claim that the safety of their employees is their first consideration.

Referring to the last letter on this subject, written by Joseph Northover, Coal Age, Aug. 9, p. 209, it is my opinion that, while the mine he describes might be operated under the conditions stated, to do so would be flirting with a danger that might entail much suffering, loss of life and property. After a practical experience of 29 years, in the three principal coal-producing states, I have failed to find conditions where I would deem the use of mixed lights, in a gaseous mine, to be consistent with safety. In a field where no gas has been known to exist, mines can be worked with open lights with safety; but, from Mr. Northover's description, I understand he is in a gaseous field where, in my opinion, gas may be expected at any point of the development. While no gas has been discovered on the east side of the mine he describes, there is no assurance that this condition will continue for any length of time.

Besides this, there is another question to be considered before we can be assured of absolute safety in operating a mine with mixed lights. Each mine foreman knows that there is always a possibility of his orders and instructions being disobeyed; or, at least, they may not be carried out, through neglect or carelessness. As long as this possibility exists, my advice is to keep open lights out of a mine operating in a gaseous field. Use open lights only in districts where gas is unknown.

The enforced use of safety lamps throughout a mine where gas is generated in certain portions of the mine, is mentioned as a burden to both the miner and the operator alike. I want to say that if enforcing safety and removing one of the many dangers attending mining operations is a burden, it is right to impose that burden. It would be a far greater burden if disaster and loss should result from any failure to make the mine safe. After using the safety lamp for 20 years, I have failed to find a cleaner and healthier light.

The U. S. Steel Corporation have adopted for their slogan, "Safety the First Consideration," and other companies are carrying out the same principle. Loyalty to this motto will not permit the adoption of a practice that is doubtful, in respect to safety. Such a practice will ultimately become obsolete.

The Liquor Problem in Mining

Referring to the remarks of "Subscriber," on this subject, Coal Age, July 26, p. 134, it is unfortunate that he would confine the discussion of the subject to "men in charge of mines." It frequently happens that men who have had the largest experience with this evil are those holding inferior positions to that of the mine foreman or superintendent. The shotlighter or the fireboss, who travels a certain section of the mine three or four times a day, is more liable to be better acquainted with the weaknesses of men, in his particular section of the mine, than is the foreman himself, who may possibly visit each working place once or twice a week. The foreman is very much further removed from the men socially than is the fireboss and has not the opportunity to know the habits of the men and to what extent they exercise self-control.

This correspondent also states that "the drink habit has increased with the advance in wages, if not in proportion to the same." This assertion does not conform to the facts and figures given, from time to time, by government reports, commission reports and the daily-press reports, all of which agree that we, as a people and nation, are gradually becoming more sober. There is no reason to suppose that miners are any exception to this rule. The improvement in the West and particularly in the mining camps, is evident to any careful observer. There are perhaps a few camps that form an exception to this rule, but they do not materially affect the general results.

If, then, "Subscriber" is wrong in his premise that the drink habit is on the increase among miners, he is naturally wrong in his conclusion that this is the result of increased wages or earnings. As a matter of fact, wages have not increased, but have materially decreased in the last decade. I mean by wages, in this sense, the net earnings of the miner, as represented by the food, clothing, shelter, etc., he is able to provide for himself and his family. While it may be true that higher wages are now paid for certain classes of work than formerly, the increased cost of living overbalances the advance in wages received. The average miner, today, expends more labor for the same pay than a decade ago.

In my opinion the liquor problem, in mining, cannot be solved either by the black-list or the certificate plan. A more sane treatment of miners is to deal with them as men in need of education. They must be shown that liquor is incompatible with their best interests. The movement now being made by many of the large coal companies, to provide better housings, more sanitary mining camps, and clean, healthy recreations, is doing much to overcome the evils of the drink habit among their men. I am convinced that these efforts will eventually bring good results in the line of sobriety and clean living, and will pay interest on the capital invested.

W. H. Moore.

Nanaimo, B. C., Canada.

A Hoisting Problem

Since the publication of our answer to the inquiry of John Nelson, Coal Age, July 19, p. 99, asking how to arrange the ropes in a double-compartment hoist to overcome difficulty of one rope being five and one-half in. short and the other 3 in. long, we have received three letters from correspondents, which, for lack of space, we summarize as follows:

It is a common occurrence, in mine hoisting where wooden drums are used, for the ropes to wear unevenly on the two sides of the drum; and this may be Mr. Nelson's difficulty. Assuming such is the case, when No. 1 cage is on the bottom No. 2 is hanging 5½ in. over the "stops" or "wings," at the upper landing; and, again, when No. 2 cage is on the bottom No. 1 is hanging 3 in. below the stops, at the upper landing. In this case it will do no good to lengthen or shorten either rope. For example, to lengthen No. 2 rope 5½ in., so that that cage will hang at the upper landing when No. 1 is on the bottom, would remedy the trouble only for that position of the cages. Then, when No. 2 cage is on the bottom No. 1 cage will be 8½ in. below the top.

The only way that this difficulty can be remedied is by rebuilding the winding drum, by putting on new lagging, so as to make the diameter of the drums equal on each side. Or, the difficulty may be overcome by covering the grooves with one or two thicknesses of canvas, on the side of the drum where the rope is long; or by cutting the grooves a little deeper into the lagging on the other side of the drum, using for this purpose a half-round chisel.

[The letters, of which the above is a summary, were received from Roy Hoswell, hoisting engineer, Toluca, Ill.; Harry L. Packington, hoisting engineer, Granville, Ill.; and A. Q. Davis, Uniontown, Penn. We are glad to have attention drawn to conditions such as described, which occur in daily mining practice. The answer given in reply to the inquiry of Mr. Nelson assumed a perfect condition of the winding drum, or an equal diameter throughout the length of the drum, in which case it would be necessary to lengthen the short rope 2½ in. in order to overcome the difficulty.

In case the winding drum is worn, as mentioned by correspondents, the actual lift may be different for the two cages, for the same number of turns of the drum. For example, while No. 1 cage, referred to above, ascends the length of the shaft except 3 in., No. 2 cage falls the length of the cage plus 5½ in., making the ratio of winding for the two cages 100 ft. — 3 in.) : (100 + 5½ in.). In this case, as stated, no lengthening or shortening of the ropes will equalize the winding.—Ed.]

Waste of Coal

A short time since, I noticed an article on "Waste of Mine Timber," Coal Age, July 5, p. 26. I have recently observed a similar waste of coal, in the conveyors carrying slate to the dump, and in the condemned coal returned to the breaker, to be cleaned. I believe this waste of coal occurs in most of the breakers in the anthracite region and, with proper attention, could be largely avoided.

In many cases, I have noticed a considerable percentage of pure coal free from slate and, again, coal that has not been separated from the slate. This coal is absolutely lost, being thrown out on the dump. Following the condemned coal that is returned to the breaker I have noticed that the men often throw out as much coal as slate. From my observations, there is no small percentage of coal lost, in this manner, which could be prevented by a closer supervision of the work.

In many cases, much coal, time and labor could be saved by recrushing this coal and passing it again through the breaker. This is done in some breakers, but not to the extent that it should in all breakers. There is less waste in the treatment of the smaller grades of coal than in larger sizes.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

PHYSICAL PROPERTIES OF GASES

Density of Gases—The term "density" refers to the amount of matter in a given volume or space. The commonly adopted measure of density is the ratio of the weight of a body to its volume or the space it occupies, as expressed by the following formula

$$Density = \frac{weight}{volume}$$

In a general sense, the term density has thus come to mean the weight per unit volume. For example, the density of water is commonly understood to mean its weight per cubic foot (62.4283 lb., max. dens., 4° C.). In this sense, the density of a gas is its weight per cubic foot; but this is not its common significance, in mining practice, in relation to gases.

The term has, besides, a relative meaning and is sometimes called "relative density." In this sense, it means much the same as specific gravity or relative weight. Thus, the density of a gas is the ratio of the weight of a given volume of the gas to the weight of the same volume of another gas taken as a standard, both gases being measured at the same temperature and pressure.

Hydrogen the Standard for Density—Since hydrogen is the lightest gas known, it is a convenient base or standard of comparison and its density is taken as unity or 1.

Relation of Density to Molecular Weight—The molecular weight of hydrogen is 2 and its density is therefore one-half its molecular weight. But since the density of all gases is proportional to the weight of the gas, volume for volume, it follows that:

The density of any gas referred to hydrogen as unity is one-half of its molecular weight.

For example, to find the density of water vapor (H_2O), first calculate the molecular weight of the vapor; thus,

$$\begin{aligned} \text{Water vapor } (H_2O);\ H_2 &= 2 \times 1 = 2 \\ O &= 1 \times 16 = 16 \\ \text{Molecular wt.} &= 18 \end{aligned}$$

The density of water vapor is then 18 ÷ 2 = 9; that is to say, water vapor is nine times as heavy as hydrogen, volume for volume.

Difference Between Density and Specific Gravity—In a general sense, these two terms are used synonomously. The term density, in a more restricted sense, relates to the quantity of matter in a given volume or, in other words, to the mass per unit volume; while specific gravity relates to the relative weights of different substances, per unit volume, referred to a certain fixed standard as unity. Since density is referred to hydrogen and specific gravity to air, as unity, air being 14.4 times as heavy as hydrogen, at the same temperature and pressure,

$$Density = 14.4 \times sp.gr.$$
$$Sp.gr. = density \div 14.4$$

The Coal Age Pocket Book

Specific Gravity of Mixtures of Gases—When different volumes of gases of different densities are uniformly mixed the density of the mixture is determined by dividing the combined weight of the mixed gases by the total volume of the mixture, which will give the unit weight or the weight per unit of volume of the mixture.

The actual weights of the gases may not be known, but only the volume of each gas and its density or specific gravity. In that case, multiply the density of each gas by its volume, add the products together and divide the sum by the total volume of the mixture; the quotient obtained will be the required density of the mixture.

Or, in like manner, multiply the specific gravity of each gas by its volume, and divide the sum of these products by the total volume of the mixture, and the quotient obtained will be the specific gravity of the mixture.

Calculation—For illustration, let it be required to calculate the specific gravity of flashdamp, which has a theoretical composition of 1658 volumes of methane (CH_4) to each 1000 volumes of carbon dioxide (CO_2). The process is as follows:

	Volume	Sp. gr.	Relative wt. (air = 1)
Methane,	1658 ×	0.559 =	926.8
Carbon dioxide,	1000 ×	1.529 =	1529.0
	2658		2455.8

The specific gravity of the flashdamp is then calculated, in accordance with the above rule, as follows:

$$Sp.gr. = \frac{relative\ wt.\ (air = 1)}{relative\ total\ vol.} = \frac{2455.8}{2658} = 0.924\ nearly$$

Calculation Based on the Law of Diffusion of Gases—If two gases diffuse into each other, directly, without being diluted with air, the volumes of the gases are inversely proportional to the square roots of their densities or specific gravities. This law makes it possible to calculate the density or specific gravity of such an undiluted mixture of two gases directly from their densities or specific gravities, without reference to their relative volumes. This is accomplished by means of the formula

$$D = \frac{a\sqrt{b} + b\sqrt{a}}{\sqrt{a} + \sqrt{b}}$$

in which D = density or specific gravity of the mixture; a and b = the corresponding densities or specific gravities of the two gases, respectively.

Calculation—For illustration, let it be required to calculate the specific gravity of flashdamp (undiluted mixture of methane and carbon dioxide) directly from the specific gravities of these gases: methane = 0.559 and carbon dioxide = 1.529. The process is as follows:

$$Sp.gr. = \frac{0.559\sqrt{1.529} + 1.529\sqrt{0.559}}{\sqrt{0.559} + \sqrt{1.529}} = 0.924$$

EXAMINATION QUESTIONS

West Virginia Examination

(*Continued from last issue*)

Ques.—If this were a gaseous mine, how would you prevent accumulation of gas in the gobs when pillars are drawn?

Ans.—As the pillars are drawn, all timbers should be pulled, and care should be taken to cause a fall of roof, so as to practically close each place, as the work proceeds. Any void places remaining open must be thoroughly ventilated by a sufficient scale of air; otherwise, the place must be closed by an airtight stopping.

Ques.—The scale of this map is 1 in. = 200 ft. (a) How many tons of coal can be produced from the mine, assuming the coal to be 6 ft. thick and all grades favorable to the loaded cars? (b) What quantity of air will be required to properly ventilate this mine? (c) How many men will be required to produce this tonnage? Explain fully. (d) Where would you build your permanent stoppings and overcasts?

Ans.—(a) The development shown on the map should yield, say 1000 tons per day. (b) There should be a circulation of 125,000 cu.ft. of air in this mine.

(*c*) To insure an output of 1000 tons per day will require about 200 miners, working single with a helper; or, say from 250 to 300 miners working double.

(d) The permanent overcasts and stoppings are indicated on the map by their proper symbols.

Ques.—Describe a good system of ventilation for a seam of coal 5 ft. in thickness, with a large acreage and soft, friable roof; the mine liberating some explosive gas and the production of coal being 3000 tons per day.

Ans.—The four-entry system should be used for the main slopes or entries, while the cross-entries are driven on the double-entry system. The mine should be ventilated on the exhaust system, the two central entries of the main roads being used as intake airways and haulage roads, while the two entries flanking these are made the return airways for their respective sides of the mine.

Rooms are opened to the rise side only of each pair of cross-entries; and the mine is divided, preferably, into separate panels, working, say from 50 to 60 men in each panel. This is accomplished by driving cross-headings between the consecutive pairs of cross-entries, as the work progresses. Each panel is supplied with its own separate ventilating current, by building an overcast at the mouth of each pair of cross-entries, early in its development. The return air from each panel is conducted at once into the main-return airway, while the coal is hauled through the crosscut near the mouth of each pair of cross-entries and taken out on the intake air to the main-haulage road.

The main-haulage roads should be driven 10 ft. wide, one being used for the loaded cars and the other for the empties. To provide an output of 3000 tons a day will require from 10 to 12 panels, each producing from 250 to 300 tons. Each panel should be ventilated by a current of 12,000 to 15,000 cu.ft. per min., which should be made to sweep all void places in the roof or other parts of the mine.

Ques.—Describe the difference there is in respect to the safety of a dusty mine, in the natural condition of the air entering and traveling through the mine, during the summer and winter months.

Ans.—In the summer season, the outside air has practically the same or a slightly higher temperature than that of the mine, while in the winter season the outside air has always a lower temperature than that of the mine. As a consequence the intake-air current, in the winter time, experiences a rise of temperature shortly after entering the mine. Under these conditions, the intake current is not fully saturated when it reaches the inside workings, but has a capacity to absorb moisture from the dust and coal that accumulate at the working face and on the haulage road.

This drying action of the air current prevails to a greater or less extent in the mines, during the winter season, regardless of whether the outside air is or is not fully saturated with moisture. The outside air may be fully saturated, on a damp cold day, and yet the intake-air current be quite dry, a short time after entering the mine.

Ques.—What, in your opinion, determines the best system of timbering the various roofs in coal mines, for headings and rooms?

Ans.—The nature of the roof, floor and coal, depth, inclination and thickness of the seam, and the method of working adopted must always determine the best system of timbering to be employed, under the particular conditions existing in the mine. In general, it is safe to say that the adoption of a regular system of timbering, designed to meet the particular conditions in a given case, will result in greater efficiency in respect to safety and economy of working, than any irregular or haphazard method. Even under the best conditions of roof and floor, there is danger in leaving the question of timbering the working face, to the judgment of the miner.

Ques.—What precautions should a miner use when undercutting coal?

Ans.—Before starting the work of undercutting the coal, the miner should carefully examine the roof above him. He should consider that there may be a break in the roof over the coal that is not visible, in which case, when the coal is mined (undercut) the full weight of the roof over the opening will be thrown on the unsupported coal face. This is what often happens, and the result is a fall of coal that catches the miner at work. It may take a little time, but a careful miner working under a roof with which he is not fully acquainted, will always set a prop or two in such a manner as to protect himself from any unexpected fall of slate. It is also important to sprag the coal as rapidly as it is mined. The sprags should be set firmly so as to prevent any settlement of the coal during the undercutting.

COAL AND COKE NEWS

Washington, D. C.

Little progress has been made during the past week in further developing the attitude of the administration now in charge of the Government with respect to the coal situation and the method of dealing with it. The action of the Interstate Commerce Commission with regard to the anthracite coal cases still remains in abeyance, although it is supposed that the delay is now nearly at an end and that final decisions in these cases will shortly be handed down.

The inactivity of legislative leaders with respect to attempting any investigation of coal conditions as they have been requested from many sources to do, is believed to mean that they are awaiting the action of the administration with respect to the anthracite cases in order that they may guide themselves somewhat by the outcome of the commission's findings in that regard. If it should appear that the rates on anthracite coal are too high at present and call for reduction, and if such reduction should be directly ordered and should go into effect, it is believed that little more could be done by the Government under existing conditions, looking toward the actual control of the situation in the anthracite fields.

It is probable that after the decisions have been handed down by the Interstate Commerce Commission in these cases, the whole subject will be taken up afresh and will be worked over to see whether there is anything further that can be reasonably attempted beyond the removal of the tariff provided for in the pending measure and the cut in freight rates supposed to be likely to be ordered in the forthcoming decisions.

Coal and the Cost of Pig Iron

One of the most interesting discussions of the past week in connection with the metal schedule now pending in the Senate has dealt with pig iron and the competitive possibilities of the United States in producing pig iron, especially as affected by the cost of coal in connection with the smelting process. Senator Oliver, of Pennsylvania, in this connection has furnished some information that has not heretofore been developed, and that has a bearing upon the coal and pig-iron situation as affected by the proposed rates of duty.

Mr. Oliver's contention is that the so-called "merchant furnaces" cannot live under free trade in pig iron, although he thinks that the greater manufacturers, making tonnage steel, and pouring out of each blast furnace an output running up to 400 or 500 tons a day can struggle along under free trade, despite the fact that the independent manufacturers cannot. He goes on to argue that new competition in iron and coal is to be expected from China and in that connection offered the following testimony:

> I have a friend who a little more than a year ago visited China and while there he went to visit a steel works at Han Yang and this is what he said about it: "They have enormous deposits of iron ore, very much higher in iron than ore we now use and running from 62% to 65% iron. This ore is almost free from sulphur and is low in phosphorus. They have an abundance of excellent coking coal, which can be mined at very low cost, because they have the cheapest labor in the world.
>
> "To one who has never visited China this may appear as an exaggeration, but it is a fact. I believe it is possible to produce pig iron and finished steel more cheaply in China than in any other country in the world. . . . . The Chinese coal miner is paid 7c. for a day of 12 hours; in addition he receives his found from his employer, but this consists of only about one cent's worth of rice and meal. Coal at the pit's mouth is 35c. per ton. It is transported to the river or railroad by collies, the lowest class of Chinese labor. The coolie is paid 1c. for carrying on his back a 400-lb. load of coal in some instances a distance of more than a mile from the mine to the export station. These coolies work only every other week. . . . . It costs a Chinese workman only about 90c. a month to live."

HARRISBURG, PENN.

Members of the new Pennsylvania Public Service Commission met with Governor Tener on Aug. 4 for the purpose of organization. The members arranged to dispose of accumulated business, and stated that one or more commissioners will be in Harrisburg every day and meetings will be held twice a month.

One of the first opinions to be handed down by the commission, was, that no demurrage should be charged on any cars which, by reason of the frozen condition of the cargo, were incapable of being unloaded within the free period after delivery and which were unloaded within that period after the condition of the coal admitted of that being done.

The opinion is the result of a complaint filed against the Pennsylvania R.R. Co. by the Terminal Coal Co., of Philadelphia. The complainant was asked to pay a demurrage of $52, but this was protested on the ground that the frozen condition of the coal was the only cause for the delay in unloading and that this condition was beyond control.

The commission found that the coal was so frozen when the cars were constructively delivered as to prevent the prompt unloading of the latter and that the actual unloading was accomplished as rapidly as the condition of the coal would permit.

On Aug. 19, after a hearing, the commission will take steps to promptly fix the telephone rates throughout the state. The three members of the old Railroad Commission are familiar with the situation and the idea is for the representatives of the telephone interests to present their objections to the tentative rates so that the new members will have the necessary data. Shortly after this hearing the schedule will be adopted.

On Aug. 20 a hearing will be held before this commission in the matter of the complaints of the manufacturers' association of York and Lancaster concerning the rate on bituminous coal from the Clearfield District.

No date has been set for a hearing of the complaints on anthracite coal to Philadelphia.

A Recent Report

In a recent report made to the United States Government by Prof. Emery R. Johnston, of the University of Pennsylvania, it is interesting to note that the influence of the Panama Canal on the American trade is a matter of lively interest to coal operators and land owners of Pennsylvania. It is conceded that the opening of the canal in 1914 will greatly enlarge the American coal trade and reflect a substantial measure of prosperity into the business, and, furthermore, that it will strengthen the value of coal in the state, especially coal which has the advantage of cheap rates to vessel ports.

Perhaps no coal in the country is more favorably situated in this respect than the Pittsburgh coal lying along the Ohio River and its navigable tributaries. Large bodies of fine Pittsburgh steam coal exist in the Panhandle of West Virginia, of which a great deal is held by capitalists of some of the western counties of Pennsylvania. These lands are destined to come into this market. The coal can be shipped all the way by water. From the pit mouth or the river tipples it can be loaded in barges and boated to New Orleans and the Gulf, where it may be transferred to ocean-going vessels for points on the Pacific Coast.

PENNSYLVANIA

Anthracite

Ashley, Penn.—It is expected that the Ashley planes of the Central Railroad of New Jersey, which have been closed down for repairs the past month or more, will resume operations by Aug. 16.

Pottsville—The inquest to determine the cause of the disaster, which killed 20 men at Tower City on Saturday, Aug. 2, will be held at Pottsville on Tuesday, Aug. 19. Many state mine inspectors and mining officials will attend, as well as representatives of the U. S. Bureau of Mines.

The bodies of the two firebosses have not as yet been found, and it is feared that they are buried under tons of débris.

For five minutes on the afternoon of Aug. 6, while the funeral of John Lorenz, a district superintendent in the employ of the Philadelphia & Reading Coal & Iron Co., was proceeding to the cemetery, the wheels in every one of the Reading's 40 operations were stopped and 30,000 employees stood in silence, thus paying tribute to the memory of the departed superintendent and the other 18 men who met death at the same time.

Pittston—Seven West Pittston boys were recently arrested on the charge of stealing rides on coal trains on the Bloomsburg division of the Lackawanna R.R. The arrests were made on complaint to the Lackawanna officials that these boys had hurled chunks of coal through the windows of the engine house placing in jeopardy the life of engineer John Davis and the men he might be raising from the mine.

Tamaqua—Among the sales recently recorded in this region was a piece of coal land in the Owl Creek Valley, from Fink & Co. to the Eastern Pennsylvania Coal Co. The land which was transferred is in dispute and litigation is now pending to determine the ownership. About six years ago Fink & Co. secured a lease on the ground but never did any development work until about a year ago. In the meantime other parties secured an option on the property, and were surprised when making an investigation to find that it was being developed.

Wilkes-Barre—In blasting away rock for the foundation of the new office building for the Lehigh Valley Coal Co. a vein of coal was encountered and miners were called in to properly deal with it. Several tons have already been removed, but sufficient quantity will not be encountered to pay for the extra expense of employing mine workers instead of laborers. The encountering of the coal in the excavating work will not greatly retard progress on the building.

Bituminous

Johnstown—The Penn Public Service Co. has signed a contract with the Loyalhanna Coal & Coke Co. to furnish power to its new mines at Cairnbrook, Somerset County. There are two new openings at Cairnbrook which will shortly be put in operation.

The Penn Public Service Co., which is rapidly completing high-power lines through this section of the state, is dickering with a number of large coal operators to furnish them with power, especially in Indiana, Cambria and Somerset Counties.

St. Marys—The Allegheny River Coal Co. has just discovered a new 8½-ft. bed in mine No. 5, near Furnace Run, in Armstrong County.

Osceola Mills—The Shoemaker Coal Co., of Philadelphia, has bought the Monarch shaft of the Osceola Coal Co., here, and will increase the capacity at once. The White-Dugan Co., near here, is opening a new slope at No. 1 mine to increase capacity.

Monongahela—The coal operators in this district are complaining of the scarcity of miners and as a result the mines are losing about 15 per cent. of their capacity. These conditions are depressing to the operators as there is at present a strong demand for Pittsburgh coal, and many of the larger companies have been compelled to buy coal in order to fill their contracts.

Sykesville—On the evening of Aug. 6, the men employed at the Cascade Co.'s shaft at Sykesville, held a meeting and decided to strike for the adjustment of conditions prevailing at that operation. This decision will affect 200 men.

WEST VIRGINIA

Bluefield—Six hundred miners are affected by the wage agreement signed Aug. 6, between representatives of the United Mine Workers of America and the Wyatt Coal Co., the Coalburg Colliery Co. and the Dry Branch Coal Co., operating mines on lower Cabin Creek. The price per net ton has been fixed at 30c., an increase of 3c. over the amount paid at other mines in the same field. The agreement is to expire Apr. 1, 915.

The mines in the Pocahontas field and some in the Thacker and Red Jacket field will adopt a semi-monthly pay day effective not later than Oct. 1. It is also reported that a nine-hour work day will be adopted at a number of operations. At some operations the semi-monthly pay will begin Sept. 1, and it is expected that the Norfolk & Western R.R. will also adopt the bi-weekly pay day.

Charleston—On Aug. 6, an agreement was reached between representatives of the United Mine Workers of America and of the Laing, and Dickinson Mines on Cabin Creek, by which these operations are to work under the recent agreement. Since May 1, these mines have been working under the proposition suggested by Governor Hatfield.

Mine inspector Mitchell has during the past few weeks been prosecuting a number of the miners in his district for violating the state laws. Most of these violations occurred in the mines of the Pocahontas Consolidated Collieries Co., and the fines imposed ranged from $10 to $20.

ALABAMA

Birmingham—The Maryland Coal Co. has begun dumping coal at its new mines at Sipsey, Ala., and expect within 0 days to have the output up to 600 tons per day and ultimately to reach 1000 tons daily.

KENTUCKY

Frankfort—The Kentucky Railroad Commission has handed down an opinion in which it holds that it is without jurisdiction to give any relief to the coal miners of Ohio and Muhlenberg Counties, Ky., who complained that they were kept idle by reason of the failure of the Illinois Central R.R. to furnish cars to the operators in those counties.

Hazard—The plant of the Hazard-Dean Coal Co. is well under way, and the company hopes to be loading out coal by the beginning of the fall season. A large force of men is engaged in grading the company's track up Messer Branch, and work is about to start on a tipple of the latest design. A large power house, the necessary commissary building and about six miners' houses are next to be built. The company proposes to equip a thousand-ton mine, and is laying its plans accordingly.

McRoberts—The Bank of McRoberts is the newest financial institution in the coal fields. It was incorporated recently with a capital stock of $25,000, the organizers being John E. Buckingham, I. N. Camden, George T. Watson and W. S. Perry.

OHIO

Steubenville—Joseph Specher was killed and Mige Osgan was fatally injured from being struck by a runaway coal car at the Wright Coal Co.'s plant in Bergholz, Aug. 8.

Columbus—Ohio will soon have a mine-rescue car which will cost approximately $10,000. It will be equipped with kitchen and sleeping room for the attendant who will live upon the car. It will be kept on a spur track ready for immediate transportation to the scene of any mine disaster.

Athens—The mine of the Calvin Essex Coal Co. will be in operation in Meigs County on the lands of the Athens and Pomeroy Coal & Land Co. soon. The holding company is composed of Athens men who own 700 acres of land in Salisburg and Rutland Townships, 2½ miles northwest of Pomeroy. The local company has completed the grading of a mile of railroad track to the mine site where the operating company is now grading for a power house and tipple and starting to open up the mine.

INDIANA

Brazil—Crawfordsville and Greencastle capitalists have purchased at receiver's sale the property and leases of the Indiana Coal & Clay Co. at Patricksburg. The price paid was $2870, the financial encumberances of the company, together with unpaid royalties.

ILLINOIS

Witt—The local Peabody Mine No. 12 is temporarily to receive power from Taylorville for the driving of the recently installed electric motors. This is necessary since the Peabody plant at Kincaid, from which current will later be received, has not yet been completed.

Bloomington—A large acreage of oil and gas land has recently been leased in Shelby County, and drilling operations will soon be begun.

OKLAHOMA

Oklahoma City—To protect the thousands of miners working in the coal mines, the last Oklahoma legislature passed a law requiring all such mines to install telephones. These are to be located every 1000 ft. in the mine and connected to the surface. By this arrangement there will never be a man over 500 ft. from a telephone, which in case of an accident or explosion will render communication to the surface quick and certain.

FOREIGN NEWS

Santiago, Chile—An appeal has been made to the Minister of Industry and Public Works by several miners' societies, asking that he use his influence with the coal companies to reduce the working day to nine hours. In some of the mines the men are being worked 12 hours, it is declared. Organizations among Chilean miners are mostly social and cannot be compared with the unions in the United States.

RECENT COAL AND COKE PATENTS

Miners' Drill—T. S. P. Skeen, Sandoval, Ill.; 1,065,005, June 17, 1913. Filed June 20, 1912. Serial No. 704,811.

Gas Producer—L. Moore, Glasgow, Scotland; 1,065,315, June 17, 1913. Filed Jan. 28, 1913. Serial No. 744,774.

Improvements in Crushers—T. J. Sturtevant. Glen Road, Wellesley Farms, Wellesley, Mass.; 29,949 of 1912.

Gas Producer—J. A. Herick, New York, N. Y.; 1,063,540. June 3, 1913. Filed July 10, 1911. Serial No. 637,615.

Smoke Consuming System. E. G. Hatch, New York, N. Y.; 1,064,477. June 10, 1913. Filed March 7, 1911. Serial No. 612,848.

Protective Device for Miners. J. W. Reed, Cedar Grove, W. Va.; 1,064,378. June 10, 1913. Filed Sept. 18, 1912. Serial No. 721,058.

Method of Producing Gas. O. H. Ensign, Los Angeles, Calif.; 1,064,625. June 10, 1913. Filed May 27, 1909. Serial No. 498,764.

Apparatus for Quenching Coke. W. Reubold, Charlottenburg, Germany; 1,065,081. June 17, 1913. Filed June 1, 1912. Serial No. 700,966.

Coal Washer and Ore Concentrator. A. P. Campbell, Asheville, N. C.; 1,065,213. June 17, 1913. Filed June 5, 1912. Serial No. 701,788.

Latch for End Gates of Mining Cars. I. K. Beaver, Wilburton, Penn.; 1,064,278. June 10, 1913. Filed Oct. 7, 1912. Serial No. 724,399.

Gas Producer—J. H. Hirt, assignor to Allis-Chalmers Co., Milwaukee, Wis.; 1,064,905. June 17, 1913. Filed Apr. 29, 1907. Serial No. 370,757.

Pneumatic Feeding Device for Stoping Drills. J. G. Leyner, Denver, Colo.; 1,065,059. June 17, 1913. Filed Oct. 23, 1911. Serial No. 656,267.

Safety Device for Water Gas Apparatus. W. M. Kiley and W. J. Burtle. Grand Rapids, Mich.; 1,065,254. June 17, 1913. Filed Feb. 17, 1912. Serial No. 678,197.

Rock Drill—J. A. Thompson and E. M. Mackie, assignors to Chicago Pneumatic Tool Co., Chicago, Ill.; 1,065,007. June 17, 1913. Filed Nov. 22, 1906. Serial No. 344,568.

Automatic Car Stop with Gaging Apparatus for Mines. J. E. Gable. Cambridge, Ohio, and I. A. Gable, Byesville, Ohio; 1,064,067. June 10, 1913. Filed Aug. 18, 1911. Serial No. 644,-838.

Indicating and Alarm Mechanism for the Movement of Gases in Mines. A. Szabodos and H. Mueller, New Michel, B. C., Canada; 1,064,869. June 17 1913. Filed Jan. 9, 1912. Serial No. 670,256.

PUBLICATIONS RECEIVED

Department of the Interior, Bureau of Mines. Safety Electric Switches for Mines. By H. H. Clark. Technical paper 44; 8 pages, 6x9 in.; without illustrations.

Department of the Interior, Bureau of Mines, Bulletin 54. Foundry-Cupola Gases and Temperatures, by A. W. Belden. Twenty-nine pages, 6x9 in., with numerous diagrams, figures and illustrations.

University of Illinois, Bulletin No. 67. Reinforced Concrete Wall Footings and Column Footings. By Arthur N. Talbot; 114 pages, 6x9 in.; with numerous drawings, curves, tables and halftone illustrations.

Geological Survey of Georgia, Bulletin No. 20. Mineral Springs of Georgia. By W. S. McCallie, State Geologist. Cloth-bound volume of 190 pages, 7x10 in., describing briefly the mineral springs of Georgia and giving the chemical analyses of their waters.

TRADE CATALOGS

Lidgerwood Mfg. Co., 96 Liberty St., N. Y. Bulletin No. 12. Lidgerwood Electric Hoists. Twenty pages, 9x12 in., illus. Describes many kinds and styles of hoists adapted to various uses.

The Biddle Hardware Co., 513-517 Commerce St., Philadelphia, Penn. Monel Metal, 54 pages, 4x7½ in. illustrated. Describes the properties of monel metal and the various forms in which it may be commercially obtained.

The Link-Belt Co., Philadelphia, Chicago, Indianapolis. The Peck Carrier. Book No. 120; 112 pages, 6x9 in., describing the principal possibilities and illustrating various applications of the Peck carrier and its auxiliaries.

The Francke Co., New Brunswick, N. J. Bulletin No. 18, March, 1913. Francke Flexible Couplings; 11 pages, 6x9 in.; with numerous illustrations and tables describing the operation of a flange coupling which is entirely flexible.

Standard Specifications for Horizontal Return-Tubular Boilers. April, 1913; 7 pages, 5x10 in.; giving the principal dimensions and specifications of multi-tubular boilers as adopted by a large number of firms manufacturing this class of machinery.

Henry R. Worthington, 115 Broadway, New York. Worthington Volute Centrifugal Pumps for Low and Moderate Heads. W-202. May, 1913. Sixty-two pages, 6x9 in., with numerous illustrations, drawings and curves, describing the various types and sizes of Worthington volute pumps.

PERSONALS

Charles T. Faulkner, formerly sales agent of the Sterling Coal Co., has opened an office under the name of the Western New York Fuel Co.

J. H. Walker, formerly superintendent of the Sedalia Coal Co., located in the Hocking Valley field, has taken a position with the Pan-American Coal Co. as general superintendent.

Dr. W. R. Crane, professor of mining in the Pennsylvania State College, has just returned from Alaska, where he has spent the past year investigating the coal resources of that territory.

Truman Dodson, superintendent of the Morea Colliery, has been elected president and general manager of the Locust Mountain Coal Co., to succeed Baird Snyder, recently killed in an auto accident.

E. A. Anthony, who has been store manager for the Rex Coal & Coke Co. on Dingess Run for the past 2½ years, has resigned his position and will operate a coal lease for himself on Main Island Creek.

President Wilson has named Henry B. Bidwell, of Muskogee as chairman, Royal J. Allen, of Duncan, and R. L. Kidd, of Poteau, as the Board of Appraisers to evaluate the surface of the segregated mineral land in the Choctaw Nation.

William Mangan, who has been outside foreman at the Prospect Colliery of the Lehigh Valley Coal Co. for a number of years, has resigned his position with the company, to accept a similar position with the O'Boyle Coal Co., at Sugar Notch. John Reidlehuber, of the Centralia Colliery of the same company, has been appointed to succeed Mr. Mangan.

Thomas R. Jones, of Wilkes-Barre, has been appointed division superintendent of the Lehigh Valley Coal Co.'s Delano Division with headquarters at Mahanoy City. He fills the position made vacant by the resignation of Mr. William Underwood. Mr. Jones was formerly district superintendent for the Lehigh Valley Co. in the Hazleton region, and was for many years general manager of the Warrior Run Coal Co., at Warrior Run.

OBITUARY

Geo. A. Shirey died at his home in Bluefield, W. Va., Aug. 7. Mr. Shirey was favorably known throughout the entire Pocahontas coalfield. He is survived by a wife and six daughters.

E. A. Humphries, a prominent coal and coke operator, died suddenly at his Scottdale home recently of heart trouble, aggravated by the intense heat. At the time of his death he was 69 years of age.

Geo. Dana, a pioneer coal operator of West Virginia, died recently at his home in Washington, D. C., at the age of 80 years. Mr. Dana began operating coal mines on Campbells Creek about the close of the civil war, and retired from active business several years ago, since residing in Washington. He is survived by a wife and two brothers.

Richard Newsam, one of the best known coal-mining men in the Middle West, died at his home, 208 Bigelow St., Peoria, Ill., on Aug. 4. after a lingering illness of a year. Mr. Newsam was instrumental in bringing about the establishment of the mine-rescue stations in Illinois, and had held many important offices pertaining to coal mining since 1897.

CONSTRUCTION NEWS

St. Lambert, Que.—The Grand Trunk Ry. has recently warded a contract for a 600-ton capacity coaling station at t. Lambert to the Roberts & Schaefer Co., of Chicago.

Virden, Ill.—Work has been begun on the foundations of ie steel tipple for the Royal Colliery Co., and the work of recting the new tipple will be pushed rapidly. The old tructure was destroyed by fire on May 26 last.

St. David, Ill.—The Roberts & Schaefer Co. have received contract from the Big Creek Colliery Co. for a new minig plant at St. David. It will occupy the site of the one estroyed by fire on Aug. 5.

New Castle, Penn.—Work will begin soon to reopen the 'rank McInnis and Cartis Brown coal bank in the Brown's ddition, which has been closed for some time. The mine has een leased by George Main and his son Emmet of this city.

Newport, Ind.—Haughee & Dunsford, who have been sinkig a shaft on the Wimset farm, near Newport, have passed hrough a bed of good coal nearly 6 ft. in thickness. They re now driving entries and expect to begin taking the coal ut in a short time.

Huntington, W. Va.—There appears to be a well authencated rumor that a railroad will be built in the near future hrough the Guyan Valley at least as far as Pineville. Such road would develop a practically virgin territory rich in oth coal and lumber.

Louisville Junction, Colo.—The National Fuel Co., of Dener, Colo., has recently awarded a contract to the Roberts & chaefer Co., of Chicago, for a Marcus patent picking-table creen and steel tipple for installation at the Monarch mine t Louisville Junction.

Columbus, Ohio—The Norfolk & Western R.R. Co. is buildig five new side tracks which are more than a mile long, xtending from Livingston Ave. to English Hill. The new 'acks will increase the facilities of the Columbus yards and ermit a large storage of coal.

Wilkes-Barre, Penn.—To afford additional power for genral purposes, a new 450-hp. Stirling boiler is being erected at he Exeter Colliery of the Lehigh Valley Coal Co. It is exected that this installation will be complete in about one ıonth. The new boiler replaces two smaller low-pressure oilers which have been removed.

Maynard, Ohio—The Troll Coal Mining Co., with mines at lainesville, is making some costly and highly important imrovements at its mine. When completed a total of 300 hp. 'ill have been added to the power equipment of the proprty, while many new houses will have been erected for the se of the company's employees.

Monongahela, Penn.—At a meeting of the directors of the 'ittsburgh Coal Co., it was decided to rebuild the saw and laning mill, which was destroyed by fire on the morning of uly 30. Plans for the erection of the plant have been comleted and work will be begun shortly although a scarcity f laborers may cause some delay.

Duquoin, Ill.—The Forester Coal & Coke Co., of Duquoin, as placed an order with the Roberts & Shaefer Co., of hicago, for the building of a 300-ton modern coaling staion to coal locomotives on the Illinois Central R.R. This tation will be built alongside of the steel tipple for which ie same company contracted about six weeks ago with the ame concern.

NEW INCORPORATIONS

Springfield, Ill.—The Elly Coal Co., of Girard, has been inorporated with a capital of $2,000,000. The incorporators are: lbert Salzenstein, H. C. Hamilton, and B. D. Terry.

Birmingham, Ala.—The Alabama Land & Coal Co. has been ıcorporated with a capital of $80,000. J. E. Seay is president, . S. Shannon, vice-president and G. H. Peck, secretary.

Little Rock, Ark.—The McDougal Coal Co. has been incororated at Bonanza, with a capital stock of $9000. The inorporators are: L. P. McDougal, J. T. Gray, and others.

Edgewater, Wash.—The Hamilton Creek Coal Mining & 'evoloping Co. has been incorporated with a capital stock f $100,000, by E. L. Largey, Edgewater, M. M. Aldrich, Portınd, et al.

Charleston, W. Va.—The Ridgwood Smokeless Coal Co. has removed its principal office from Fayetteville, Fayette County, to Vaughn, Nicholas Co., and changed its name to the Ridgway Coal Co.

Harrisburg, Penn.—The Auxiliary Coal Mining Co., of Pittsburgh, has been incorporated with a capital of $15,000. The incorporators are: Jacob Swires and H. H. Homer, of Phillipsburg, and H. M. Fair, of Altoona.

Des Moines, Ia.—The Central Iowa Fuel Co. has been incorporated with an authorized capital stock of $100,000. The principal offices will be in Chariton, Lucas County, in the state of Iowa, and the purpose of the company is to mine coal and other minerals. The incorporators are A. E. Hollinsworth, Joseph Norwood, J. H. Balir, D. M. Ritten, and W. L. Read, all of Des Moines.

Charleston, W. Va.—Another coal company has been chartered to do business in West Virginia under the name of the Black Fork Coal Co., which will have offices in Fairmont, Marion Co., and chief works in Webster County. The authorized capital stock is $200,000, and the incorporators are E. E. Frame, Fairmont, J. C. Lewis, Grafton, J. S. Beatty, Manington, J. M. Ritchie and H. W. Showalter, of Fairmont.

Louisville, Ky.—The organization of the Continental Coal Corporation of Kentucky, which will take over the Kentucky retail business of the Continental Coal Corporation of Tennessee, was completed on Aug. 7. The capital stock of the new concern is $50,000, and the debt is limited to $200,000. H. L. Corey, of Chattanooga, was chosen president; F. B. Martin was selected vice-president, and S. O. Le Seur was made general manager.

INDUSTRIAL NEWS

Philadelphia, Penn.—The Hirsch Electric Mine Lamp Co. has moved its factory to the corner of 12th and Wood Sts., where its manufacturing facilities are greatly increased. Through mistake this notice was printed in our last issue under the heading of Pittsburgh, Penn.

Springfield, Mass.—The Witherbee Igniter Co. has just received word from the Bureau of Mines that its portable electric mine lamp has been approved for use as a cap lamp in gaseous mines. These lamps are much more convenient and give a better light than the ordinary safety lamp.

Jefferson City, Mo.—The Chicago & Alton R.R. Co. has been authorized by the State Utility Commission to issue $861,000 of betterment bonds, based under a general mortgage of July 1, 1912. The bonds are to pay for improvements made during the months of March, April, May and June.

Bluefield, W. Va.—The Solvay Colliery Co., at Marytown, on Aug. 1, concluded the purchase of and made the first payment on the mining lease and property of the Spring Coal Co., of Springton. It is the purpose of the purchaser to use the coal from this development in the manufacture of coke in byproduct ovens.

Scranton, Penn.—F. H. Emery & Co., manufacturers of the Emery patent slate pickers are contemplating the purchase of the old Allis-Chalmers plant at the corner of 10th Ave. and Vine St. Additional facilities have been made necessary by the large number of orders which the picker company has been receiving recently.

Scranton, Penn.—A well authenticated rumor states that a plant will be started soon for the manufacture of a new and improved slate picker. This will be based upon the invention and patents of Charles Farrar, of Dunmore. It is possible also that the new factory will build a complete line of coal-cleaning machinery. The name of the company has not yet been decided.

Lorain, Ohio—During the month of July the Baltimore & Ohio R.R. dumped 600,000 tons of coal over its docks at Lorain. This coal was mined in West Virginia, Ohio, and Pennsylvania, and was destined to shipment across the Lakes to Canada and the Northwest. Should the coal business continue at this rate, and the traffic officers believe that it will, it is expected that this year will establish a new record for any season of lake navigation. The prospects are that the coal tonnage will reach 3,500,000 tons.

Chicago, Ill.—Forty locomotives of the Chicago & Northwestern, and the Chicago, Burlington & Quincy R.R., are now engaged in a test of lignite as fuel. The present cost of coal in western Nebraska, Colorado, Wyoming and the Dakotas is from $5 to $6 per ton. Lignite, on the other hand, can be bought for $1.75 or less. If the present test demonstrates the practicability of lignite for fuel, there will be an enormous saving in the coal bills of the railroads.

COAL TRADE REVIEWS

GENERAL REVIEW

Heavy demand for soft coal still persists, but not so aggressively as before. Tendency is toward further advances. Supply and demand well balanced for the time being. Lake tonnages heavy. Anthracite quiet, but steady, with an excellent undertone.

The constructive element in the trade has suffered a slight check during the week. Buying is more scattered, and there is an absence of the aggressive support that has charactrized the recent market. No important, in fact hardly any, recession in prices has occurred, and the situation simply appears to be one of backing and filling pending further developments. Quotations are not weak, and any concessions offered find ready buyers. The natural tendency is upward and a further advance will occur immediately if any of the several expected favorable conditions materialize.

Anthracite has developed a new strength, partially because of the small shipments last month and the rigid curtailment in production, but probably more particularly because of the near approach of the consuming season. The market seems capable of absorbing the limited production, which is much curtailed and concessions on the regular company's circular are infrequent. There is an excellent undertone to the anthracite trade indicative of a marked activity this fall.

The advance in quotations on the West Virginia grades for shipment into the West, has diverted a greater tonnage of these fuels into the Eastern market, and there is already some talk of an easier situation in September. It is thus barely possible there may be a temporary slump in the spot market to the $2.85 price on West Virginia coal, with possibly further opportunities for contracting at that figure also.

As a whole, however, the supply and demand are well balanced and the Pennsylvania grades have moved up another notch. Operators generally are worried about the heavy demand on contracts, and they would find it difficult to take advantage of any spot business. The car and labor supply continues to be the limiting factor in the Pittsburgh district; these are both fair so that production is close to the previous high records. The pressure is particularly heavy for Lake shipments. It is fortunate that the consumers are well covered as there is not much free coal, and it would be difficult to place any contracts which involve shipments prior to Dec. 1. The movement is tending to slow up which would indicate a limited car supply, or a heavier shipment of other freight.

The demand in Ohio continues as insistent as ever, and the movement is keeping up as good as could be expected. The car situation is the only disturbing factor. The domestic demand is strong, the steam consumption heavy, and the outlook excellent over the future. The loading at Hampton Roads is showing a marked improvement, the dumping being heavy, with large shipments in both the Coastwise and foreign trade; some coal is even accumulating on the piers. The heavy demand from the Northwest continues unabated, both the railroad and industrial consumption are large, and the car supply inadequate.

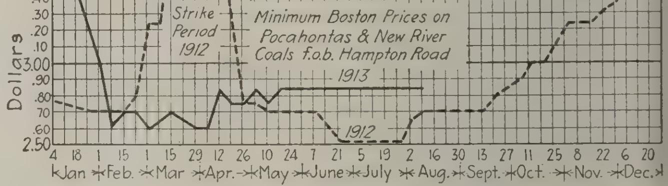
A perceptible slowing up is notable in the Southern market. As a result there is considerable coal on track, and the market is showing a tendency to ease. The car shortage is becoming steadily worse in the Middlewest, it being ascribed there to the absence of any relaxation of the market during the summer. The demand is insistent, the consumption heavy, while price increases have already been recorded, and will probably be followed by others. There is a particular improvement in the demand for the Western grades.

BOSTON, MASS.

A slackening demand from the West due to advance in prices on the Pocahontas and New River grades. An easier market is looked for in early September. Pennsylvania coals firm and sales are only being made for delivery this month and next. Anthracite orders coming in better than was anticipated.

Bituminous—The output of the West Virginia districts is somewhat exceeding expectations, at least for early August, and already there is talk of an easier market when Septmber comes in. The loading at Hampton Roads shows marked improvement and few boats are now detained more than the two or three days usual in normal times. Another feature is the advance in prices for Western shipment, resulting in a slackened demand from that quarter. If this particular phase continues for a month or so and output is kept up to the present market there is small question about there being a plentiful supply of Pocahontas and New River during the early fall, for the tide-water trade. This does not mean the $2.85 f.o.b. price is at all likely to break, but simply that spot coal will probably sell down to that figure, and for a time there will be opportunity for additional purchases on the contract basis.

Meanwhile there is sufficient call for coal as it comes down, although almost exclusively on old obligations. It is, however, a market that shows demand and supply pretty well balanced. Buyers coastwise will be much interested in developments with regard to the trade West. It is being remarked that if the new scale of prices holds in that territory and the usual volume of coal moves that way in September, then by October New England may look for higher prices on West Virginia fuel.



The Pennsylvania situation shows notable firmness, with no weak spots anywhere. Certain coals have been marked up another 5@10c. only this week, and an adequate demand is still forthcoming. Prices all-rail are firm, and operators are wary of selling for deferred delivery; $1.60 has been paid for certain Moshannon coals within a short time, and when such a price can be realized for Clearfield output, it cannot be said the market is lacking in strength.

Anthracite—Orders are being filed for August coal in surprisingly good number. Dealers are still holding to the policy of carrying full stocks and are taking on cargoes as fast as retail deliveries will permit. There is perplexity over the varying policies of the anthracite companies with regard to charging the Pennsylvania tax.

Current prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta New Rive
Mines*	$1.15@1.55	$1.35@1.70	$1.67@1.77	
Philadelphia*	2.40@2.80	2.60@2.95	2.92@3.02	
New York*	2.70@3.10	2.90@3.25	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@3.0
Boston†				3.98@4.1
Providence†				3.85@4.0

*F.o.b. †On cars.

NEW YORK

Slight tendency to ease up on the low-grade bituminous coals, but the market is well supported. Railroad and industrial consumption continues heavy. Hard coal dull, but has an excellent undertone indicative of a good latent strength.

Bituminous—There was a slight tendency to ease up in the soft-coal market during the past week, but it did not extend beyond the low grades. Even the most conservative interests in the trade are agreed that there is little probability of the market developing any weakness until navigation closes on the lakes, at least. Even then the winter's demand will be up to the maximum. Railroads are particularly good buyers, while the general steam consumption seems to be large in all directions in spite of the unfavorable reports regarding business conditions generally. The oldest members of the local trade state that they have never known the bituminous trade to be in a stronger position at this period of the year. Not only is the demand heavy on practically all grades, but the business aspects of the trade are also excellent, collections being promptly made. The car supply is short on occasions, but considering the heavy shipments the situation cannot be considered bad as yet. There are no weak spots in the market which are liable to develop to serious proportions. We continue to quote the local market on the following basis:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.75@2.80; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.25@3.30.

Anthracite—Hard coal has not experienced any material change during the week, and still continues comparatively quiet, but with a strong undertone that indicates an exceedingly active market this fall. It is stated that the supplies on hand are far below normal, some companies having no stocks at all with the possible exception of a few odd lots of the steam grades.

Some cutting in the circular is being noticed, but on the whole prices are well maintained. Stove still continues in the strongest demand, while egg and pea are being stocked freely. There is plenty of cars due to the mining being restricted from two to four days a week. Indications are that the demand this fall will be far in excess of the productive capacity of the mines.

We continue quoting the New York market on the following basis:

		Individual	
	Circular	Lehigh	Scranton
Broken	$4.70	$4.45@4.85	$4.50@4.90
Egg	4.95	4.95@5.10	5.05@5.15
Stove	4.95	5.10@5.20	5.15
Chestnut	5.15	5.25@5.35	5.40
Pea	3.50	3.30@3.45	3.35@3.50
Buckwheat	2.75	2.15@2.45	2.55@2.75
Rice	2.25	1.70@1.95	2.25
Barley	1.75	1.30@1.70	1.75

PHILADELPHIA, PENN.

Anthracite trade showing little or no improvement, although there seems to be a fair demand from the New England market. Curtailed mining still continues. Local market dull. The bituminous situation still continues to improve, the market absorbing the entire production, with little or no spot coal for sale.

The anthracite coal industry shows little or no improvement over last week. Under the curtailed operating, quite a quantity of the steam sizes and chestnut coal are going into stock, notably chestnut, for which the demand seems to have dropped off very materially. The market seems to be capable of handling broken, egg and stove, however, although orders are not coming in as freely as desired. The New England business from tidewater still continues fairly good. The large fleets of barges sailing from this port are kept busy with cargoes, and there is quite a tonnage moving in this direction.

The retail trade is preparing itself for the fall. The month of August is essentially furbishing time; repairs, additions, and the little odd jobs around a coal yard that cannot be looked after when the demand is on, are cleaned up, so as to handle the business in the fall, and from present indications it is going to be active when it does get started.

Sundry complaints are heard here and there about the Pennsylvania state tax, and with many of the companies absorbing it others charging it are having their hands full explaining why. This is probably having the effect of diverting considerable business from its usual channels. The absorption of this tax is being used by many to stimulate business. It is reported, although this cannot be vouched for, that September first may see all operators either charging the tax as a separate item, or including it in the price of the coal; in other words, advancing all sizes to a price that will include the tax which would bviously be a less irritating way of handling the matter.

The bituminous business needs hardly any comment. The same favorable conditions continue to prevail, and quotations of less than $1.25 for any kind of coal are few and far between. The soft-coal operator is doing probably better than ever before at this season.

BALTIMORE, MD.

Bituminous coals growing scarce in Pennsylvania. All large companies practically covered by contracts. Strike in one region and a general shortage of cars is also having an effect.

Soft-coal men here are well pleased with the general strength of the market. The Lakes are still taking large quantities of coal, in fact to such an extent that the West Virginia gas product is being held at a full dollar all along the line; the better grade Pennsylvanias are already out of the market entirely or fast approaching that state. In not a few sections mines are entirely sold out on contract, and the producers are worrying how to meet the heavy call on contracts, in the face of the growing car shortage. Even if there was enough coal produced to warrant entering the outside market, these companies would find it impossible to seize the opportunity. Others with some coal to sell are fast closing it out, for the most part at $1.25 or better for even ordinary grades.

Locally the situation is fairly brisk, and while there is no shortage of fuel at tide there is also no surplus reported. Shipments over the piers continue heavy on contract. The foreign movement is keeping up also, and while July with a total of nearly 83,000 tons falls back of the previous month by more than 20,000 tons, it still maintained the average so far this year.

The anthracite trade is beginning to improve. Dealers here are receiving inquiries, and the hard-coal business will be under way in another six weeks.

The influence of the coming hurricane season on southern charters is already being felt. Offerings have been a little less free for the southward coastwise haul, especially by sailing vessels. Tampa is now being quoted up to $1.30; Savannah is calling from $1.05@1.10, and Galveston hauls demand from $1.40@1.50, which are considerably in excess of figures several weeks ago.

PITTSBURGH, PENN.

Mines working up to capacity, with practically no free coal. Contracts hard to make for shipment before Dec. 1. Sufficient Connellsville furnace coke has been taken at the full $2.50 price to meet uncovered August requirements. Foundry coke slightly advanced.

Bituminous—Mines continue to work up to the limit made by the supply of labor and cars, both of which are moderately satisfactory, resulting in production at close to the very best record. The pressure is particularly for lake coal, although shipments on contract are heavy. There is hardly any free coal, but this is not inconveniencing consumers as they are well covered by contracts against which they are getting fair deliveries, so there is not much demand for prompt lots. Few operators are in position to take on fresh contracts, at least for shipment prior to Dec. 1, when the lake shipping season will have closed. Slack is bringing good prices, usually the full circular figure. We continue to quote as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The furnace coke price of $2.50 is very well maintained. Practically all the August coke required by furnaces in operation and not covered by longer term contracts, or otherwise, has now been purchased, at the full price, and the sales for August may be estimated at close to 150,000 tons, or about the same tonnage as was taken for July. In two cases September coke was taken as well as August, involving some 15,000 or 20,000 tons for September, and in one instance a contract was made for 2500 tons monthly, August, September and October. In other cases the buying has been for August only.

Several additional furnaces have blown out lately and production will require further curtailment to keep it in line with consumption, but thus far no spot or prompt coke has been pressing the market. Foundry coke has stiffened slightly, practically all of the few sellers at below $3 having withdrawn such prices, making the market quotable at $3. We now quote as follows: Prompt furnace, $2.50; contract furnace, $2.50; prompt foundry, $3; contract foundry, $3 per ton at ovens.

For the first time in many weeks the "Connellsville Courier" reports shipments of coke at considerably less than production, the figures for the week ended Aug. 2 being: Production, 385,065 tons, a decrease of 8268 tons: shipments, 366,053 tons, a decrease of 27,581 tons. Shipments fell 19,012 tons below production, but it is represented that the surplus was probably by the producer-consumer class, the merchant ovens having no surplus to press on the market.

BUFFALO, N. Y.

Bituminous prices still have an upward tendency, with some new high-priced contracts reported. Consumers not disturbed at an increased slackness in deliveries. Heavy rush of anthracite west by lake.

Bituminous—There is no sign of any easing off in the bituminous trade. During the week contracts for a year have been made here at surprisingly high figures. The more sanguine jobbers are saying that by the middle of October the mine-run price will be $1.50 for any good coal. While this view is not universal, it is agreed that everything now looks like it. Almost all operators have been buying in the open market, to satisfy contracts. Salesmen are doing special jobs, on account of the utter uselessness of sending them on the road to sell coal that could not be delivered. As a rule, the consumer is not disturbed, and is apparently incredulous at what the selling end of the trade tells him. At the same time the rail deliveries are steadily growing slower. The movement is indicative of a very limited motive power, or a material increase of other freight. When a car reaches a siding at a junction point it usually stays there till the shipper hunts it up and goes after the road. The grain crops are now moving and the situation is sure to grow worse from this time on.

Bituminous prices are as strong as formerly, and are quotable as before with an upward tendency, as follows: Pittsburgh lump, $2.90; three-quarter, $2.80; mine-run, $2.65; slack, $2.15, with Allegheny Valley about 15c. lower.

Coke—There is a somewhat increased activity in the coke trade. Some of the pig-iron furnaces in this vicinity that shut down last month, have started up again and others are in prospect of doing so. There is probability of a change in that trade before long, however, on account of the uncertainty of the future of the Connellsville district. Quotations remain on the basis of $2.65 for best Connellsville foundry.

Anthracite—This trade is featureless and nothing expected till there is sign of colder weather. Western shippers are giving almost their entire time to rushing coal forward by lake, and the figures are already far ahead of those of former seasons. To Aug. 1 last season, the shipment was only 1,987,385 tons, which was about the same as the year before, and not exceeded in former seasons as a whole; shipments this season to August are 2,566,206 tons from Buffalo, with every prospect of keeping up the pace. The July shipment of 780,000 tons again broke the monthly record, as has been done once or twice before this season. Lake shipments for the week were 175,000 tons.

COLUMBUS, OHIO

Market steady in every respect. Aug. 1 price list is well maintained. Some car shortage appearing in all the mining districts. Good demand for steam and domestic sizes continues and lake trade is strong.

Strong quotations and steadiness were the chief features of the trade in Ohio during the past week. The demand for all grades continues good and the movement all that could be expected for the time of the year. About the only disturbing factor is the increasing car shortage which had the effect of curtailing the output in all sections of the state. The tone of the market is good and future prospects are considered bright.

Domestic demand is increasing as the fall approaches; many of the larger consumers have placed their orders and dealers are pretty busy making deliveries. Stocks are fair, but with the volume of business being done, orders for immediate shipment are necessary. There is also a considerable trade in domestic sizes for deferred delivery, although there is a disposition to go slow in booking such orders. Threshing is producing quite a good business in all rural sections.

Steam business is also strong and as a result prices show no weakening. Factories are requiring a considerable tonnage to keep going and in many cases their fuel requisitions are being increased. No stocking is being done as yet as purchasing agents believe that prices will not advance materially from this time on. The demand from railroads for fuel is also strong as the freight movement is holding up well. The shipments to the Northwest via the lakes are heavy and no let up of consequence is reported. Lake shipments through the Hocking Valley docks at Toledo so far this season total 1,572,000 tons.

Because of the car shortage, the output during the week was somewhat less than normal. In the eastern Ohio district the shortage of equipment was the most serious and the output is estimated at 75 per cent. of the average. Some shortage was also reported from the Pomeroy Bend and the domestic fields. In the Hocking Valley, a freight wreck of some seriousness had the effect of aggravating the situation.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburg	Pomeroy	Kanawha
Domestic lump.....	$1.70 @ 1.65	....	$1.70 @ 1.65	$1.70 @ 1.65
3-4 inch...........	1.55 @ 1.50	$1.30 @ 1.25	1.45 @ 1.40	1.50 @ 1.40
Nut..............	1.30 @ 1.20	....	1.35 @ 1.30	....
Mine-run..........	1.35 @ 1.25	1.15 @ 1.10	1.30 @ 1.25	1.20 @ 1.25
Nut, pea and slack..	0.70 @ 0.65	....	0.60 @ 0.55	0.65 @ 0.70
Coarse slack........	0.60 @ 0.55	0.75 @ 0.70	0.50 @ 0.45	0.55 @ 0.50

HAMPTON ROADS, VA.

Supply of coal at tidewater normal. Demand good and prices firm. Dumpings for the week heavy and prospects excellent for a record month.

Dumpings at Hampton Roads piers for the week have been heavy. This is particularly true as regards coal moving from Sewalls Point as loadings there have been very heavy. There have been a number of large cargoes moving coastwise and the foreign business has also been good: the shipments have moved to Genoa, Dakar, Valparaiso, St. Lucia, Para and Menos.

Prices for New River and Pocahontas have remained firm, although there is a fair accumulation of coal on all terminals. There has been some demand for Kanawha coal at $2.50 to $2.65, but few sales have been made at the latter figure.

While the dumpings for August may not break the record of previous months at the same time it is predicted by those in position to know that the figures will run considerably over the quantity dumped the same month last year.

LOUISVILLE, KY.

Deficiency in the car supply is causing a shortage which is quite acute on some grades. Demand from the Northwest continues heavy. Industrial and railroad consumption large.

The feature of the local situation is abnormal scarcity of nut and slack at the consuming centers in spite of the rather heavy domestic demand. This is due to the inadequate car supply, for which there is no immediate indication of any improvement. The demand from the Northwest for the prepared grades is still heavy, and most mines are receiving only a fraction of the required equipment for loading. The situation is most acute in the eastern Kentucky field, but applies also to the western district, though probably not so severe.

A heavy demand from the Illinois Central Railroad is tending to further complicate the situation. This road participated in the heavy storing movement, which was general among the railroads some time ago when prices were low, but they still appear to be short and are concentrating their efforts on their own requirements to the detriment of the other freights generally. The industrial consumption is heavy, and there is grave danger of something on the order of a famine developing unless the railroads effect a rapid improvement in the car situation.

The steadily increasing demand for nut and slack of the better grades has put this on a selling basis of 90c., which is more nearly the winter market; the lower grades are quotable at 65 to 75c., with pea and slack strong at 40c. Eastern Kentucky grades continue unchanged at previous quotations, with western Kentucky now quotable at $1.10 for lump, 95c. for nut, and 85c. for mine-run.

BIRMINGHAM, ALA.

A noticeable slowing up in consumption. Coal accumulating on track and dealers are requesting shipments held up.

A pronounced slackening up of orders and requests for delays in shipments on contracts, were the principal items of interest in the coal trade during the current week. As a consequence there is some accumulation on track at various points. Prices have not suffered to any appreciable extent, but unless there is immediate improvement in conditions we may expect lower prices all along the line.

Reports from the state mine inspector's office are to the effect that Alabama mines are now producing coal at the rate of about eighteen million tons per year, which is approximately a 10% increase over the tonnage mined in 1912.

There is no apparent change in the foundry or furnace coke markets.

NEW ORLEANS

Harbor demands heavy. Exports curtailed because of threatening weather at this period of the year. Severe car shortage impending.

Sawmills were among the largest buyers of steam grades during the past week. Most of the mills in this territory use coal as fuel rather than wood, as they are mostly located on rivers where delivery is cheap. Harbor demands were again heavy. With the large crop movement soon to begin and with the prospect of heavier exports than ever before, local dealers are preparing for an unusual demand from shipping interests. The only exports of coal during the week were to Ceiba and Tela, Honduras. Coal shipments to Caribbean points are curtailed as much as possible at this time of year, owing to the hurricane seasons.

While the railroads are still filling orders for cars with reasonable promptness there is plenty of evidence of the approach of an unusually severe car shortage. Alabama stock continues to be moved in as fast as possible. Unusually heavy demands for coal from Texas points is calling for many cars and every effort is being made to get these orders off. No changes in quotations were made during the week.

CHICAGO

Strong demand for smokeless coals and advances in price already made will probably be followed by others. Quotations on screenings have dropped. A scarcity of smokeless lump and egg is reported. The anthracite market is stronger and there is an increasing volume of orders for coke.

Demand for domestic coal, especially the Western variety, is improving steadily. Franklin County operators have advanced their prices to $1.60 a ton, f.o.b. mines, and a large volume of orders are being received at this figure. Carterville operators report a substantial increase in the demand for that coal, and during the next five months it is expected they will be exceptionally busy filling orders. Carterville lump and egg is selling at prices ranging from $1.40 to $1.50 f.o.b. the mines, and higher prices are anticipated.

There has been a marked decrease in the demand for screenings and prices have dropped from 10c. to 15c. a ton; this is attributed chiefly to an oversupply. A scarcity of smokeless lump and egg is reported. The circular price for August on that coal is $2.25, but what little of it appears upon the spot market commands $2.50 and in some instances sales at $2.65 have been recorded. An unusual demand prevails for smokeless mine-run and it is believed in some quarters that there will be a shortage of that fuel within the next four months. This applies not only to the smokeless coals of West Virginia, but also to the low volatile central Pennsylvania grades.

According to a number of dealers, there has been a distinct betterment in the anthracite market and the demand for coke is steadily growing.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$ 2.07	$2.45@2.65	$2.27	
Steam lump	1.87@1.97		2.07	
Egg		2.45@2.65		$4.30@4.55
Mine-run	1.82@1.92	2.30	1.87	3.55@3.65
Screenings	1.42@1.52	1.65@1.85	1.42@1.52	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-product, egg, stove and nut, $4.75@4.85; gas house, $4.65@4.75.

DETROIT, MICH.

West Virginia coal in strong demand and market becoming steadily broader. Car shortage quite acute. Prices directly controlled by the supply, which is limited.

Bituminous—The shortage of railroad cars is the main feature of the local situation, and the trade is of the opinion that there will be an unprecedented shortage the coming fall; this is due to the fact that there was no relaxation during the summer, the demand having been insistent and the consumption heavy throughout the entire season. Slack is the only easy department in the trade, and, while there is no surplus, there are at the same time no rush orders.

As a result of the increased buying and the heavy consumption, prices are stronger on all grades. The first of September will probably see gas-coal quotations on the basis of $1.40 to $1.50 for three-quarter lump. The smokeless coals are practically all sold up, and are very firm. The domestic trade is unusually strong, lump and egg having advanced from $1.65 to $1.75 with the supply short; dealers who have failed to purchase their requirements of this grade will be in a serious situation when the fall demand opens up. The Pocahontas domestic coals are particularly scarce, lump and egg now being quotable at $2.25, while it is freely predicted that they will advance to $2.50 or $2.75 in September.

The local market is now quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.75	....	$1.60	....	....	$2.25	$2.25
Egg	1.75	....	1.60	....	....	2.25	2.25
Steam lump	1.50	....	....	....	....	....	....
¾-in. lump	1.35	$1.35	1.25	$1.25	$1.25	....	....
Mine-run	1.20	1.20	1.20	1.20	1.20	1.50	....
Slack	1.00	1.00	0.65	0.65	0.65	....	....

Anthracite—The local anthracite market is steady with prices firm, due probably to the prospective car shortage. The local demand is in excess of the arrivals and premiums of 25c. have been asked in a few cases on egg and stove.

ST. LOUIS, MO.

Steam trade weakening and indications are it will continue. Domestic market stronger, and coal actually scarce. Car shortage reported on practically all roads. This will have a tendency to enliven the market.

The warm weather has not affected the rising market, as far as domestic sizes are concerned; as a matter of fact, coal has been in demand during the past week from the high-grade fields, with a decided shortage. The screenings market continues to drop, Carterville now being quoted at about 30c., with Standard grades at 25@30c. By the first or fifteenth of September, Carterville screenings will be down to about 15@25c., and the Standard operators will be lucky if they do not have to pay the railroad companies to dispose of their screenings; the market is absolutely demoralized, and will likely continue so until about November. Of course, this means a sharp advance in screened sizes, and all mines are from one to two weeks behind on the shipments of lump and egg.

The car shortage is getting serious on practically all the roads in the high-grade fields, and indications are that it will make itself felt to a greater extent within the next 30 days than ever before. The Standard market is coming into its own, as far as the screened sizes are concerned, but steam coal is going backward.

Anthracite is moving slowly, with more coke on the market than there is call for. Very little smokeless is coming in and there is not likely to be any if the outside market continues to soar, as St. Louis will not pay the price.

The prevailing circular is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.95@1.00
3-in. lump	....	....	$1.25	....

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

The following is comparative statement of the anthracite shipments for July and the first seven months, of the years 1912-13, in long tons:

	July		7 Months			
	1913	1912	1913	%	1912	%
Phila. & Reading	902,763	1,217,892	7,761,147	19.24	6,479,227	20.01
Lehigh Valley	1,011,987	1,144,678	7,604,118	18.85	5,857,344	18.09
Cent. R.R. N. J.	775.550	865,618	5,351,214	13.27	4,237,708	13.08
Del. Lack. & West	871,677	883,312	5,661,037	14.03	4,600,896	14.21
Del. & Hudson	589,589	687,843	4,094,128	10.15	3,261,055	10.07
Pennsylvania	439,912	545,655	3,607,018	9.94	2,900,546	8.96
Erie	683,161	708,568	4,762,953	11.81	3,876,540	11.91
Ont. & Western	213,213	231,587	1,498,091	3.71	1,169,246	3.70
Total	5,487,852	6,265,153	40,339,706	100,00	32,382,132	100.00

Stocks at Tide on July 31 were 537,404 tons, an increase of 4375 tons. Stocks on same date of previous years were:

1907.	1908.	1909	1910	1911	1912	1913
645,030	886,653	1,006,195	896,064	826,396	380,088	537,404

LAKE SHIPMENTS

Anthracite Shipments through the Sault canals for the current year to Aug. 1 were 1,425,554 tons as compared with 505,225 tons for the same period last year.

Bituminous Shipments for the same periods were: 7,986,881 for the current year as compared with 5,981,229 in 1912, making gross of 9.412,435 for 1913 and 6,486,454 in 1912.

THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Aug. 1, as follows:

	Surplus	Shortage	Net*
New England Lines	124	144	20
N. Y.; New Jersey, Del.; Maryland; Eastern Penn.	1,024	300	**724**
Ohio; Indiana; Michigan; Western Pennsylvania	340	1,263	923
West Virginia, Virginia, North & South Carolina	709	1,612	903
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	150	425	275
Iowa, Illinois, Wis., Minn.; North & South Dakota	1,556	135	**1,421**
Montana, Wyoming, Nebraska	202	0	**202**
Kansas, Colorado, Missouri, Arkansas, Oklahoma	2,486	25	**2,461**
Texas, Louisiana, New Mexico	195	53	**142**
Oregon, Idaho, California, Arizona	2,024	72	**1,952**
Canadian Lines	0	0	0
Totals	8,810	4,029	**4,781**

*__Bold face__ type indicate a surplus.

FOREIGN MARKETS

GREAT BRITAIN

Aug. 1.—In view of the nearness of the August holidays, business is very quiet and prices are unchanged as follows:

Best Welsh steam	$4.80@5.04	Best Monmouthshires	$4.08@4.20
Best seconds	4.56@4.68	Seconds	3.96@4.02
Seconds	4.32@4.50	Best Cardiff smalls	2.46@2.52
Best dry coals	4.32@4.56	Seconds	2.34@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

British Exports—The following is a comparative statement of British exports for June and the first six months of the last three years, in long tons:

	June		6 Months		
	1912	1913	1911	1912	1913
Anthracite	189,973	218,814	1,169,675	974,193	1,407,090
Steam	3,928,199	4,397,791	22,985,294	18,720,167	26,034,247
Gas	1,161,590	986,510	5,074,073	4,487,837	5,510,405
Household	154,856	144,792	713,568	640,455	855,375
Other sorts	322,026	258,503	1,551,349	1,350,671	1,719,118
Total	5,756,644	6,006,410	31,493,959	26,173,323	35,526,235
Coke	51,139	75,336	462,559	388,108	499,670
Manufactured fuel	108,649	185,162	851,867	635,283	1,022,232
Grand total	5,916,432	6,266,908	32,808,385	27,196,714	37,048,137
Bunker coal	1,561,215	1,721,016	....	8,125,897	10,087,037

FRANCE

French imports and exports for the first five months of this year and last year were as follows:

	Imports		Exports	
	1913	1912	1913	1912
Coal	7,543,700	5,708,100	583,299	929,194
Coke	1,389,800	1,086,500	97,021	67,618
Briquettes	439,900	447,900	74,091	87,662

BELGIUM

The following are the Belgium imports and exports for the six months of the current year:

	Exports		Imports	
	1912 Tons	1913 Tons	1912 Tons	1913 Tons
Coal	2,451,753	2,400,839	3,884,851	4,482,544
Coke	463,406	520,291	454,372	610,361
Briquettes	338,828	282,969	201,295	236,557

EGYPT

Coal imports into Egypt for the year of 1912 amounted to 7,783,490 tons, as compared with 6,486,214 tons in 1911. The principal shippers were England, which furnished 89%, the United States with 6%, and Germany with 4%.

SPANISH IMPORTS

Coal imports into Spain for the five months to May 31 of the current year were 1,161,841 metric tons, as compared with 883,372 tons for the same period last year. Coke imports for this period of the current year were 156,495 tons as compared with 169,516 tons for the same period last year.

COAL FREIGHT DECISIONS

Suspension Docket No. 196—Switching Charges at Chicago (Chicago, Milwaukee & St. Paul Ry.).

1. Coal consigned to stations on the Chicago, Milwaukee & St. Paul Railway in Chicago is delivered to that carrier at Galewood, a station on its rails within the switching limits of Chicago. Heretofore the Chicago, Milwaukee & St. Paul has received for its service from Galewood $4 per car out of the joint rate from the mines, plus 10c. per ton on all excess over a given weight from the shipper. It now demands 20c. per ton. The carriers to Chicago contend that they cannot afford to absorb the additional amount over the present $4 per car and accordingly filed tariffs in cancellation of the joint rates, leaving the shipper to pay the Chicago rate plus the 20c. per ton now demanded by the Milwaukee, minus, however, the $4 per car which the carriers from the mines are willing to continue to absorb. **Held:** That the resulting advance in the rate to the shipper is not justified and the proposed tariffs should be canceled.
2. Switching conditions in Chicago leading up to the establishment of the present basis of charges and absorptions in the Chicago switching district, as published in the Lowrey traiff, discussed. **Opinion No. 2314.**

I. C. C. No. 3538—Consolidation Coal Co. (of Maryland) vs. Baltimore & Ohio R.R.

Allegation that unreasonable charges result from the initial carrier's failure to furnish cars of the capacity ordered by shipper not sustained. **Opinion No. 2318.**

I. C. C. No. 4480—Shoal Creek Coal Co. vs. Toledo, St. Louis & Western R.R.

Advances in rates on bituminous coal from Panama, Ill., mines to Burlington, Fort Madison, and Keokuk, Iowa, not justified by defendants. **Opinion No. 2319.**

I. C. C. No. 3854—Coke Producers Association (Connellsville) vs. Baltimore & Ohio R.R.

Rates on coke in carloads from the Connellsville producing region of Pennsylvania to various destinations are attacked as unreasonable per se, unjustly discriminatory, and unduly preferential; **Held:**

1. That the rates to Youngstown, Canton, Cleveland and Toledo, Ohio; North Cornwall, Robesonia, Reading and Philadelphia, Penn.; Baltimore, Md.; and Newark, N. J., are unreasonable per se.
2. That the present relationship of rates as between the Connellsville district and the Fairmont district in West Virginia is not unduly discriminatory against Connellsville or unduly preferential to Fairmont and must be maintained.
3. That participation by defendants in through rates from West Virginia and Tennessee fields, which yield lower earnings per ton-mile than their rates from the Connellsville field, is, under the conditions of competition between carriers which defendants cannot control, neither unduly discriminatory nor unduly preferential. **Opinion No. 2324.**

I. C. C. No. 3998—Memphis (Tenn.) Freight Bureau vs. Louisville & Nashville R.R.

Rates of $1.10 per ton on coal from western Kentucky and Alabama mines not found to be unreasonable. Complaint dismissied. **Opinion No. 2229.**

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending Aug. 9:

Stocks	Week's Range High	Week's Range Low	Week's Range Last	Year's Range High	Year's Range Low

No Important Dividends were announced during the week.

Rocky Mountain Fuel Co. (Denver)—This company, reincorporated in Wyoming, has arranged to increase its capital stock from $8,000,000 to $10,000,000 preparatory to making an issue of $10,000,000 new bonds, of which $4,000,000 will be reserved to retire the $4,000,000 5% bonds of 1911, and the remainder will be used for extensions and additions, as required.

American Coal Products Co.—This concern was incorporated under the laws of New Jersey, Feb. 6, 1903, and owns and operates, through its subsidiaries, some forty plants for the manufacture of coal products, which are scattered in 37 cities of the United States and Canada. The company owns all the stock of the United Coke & Gas Co. and nearly all of the stock of the Barrett Manufacturing Co.; also has an interest in the United Coke & Gas Co., which took over the by-product, coke ovens and other patents comprising the Otto, Hoffman and United Otto system of construction.

Texas & Pacific Coal Co.—This concern owns 60,000 acres of coal land in Texas and on Apr. 20, 1910, stockholders voted to increase authorized stock from $2,500,000 to $3,500,000, but to June, 1912, no new stock had been issued. The company has been declaring dividends at about the rate of 1½% per quarter, regularly.

The Alabama Consolidated Coal & Iron Co.—The reorganization plans of this company provides for an assessment of $30 per share on preferred and $15 on the common. It is also proposed to issue $1,000,000 of 6% 20-year bonds of which $550,000 will be sold which, together with the assessment, will be used for paying off the indebtedness of $1,150,000; the new capitalization will be $7,869,000 as against $6,969,000 as at present.

COAL AGE

Westinghouse Motors Driving Pumps in a Mine

Westinghouse Motors for Mine Pumps

are so designed that they will operate satisfactorily under the most exacting conditions of the service for which they are intended.

All parts subject to stress and wear are much stronger and more reliable than the needs of the service require and will last for years. They are extremely simple in construction and are easily inspected and renewed.

If the service requires, motors with moisture proof insulation can be furnished, or motors can be provided with splash proof covers to afford protection from the drip. They will operate successfully up to 190 degrees Fahrenheit, and will withstand rapid changes in temperature without injury.

Full information on request.

The Value Of A Trademark

The Weekly Ad-Talk Page

Many times advertising salesmen have had their prospective customers say, "Not yet! I believe that my machine is one of the best on earth for its purpose. It's the result of years of thought and work, but it has just one defect, a slight one, but until that's eliminated I won't advertise.

"I could sell many of them through your paper—but they wouldn't stay sold.

"I couldn't get a single repeat order nor an order through the recommendation of a user; and you know as well as I do that my advertising would prove a failure unless my goods made good.

"In brief, I can't afford to put my trademark on this machine and advertise it because it has not yet reached the *standard* which our trademark represents."

There's an illuminating point in those remarks for every buyer.

When a manufacturer adopts and advertises a trademark he guards it jealously. For him it possesses a living, breathing personality—an individuality. It is *himself*—his aims, his objects, his ideals.

He knows that, properly advertised and lived up to, that trademark becomes the most valuable asset in his business.

He knows that, once well known and established, the "good-will" represented by that trademark will bring a greater price than his factory, his equipment, his office furniture, the office cat and the office boy combined.

If you doubt that, try to buy the right to do business as jewellers and silversmiths under the name of Tiffany & Co.

Their enormous stock of precious stones, their objects of silver and gold are not worth one part of the value of the simple firm name.

When a manufacturer trademarks a machine he sets upon it the seal of his belief in it.

Then he spends thousands to advertise it with the belief that the *repeat orders* will pay him for his advertising investment. He knows the machine from A to Izzard—how it will work under all manner of conditions.

This development work is costly to him, but he knows it is necessary.

So he tries it out, works over it, experiments in all directions until he knows it is right.

Then he advertises.

Under these circumstances is it to be wondered at that goods continuously advertised are *reliable*?

Or can there be any doubt that it *pays* to read advertisements and buy advertised goods?

A trademark is not necessarily a picture nor a "slogan," nor does it necessarily, in the sense we refer to it, have to bear the word "Trademark."

It may be just the name of the firm.

Honest firms are not putting their name onto dishonest goods.

And dishonest firms are not doing much advertising. They can't.

Suppose, for instance, that a concern advertising in Coal Age were, through some oversight on the part of their advertising writer, to make a technical misstatement in their advertisement.

How long would it take the well informed readers to discover the error and flood the editorial department with letters?

We know because it has happened.

And advertisers know it, too. None of them is looking for such unfavorable publicity.

The "white light that beats upon a throne" isn't a circumstance to the flooding brilliancy surrounding advertised goods.

It is your measure of protection when you go into the market to buy.

COAL AGE

Vol. 4 NEW YORK, AUGUST 23, 1913 No. 8

"There lived an old woman in Gath
Who threw her child out with the bath."

A nonsense jingle say you—satire say we.

For example:

You are one of the fellows who honor the scriptural injunction "Love thy neighbor as thyself." If your "buddie" goes broke, your purse is open to him, if he gets sick your time is at his disposal, if he meets with an accident in the mine you are willing to risk your life, if need be, to aid in his rescue, if he should die you take the lead toward giving him proper burial and his family may lean on you for advice and assistance at any time.

But—. Time and again you've been warned not to do certain things, you've been told that to do so is criminal carelessness; to make the thing more impressive, if possible, you've been told that 80 percent. of all accidents in mines are due to negligence and the greater percentage at that to the carelessness of others than the ones who are the victims. And yet in spite of all these facts, you become so self centered at times (like the woman from Gath), and so anxious to finish certain work that you throw caution to the winds and shortcut your tasks in spite of the danger to yourself and to others. Even if your own son be in the pit, you do not for a moment allow that fact to influence you.

Here's a paradox in human nature: Men willingly give hours of time to relieving distress, but often refuse minutes toward preventing it. Why? Probably because they do not realize what is required.

We've reached a point in safety-first campaigns where little more progress can be hoped for until some one hits on an effective way of making coal workers realize that the man who deliberately risks his own life is as much of an enemy to mankind as the one who is willing to commit murder.

If you cannot see satire written all over the "Gath" jingle, it's because you do not realize that it is possible for parents to become so self centered that they can forget their own children. The lesson of the satire is wasted because you refuse to see anything but the child and you insist that every mother loves her offspring. In fact, you take the same position that the average man takes when we load him down with "don'ts." He seems to think that we are trying to persuade him to love his neighbor and he resents this because he is positive that he does love his neighbor.

Let's carry the jingle illustration a little further. Suppose some "well meaning society lady" learning about the mother from Gath should swallow the jingle whole and decide to make a trip into Gath to educate the mothers of that country as to the sinfulness of throwing children out with the bath water. Would she be showered with gratitude? We think not.

Much well intended effort has been wasted on the miner. Let's not hold that against him. Nor should we despair. Surely men who are capable of the heroism displayed after most mine explosions will not balk at a few rules of discipline unless they are approached on the blind side.

IDEAS AND SUGGESTIONS

The Salaried Man

By Josiah Keely*

The word "hustle" has been worked overtime in describing American methods of doing things. For a long time the coal business was "hustled." Then "efficiency" came in for a large share of attention, and is still used in a vague sort of way to describe intelligent hustling. But in spite of improved machinery, new methods, and highly organized corps of officials, many people look back to the early days when the output was greater and the cost less.

You ask operators the reasons and they will tell you that other industries have attracted their good miners, that labor unions have taken away the individual efforts of their workmen, that there is a shortage of labor, that the quality of service has depreciated, and that much of the old time hustle has been absorbed in competition, all of which may be in part true.

Probably little is to be gained by reviewing the past, but the further back we go the nearer together we find the operator and the miner. In fact, we might say that in the beginning the miner was the operator, but the coal industry has developed until the operator is a syndicate and the system of operating is a collection of jobs at one end and a handful of miners at the other, with much lost motion among the holders of company positions.

Stockholders Are Interested in Dividends

The stockholders are naturally more interested in dividends than in coal; the managers are holding their positions by virtue of their ability to produce dividends; the heads of the departments draw salaries in proportion to their influence with various interests; the division superintendents sometimes visit the mines but oftener are more concerned with reports, high-priced experts are employed and are interested in the expertness of their own particular work.

When it comes down to the mine superintendent, he is the coal getter, but delegates his authority variously. He is supposed to be working under instructions—instructions from the heads of departments, instructions from the division superintendents, instructions from the experts, but always instructions. If he goes counter to said instructions and "gets away with it," he is often forgiven and sometimes promoted. If he disobeys and fails to accomplish results, off goes his head. If he follows instructions not wisely but too well, and conditions, or his manner of execution, preclude results, he is straightway marked for the guillotine.

The mine foreman and other job holders manage from day to day as necessity demands, sometimes complaining of breakdowns and lack of material, and sometimes anathematizing the lazy, perverse miners. It is the toiler whose efforts are cumulative that still sometimes manifests the traditional hustle. True, he looks forward to a season of rest when he may enjoy his accumulations, but he rarely feels that he has arrived at that goal.

On the other hand, the job-holder having this same dream of a period of ease, sooner or later imagines that the time has come for him to hold his position by virtue of long service. Your trackboss must at one time have been something more than the average wage earner, and, if his zeal had continued, he might have become assistant to the mine foreman; he may prove not even a good trackboss, he arrived after his first promotion.

The mine foreman has been a good workman, a good under boss, and starts in as a good pit-boss. Why, with this record, should he not get better? He has had a dream of rest, and, although he may be good enough to be retained for years, he has struck his gait as a job-holder and arrived.

The mine superintendent, of all men, must have at one time been a hustler. He has made good somewhere. He has had numerous promotions. He is a man with a record. The powers do not pick up just any sort of a man to experiment with as mine superintendent. He has now what most of his men consider the highest position to be attained. They have heard of the manager, but they see the mine superintendent in all his importance. He sometimes wears a white collar right on working days and calls the men of the main office by their first names. Then, why, in the prime of life, should he not make good and in turn be promoted?

Of course, there is the possibility of his having been overestimated, but the chances are that he has listened too often to the call of the job, has dreamed that dream of rest, and feels that, with family, with influence in the community, and with some association with the men higher up, he has arrived. He straightway sets him out a vineyard, plants a hedge; he takes unto himself horses, cattle and chickens. Feed is convenient, labor is handy, and the company store is well stocked with the necessities of life. He has perhaps served long and faithfully. He rests. True, he has activities; he may run a Sunday school, be a politician, a speculator, or a sport, but so far as the coal industry is concerned, he rests.

It is needless to follow the tendency up through bigger jobs where the vineyards and cows give place to automobiles and fine residences and where the innocent pastimes of peddling official influence and farming out company labor are forgotten in the excitement of big deals and subsidiary organizations.

The Toiler's Dream

Far be it from any of us to disclaim having listened to the call of the job, of having dreamed the toilers' dream, but when we pull apart the fabric of the modern coal syndicate with the job-holders at one end and the miners at the other, we are reminded of that old trick of the fragile woman of the circus, holding in one small hand the end of a pole which a dozen lusty farmer youths are trying to push down to the platform. The only sleight is that she has so arranged their hands on the pole that each is pushing against the other, while she holds the lever end.

---

*District superintendent, Acosta, Penn.

Nor can we make any claim to astuteness in so characterizing one of the weaknesses of the efficiency struggle in our larger coal operations. It may not even be a new way of appealing to job-holders for more ambition, but we believe that while coal is now paying our salaries at a loss over the early days, it might be paying even better incomes and larger dividends, if officials from mine foremen to managers could put off a little further in the future that time of rest and try for one more promotion before listening to the call of the job.

⁂

Some Practical Short Cuts

By Alexander Franklin

State mining laws invariably specify that foremen shall have a certain number of years practical experience in the mines. This is, of course, a desirable provision, but it must be remembered that experience is, after all, but one requisite for a position of responsibility. If the foreman lacks initiative or does not possess a nimble and active mind, capable of devising ways and means for meeting the continual unprecedented emergencies, his experience will count for little.

An instance of this kind came to my attention recently. In making a change in the ventilating system of a mine, it was found necessary to cover an overcast. A job of this kind is often difficult to handle satisfactorily because of the insufficient head room available. In this case the foreman remembered a lot of old discarded pipe which he ordered placed over the opening and covered with a layer of cement. The job proved economical, permanent and satisfactory in every respect, in addition to which, it also solved the problem of finding a disposal for the old pipe. While apparently simple enough in itself, this is, nevertheless, a good example of the effectiveness of a little headwork.

In this same mine another incident occurred showing how important economies can sometimes be effected by a little careful thinking. As is well known, the Pennsylvania mining law requires that no rooms be turned ahead of the ventilation except with the special permission of the inspector. In this case the entrymen laid wooden tracks inside of the last crosscut and these were used until it became necessary to put in a switch at the next breakthrough inside. The wooden track was then torn up and replaced with steel, so that when the machines made their cuttings for the room neck, they stood so high on the new track that it was invariably necessary to pay yardage for taking up the bottom.

The plan was finally evolved of turning the room immediately the entry had been driven far enough to accommodate the new work without crowding. Permission was accordingly obtained from the mine inspector, and the new system tried and found to present advantages.

In the first place the machinemen took a "side swipe" at the room neck while they were unloaded to make the entry cut, thus giving them an additional cutting without making an extra move. The entrymen could also be loading out of the room neck while the machinemen were cutting the entry, which obviated this customary period of idleness. As the cutting was made on the bottom the usual yardage paid for taking this up was eliminated. And finally when the steel track was laid all the switches for the rooms could be located at the same time and this work completed at one operation.

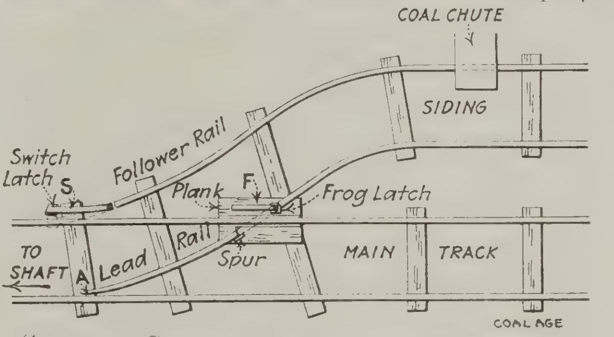
Doubtless many others have had similar experiences as these. The examples cited are simple and embody conditions in the everyday working of a mine. Nevertheless, they show the enormous discrepancy that may occur through the lack of a little headwork.

⁂

To Expedite Loading Cars on Light Pitches

By Ralph W. Mayer*

Much time is often lost by the motorman being required to wait for the loading of cars where the pitch of the seam is so small that the inclination of the loading chute is not sufficient to cause the coal to slide rapidly into the car. In such a case, much time is saved by laying a switch at each chute, as shown in the accompanying figure, so that the empty car can be set out on the switch.



Showing General Arrangement of Switch

In this arrangement, it is advisable to adopt a special form of switch that will leave the main track unbroken. Such a switch is shown in the figure. Instead of a frog there is a frog latch (*F*), which is pivoted on one end by a bolt. When swung into position across the rail of the main track, the other end of the latch is held in position by the spur shown in the figure, and is otherwise secured by a grooved plate spiked to the plank underneath the lead rail. The lead rail has a fixed point, as shown at *A*. The end of the lead rail at the frog latch is elevated sufficiently above the rail of the main track to accommodate the frog latch when laid across that rail.

The switch latch, on the follower rail, is also pivoted on one end by a bolt, as shown at *S*. When in position, this latch is swung over and laid on top of the rail of the main track where it is held in position by a slight projection on its underside.

This arrangement gives a clear main track, and the motorman is not required to wait while the car is being loaded. In most cases, a switchman cuts off the empty car at the switch, without the motor stopping. The miner then runs his loaded car onto the main track and sidetracks the empty car, which he loads at his leisure. The motorman returning gathers up the loaded cars standing on the main track.

⁂

The average annual earnings of all classes of labor in the mines of Germany in the year 1912 amounted to $340. In 1890 the average amounted to only $260, so that in the intervening 22 years, wages have increased a little over 30 per cent.

*Roslyn, Wash.

Tertiary Coal Fields of the Rio Grande

By B. L. Miller*

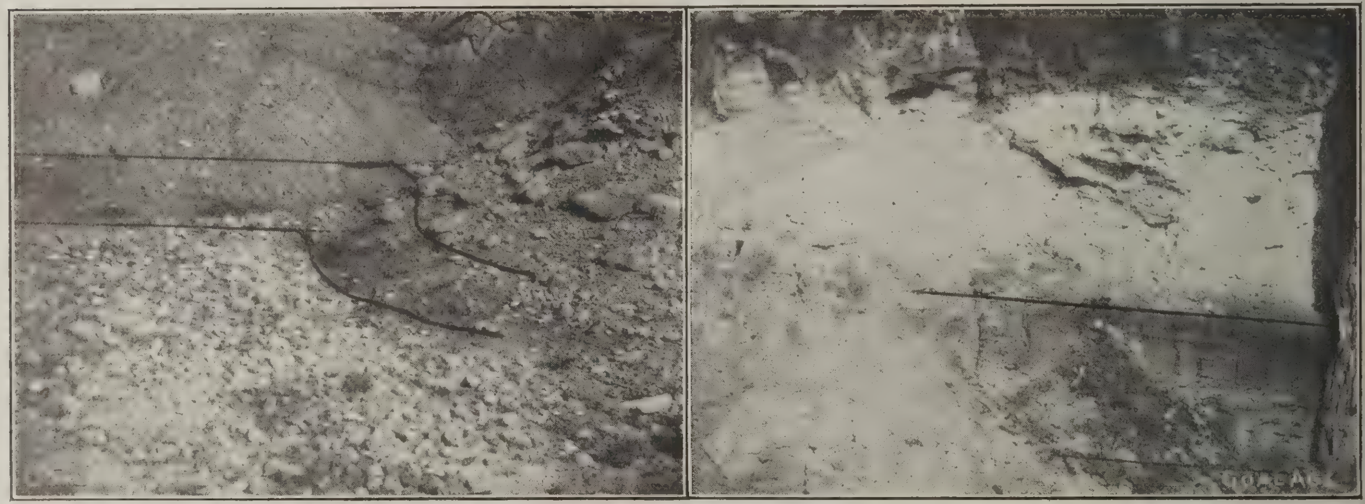
SYNOPSIS—The mines of the Laredo field are extracting at a profit coal which is from 24 to 30 in. thick. Prices of the fuel at the surface are three times those obtained for coal at Pennsylvania mines. The coal is not a lignite but has many points of resemblance to cannel coal.

⁂

The Southwestern portion of the United States and the greater part of Mexico have long been known to be markedly deficient in fuel supplies but until recent years this lack of fuel has been of little consequence. The small supply needed, when the country was occupied only by scattered ranchmen, was furnished by the scanty vegetable growth characteristic of semiarid regions. There were few towns of any considerable size and such as did exist contained no industries demanding large supplies of fuel, while the mild climate did not necessitate much artificial heat in the houses of the residents. Under these conditions the known deposits of coal occurring in these regions received little attention.

With the rapid industrial development which has recently been taking place in the Southwest a change has come and attention is being directed to new sources of fuel supply. Especially is this true in regard to southern Texas. Many new railroads have been built and more are projected and general agriculture is replacing the occupation of ranching which formerly was almost universal. The population is rapidly increasing and new industries of various kinds are being started, all of which require large supplies of fuel.

Fortunately for this district petroleum was discovered in Beaumont, Tex., some years ago and later in several other places in the same state and in Louisiana, while natural gas has also been found, although unfortunately in most places in rather small amounts. But the supplies of petroleum and natural gas from Texas and Louisiana have not kept pace with the increasing demand for fuel and southern Texas has been compelled to obtain large supplies of coal from Oklahoma, Arkansas, Colorado and New Mexico. The transportation charges on account of the long haulage, however, are excessive and would tend to discourage many industries. McAlester, Okla., coal retails in San Antonio at $10 per ton while crude petroleum is gradually advancing in price.



Outcrops of Coal along Espada Creek

Coal of Three Geologic Periods

Despite these conditions, Texas has thus far failed to take advantage of some of her coal deposits, though they appear promising enough. The coal fields of Texas are varied in character and rather widely distributed. They belong to the Carboniferous, Cretaceous and Eocene geologic periods and represent all the gradations between soft brown lignites and a good grade of bituminous coal. The Carboniferous coal fields lie in the north central portion of the state about 150 miles northwest of Austin. The Cretaceous coal deposits are confined to a rather small area in the vicinity of Eagle Pass. Both the Carboniferous and Cretaceous coals are bituminous in character.

The Eocene coal and lignite deposits are extensively developed in a broad belt extending across the state from the southwest corner of Arkansas to the Rio Grande. Except in Webb and Dimmitt counties all these carbonaceous deposits consist of lignite which has been worked in many different locations but not extensively in any one place. The supply is great but its deterioration in shipment has restricted it to local use. In Webb and Dimmitt counties, however, the Eocene contains deposits of a good grade of bituminous coal which possesses many of the characteristics of cannel. Only along the Rio Grande in the former locality has the coal been worked but it has been encountered in some well borings in the latter county. The purpose of this paper is to describe the geology of the Webb County coal deposits.

The Laredo Coal Field

The Webb County coal field borders the Rio Grande River and extends from a point about 15 miles above Laredo for a distance of 35 or more miles. The field is frequently called the "Laredo Coal Field" and a recent map of the United States Geological Survey locates it along the International and Great Northern R.R., extending about 10 miles on either side of Laredo along the river. This is incorrect, as the coal field lies entirely northwest of the location mentioned.

---

*Professor of economic and field geology, Lehigh University, South Bethlehem, Penn.

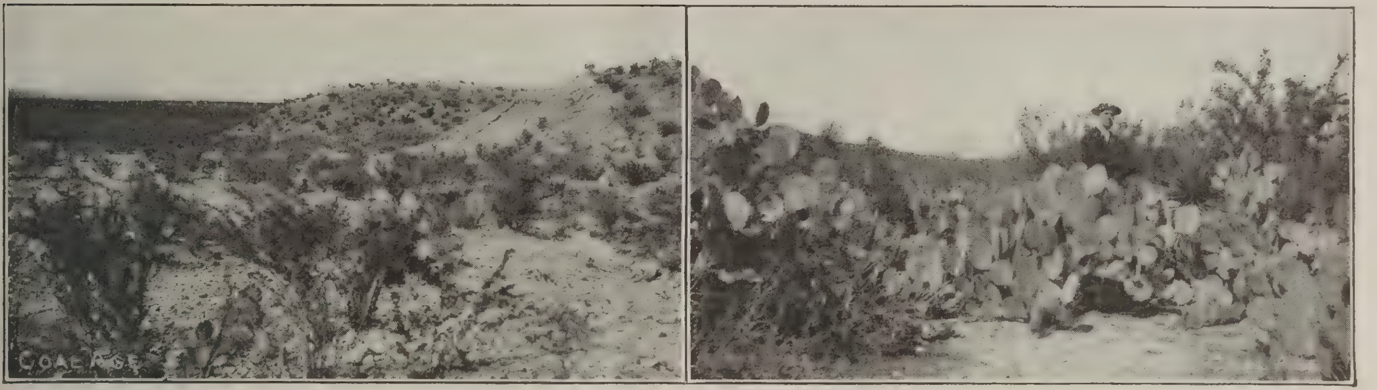
The coal of this region has long been known. It was mentioned in the report of the United States and Mexico Boundary Survey published in 1857 and by early travelers in that region. No use could be made of the coal, however, until a railroad was constructed. About 25 years ago the Rio Grande & Eagle Pass R.R. was built from Laredo into the lower portion of the field and mines have been in operation there ever since. At the present time two companies are operating in the district. The Cannel Coal Co. has mines at San José and Cannel and the Santo Tomas Coal Co. is operating at Minera.

The coal occurs in thin beds which outcrop in many places along the Rio Grande River and the creeks or arroyos that enter the river from the north. The country is semiarid and covered with a moderately heavy growth of cactus, mesquite and various other kinds of thorn-bearing plants. The arroyos that lead into the Rio Grande contain water in pools during most of the year but in order to obtain sufficient water for the cattle in the ranches, reservoirs (called tanks) are formed by the construction of dams across these waterways and the water impounded for use in the dry season.

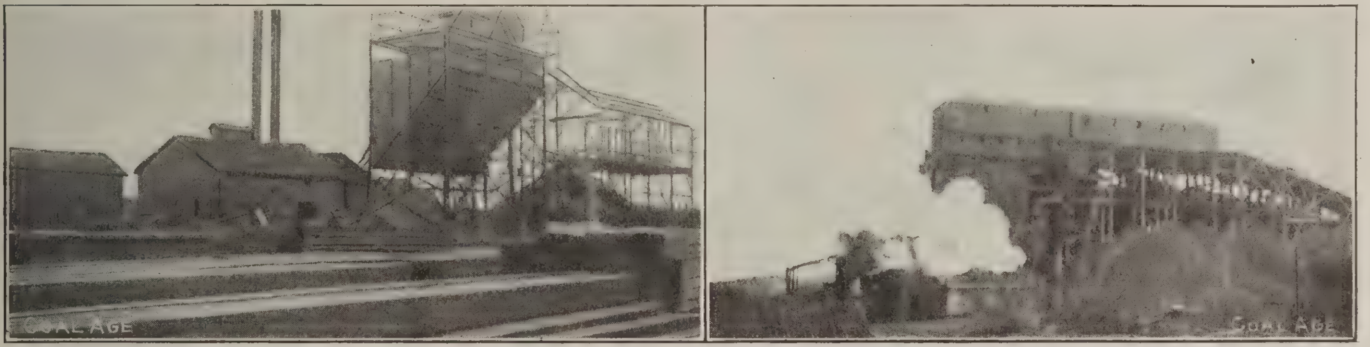
The Rocks Are Not Well Cemented

The principal rock of the region is a shallow-water cross-bedded, gray to buff sandstone that shows ripple-marked surfaces in many places. The grains of quartz are rather loosely cemented together and wind erosion is able to wear away the softer layers in exposed cliffs with ease. The harder layers are responsible for the flat-topped isolated hills that are seen in many places and also explain the rapids in the river. Interbedded with the sandstone layers are numerous beds of drab clay with occasional layers of ironstone and carbonaceous shale and coal. The clay contains much gypsum and on a clay slope crystals of clear selenite are abundant. Clay concretions both large and small are also common.

Limestone of a soft porous character outcrops in a few places several miles back from the river. Over almost the entire region with the exception of the steep slopes and the silt-covered river terraces there is a thin cover of quartz and quartzite pebbles among which are many pieces of petrified wood, jasper and chalcedony.



Typical Scenes in the Laredo Coal Fields



San José Mine of the Cannel Coal Co.

(New steel tipple now being erected at shaft.) (The old wood tipple with slope approach.)

In certain places the Rio Grande is bordered by high bluffs of the Eocene sandstone and clays that are in many places about 100 ft. high. In most places, however, there are two fine-silt terraces bordering the river. One of these rises only about 20 ft. above the water while the other lies at an elevation of about 40 ft. higher. In many places the lower one has been cut away and in some places both are now absent. These silt terraces extend back from the river to a distance of several miles in some places. They have attracted much attention in recent years since it has been found possible to grow a fine quality of Bermuda onions in them by means of irrigation. The water is pumped from the river for the purpose.

The Fuel Produced Is Not Lignite

The coal of the field has frequently been described as a brown coal or lignite. This is certainly not the case, as the coal has a luster and breaks with a glossy conchoidal fracture. It contains much volatile matter and has an oily appearance similar to cannel coal. It also resembles that fuel in the way it burns and it may properly be called semicannel. Dumble likened it to hardened asphaltum.

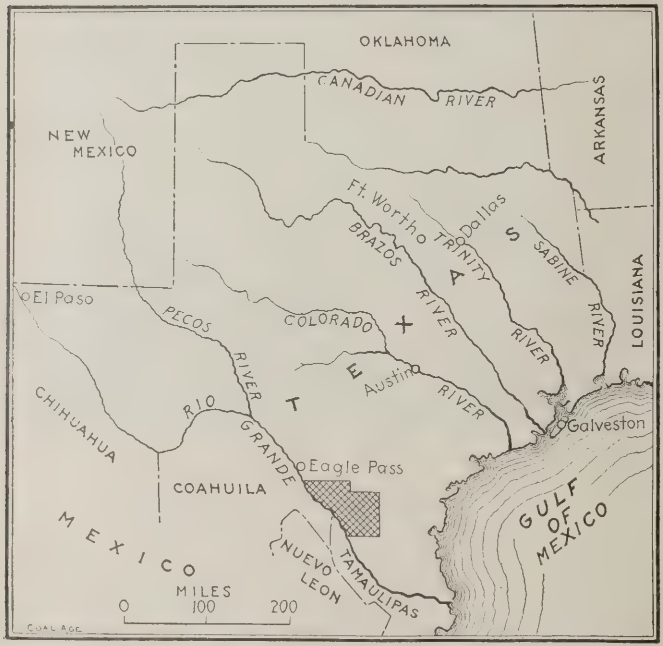
Thin seams of an intensely black glossy material resembling jet that breaks readily into angular fragments are occasionally found within the coal bed. On exposure to the air it weathers slowly and many of the outcrops show coal of a comparatively fresh appearance. It does not crumble readily so that there is little dust produced in the mining or shipping of the fuel.

The U. S. Geological Survey publishes the following analyses, made by S. H. Worrell, of the coal from two of the present working mines:

ANALYSIS OF COALS IN WEBB COUNTY, TEXAS

Proximate analysis, dry				Ultimate analysis, dry					
Moisture	Volatile	Fixed Carbon	Ash	Carbon	Hydrogen	Oxygen	Nitrogen	Sulphur	B.t.u. dry
2.30	54.00	37.97	8.03	71.04	5.65	10.03	3.00	2.25	12,604
2.80	50.45	38.10	11.45	66.06	5.72	12.18	2.50	2.09	11,740

The coal comes to the surface in the tributary arroyos of the Rio Grande for a distance of about five miles from their mouths. A dip of about 1 deg. to 2 deg. northeastwardly causes the coal beds to disappear from view farther to the northeast. The strike of the coal beds and associated sandstones, while not constant, is approximately parallel to the course of the Rio Grande.



THE STATE OF TEXAS, WITH WEBB COUNTY CROSS-HATCHED

The coal outcrops in a few places on the Mexican side of the boundary and an attempt was made to mine it at one time at a point opposite Minera. Much money was expended in building a railroad from Nuevo Laredo and in equipping a plant but the coal bed was found to dip beneath the river and not to be present on the Mexican side in sufficient quantities to permit operation.

In most places there are several beds of coal, the thicker ones of which are continuous over large areas. The thinner beds are less persistent and in places can be seen to die out by passing into carbonaceous shale. Occasionally thin lenses of shale are also encountered within the coal bed but these are seldom persistent or thick.

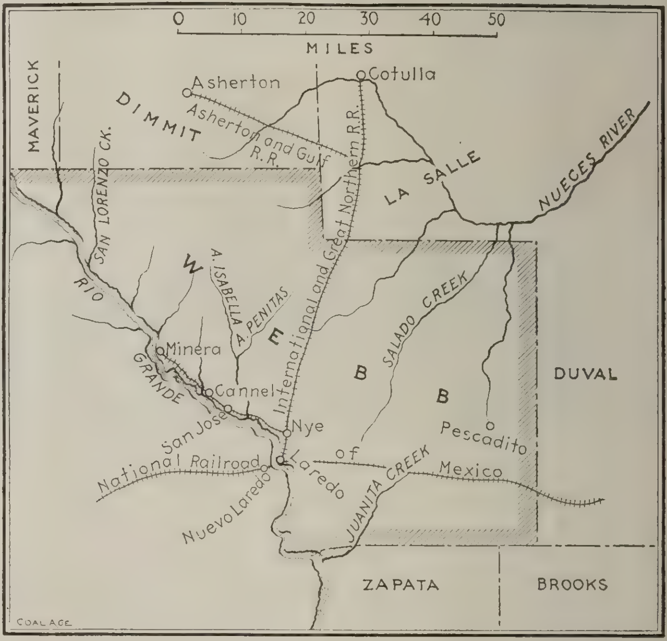
Slickensides in Roof and Small Faults in Coal

The roof of the coal is in most places a clay or clay shale, drab to black in color, and varying from a few inches to a few feet in thickness. Gray sandstone in most cases lies a few feet above the coal bed. The clay does not make a good permanent roof, as it tends to scale off and fall. In the working rooms of the mines few supports are used but considerable timbering is necessary in the entries.

The region has undergone some disturbance as shown by occasional normal faults, which are always small, the throw being seldom more than 1 or 2 ft. The largest fault observed was in the San José mine, and had a throw of about 4 ft. 6 in. In the vicinity of the faults the overlying clay layer shows much slickensiding, which makes the roof fall readily. But even in such places when the coal is blasted down, the roof does not fall with it so that as the coal as mined is unusually free from any adherent impurities.

Thin Coal and High Prices at Tipple

The coal beds are thin in comparison with those of the Eastern fields, and it would seem that they could not be worked with profit. When it is realized, however, that the Rio Grande coal at the mouth of the mine readily sells for three times as much as the best grade of bituminous coal in the coal fields of western Pennsylvania and West Virginia, and that the demand for it exceeds the supply it will readily be seen that the thickness demanded for profitable operation in western Pennsylvania is no criterion for southern Texas. The beds seldom contain more than 30 in. of clean coal, while most of them now worked scarcely exceed 24 in. In all probability beds considerably thinner can be worked with a fair margin of profit.



WEBB COUNTY, TEX., WHERE THE CANNEL COAL FIELD IS LOCATED

The mines at San José, the most easterly portion of the present working field, may be described as being typical of the region. At this point the Cannel Coal Co. is working two beds, one of which lies 70 ft. below the silt-covered bottom on which the town is built and the other lies 90 ft. lower. The upper bed is worked by means of an incline and shaft. A new steel tipple is just now being erected at the latter. This shaft is 216 ft. deep, and when it is completed both beds of coal will be worked from it. The thickness of the upper bed averages about 27 in., and that of the lower one about 24 in. The coal in the two beds is similar, the only essential differences being the presence of fewer faults in the lower bed.

WORKING CONDITIONS

The mine is operated by the room-and-pillar method, but it is planned to work the lower bed by the longwall system. The pillars vary from 40 to 80 ft., nearly all of which coal is recovered on the retreat. The mine is comparatively dry. Gas gives no trouble, and, consequently, little attention has been given to ventilation, with the result that parts of the mine are hot. Many of the miners wear only a cap and overalls while at work.

THE PRIMITIVE COAL-MINING TOWN OF SAN JOSÉ, TEX.

The mine is provided with electric haulage. The coal is hauled up to the top of the tipple where any pieces of slate that may have been included with the coal are picked out by hand as the coal is carried forward by a belt conveyor.

Mexican labor is used in the mines almost exclusively, and, on the whole, is fairly satisfactory.

As stated above, the present working coal mines of the Rio Grande are few in number and located near the eastern side of the coal basin. So far as it can be determined by the outcrops, coal of equally good quality and of approximately equal thickness is believed to underlie a much greater area farther up the river, and it is to be hoped that the working field will be extended so that the fuel situation in south Texas may be relieved.

⁂

The Fuel Resources of North Dakota

The production of lignite coal in North Dakota in 1912, according to E. W. Parker, of the U. S. Geological Survey, amounted to 499,480 short tons, valued at $765,105, compared with 502,628 short tons valued at $720,489 in 1911, this being the maximum output in the history of the state. The decrease of 3148 short tons in 1912 was so small as to possess no significance, while the increase of $44,616 in the value of the product indicates a satisfactory condition of the trade.

On account of its heavy percentage of moisture and rapid disintegration on exposure, lignite does not stand transportation well, and, consequently, its field of usefulness has been thus far limited. Its principal use has been to supply fuel to the settlers on the treeless plans in the western part of the state. For that purpose it has been mined in a crude way in almost every county in the lignite-bearing area. Commercial mines are situated on the lines of railway, and supply the towns of the state with fuel for domestic purposes and for use under steam boilers.

Lignite has, however, been found to be an excellent fuel for the generation of producer gas, and with the development of the manufacturing industries of the state, the extensive deposits of lignite in North Dakota will receive more attention as a source of power. It has been found that one ton of lignite in the gas producer will yield as much horsepower in internal-combustion engines as one ton of the best bituminous coal under boilers. As the gas producer and internal-combustion engine in large units come into more general use in the West as they are rapidly doing in the East, the hundreds of billions of tons of lignite known to underly North Dakota will be found to possess great potentialties in the settlement and economic development of the state.

⁂

Machinery at Panama Exposition

The idea governing the selection of exhibits in the machinery department of the Panama-Pacific International Exposition, which is to open on Feb. 20, 1915, is that they shall represent present-day practice and not be historical in character.

At the St. Louis exposition an extensive series of tests were carried out on gas producers, using lignite coal, and internal-combustion engines using this gas, the results of which were published by the government and were of interest to engineers.

At San Francisco it is intended to show the latest development of the steam turbine which was really the first kind of a steam engine to be invented, having been first built by Hero of Alexandria before the Christian Era.

The Diesel engine is also to be exhibited. This engine uses the heavy fuel oils, such as are produced in California. The power is obtained by injecting the oil into the cylinder after the air has been compressed to such an extent that its temperature has been raised above the ignition temperature of the oil. The thermal efficiency has reached 30 to 32 per cent., which is 2½ to 3 times that of the more economical types of steam engines.

It is hoped that an engine being tried out in England may also be exhibited. This engine gets its power from producer gas made from powdered coal, which is fed by a worm through tubular passages within the cylinder head, being heated at the same time by the exhaust gases.

The authorities of the exposition have been promised an exhibit of the Humphry gas pump, in which the expansive force of the exploded gas in each end of a V-cylinder acts on the water held in the curved part. A pump of a capacity of 50,000,000 gal. daily is now supplying water for London, and one pumping 150,000,000 gal. per day is to be installed in Germany.

Tipples of the Allegheny River Mining Co.

SYNOPSIS—Only three men are needed on top to operate each tipple though all are equipped with two dumps. The cars are pulled forward by power, and run by gravity to a bumping block. They are freed automatically from the latter one by one and proceed by gravity to the dump, where the coal is discharged and the car passes on to the kickback.

⁂

Three tipples of the Allegheny River Mining Co. in the western Pennsylvania district were equipped last year with mechanical devices for easy and precise delivery of loaded mine cars, one at a time, from the "trip" on the tipple approach, to and onto the "dump."

This work is done by two separate devices of a simple nature, a trip puller at the tipple entrance and an automatic stop and feeder just before the dump. The operation is rapid and economical of labor, and is conducive to safety of man and dump by keeping the cars always under perfect control.

The three mines outfitted in this way are the Chickasaw, near Rimerton; the Seminole, near New Bethlehem; and the Conifer, near a town of the same name, in Jefferson County. The Chickasaw and Seminole tipples were built to use the car-handling system, while at Conifer the equipment was installed in an old tipple, thus proving its adaptability to old as well as new equipment.

The illustrations show only the Chickasaw and Seminole tipples, which are essentially similar in arrangement and equipment. Both are double, with two dumps and corresponding sets of car-handling devices.

THE LOADED TRIP CAR PULLERS

Electric locomotives bring out trips of loaded mine cars and leave them on the double tracks of the tipple approach, Fig. 1. Thence they are drawn slowly forward onto the tipple floor, Fig. 2, by the trip pullers, one for each track. Here the attendant uncouples the cars so that as they pass the pullers they may run forward by gravity to the stops at the dumps.

Each trip puller consists of a strand of steel-bar link chain, of 12-in. pitch, carrying every 10 ft. a roller-supported dog of the knockover type, to engage the car axles. Both are driven from one 25-hp. motor and a main headshaft. Between the motor and the headshaft is a Webster steel-plate friction clutch, operated by a lever conveniently within reach of the attendant. Independent control of each puller is provided by a clutch in its geared drive from the main headshaft.

The pullers are each 19 ft. long on centers of sprocket wheels and are designed to haul trips of 40 cars, delivering them at the rate of four per minute. This gives, for the two tracks and dumps, a capacity of 480 cars per hour.

AUTOMATIC STOPS AT THE DUMPS

The cars released from the pullers run forward toward the dumps, but are checked by spring stops at the feeders. The number of cars held back by the stops may be as many as the space ahead of the pullers will permit. At the Allegheny River tipples, this distance is ample for several wagons.

The forward car is held by the stops while its predecessor is dumped. The dump operator releases the loads one at a time, each loaded car running forward by gravity, bumping the empty ahead off the dump and taking its own place there ready for dumping.

The incoming car depresses two triggers and thereby closes the bumping blocks in time to check and hold the car. The parts remain latched in this position until the car is to be released.

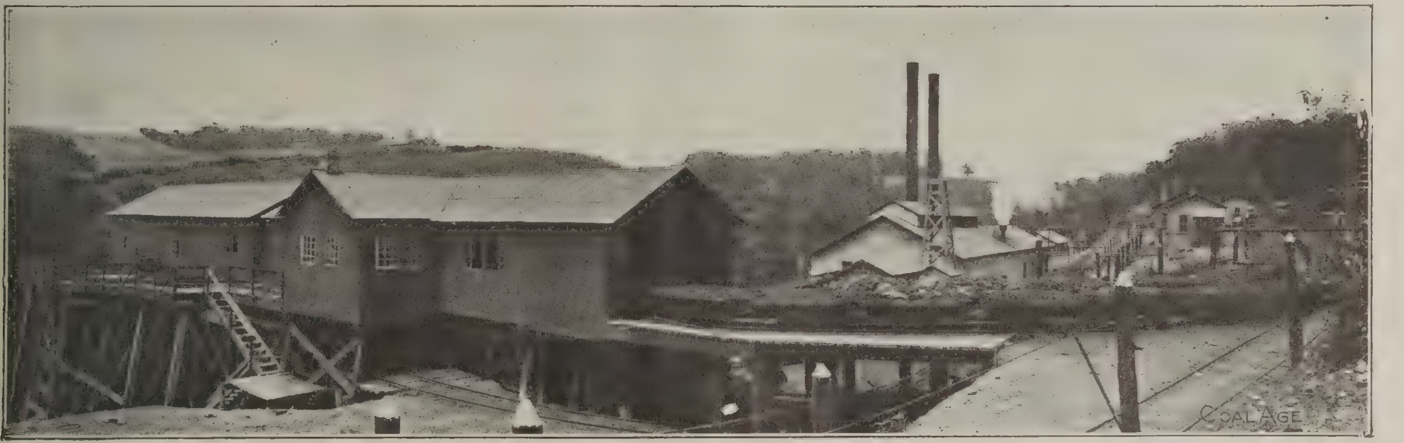

FIG. 1. TRIP ENTERING TIPPLE AND ABOUT TO BE DRAWN FORWARD BY THE TRIP PULLER

This may be done automatically or by the dump operator, by throwing a lever which opens the bumping blocks and raises the triggers. The car is then free to run forward, and the feeder is in form to check the next car.

INCREASED CAPACITY WITH REDUCED LABOR

The savings possible by use of this mechanical equipment are numerous. Actual operation requires only three men for a double tipple, one at the trip puller and one at each dump. At the Conifer mine, the installation of the one trip puller and two car feeders in the old tipple enable the company to operate with five less men than formerly.

By regularity and reliability of car handling the dumping capacity of the tipple is increased and a larger mine output thereby made possible. The feeder protects both the dump and the men from being injured by uncontrolled cars. Car feeders of this type are equally advantageous for caging cars in shaft mines, the operation being substantially the same as on the tipple floor. These feeders are patented by Dempey-Degener Co., Pittsburgh representatives of the Webster Manufacturing Company.

Belt Conveyor for Boiler Fuel

At each of these two new mines there is a Webster feature of interest—the conveyor for delivering slack coal from the tipple to the boiler room for steam fuel.

Slack from the tipple screens is delivered (by an inclined flight conveyor at Chickasaw) to a 14-in. belt conveyor, which extends through a covered runway, to the boiler house. A tripper, traveling an overhead track, may be set to take off the coal at any point and spout it to piles on the floor in front of the boilers.

The arrangement is simple in the extreme, and correspondingly easy of operation. The flight conveyor and the belt are both driven by one motor, which is controlled by the fireman. The coal is fed to the flight conveyor from a bin, kept filled by the tipplemen. Thus the power plant has its full supply always available, and the tipplemen can maintain the supply at convenience.

Large Acreage Restored to Public Domain

Six million acres of withdrawn public land were restored to entry during the months of May and June, upon approval by the Secretary of the Interior of the recommendations of the U. S. Geological Survey. This action was the result of examination and classification of the lands by the survey, those restored either having been found not to be valuable for power sites, reservoirs, coal, phosphate or potash deposits, or having been definitely valued as coal lands and rendered available for purchase under the coal-land law.

The total outstanding withdrawals on July 1 in all the public-land states amounted to 68,609,289 acres, of which more than 58,000,000 are in coal-land withdrawals. These lands are held pending classification by the Geological Survey, and as rapidly as they are found to be mineral bearing, they are either valued and placed on sale, as in the case of coal lands; definitely reserved pending appropriate legislation by congress to provide for their disposition (as in the case with potash or phosphate lands) or held subject to development, under departmental regulations (as in the case of water power or reservoir reservations); or if they are found to be nonmineral in character, they are restored to public interests. This work of valuation and classification is being prosecuted rapidly by the Geological Survey.

Advantages of the Steel Tie

Speaking at the West Virginia Coal Mining Institute, J. C. Evans summarized the advantages of the steel tie as follows:

The cost is less for steel than for wood ties when length of life is considered as well as first cost. It makes possible the use of the jumper rail. The track is kept true to gage, and the rails bend less under the load. As the rail rests on the floor, additional height is provided for the mine cars. No spikes or splice bars are required. The miners rarely object to laying their own track when steel ties are used and so save expense and delay. They are more willing to remove these ties when drawing pillars. When the cars are derailed they are more easily retracked. As a motorman can place enough ties on a car in a few minutes to support the rail in a room from end to end, both time and labor are saved by their use.

When the coal is thin, steel ties pay for themselves by reducing the necessity of taking up bottom or ripping top. No track gage or other tools are required except an axe and in one mine not even this is used. The difficulty of swinging a hammer makes it hard to lay track with wood ties in low coal. The wedges for steel-tie tracks are driven by a horizontal blow and lack of height is no drawback. Fewer ties are required. Steel ties last indefinitely while wood ties are seldom used more than twice. Reports show that the ties have been used six years with the percentage of loss small; practically none were worn out. Steel ties form inventory items, because they can be used again and again. Experienced trackmen are not needed to lay them. Steel ties take less storage room than wood and a miner can carry six at one time without special effort. The track can be laid and lifted in one-fourth of the time required to lay or lift track resting on wood ties.

Official Call for Meeting of the American Mining Congress

To bring about a better coöperation in the production, distribution and use of mineral wealth through discussion and deliberation, the Sixteenth Annual Session of the American Mining Congress is hereby called to meet at Philadelphia, Penn., October 20-24, 1913.

The convention will be composed of the members of the American Mining Congress, specially invited guests and duly accredited delegates appointed under the authority hereby extended for the appointment of delegates, as follows:

The President of United States may appoint ten delegates at large;

The Chief Executive of foreign nations may appoint ten delegates;

Governors of States and territories may each appoint ten delegates;

Mayors of cities and towns, Boards of County Supervisors, Boards of Trade, Chambers of Commerce, Mining Bureaus and Exchanges, Mining Organizations, Scientific Societies, Engineers' Associations and State Mining Schools, may appoint two delegates each.

We respectfully urge the early appointment of delegates on the basis above specified and that the name and postoffice address of each delegate so appointed be forwarded to the Secretary at 1031 Land Title Building, Philadelphia, Penn., at the earliest date possible, in order that such information may be furnished as will enable the delegate to consider in advance the subjects to be discussed and be better prepared to speak with intelligence and effect.

THE AMERICAN MINING CONGRESS.
By order of the Executive Committee.
DAVID W. BRUNTON, President.

JAMES F. CALLBREATH, Secretary.
Philadelphia, Penn., Aug. 15, 1913.

Difficulties of Mine Inspection

A number of instances have recently occurred that emphasize in a peculiar manner some of the difficulties encountered by mine inspectors who attempt to faithfully perform the duties of their office. The pathway is beset by numerous obstacles and pitfalls. The situation is a three-cornered proposition, involving the operator, the miner and the mine inspector, to say nothing of organizers working more for their own selfish ends than to safeguard the lives of miners or to increase the production of coal.

It is recently reported that charges are to be preferred by certain coal operators against State Mine Inspector Thomas H. Shaw, Midland, Ark. It is rumored that certain high officials of District No. 21, U. M. W. A., preferred another candidate than Mr. Shaw; and his recent appointment as state mine inspector has failed to meet with their approval. It is proposed to secure an injunction to restrain the mine inspector from officially exposing the true conditions existing in the mines of the state. We are glad to note that Mr. Shaw will stand by his guns and, as an honest man, invites investigation, depending on his 28 years of mining experience. The better class of miing men fully indorse his administration, believing that it will result in minimizing the loss of life, and increasing the health of the miner, while insuring the greater protection of mining property.

Recently this fearless mine inspector closed three mines and condemned two mining camps, owing to the unsanitary conditions existing therein. The closing of the mines, by order of the mine inspector, resulted in the matter being brought to the attention of the State Board of Health, and a conference was arranged between the state authorities, the operators and the miners. State Labor Commissioner J. C. Clary and Drs. Smith and Myers, respectively state and county health officers, approved the action of the mine inspector; and the conference resulted in a new light being thrown on the operation of mines. It was promptly agreed by the mine officials that the operators will coöperate with Inspector Shaw, and abide by his decision and action in improving conditions in the mines; the sanitation of the camps and water-supply. The meeting was harmonious in every respect, and productive of much good.

Two of the mines closed belonged to the largest companies operating in Arkansas, namely, the Central Coal & Coke Co., operating mines in Arkansas, Kansas, Missouri, Oklahoma and Wyoming; and the Western Coal & Mining Co., operating mines in Arkansas, Kansas, Illinois, Missouri and Oklahoma. The mines closed were shaft mine No. 26, Bonanza, and shaft mine No. 17, Jenny Lind, belonging respectively to the two companies just named; and a slope mine at Hartford, belonging to the Bolen-Darnell Coal Co.

Following are copies of notices sent by Mine Inspector Shaw to the mine operators, firebosses and miners, throughout the state.

TO MINE OPERATORS:

You are hereby notified that two entries must be made in compliance with the Act of Arkansas No. 225, Section 7, which reads as follows:

The owner, agent, lessee or operator of any coal mine in this state, if said mine is worked on the room-and-pillar plan, shall cause such work to be prosecuted in such mine in the following manner, to wit: Two entries parallel with each other must be driven for the ingress and egress of the air, and crosscuts must be made at intervals not to exceed forty feet apart. Where gas exists they shall be driven thirty feet apart or a crosscut be made at any other place ordered by the management. No room shall be turned inside the last crosscut.

Also Section 10, of same Act, which reads as follows:

DUTIES OF FIREBOSS:

In all mines where a fireboss is employed all working places and worked out places adjacent to working places shall be examined when it can be done, at least once a day, by a competent fireboss, whose duty it shall be to enter a report of existing conditions of such working place or worked out place, in a well bound book kept by him for that purpose, and all dangerous places that are marked out, shall be marked on a blackboard furnished by the company before any other employees enter the mine.

Also see Section 11 which provides that nothing but pure lard oil, where oil is used for lighting purposes, shall be used in any underground works in the main upcast, this section shall not apply to rope riders.

All violations of this act will be prosecuted.

TO MINERS:

All drill dust must be removed from the vicinity of shots and crosscut entries and all air courses must be made not less than seven feet wide. I have notified all mine foremen to not pay for such places unless these orders are obeyed.

TO SHOTFIRERS:

Do not fire any shots where a miner leaves drill dust. Refuse to fire shots in any dusty entry until the mine manager has the dust cleaned up and entries sprinkled. Refuse to fire any shots which you consider dangerous. I will stand between you and the company or the miners' organization in the matter of obeying this order.

THOMAS H. SHAW,
State Mine Inspector.

Midland, Ark.

Coal Shipping on the Great Lakes

By John W. Chamberlain*

SYNOPSIS—This article discusses the development of the coal shipping in detail on the different Lakes. Rail fuels are aggressive competitors at Lake Michigan ports but are practically negligible in the Lake Superior markets; the water movement into the Northwest is increasing rapidly.

⁂

Before leaving the subject of coal docks and other loading appliances it might be well to go over the outlay necessary to construct a water trestle, which is essentially the reason for the move to dispense with them. The trestle of the Philadelphia & Reading Coal & Iron Co., at Buffalo, the newest and presumably the most modern of all, required 180,000 cu.yd. of dredging, 38,000 lin. ft. of piling, 2,750,000 ft. board measure, of white pine and 360 tons of spikes, bolts, etc. It was built in 268 working days, is 1805 ft. in length, has 1316 ft. of water frontage, is equipped with 80 pockets of 6000 tons storage capacity and is capable of loading 10,000 tons daily.

The cost of handling is a vital problem and the recent inventions used in the iron trade are also applied in the coal shipping. Where it used to cost 50c. a ton to handle ore by wheelbarrow, the Brown hoist cut the cost down to 18c. and the Hulett clamshell hoist to 5c. a ton. It is doubtful if a further reduction can be effected, though it would be possible to reduce the breakage of coal in handling still further.

The history of the movement of coal differs in each lake. The Canadian government announces that it is preparing to enlarge the Welland Canal connecting Lakes Erie and Ontario to 30 ft. in depth and to provide locks 800 ft. long and 80 ft. wide. This would greatly stimulate the trade between Lake Ontario and the upper lakes. The Erie Barge Canal will also have its influence when completed.

Bituminous at the Lower Lake Ports

Quite an amount of bituminous coal now finds its way to Lake Ontario from the port of Erie, Penn., and the eastern ports of Ohio. At the same time the Pennsylvania Railroad is ambitious to build up the port of Sodus Point on Lake Ontario and appears willing to make rail rates that are competitive with the Erie-Ontario route. Lake traffic is, however, much influenced by the offering of freight both ways for vessels and one drawback to the Lake Ontario trade is the lack of down cargoes.

In the early history of the anthracite trade on Lake Erie there was a good demand at Sandusky, Toledo and Detroit. This trade has now been absorbed by the railroads. Buffalo ships a few thousand tons annually to Port Colborne at the head of the Welland Canal and receives varying, minor amounts from West Virginia through the port of Sandusky. Otherwise the Lake Erie coal traffic, both anthracite and bituminous, is practically all with the upper lakes. Buffalo has no other bituminous lake traffic.

Above Detroit the river ports are only a small factor in the coal trade. Some of them now receive only a cargo or two of anthracite a season, though the bituminous receipts sometimes run up to 50,000 tons. The same is true of the ports on Lake Huron. The Saginaw Bay ports once bought liberally, especially when they were heavy shippers of lumber, but partly on account of the disappearance of the lumber trade and still more since coal is produced in that section, the lake coal trade has fallen off. The port of Alpena, farthest north on Lake Huron, is increasing its traffic somewhat and since it has become the prospective Eastern terminus of a rail-

road to run across to Lake Michigan its importance in the coal and other trades will soon increase materially.

The Georgian Bay ports have never been large receivers of anthracite; a cargo or two a season has been the usual amount. This coal is often considered a luxury on account of the price and many localities, even where freights are low, do not feel able to pay the difference between it and bituminous. On the other hand the need of some fuel other than wood is becoming more pressing every year. Besides this quite a number of the Georgian Bay ports are termini of railroad lines, which, though they may get most of their fuel further east on their routes, are obliged to buy quite an amount of it at the western end. Parry Sound, for instance, received 330,000 tons, Owen Sound, 100,000 tons and Midland, 80,000 tons of bituminous in 1911.

Lake Michigan

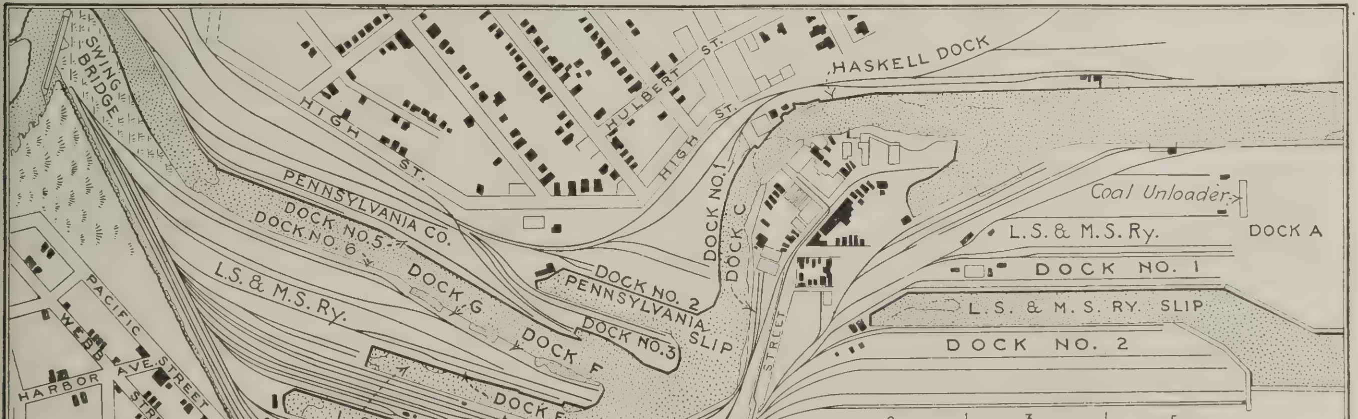
Lake Michigan ports were at one time greatly dependent on the lake fleet for coal and such is still the case with a few of the leading cities, especially if they are distributors Westward to any extent. This distributing territory is not extensive, as anthracite is not sold in much quantity either west or south of Minnesota, while the states west of the Mississippi now mine their own bituminous to a great extent. Still it will be a long time hence, if ever, that Milwaukee or Chicago gives up its coal trade by lake. The freight on anthracite by lake is a trifle, in comparison with the rail freight so that the bituminous mines of Pennsylvania, West Virginia and Ohio are able to compete with the mines of Illinois.

Lake carrying is also rapid and whether considered supplementary to the rail traffic or not it would be practically impossible to supply the territory west of Lake Michigan with coal all-rail. A lake steamer loads 10,000 tons of coal at Buffalo or Ashtabula at the rate of 1000 tons an hour and in three days is unloading it at the same rate on the farther side of Lake Michigan. For the railroads to deliver it at any such rate would be to practically shut off all other traffic on their lines.

The other Lake Michigan ports receive coal in only modest quantities though the aggregate, especially of bituminous, is large. Some of them take nearly half a million tons of soft coal by lake annually, but anthracite receipts are not heavy. Sheboygan, the chief minor port, receives about 250,000 tons of anthracite and 350,000 tons of bituminous by lake, annually. Local changes of late have reduced the lake trade in anthracite at Gladstone and Manitowoc materially. The east-shore ports are mostly supplied all-rail.

Lake Superior

Conditions on Lake Superior, as regards traffic with the lower lakes, are quite different from those in the



COAL AGE

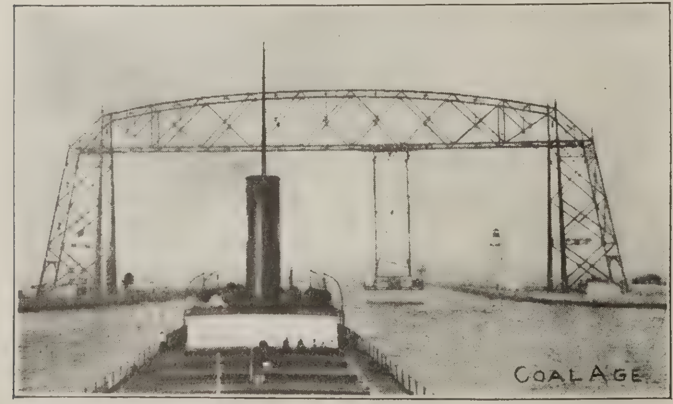
other lake districts. Lake Superior trades mainly with Lake Erie and with the Canadian ports from Georgian Bay to Montreal, the latter traffic being mainly in grain and package freight. An enormous amount of iron ore, grain and flour is shipped to Lake Erie, together with quite an amount of lumber, the return freight being mostly coal. As to what this traffic is the reports of the locks at the Sault will tell. The element of rail competition is almost entirely lacking. As a rule, even from the south-shore ports of Lake Superior the rail distances to Lake Erie are fully as great as by water, while from the north-shore ports, rail shipments are entirely prohibitive.

The distance from Chicago, at the head of Lake Michigan, is 540 miles by rail to Buffalo, while it is 880 by water, but the Lake Superior distances favor the water route. So it is imperative that the bulk of business eastward from Lake Superior be done by lake in the summer season. The Lake Erie ports take in all the ore and grain that will be needed till the next shipping season opens and send coal to Lake Superior on the same plan. While the coal is chiefly shipped to Superior and Duluth at the head of Lake Superior, an aggregate of 8,500,000 tons in a season, there is a large and growing trade of the same sort with other ports, particularly with Fort William and Port Arthur, the twin Canadian ports on the north shore, that feed the markets of Winnipeg and the Canadian Northwest. These two ports now receive more than 3,000,000 tons of bituminous and over 450,000 tons of anthracite by lake each season. The future of this traffic is also very bright as the adjoining country is developing rapidly.



Aerial Bridge at the Entrance to Duluth Harbor

There is also a healthy trade in coal by lake to ports on the south shore of Lake Superior, though this does not increase very fast. These south-shore ports received 70,000 tons of anthracite from Buffalo in 1912. The amount of bituminous is more than ten times that of anthracite. As to future trade there it will all depend on the prosperity of that district. The lumber business, which has been heavy for a long time, is falling off, but iron ore is still a great trade and agriculture ought to come in as the timber disappears. Outside territory to be supplied from these ports is not large as compared with those further north and west. There is a peculiar condition in the Portage Lake district, where prosperity and progress depend largely on the continuation of the copper production. The Portage Lake Canal, a short cut to the extreme upper Lake Superior and a saving of the dangerous route around Keweenaw Point, brings much tonnage to the Portage Lake district.

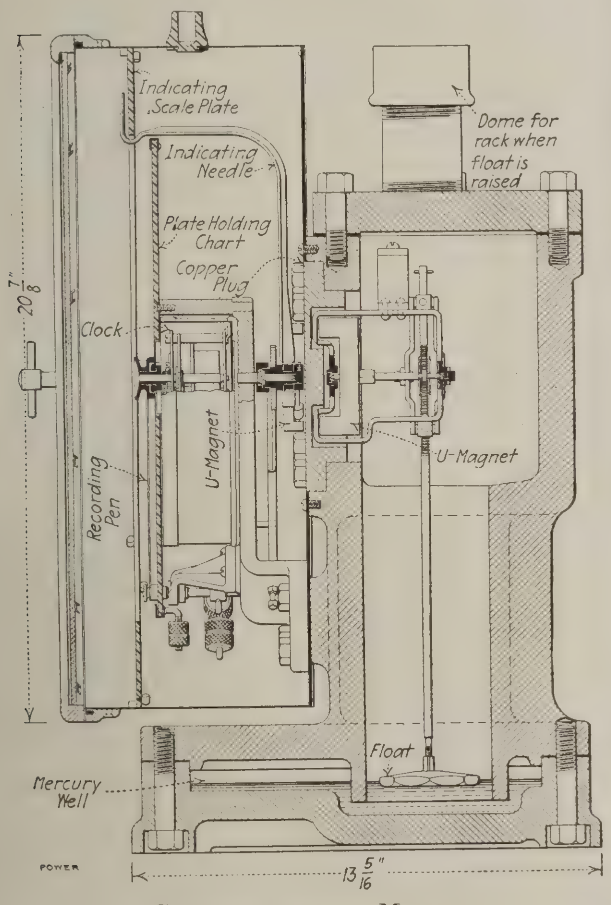
(To Be Continued)

POWER DEPARTMENT

An Improved Flow-Meter

In the large power plants of the present day the economical handling of steam, water, air or other fluids depends upon accurate information showing the total volume transmitted and its instantaneous rate of travel during any interval of time. Only within recent years has this subject received careful attention, and as a result the General Electric Co. has developed a flow-meter to prevent the enormous wastes which have been allowed to take place at many plants.



Section through Meter

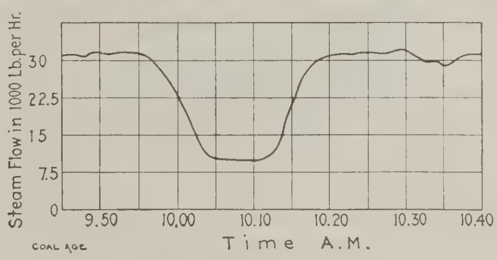
The instrument evolved, as may be seen in the illustrations is designed to meet the requirement of a strong mechanical meter, which can be used not only as a test instrument, but also as a permanent means for the continuous measurement of either liquids, gases or vapors.

The body of this flow-meter consists of an iron casting cored out to form one leg of a U-tube, as a reservoir for mercury, the other leg of the U-tube being formed by a pipe which opens into the reservoir. The pressure on the surface of the mercury varies with the rate of flow of the fluid being measured as will be explained later.

A float rests on the surface of the column of mercury in the body of the meter, and rises and falls with the corresponding changes in its elevation. This float is geared by rack and pinion to a horizontal shaft which carries a permanent horseshoe or U-shaped magnet, whose poles face a copper cap which closes the opening into the meter body. The remaining parts of the meter's mechanism are mounted on the outside of this copper cap.

A smaller magnet of opposite polarity to that within the body of the meter is mounted upon an external shaft whose center line is coincident with that of the internal shaft if same were extended through the copper cover. The two magnets thus face each other upon opposite sides of the copper sheet, and any movement of the larger, induces through the medium of the magnetic flux an equal and similar movement of the smaller, thus transmitting motion to its shaft without the necessity of piercing the wall of the meter body. The external shaft actuated by the smaller or sympathetic magnet moves the indicating needle and the recording pen through suitable mechanism.

The pressure which moves the column of mercury in the U-tube is obtained for pipes two inches and greater in diameter by inserting a modified form of Pitot tube termed a nozzle-plug directly into the pipeline, except in cases where it is desired to increase the flow at the point of metering, under which circumstances a special pipe reducer is provided. This can be done without seriously disturbing this pipeline. The special reducer above referred to is made of brass and has a long throat with rounded entrance terminating in a flange, which is inserted in a joint of the piping and is held in place in the same manner as a gasket. A special nozzle-plug is supplied with this pipe reducer.



Steam-Flow Curve

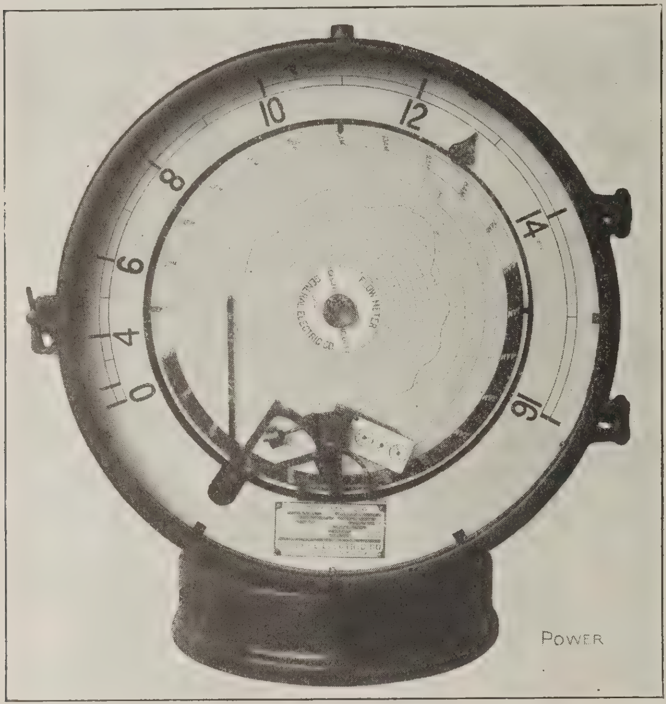
The nozzle-plug contains two separate conduits, each having a set of openings arranged on diametrically opposite sides of the plug. Those apertures upon the side which faces the flow are called leading, while those on the opposite side are called trailing openings.

The flow against the leading openings in the nozzle-plug sets up a pressure in the leading conduit which equals the static pressure plus that due to the velocity head. The flow past the trailing openings causes a suction which lowers the pressure in the trailing conduit to a point which is below the pressure existing in the pipe line. As these two conduits are connected to opposite legs of the U-tube by ¼-in. pipe, the column of mercury is affected by this unbalanced pressure, causing a corresponding movement of the float.

The openings in the nozzle-plug extend across the pipe diametrically so as to make the pressure transmitted to the meter as nearly as possible that due to the mean velocity rather than that at a single point in the pipe.

The chart upon which the pen records are made is rotated by a suitable clock mechanism. The recording pen sweeps the chart radially and the resulting curve shows the rate of flow at any time during the chart cycle.

An integrating device sometimes applied to this meter consists of a stationary flow-rate planimeter driven by the chart paper. The angular position of the planimeter wheel is determined by a cam connected to the shaft of the recording pen and moving with it. The planimeter dials read in arbitrary quantities, which multiplied by a constant furnished with the meter gives the flow in the desired unit. This device is extremely simple and there is practically no danger of its getting out of adjustment.



Meter with Indicating Scale, Recording Chart and Integrating Dial

For pipes which are less than two inches in diameter, an orifice-tube made of brass and tapered internally from both ends so as to form a restricted opening at the middle of the tube is provided. This must be incorporated in the pipe line. One leg of the U-tube is connected with the orifice-tube near its end and the other leg to its middle point where the greater velocity will give a reduced pressure in the pipe leading to the recording instrument.

To meet the requirements of the different classes of service, and the various conditions met with, the meter can be made up in four different ways: First, as a recording or curve-drawing instrument; second, with both indicating scale and recording chart; third, with recording chart and integrating dials; fourth, with indicating scale, recording chart and integrating dials.

Some of the large manufacturers of power have found that flow-meters pay for themselves in a short time. By their use the record of the performance of the apparatus shows whether or not it is operating at its maximum efficiency. Surprising conditions have been brought to light by their use showing at the same time their great practicability.

A flow-meter upon each boiler of a battery operating upon a single header shows exactly what each is doing, and permits adjusting the operation of the units so that each will carry its full share of the load. They also indicate immediately whether the load has increased, or the steaming rate of the boiler's decreased in case the steam pressure begins to drop. Moreover, it is possible from the graphic record to determine whether the method of firing can, or cannot be made more efficient.

In a big plant the use of flow-meters makes it possible to segregate the cost of the steam, water, etc., so that each department may be correctly charged with its legitimate share of these expenses. A study of the feed-water chart will determine the rate at which the feed water should be supplied in order to secure the highest degree of efficiency.

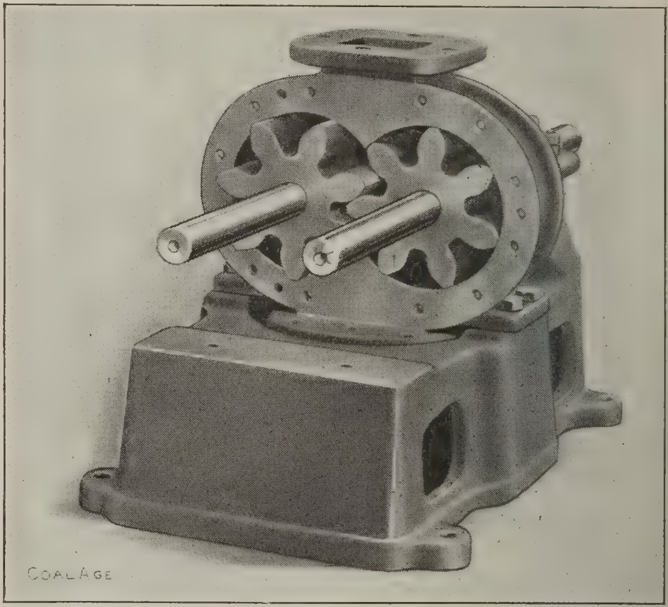
These illustrations of the application of the flow-meter give some idea of the adaptability of the instrument, and the type of service for which it is fitted.

⁂

A New Rotary Pump

The Goulds Mfg. Co., of Seneca Falls, N. Y., have recently placed upon the market a new rotary pump of a unique design. Heretofore machines of this type have usually been made with two- to three-lobed cams. These are rotated in their proper relation to each other by external gears placed upon the camshafts.

In the new design, as may be seen from the accompanying illustration, the cams are practically pinions meshing together. They therefore require no external gears to revolve them in their proper inter-relations.



The New Pump with End of Casing Removed

These machines are simple in construction, valveless, and may be either belted or direct connected to any suitable means of driving. They are built to withstand a working pressure of 100 lb. or a head equal to about 230 ft. of water. Water cutting of the cams caused by the rapid expulsion of the liquid entrapped between the teeth of the two gears has been eliminated by means of a bypass opening in the end cover of the machine.

EDITORIALS

The Brookside Explosion

The explosion at the East Brookside colliery, which occurred at 11:30, Aug. 2, proves not to have originated from dynamite. The exploration of the workings revealed that the 175 lb. of dynamite and 75 lb. of carbide stored in the mine had neither of them contributed to the explosion. It was naturally assumed that dynamite was the cause, as the explosion killed immediately all the men where the dynamite was stored and was not so death-dealing in other parts of the mine, but the finding of the explosive intact disproves that assumption. It is said that the bodies of the men were badly burned yet their clothing was not scorched and even loose pieces of paper were not consumed. The punk-like fringe on the timber also was not ignited.

These strange phenomena have given rise to the idea that there were no explosions, properly so termed, and that the men were killed not by flame but by a blast of heated air. At Valleyfield in Scotland, where an outburst of coal occurred, smothering the men, they were found when uncovered to be blistered, apparently by the heat of the escaping gas. A heavy fall of rock might also serve to heat the air in like degree, and in this case the air current was sufficient to sweep the clothes from the bodies of the men. Perhaps the explosion will serve to open in a definite way the problem whether the heat of compression in a mine is ever so severe as to start an explosion of coal dust and air. James Asworth has claimed for several years that it is.

⁂

The Original Sulphur in Coal

For the discussion which follows we define "original" or "intrinsic" sulphur in the coal as the sulphur which was an integral part of the vegetal substances composing the peat bog from which the coal bed is derived. Of course, it is obvious that these terms are only relative, for the sulphur did not *originate* in the peat bog but was in the first place a part of the molten magma. Later, after chemical change, it was dissolved by thermal and surface waters and deposited by them in the depths of lagoons or in the ocean, and finally was drawn into the plant system with the vegetal juices.

We were surprised recently when a mining engineer of ability and no little information declared that "organic" sulphur was the sulphur irreducible by heat and was in the form of calcium sulphate. All other sulphur bodies were in his view additive compounds to the original deposit and probably he conceived that no other sulphur-bearing bodies were present in coal except iron pyrite.

As the word organic is usually restricted to compounds containing carbon and hydrogen, perhaps he should have said "original" sulphur, but in any event it may be pointed out that he took a narrow view of the possibilities of the occurrence of sulphur in coal from vegetal sources.

Nor are most commercial chemists disposed to view the matter in a much larger light, for some appear to believe that the sulphur of the original coal substance is always in the form of a sulphate and few would be disposed to regard pyrite as being merely a much altered outcome of the original vegetal juices. In view of the erroneous speculations now passing muster, perhaps a few suggestions might unsettle errors, even if they did not establish fact.

As we find in the ash of coal the elements, iron, aluminum, calcium, sodium, potassium, magnesium and sulphur, it is not unreasonable to expect that coal may contain or have contained ferric or ferrous sulphates, potash and soda alums, gypsum and magnesium sulphate. All these are more or less soluble in water and may enter with the fluids as plant foods. Barium sulphate is so freely absorbed by some plants in the arid West that the "locoing" of horses is ascribed to the consumption of a weed thus rendered poisonous.

That sulphur enters into the plant organism mainly as sulphates may be conceded readily. Though sulphurous acid has been shown to be inspired by oak leaves in the neighborhood of works producing that gas, probably no measurable sulphur in coal arises from any such source, though some sulphur may have entered the plant economy as a hydrocarbon compound with the vegetal juices yet not as a sulphate.

But we need not necessarily assume that the sulphates entering the vegetal substances are unchanged chemically, nor is it reasonable to infer that, after the vegetal matter has died and been wholly or partially metamorphosed, further changes are impossible. It is true that most of the sulphates are little affected by heat, but they are not so stable when attacked by other methods and under different conditions.

There are plenty of indications that the sulphur is not entirely retained as a sulphate. Otherwise how could we explain the fact that when vegetal matter is heated to the boiling point, the sulphur content is reduced; and how could we find a cause for the evaporation of 0.65 per cent. of sulphur when a certain cannel coal was heated to 212 deg. Fahrenheit?

It has been noted that coals which have been subjected to great heat show less sulphur than those which have been less heated; the anthracites and semibituminous coals of the Appalachian disturbance contain less sulphur than the fuels more remote from that trouble. If the coals had been rich in certain sulphates, the heat could not have reduced their sulphur content without some chemical reaction.

If the sulphur had been pyritic, some might possibly have been reduced almost to the monosulphide form. If this had occurred it is strange that the iron in coal would not be found today in combination with one atom of sulphur, for the monosulphide does not have the power of reabsorbing the atom which it has lost. This leads us to wonder whether the heat which metamorphosed the coal was sufficient to separate sulphur from pyrite and whether at the time of maximum heat any pyrite existed.

These considerations tend to make us believe that at the time when the Appalachian uplift was thrusting most severely, pyrite was largely absent and the sulphur was in combination with carbon and hydrogen and indeed, as we find that the upper coal measures often thicken in the Appalachian folds, we are disposed to think that the uplift must have been started even before these measures were laid down and that the coal was a mere peat, when the pressures were severe.

But we must not be too willing to declare that the sulphates were absent when the uplift occurred, for these bodies are not so permanent in character as is often thought, and conditions favoring their reduction were probably in existence and these actions, made more effective by the heat of uplift, may have been hastened by that action.

According to Hoppe-Seyler, nascent methane has a marked power of acting upon sulphate of lime. He produced such an action by the use of fermenting cellulose. Furthermore, according to Ochsenius, a solution of magnesium sulphate in which hay or straw is kept is turned to a sulphide.

Other changes are, however, possible. Thus it has been urged that in the presence of carbon, the sulphate of calcium will be converted to a sulphide, the oxygen joining with carbon to form carbon dioxide. The sulphur of this sulphide might then combine with the hydrogen of the water and the dioxide mentioned unite with the calcium and the oxygen atom of the water to form hydric sulphide and limestone respectively.

Nor are these all the possibilities, because we know there are bacteria which have a power of extracting sulphur from sulphates. Such are the Beggiatoa alba and Chromatium Okeini. Beijerinck has shown that in the absence of air, sulphates may be reduced at a temperature of 77 to 86 deg. F. in 12 to 14 hr. by these low forms of life. In the absence of air, there would be no oxidizing bacteria to complete the sulphur circle and to form sulphates anew as usually happens today.

The formation of hydrogen sulphide from sulphates, probably by bacterial action, is constantly going on in the Black Sea, and as samples are taken below the surface this enrichment is found to increase continually and in a marked degree.

The main difficulty in the acceptance of a bacterial action as an explanation arises from the fact that sulphur bacteria appear to have been most active in more recent times and the most marked effect of their work is found in the Miocene period, and not as early as the Carboniferous.

Certain it is that the bulk of the sulphur now being mined is stratified in such manner that we cannot believe it was placed where it is by volcanic action. It is probably derived from some body, vital or chemical, which has leached the sulphur from its original place as part of some sulphate, possibly gypsum. As this process has been so general there is no obvious unreasonableness in the assumption that all the sulphur in coal, whether as sulphate, sulphide or hydrocarbon compound, was originally absorbed as sulphate in the plant food.

That pyrite is an impurity derived from the plant tissue is suggested by the fact that it is not found in the clay floor. In fact, the sulphates are not often found in clay nor are the sulphides. But pyrite is probably rarely found in precisely the same position as the sulphate from which it is formed, and its quantity may have been increased by inflows of ferrous and ferric or other sulphates which were converted to pyrite by the action of methane.

⁂

The Bituminous Market in New England

The soft-coal market this year has been an enigma, particularly in New England. When the operators put the 15c. advance on Pocahontas, New River and Georges Creek, coincident with the depression in business circles early in the spring, it seemed like tempting fate, and predictions were made freely that so much coal would be offered that the selling price would be down to the same basis as 1911 and 1912 by the current month.

Obviously these forecasts were wrong. Even with heavier receipts at Boston than ever before, the new high level has been firmly maintained and it is doubtful if a single ton has sold at a concession. The labor trouble in the New River field, and the possibility of an extension into other parts of the state, was no doubt a factor in the situation; but it was not a controlling one as prices continue as firm, the demand as insistent, and the loading at Hampton Roads as slow, even now that the strike has been definitely settled.

There are a number of conditions that point to a deficiency in the local supplies. Water shipments to Boston for the first six months of the current year are some 200,000 tons ahead of those for the same period last year; but the vessel movement last year was abnormally light, the difference being made up by a larger rail tonnage from Pennsylvania and furthermore the average annual increase in the water arrivals during the past few years has run between two and four hundred thousand tons. In addition to this there is the acknowledged fact that a number of the typical contracts are seriously in arrears.

In New England it is felt that the situation hinges entirely on the production and the outlook is regarded as not particularly favorable because of the reports of a poor labor supply. Should the production be seriously crippled by the insufficiency of miners and conditions further aggravated by the anticipated car shortage, there will undoubtedly be a tense situation this winter. Such a contingency will naturally broaden the market for the Pennsylvania grades, there already being a noticeable increase in the shipments out of Philadelphia.

The past history of the trade shows that when the summer market turns the corner in August or earlier and begins to improve, there is small probability of any easing off until the winter is over and the spring cessation appears. Another condition that is already being anticipated in some quarters, is the possibility of another suspension in the bituminous fields next April; should the outlook prove serious, a heavy storing movement on the part of the consumers might be started that would precipitate a runaway market. Even with a large production the winter trade promises to continue firm, although fairly steady, but with any restriction on the output due to a shortage of cars or labor, the situation will be serious.

SOCIOLOGICAL DEPARTMENT

The Woodward-Pettebone First-Aid Meet

Special Correspondence

First-aid teams from seven of the largest collieries of the anthracite field were pitted against each other in contests, held at Harvey's Lake, and 5000 spectators viewed the events. The contests were held under the auspices of the Woodward and Pettebone teams, of the Delaware, Lackawanna & Western R.R. Coal Department, and prizes were awarded in each of the contests.

The Three Judging Physicians, Henry G. Davies and Charles Enzian

Subject Treated for Compound Fracture of Nose and Dislocation of Left Shoulder

Sylvester Method of Artificial Respiration

Rescuing Man Who Touched Live Wire

Treating Scalp Wound, the Captains' Event

The problems presented were not of a difficult nature, but they were such as caused the men to use their wits, though none could be rightly regarded as catch problems. They were such as any first-aid team is apt to be called upon daily to solve in anthracite mines. All the teams showed the benefits of careful training, and while all of them could not be prize winners, each and every team performed its work in a highly creditable manner, and no first-aid team was forced to go home ashamed of its demonstration.

The Pyne colliery team, of Scranton, won the prize for the big event, which was $20. A safety lamp was awarded to the captain. The Pyne team scored 96½ points. The Avondale colliery team was second with 93 points and won $12 as a prize and a safety lamp for the captain. The third prize, $5, was won by the Auchincloss team.

The results of the contest follow:

Full-Team Event—Problem No. 1—Compound fracture of jaw, left side, blood spurting; compound fracture of right collarbone and a lacerated wound of left elbow.

Problem No. 2—Burns of head, face, chest and arms, and an incised wound of heel of left foot.

Pyne colliery	96 1-2	Bliss colliery	90 1-2
Avondale colliery	93	Truesdale colliery	90 1-2
Auchincloss colliery	91 1-2	Bellevue colliery	90 1-2
Raub colliery	91 1-2	Forty Fort colliery	87

Captains' Event—Problem—Large scalp wound (Capeline roller bandage). Lacerated wound of left shoulder (spica).

William Hill, Bliss colliery	100	H. R. Kettle, Avondale colliery	90
William L. James, Truesdale colliery	95	Philip Williams, Forty Fort colliery	90
J. M. Jones, Bellevue colliery	93	William Griffiths, Pyne colliery	88
James H. Jenkins, Auchincloss colliery	91	Nicholas Cook, Raub colliery	88

Two-Man Event—Problem—Compound fracture of nose, dislocation of left shoulder.

Auchincloss team—James Jenkins and John H. Keating, 100. Time, 3:47.

Raub—Nicholas Cook and William Rowett, 100. Time, 7:45.

Forty Fort—Philip Williams and Walter Jones, 100. Time, 11:45.

Truesdale—D. J. Williams and W. L. James, 100. Time, 11:45.

Biss—William Jones and William Hill, 95.

Bellevue—Thomas Robson and Edmond Davis, 95.

Avondale—W. R. Williams and John Driscoll, 90.

Pyne—Albert Rose and Philip Watkins, 88.

One-Man Event—Problem—Rescue man who has taken hold of live wire; carry 50 ft., perform artificial respiration and dress for burns.

Pyne—Albert Reese, 100
Bellevue—William Williams, 95; Time 8:54
Forty Fort—William Cutts, 95; Time 11:25
Truesdale—John Traber, 95; Time 13:2
Auchincloss—J. H. Keating, 93.
Bliss—W. J. Hill, 92.
Raub—Martin Inman, 90.
Avondale—Ezra Griffith, 90.

THE OFFICIALS AND JUDGES AT THE WOODWARD-PETTEBONE MEET

One-Man Event—Problem—Wound in palm, severe bleeding, also wound of right eye.

Truesdale—E. J. Williams	100	Forty Fort—John Kasperin	92
Bliss—John Grosil	97	Avondale—Frank Maday	90
Raub—William Roderick	95	Pyne—Thomas Llewellyn	87
Auchincloss—William Bailey	95		

The following members comprised the different teams:

Bliss—W. J. Hill, William Jones, Isaac Edwards, Oliver Parfet, Thomas Thomas, John Grosil.

Truesdale—W. L. James, Arnold Menge, Joseph Stinson, D. I. Williams, John Traber, E. J. Williams.

Bellevue—J. M. Jones, Edmond Davis, William Williams, Martin Ratchford, Thomas Robson, John Mulhern.

Auchincloss—J. H. Jenkins, J. H. Keating, Thomas Wren, Thomas Chamberlain, Ire Angle, William Bailey.

Avondale—H. R. Kettle, John Driscoll, W. R. Williams, Ezra Griffith, Daniel Thomas, Frank Haday.

Pyne—William Griffith, Albert Rose, Philip Watkins, Jenkin Davis, Thomas Davis, Thomas Llewellyn.

Forty Fort—Philip Williams, Frank Romanshusky, Walter Jones, Andrew Tebust, William Cutts, John Kasperin.

Raub—Nicholas Cook, William Rowett, Martin Inman, John McGroarty, Leo Smith, William Roderick.

The prizes were awarded by Henry G. Davis, superintendent of the Wyoming Division of the Delaware, Lackawanna & Western R.R. Co., Coal Department. Charles Enzian, of the Federal Bureau of Mines, was master of events. The judges were: Drs. J. A. Samuel, Charles L. Shafer and A. B. Smith.

⁂

The H. C. Frick Coke Co.'s Picture Show

The stereoptican show which has been prepared by the H. C. Frick Coke Co. of Pennsylvania, a subsidiary of the United States Steel Corporation, was recently shown at Vivian, W. Va., to twelve or fifteen hundred interested spectators. After the show had been given at the mines in and around Gary, it was turned over to Lawson Blenkinsopp, state mine inspector of the 11th district, for use at other points in his district.

The idea was conceived by Thomas Lynch, president of the United States Coal & Coke Co., and of all the other subsidiary coal companies of the United States Steel Corporation but one. The coal mines under his jurisdiction together produce more than half as much coal as the great state of West Virginia, and notwithstanding the fact that this coal is mined largely from shaft and slope mines, some of which are deep and gaseous, the number of men killed per million tons of coal mined is much below that of the state of West Virginia, the United States, or any other mining section. After Mr. Lynch had decided what scope he wished to cover with these pictures, he turned the matter over to W. H. Clingerman, general superintendent, J. P. K. Miller, chief engineer, and Austin King, chief mine inspector, all of the H. C. Frick Coke Co., for development. Mr. King was given full charge of the work and spent the better part of a year in taking thousands of pictures of various accidents as they happened, sham accidents, and conditions where accidents had occurred previous to the time he began this work.

After the pictures to be shown were selected, they were exhibited at all the mines, some 60 in number, of the H. C Frick Coke Co., located in Westmoreland and Fayette Counties, Penn., including the towns of Connellsville, Scottdale, Mt. Pleasant and Uniontown. They were also shown at the mines of the National Mining Co. in Allegheny County, Penn. in Pittsburgh for the benefit of the Coal Mining Institute of America; at the mines of the United States Coal & Coke Co., and at Vivian and Welch, W. Va. They are to be taken to Indiana and Illinois to be exhibited at the mines of the Steel Corporation in those states, after which they will be rearranged with some moving pictures that are now being made in the mines of the United States Coal & Coke Co with the assistance of that corporation. Photographers from the Government Bureau of Mines are doing this work.

A number of views are also shown of special features of the United States Steel Corporation work, including trained nurses taking care of the sick; the first-aid team which won first prize at the International Red Cross Convention at Washington; swimming pools and play grounds for the children, etc.

A reel of comic moving pictures entitled, "That College Life," and a film showing the results of disregarding safety devices are also exhibited. A number of panoramic views were shown at Vivian, W. Va., of the various plants of the United States Coal & Coke Co. at Gary, as well as a reel of moving pictures of the parade, first-aid contests and various athletic exercises on the Fourth of July.

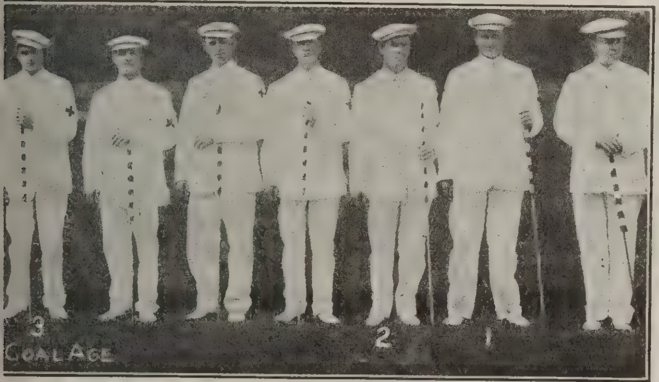
⁂

The First-Aid Prizes, 1912

The William Howard Taft Fund was established by an anonymous friend of the Red Cross and its intention is to provide prizes for first-aid work on railroads. The awards are $50 for the first prize, $25 for the second, $1 for the third and $10 for the fourth.

The Red Cross Society has itself offered similar prize for meritorious first-aid work in all industries but railroading, limited to students of classes organized under Red Cross auspices. As recorded in our news department recently, three men in the Cary team of the Continental Coal Corporation were recipients each of one-third of the first prize. Through the favor of W. L. Moss, the general manager, we are able to show a picture of the team, with the first-aid prize winners carefully ndicated.

From the affidavit of Fred D. Haston, M. D., of Arjay, Ky., we obtained the following details: Thad Idol, an mployee of the Continental Coal Corporation, at Cary, Ky., was injured in the mines at that place on Oct. 29, 1912, about 3 p.m. by a small mine car leaving the track nd running over his left leg about three inches above the nkle, producing a fracture of the fibula with considerble contusion of the skin and neighboring structures. The pain was intense, so much so that the patient remarked that the few moments while the first-aid men were reaching him seemed like as many hours. Probly a space of 10 min. elapsed between the time of the njury and the application of the first-aid dressing, which as performed by W. T. Caton, Luster Lock and Ed. uncan, all of the Cary team, and holders of first-aid iplomas from the Continental Coal Corporation as a relt of the contest of Aug. 24, 1912. They also had reived certificates from the American Red Cross Society.



he Cary First-Aid Team of the Continental Coal Corporation

(1) W. T. Caton, (2) Ed. Duncan, (3) Lester Lock. These ree each received one-third of the prize paid by the Amerin National Red Cross for the best example of first-aid work tually done during the year 1912.

Instant relief was given the victim by the proficient d prompt work of the first-aid men. Thad Idol testied that he felt no more pain after his leg was dressed. wo hours later, the injury was inspected at the miners' spital, to which the victim was removed and Drs. Hasn and B. E. Gianini, the latter of Straight Creek, deared it to be the most nearly perfect first-aid dressing er applied in that mining district.

The second prize was won by Edmund Williams, of e Berwind-White Coal Mining Co. He treated a severe se of Pott's fracture, which is a breakage of the lower rt of the fibula, accompanied with injury to the ankle int, so that the foot is dislocated outward. The accint occurred at Eureka No. 39, on Feb. 26, 1912. Dr. W. Hawes, of the B.-W. C. M. Co., was attending suron.

The two other prizes went to men who were not emoyed at coal mines.

G. B. Markle Co.'s First-Aid Contest

Special Correspondence

The first annual first-aid contest of the G. B. Markle Co. was held at Drifton, on Aug. 8. The corps participating were Highland No. 2, Inside, Jeddo No. 7, Inside, Jeddo No. 4, Inside, and Highland No. 5, Outside. The contest consisted of four events, as follows:

Event No. 1. A man falls, fractures his nose and receives a bad laceration on the right side of the head, 2 in. above the temple.

Event No. 2. Fracture of the middle of the left forearm.

Event No. 3. A man is rescued from a gas explosion and turned over to the first-aid team to be treated for a badly burned head, neck and shoulders.

Event No. 4. A man receives a compound fracture of the left leg, 4 in. above the knee; the artery is cut also. Patient to be transported on stretcher after being treated.

The ratings in detail were as follows:

Event No.	Jeddo No. 4 Inside	Highland No. 5 Outside	Jeddo No. 7 Inside	Highland No. 2 Inside
1	98	98	96	98
2	98	89	93	95
3	95	100	98	93
4	98	100	98	98
Average,	97¼	96¾	96¼	96

Each corps was started with a credit of 100 per cent. and penalized in accord with the recommendation of the National Mine Safety Association; in fact the whole contest was conducted as nearly as possible along the lines suggested by that body.

The general rules governing the contest were as follows: 1. All teams will contest each event simultaneously, and the captain of each team will announce to the judges the moment his men have finished the work on the patient. No work will be allowed after such announcement. 2. There will be no penalty for slowness in work unless same is sufficient to cause further injury to the patient. 3. No coaching or aid from anyone not in competition is allowed. 4. The following penalties will be imposed:

	Per Cent.
For not doing most important thing first	2
For captain's failure to command men properly	2
For slowness in work	2
For failure to cover wound completely	2
For wrong artificial respiration	2
For loose splint	2
For not padding splints properly	2
For loose bandage	2
For bandage too tight	2
For "granny knot"	2
For awkward handling of patient on stretcher	2
For lack of neatness	2
For assistance lent by patient	3
For tourniquet too tight	3
For failure to stop bleeding	5
For not treating shock	5
For failure to be aseptic	10

The members of the competing corps were as follows:

Jeddo No. 4 Inside:
Henry Klose (captain)
Andrew Kushner,
Hugh McMonigal,
Edward McMonigal,
Joe Lynott,
Josepn Makuta (patient)

Highland No. 5 Outside:
Donald Beverage (captain)
Mike Leback,
Mike Klupz,
Charles Dennion,
Mannus McLaughlin,
Con. Gaffney,
John Soltas (patient)

Jeddo No. 7 Inside:
James Gildea (captain)
James Mulhall,
James O'Donnell,
Ben Bittner,
John Spitzner,
Thomas Thomas (patient)

Highland No. 2 Inside:
Daniel Bradley (captain)
Patrick Quinn,
Geo. Zeisloft,
John Contina,
John Gallagher.
Walter Cherekowskie (patient)

The judges were: Dr. T. H. Mays, of Drifton; Charles Enzian, of the U. S. Bureau of Mines, and Atherton Bowen, of the Lehigh Valley Coal Co.

Previous to the contest A. B. Jessup, general manager of the G. B. Markle Co. gave a short address, concluding with an introduction of the judges. Mr. Enzian then gave a talk in which he gave an outline of what was expected of a first-aid man and a first-aid corps. Following the contest Dr. Mays talked on the surgical questions raised by the problems in the contest, and Mr. Bowen commented on the team work and discipline.

G. B. Markle concluded the program by awarding the prize, a handsome loving cup, to the Jeddo No. 4 Inside Corps. In his remarks he congratulated all the teams and expressed much gratification on account of the excellent work in the contest and said that, although among the last to take up this work in a systematic way, ample facilities would be furnished and he confidently expected that such a state of efficiency would be reached that their position as compared with the other corps in the coal fields would be among the first.

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 11—This subject has not been discussed as thoroughly as I had hoped. Each week I have waited anxiously for some new arguments that would alter my opinion. But thus far, I have failed to see any reason advanced that would warrant the use of mixed lights in a mine generating gas. In my opinion, if gas has been discovered in any portion of a mine, there is no certainty that the danger can be confined to that one district and in this case, safety lamps should be employed throughout the mine.

No one will deny, of course, that there is a certain disadvantage in working with a safety lamp, but the annoyance is more imaginary than real and should not be considered when the question of safety is at stake. It seems to me the time has come when we should consider how far we can keep away from danger—not how near we can ride to the edge of a precipice without falling over.

The recent Cincinnati mine explosion, Apr. 23, has taught us a lesson in reference to the use of mixed lights in a mine operating in a gaseous field. This mine was examined by the mine inspector six weeks previous to the explosion and reported to be free from gas. By the explosion, 96 lives were sacrificed. As stated in Coal Age, May 3, p. 679, the use of mixed lights in the Cincinnati mine and other mines in the Pittsburgh district is naturally revived by this disaster, which emphasizes the danger of the use of open lights in any part of a mine where safeties are required in certain districts or places. Numerous other disasters could be mentioned that prove the same rule.

In some cases, recently, electric lamps have been tried and used in place of safety lamps. While these lights can be used on the intake airway where it is unnecessary to test for gas, in my opinion, they cannot be employed generally in the regular work at the face, because they give no indication of the presence of gas.

The argument has been advanced against the use of the safety lamp; namely, that it affects the eyesight. This may be true in some cases but is not my experience. During the 30 years I have worked in the mines, I have used the safety lamp a good portion of the time; and I can still read the finest print without glasses.

Another argument that has been advanced is that a man cannot do as much work with a safety lamp as with an open light. While I have no statistics to prove that this statement is not true, my experience is that the safety lamp gives enough light for digging coal and performing any other work required in the mine. The point that appeals to me is that if coal can be mined to pay, in one district, with a safety lamp, it can be done all through the mine.

The cry "Safety first," it seems to me, is wholly inconsistent with advocating the use of mixed lights in mining. The inconsistency is more apparent than ever when it is considered that thousands of dollars are spent each year to ascertain and test the safest methods to be employed in mining coal. Thousands more are spent for inspectors to examine and see that the safety devices in use are efficient and in good condition. At the same time, we find many operators, for the sake of saving another dollar, endeavor to see how little they can do and still comply with the law. They do not consider that in saving one dollar they may lose a thousand.

Thomas Hogarth.

Heilwood, Penn.

Letter No. 12—I do not consider that the use of mixed lights is dangerous, in coal mining, provided proper care is exercised to safeguard the practice in the mines, and provided the workings are well ventilated. With proper mine regulations strictly enforced, no accident should occur.

The miners at the working face require a good light, which the safety lamp does not afford. For this reason, the use of the safety lamp, at the coal face, should be avoided wherever this is possible. Provide a good air current well conducted to the face and use open lights wherever and whenever this is practicable, is my theory.

In my opinion, a mine operated entirely under locked safety lamps has as many chances of an explosion as one where mixed lights are permitted. They are both generating explosive gas and the same care and vigilance that make one mine safe will make the other safe also. What is needed is a good system of ventilation whereby an ample air current is circulated throughout the entire mine and so conducted that it will sweep the working face in every room or chamber. By this means the gases generated will be rendered harmless, and it will be impossible for any gas to accumulate in dangerous quantity.

It is important also to examine every part of the mine daily and often, where gas is generated. Whenever a shot is fired, the place should be examined for gas before the workmen are allowed to return to their work. In order to prevent the short-circuiting of the air by a door being left open, a check door should be provided wherever this is necessary, and an attendant should be on hand constantly when men and cars are passing.

R. J. Pickett.

Shelburn, Ind.

⁂

The Mine Air after an Explosion

In reading different articles relating to mine explosions, I have often been surprised at the statements of some of our best mining men that seem to indicate a doubt or misbelief, on their part, that any firedamp could remain or be present after a mine explosion.

On several occasions, I have made tests of the mine air following an explosion of gas; and, in many cases, have been able to detect the presence of firedamp in considerable quantity. An instance of this kind occurred some months ago in a thoroughly equipped and well ventilated mine, near Pittsburgh, where an explosion of gas occurred by which two miners and a fireboss were badly burned. One hour after the accident, I accompanied the mine inspector of the district and the officials of the company to the scene of the explosion to ascertain, if possible, its cause and effect.

The miners had been pulling entry stumps. They were using the Wolf safety lamp. While changing cars they had neglected to close the door on the entry, thereby short-circuiting the air at that point, which caused the gas accumulated above the falls to descend to where the men were working. Just at that time, the fireboss, making his rounds, closed the door and proceeded at once to where the men were working. Taking one of their lamps, he started to show them the gas that he knew *was* present, when the lamp exploded with the results mentioned.

Although we were there and made the test for gas only an hour after the explosion occurred, we were able to find a sufficient body of firedamp to produce again the same results. This firedamp had accumulated after the explosion, which showed that the previous inflammation had not been sufficient to consume all the gas. There was, in this case, a considerable amount of unburned gas, which only required an addition of fresh air to produce a second explosion if ignited. In any case, such ignition might occur from a fire trail started by the first explosion.

JOHN E. AMBROSE.

⁂

The Liquor Problem in Mining

I was interested in reading the letter of "Mine Superintendent," on this subject, COAL AGE, Aug. 9, p. 186. Many have experienced the same difficulty that he has described, in eliciting assistance from those in authority. As far as the law is concerned, it is apparently a case of "work out your own salvation." At the request of the writer, on one occasion, the district attorney employed two detectives for the surveillance of a place in the effort to suppress the drink traffic. The result was the inebriation of these minions of the law.

A few years ago, the writer having been appointed to take charge of a large and important operation, paid a visit to the place, unknown to any one. Although it was the Sabbath, drunken miners, in every state of inebriation, were to be seen lounging about and sleeping or singing ribald songs in their own language. On many porches, kegs were on tap while glasses were clanked in drinking health. The scene was disgraceful and, to avoid insult, the sober, intelligent few kept themselves indoors.

The outlook was discouraging and I determined, then and there, to hit the cause hard, from the start. My information, on assuming charge, was that the mines were never worked to full capacity until the Thursday following each pay day. Monday was known as "blue Monday" and Tuesday was little better, with a slight improvement Wednesday; but Thursday the conditions were again normal. The general superintendent gave me his unqualified support and a fighting campaign was determined. The mine foremen were ordered to make out lists of those addicted to the drink habit. The clerks furnished a list of boarding-house keepers, giving the number of boarders and their names and nationality.

The next move was to notify the drivers of all beer wagons to remove the empty kegs from the streets at once. This order was ignored and the company, after waiting patiently a few days, sent the company wagons to collect every keg found in the street and these were, later, used to generate steam. The loss of the kegs brought a strenuous protest from the brewers; but they were informed that due notice and time had been given for the removal of the kegs from the streets and that, in future, these unsightly objects would not be tolerated. The brewery companies promised and, for a time, kept the kegs off the street; but the old conditions soon returned. Again the company wagons gathered up the kegs and this time dumped them into an inaccessible ravine. This last act brought instant relief and the streets of the village were thereafter wonderfully improved.

The next move was the completion of a fence that had been partially built some time since, inclosing the camp. Gates were provided, chained and locked, keys being given to the company drivers only. This necessitated the beer wagons driving over a hill in order to reach the camp. It was explained by the coal company that the streets were practically the playground of the children and, unless the brewery companies contributed toward the maintenance of these roads, they would be prohibited from using them. It is needless to say that this proposition was scorned.

Later, rumor had it that a professional pugilist had been employed by the brewery companies to visit the mine, pick a quarrel with the one responsible for their troubles, and if necessary alter the contour of his features. Deeming it wise to be prepared for an onslaught of this nature, there was in evidence, on the appearance of this party, something that protruded from the hip pocket of the superintendent to which the visitor gave respectful attention. The interview sought was brief, the party in question professing business that demanded his immediate attention.

The advantage thus far gained was followed up by employing a bright boy, who, while pretending to play about the streets, made note of the number of kegs delivered at each house. By comparing these notes with those of the foremen, it was shown that the men who lost the most time from work were those who boarded or lived where the most beer was delivered. These men were called, one by one, to the office and given to understand that, while there was no objection to their drinking in moderation, biweekly sprees and undue loss of time would not be tolerated. Some profited by the advice; but the remainder, failing to comply, there were soon 15 vacant houses, which were quickly filled again by men who were disposed to work and to obey the rules of the company.

The rules were printed in the different languages and posted at the mine. They required that any one desiring to be absent from his place must notify the mine foreman before doing so; and any one remaining idle the day after pay day could not return to work without a written permit from the superintendent. A few of the men adopted the scheme of going to their place and returning in a short time; but these were reported by the foremen as absent and their turns were stopped the following day. In a short time, "blue Monday" was a thing of the past—"an unpleasant memory." The output on that day equaled that of any other day in the month, and the output of the mine became so steady that, during the two years that followed, there was a difference of only 2000 tons in the annual production of the mines—0.4 per cent. Affairs at the mine took on a new aspect and the men actually became proud of their record for steadiness. The change took six months.

The desire on the part of many progressive companies to make life more attractive to their employees is producing good results. It is true, it is not always appreciated by those benefited. The bath tubs may be used for brooders or coal bins, and sewers as a depository for old clothes, tin cans, etc.; but time will eradicate even this misuse of privileges.

There is one point remaining to be considered. Observation has shown that "dry sections" commonly consume more beer than "wet sections." Where saloons are removed from the vicinity of the mine the last vestige of control is taken away from the mine officials. By the exercise of a half-concealed threat, it is possible to force a saloonkeeper to use his influence toward preventing the loss of time by his patrons, which operates against the interest of the saloonkeeper in preventing the steady operation of the mine.

CHARLTON DIXON.

Pittsburgh, Penn.

⁂

The Anthracite Industry

In the articles by "Special Correspondent," COAL AGE, Aug. 9, p. 186, defending the so called "anthracite coal trust," I see no explanation of the two leading facts of my own experience as a user of anthracite coal in a residence furnace; namely, the price and quality of the anthracite coal furnished by coal operators, to the Chicago market, today.

The price of anthracite coal in Chicago, is throughout the year higher than it was before the big strike, and the quality of such coal to be purchased from the best companies in Chicago is much inferior to what it was when there was real competition in quality and price.

The large proportion of stone and slate, in the best coal I could find, has driven me to substitute coke, briquettes, or anything else that will not produce such a large percentage of waste and require so much time, every night, to dig the refuse out of the fire. I would like to ask "Special Correspondent" if the rapacity of the "trust" is not responsible for maintaining the present high prices and working off a poor quality of coal on the consumer. If this is not the case, will he kindly explain the responsible cause.

Link-Belt Co.

Chicago, Ill.

⁂

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Diffusion of Air and Gases—If the molecules of all matter are assumed to be in a constant state of vibration, it naturally follows that the vibratory movement or force will vary with the density of the matter. In the case of fluids—air, gas, or liquid—the molecules are free to move among themselves, which is not true of solids, whose molecules, normally, hold fixed relations to each other.

If the densities of two fluids are equal, the vibratory force is equal in each fluid; and, at the plane of contact of the two fluid bodies, action and reaction are equal between the vibrating molecules and there is no tendency of these fluids to mix. The laws governing the mixture of liquids is not as simple as in the case of gases, owing chiefly to numerous physical properties of liquids that modify and retard the diffusive action. While the diffusion of gases into each other and into air is extremely rapid, the diffusion of liquids is often very slow and in some cases does not take place at all because of the counteracting forces.

Gases of different densities diffuse into each other and into air. The action is extremely rapid and conforms very closely to certain well defined laws. The diffusion of mine gases into the mine air and into the air current is an important feature of mine ventilation.

Experiment—The diffusion of air and gases has been shown to take place through certain substances with practically the same rapidity as when they are in direct contact. The diffusion of hydrogen into air is well shown by the following simple experiment. A glass tube, say 18 or 20 in. long, 1-in. bore, is closed at one end with a plug of plaster. The tube is first filled with the gas and the open end then immersed beneath the surface of a basin of mercury. At once the mercury is observed to rise slowly in the tube to take the place of the hydrogen that has passed out through the plug and escaped into the air. Investigation shows, however, that while hydrogen has passed out of the tube, some air has pased into the tube, as there remains in the tube a mixture of hydrogen and air.

Law of Diffusion of Air and Gases—By a similar experiment, showing the diffusion of hydrogen into oxygen, Graham found that for every volume of oxygen that passed into the hydrogen, four volumes of the hydrogen passed into the oxygen, the ratio thus being 4:1, in this case. But, calling the density of hydrogen unity or 1, that of oxygen is 16 and $\sqrt{16} = 4$. This and other similar experiments, all confirming the first, led Graham to observe the following law.

Graham's Law—The velocity or rate of diffusion of air and gases is inversely as the square roots of their densities or specific gravities.

This law is simply expressed by the following formulas:

$$\textit{Rel. vel. of diffusion (gas : hydrogen)} = \frac{1}{\sqrt{\textit{density of gas}}}$$

$$\textit{Rel. vel. of diffusion (gas : air)} = \frac{1}{\sqrt{\textit{sp.gr. of gas}}}$$

The Coal Age Pocket Book

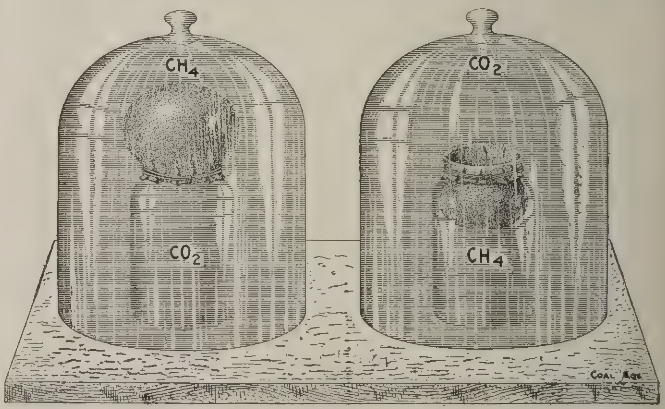
Illustration of Graham's Law—The relative velocities or rates of diffusion of different gases (hydrogen = 1) are calculated from their respective densities referred to hydrogen as unity; thus,

$$\text{Methane } (CH_4)\text{; density, 8;}\quad \textit{Rel. vel.} = \frac{1}{\sqrt{8}} = \frac{1}{2.828} = 0.354 \quad (H = 1)$$

In like manner, the relative velocities or ratio of diffusion of different gases (air = 1) are calculated from their respective specific gravities, referred to air as unity; thus;

$$\left.\begin{array}{ll} \text{Carbon dioxide } (CO_2)\text{; sp.gr., 1.529;} & v = \dfrac{1}{\sqrt{1.529}} = 0.808 \\ \text{Methane } (CH_4)\text{; sp.gr., 0.559;} & v = \dfrac{1}{\sqrt{0.559}} = 1.337 \end{array}\right\} (\text{Air} = 1)$$

Experiment Showing Effect of Diffusion—An interesting experiment, showing the relative increase or decrease of the volume of gas contained in a vessel owing to diffusion, is illustrated in the accompanying figure. The velocity of diffusion of methane being greater than that of carbon dioxide, when the latter is contained in the inner jar and the former in the outer bell-jar the bladder is expanded, because the methane passing into the small jar is greater in volume than the carbon dioxide passing out. Again, the bladder is depressed when the gases change places.



SHOWING EXPANSIVE EFFECT DUE TO DIFFUSION

INQUIRIES OF GENERAL INTEREST

The Calculation of Relative Humidity

Referring to the description of the humidity chart, and the calculation of the relative humidity of air, COAL AGE, July 12, p. 62, I want to ask if you will kindly give the authority for the constants 88 and 30 used in that calculation as I am working along these lines.

L. L. A. MORAN.

Pittsburgh, Penn.

The formula given in this calculation is the Apjohn formula used by Prof. Alexander Buchan, Secretary Royal Meteorological Society, London.

The use of the wet- and dry-bulb hygrometer (psychrometer) depends on the principles that: 1. The relative humidity of the atmosphere is the ratio of the pressure of the water vapor in the air at the time of the experiment, to the pressure of the water vapor at the point of saturation, for the temperature of the air or the dry-bulb thermometer. 2. The actual pressure of the water vapor at the time of the experiment is equal to the water-vapor pressure at the point of saturation (dew point), for the temperature of the wet-bulb thermometer. The water-vapor pressure at the point of saturation is given in psychrometer tables.*

In the use of the psychrometer, if the dew point were known or the temperature at which the weight of vapor present in the air would produce saturation, the vapor pressure corresponding to that temperature, as given by the tables, divided by the vapor pressure for the temperature of the dry bulb would give the relative humidity.

The psychrometer makes it possible to *calculate* the dew-point temperature from the difference of the readings of the wet and dry bulbs, if the barometric pressure is known. To do this, the barometric pressure is multiplied by the difference in the readings of the wet- and dry-bulb thermometers and that product again multiplied by a constant c. The resulting product subtracted from the saturated water-vapor pressure, corresponding to the wet-bulb temperature, as taken from the tables, gives the dew-point pressure, which is the actual pressure of the vapor in the air at the time of the experiment. This actual vapor pressure divided by the saturated vapor pressure for the temperature of the dry bulb, gives the relative humidity of the air expressed decimally. The constant c, varies with the wet-bulb temperature, and has been determined, by a large number of experiments, as calculated by the formula.

$$c = 0.000367(1 + 0.00064\ t_w)$$

Referring to the formula given on p. 62, the constant 30 is practically the normal barometric pressure at sea level, and the constant 88 has been determined by experiment, for temperatures above 32 deg. F. The value of this constant is 96, for temperatures below 32 deg. F. Because the range of ordinary temperatures is comparatively slight, it is possible, with almost inappreciable error, to simplify the calculation by the use of the constants 88 and 30. That these constants practically agree with the formula given above for determining the constant c is shown by a simple calculation. Thus, substituting in that formula, the value $t_w = 50°$ F.,

$$c = 0.000367\ (1 + 0.00064 \times 50) = 0.000379$$

Also,
$$\frac{1}{30 \times 88} = 0.000379$$

The formula of Dr. Apjohn is based on the theory that the heat absorbed by the water converted into vapor is taken from the air immediately surrounding the wet bulb and which becomes saturated therewith. The heat thus lost by the air causes the fall of temperature, which is the difference between the wet- and dry-bulb readings. The calculation thus involves the latent heat of the vapor at the wet-bulb temperature, the specific heat of the air, the specific gravity of the vapor, the fall of temperature, which factors when properly assembled determine the ratio of the actual vapor pressure at the time of observation to the total pressure. The formula, partially rational, is corrected by an empirical constant.

Ventilation

Kindly give the best and simplest method of calculating the coefficient of friction in mine ventilation, and explain the solution of the following problem:

In a gangway 5x8 ft., 4000 ft. long, the anemometer reading indicates a velocity of 200 ft. per min. Find the volume of air passing in cubic feet per minute; the pressure producing circulation, in pounds per square foot; the water gage corresponding to this pressure; and the horsepower on the air.

A SUBSCRIBER.

The coefficient of friction, in mine ventilation; or, as it is more properly called, the *unit resistance,* is not calculated, but determined by experiment. It has been found that, under ordinary mining conditions, this unit resistance, or the resistance offered by 1 sq.ft. of rubbing surface to an air current having a velocity of 1 ft. per min. is 0.00000002, which is the Atkinson value abbreviated. The Fairley coefficient, which is often used in mining calculations, is one-half of the Atkinson coefficient, or 0.00000001.

The rubbing surface, area, quantity, pressure, water gage and horsepower are then calculated as follows:

$$s = 2\ (5 + 8) \times 4000 = 104{,}000\ sq.ft.$$

$$a = 5 \times 8 = 40\ sq.ft.$$

$$q = av = 40 \times 200 = 8000\ cu.ft.\ per\ min.$$

$$p = \frac{ksv^2}{a} = \frac{0.00000002 \times 104{,}000 \times 200^2}{40}$$
$$= 2.08\ lb.\ per\ sq.ft.$$

$$w.g. = \frac{2.08}{5.2} = 0.4\ in.$$

$$H = \frac{qp}{33{,}000} = \frac{8000 \times 2.08}{33{,}000} = 0.5+\ hp.$$

---

*Bulletin No. 235, U. S. Department of Agriculture, Washington, D. C.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—Find the power of the engine required to operate an endless-rope haulage, for an output of 800 tons of coal per day of eight hours. The mine cars hold 1500 lb., and weigh 900 lb., each. The haulage road is 3000 ft. long and practically level. Assume a speed of 6 miles per hour, or, say 500 ft. per minute.

Ans.—The required output of coal is (800 × 2000) ÷ (8 × 60) = 3333+ lb. per min. Allowing no time lost in delays and assuming a coefficient of rolling friction for the cars and ropes, $f = 0.025$, the effective horsepower may be calculated by the formula

$$H = \frac{fl}{33{,}000}\left[O\left(1 + \frac{2\,w_c}{w}\right) + 2\,w_r v\right]$$

Substituting in this formula the following values: $f = 0.025$; $l = 3000$ ft.; $O = 3333$ lb. per min.; w (coal) = 1500 lb.; w_c (car) = 900 lb.; w_r (rope) = 1.58 lb. per ft.; $v = 500$ ft. per min.,

$$H = \frac{0.025 \times 3000}{33{,}000}\left[3333\left(1 + \frac{2 \times 900}{1500}\right) + 2 \times 1.58 \times 500\right]$$

$$= 20+\ hp.$$

Ques.—The timbering or lining of a hoisting shaft shows signs of collapse. State how you would temporarily secure it, and describe what measures you would adopt in renewing the timber.

Ans.—In order to temporarily secure the bulging timbers on the face of the shaft, extra cross-buntons should be inserted wherever these will not interfere with the hoisting operations; or, if necessary, hoisting must cease until the shaft can be repaired.

The work of renewing timbers in a shaft should be started at the top and proceed downward. Only such timbers should be taken out at one time as are necessary to permit the insertion of the new timbers. The latter should be of sufficient thickness to give the required strength to support the strata. The new timbers should be lagged or packed as tightly as possible behind, so as to give the required support to the strata. Permanent cross-buntons should be inserted at regular intervals, and the work should be done in a substantial manner. Suitable provision should be made, as may be required, to drain the space behind the timbers and conduct the water to the foot of the shaft.

Ques.—Name the principal gases found in coal mines that are chemical mixtures and also those that commonly form a mechanical mixture in the mine.

Ans.—Methane, or marsh gas (CH_4), is a chemical compound, the molecule consisting of one atom of carbon and four atoms of hydrogen; olefiant gas (C_2H_4), consisting of two atoms of carbon and four of hydrogen; carbon monoxide (CO), consisting of one atom of carbon and one atom of oxygen; carbon dioxide (CO_2), consisting of one atom of carbon and two atoms of oxygen; and hydrogen sulphide (H_2S), consisting of two atoms of hydrogen and one atom of sulphur. All of these gases, as they occur in mines, are more or less mixed with air, in varying quantities, forming mechanical mixtures of air and gas. Air itself is a mechanical mixture, consisting of, practically, four parts, by volume, of nitrogen and one part, by volume, of oxygen.

Firedamp is a mechanical mixture, consisting of methane or marsh gas and air, in explosive proportions, together with varying quantities of other gases, which more or less modify the character of the firedamp. These other gases may or may not be present in the firedamp. Afterdamp is a mechanical mixture, consisting principally of nitrogen and carbon dioxide, together with varying quantities of unburned marsh gas, carbon monoxide and water vapor. Blackdamp is a mechanical mixture consisting, chiefly, of carbon dioxide and nitrogen, in varying proportions. Whitedamp is another name for carbon monoxide as it is found in the mines mixed more or less with air.

Ques.—In a nongaseous mine, where would you locate the main-haulage road, on the intake or the return airway, and why?

Ans.—While the main-intake airway should be made the haulage road in a gaseous mine, to avoid the danger of the ignition of the gas in the return-air current by the lamps of the drivers, it is more practicable, in a nongaseous mine, to make the return airway the haulage road. The reason is that, by so doing, a blower fan can be used and the mine ventilated under a pressure greater than that of the atmosphere. The gases generated in abandoned workings are then driven back and escape by any crevice or break to the surface. The mine is thus kept freer from gas than under the exhaust system.

In the use of the blowing system of ventilation, it is necessary to make the return airway the haulage road, in order to avoid the use of doors at the shaft or slope bottom. For the same reason, in the use of the exhaust system, it is necessary to make the main intake the haulage road.

Ques.—If the percentage of gas in the main return of two air splits is 2.5 per cent., and there is 0.75 per cent. of gas in one of these splits, what is the percentage of gas in the other split; there being 20,000 cu.ft. of air passing in the former and 30,000 cu.ft. of air in the latter?

Ans.—The total volume of air passing in the main-return airway coming from these two splits is 20,000 + 30,000 = 50,000 cu.ft. per min. The volume of gas in this return current is then 50,000 × 0.025 = 1250 cu.ft. per min. In like manner, the volume of gas generated in the first split is 20,000 × 0.0075 = 150 cu.ft. per min. The volume of gas generated in the second split is therefore 1250 — 150 = 1100 cu.ft. per min. This makes the percentage of gas in the second split

$$\frac{1100 \times 100}{30{,}000} = 3\tfrac{2}{3}\ per\ cent.$$

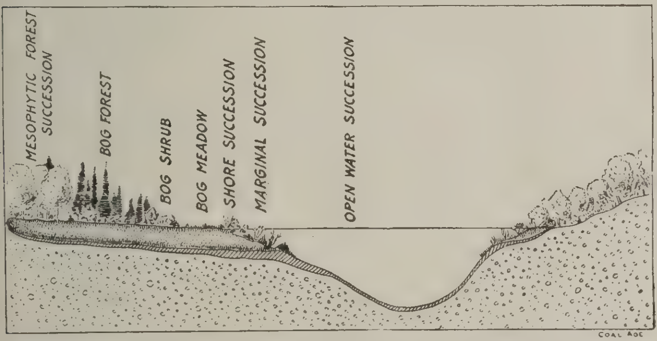
This answer assumes that the given volumes are measured at the return end of each split.

BOOK REVIEW DEPARTMENT

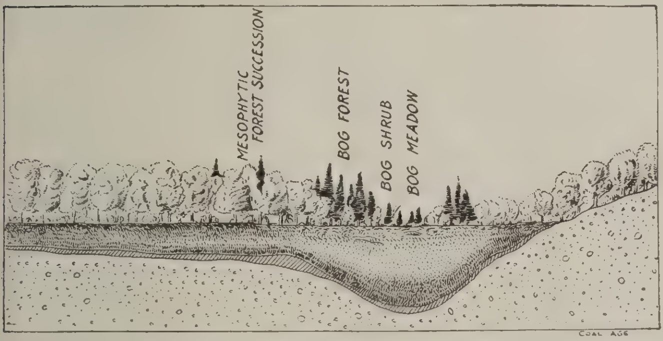
PEAT DEPOSITS—By Alfred Dachnowski, 392 pp. with 32-page index; 6½x9⅝; 1 map, 8 plates, 29 figures. Geological Survey of Ohio, Fourth series. Bull. 16. Cloth boards. Price, 75c.

This book was prepared with the coöperation of the Bureau of Mines, but we think that the main part of the assistance rendered consisted in the making of analyses and in the article on "The Uses of Peat," by Charles A. Davis. Certainly the clarity and simplicity of the bulletins of that admirable institution are not apparent in this report. When we have subjected the newer scientific expressions in many sentences to careful examination and then endeavored to extract the sense from such passages, we have found ourselves somewhat nonplused for the construction is as involved as the terminology is unusual.

However, this charge covers all the faults of the book. It is a most scholarly addition to the study of peat deposits dealing with the subject from economical, ecologic, agronomic and phytologic points of view, to make use of the author's own expressions. The study is of no little interest, though the present bogs are not tenanted by the same plants, as those of the carboniferous era, nor are they growing in soils analogous to those from which our coal beds sprang.



The Early Appearance of a Lake, Having Vegetation Suited to Free Water



The Lake Develops into a Bog, the Early Deposits Overlapping Older

They show a great variety of conditions derived partly probably from the variant nature of the component plants, the different characters of their soil foods and the unequal progress of the processes of decay. Thus the nitrogen in one moisture-free sample in Big Spring Township, Seneca County, ran 3.48 per cent. Had it been moisture- and ash-free, the figure would have been increased to 4.33 per cent. On the other hand, the nitrogen content in a moisture-free sample may fall to 1.01 per cent. in a peat where the ash present is only 8.45 per cent.

Sulphur also varies from 4.57 per cent. to 0.21 per cent. As the ash in the first sample is 22.14 per cent. the ash- and moisture-free sulphur content would rise to 5.88 per cent. The latter sample has only 7.59 per cent. of ash. Only occasionally is pyrite mentioned as being present. It does not appear that the ash, nitrogen and sulphur have any regular relationship. It is only by chance that the figures we give show at once high sulphur or high nitrogen and high ash. One peat with 45.08 per cent. of ash has only 0.35 per cent. of sulphur, the nitrogen being 2.30 per cent.

The large amount of sulphur in these Ohio peats is an evidence that if coal were formed today it would have as large a percentage of sulphur as coals of the carboniferous system. Vegetation now as then serves as a concentrator of all sulphur-trioxide compounds in soil and waters.

The author names the various plants which occur together in the peat bogs. These groups occur in a regular determinable succession, one group at the bottom and the other at margins of the lagoons from which the bogs are formed. The illustration shows these "successions" as the author terms them in their order. The book is extremely interesting and everyone who esteems himself a geologist or a botanist should have it in his library, not so much for the local facts, which are themselves extremely valuable, as for the broadened view the reader will obtain of the conditions determining vegetable growth and the deposition of coal.

⁂

EXPLOSIVES. A SYNOPTIC AND CRITICAL TREATMENT OF THE LITERATURE OF THE SUBJECT AS GATHERED FROM VARIOUS SOURCES. By H. Brunswig. Translated and annotated by C. E. Monroe and A. L. Kibler, George Washington University. 322 pp. and index; 5¼x8¼ in., 45 ill.; John Wiley & Sons, New York, Cloth Boards. Price, $3.

Who Dr. Brunswig is, we do not know and the authors do not enlighten us, but it must be conceded that his book bears translation and the careful reading of the student. The original work is dated January, 1909, so that the information is quite reasonably up to date, though, of course, it does not treat explosives from an American mining standpoint. If it had not been for the mysterious words "Part 1" appearing at the head of the table of contents and of the first reading page, we would have thought it a complete treatise on explosives. More, of course, could be written, but the view taken seems to comprehend the whole field from a popular point of view. The subjects considered are. General behavior of explosive systems, velocity pressure, temperature, flame and products of explosive reactions, explosions by influence, and the properties of explosive bodies. Then igniters, fuses and detonators, mercury fulminate, propellants and blasting explosives are discussed. It may be noted that the book gives the bulk of its attention not to military but to civil explosives.

It is essential that this subject be understood by mine managers. In English examinations for such officials, stress is always laid on such knowledge and the emphasis is justified by the importance of the subject.

⁂

AIR COMPRESSION AND TRANSMISSION, by H. J. Thorkelson, associate professor of steam and gas engineering, University of Wisconsin; 200 pp., with index, 6x9¼ in. Copious illustrations, also tables and diagrams. McGraw-Hill Book Co., 239 West 39th St., New York City. Cloth boards. Price, $2.

Mr. Thorkelson has written this book to meet the needs of the ordinary engineer. Turning the pages over one is confronted with a few integration signs and is disposed to think that the book is not suited for the use of beginners. But in all, the sign is used only seven times and is found only on two pages which occur consecutively. Avoiding these few paragraphs the reader who is seeking for elementary methods of presentation will not once be offended unless he feels that everything is made too explicit and that too much space is devoted to bedrock principles. In an appendix, Mr. Thorkelson even explains the use of logarithms. But though it is true that this little volume is suited to the use of beginners yet it covers the whole field—decompression, ventilation, rotary blowing machines, fans and their design, piston compressors, turbine blowers, hydraulic compression, the effect of altitude, the measurement of compressed air and the care of compressors. It is not written from the point of view of the colliery engineer, but it nevertheless will be found of great value to him in solving his problems and in explaining the wherefores of his compression machinery.

COAL AND COKE NEWS

Washington, D. C.

Statements have been given out by the American Mining Congress with reference to the 16th annual convention of that body which is to be held in Philadelphia during the latter part of October, a feature of which will be a display of mining machinery.

Special attention is to be paid to the problem of safety for miners, both in the discussion and in connection with the exposition of machinery. All classes of safety devices will be on show and there will be demonstrations of operation in order to furnish tests of efficiency. It is expected that there will be large representations from the West because of the supposedly greater advance that has been attained in that part of the country with respect to protection of human life.

Three special transcontinental trains will be run, one from Los Angeles, one from San Francisco, and one from Seattle, picking up men from all of the important mining communities in the West. A special train will also be run by the iron and copper men of Minnesota and Michigan and two trains are expected to be sent from Chicago. A fully equipped mine-rescue car will probably be loaned by the State of Illinois.

The Pennsylvania coal companies will also place on display a number of rescue cars and it is intended to have a working coal mine fitted up in the basement of Horitcultural Hall where the mining show is to be held. The Bureau of Mines will have its methods exemplified by demonstration and there will be moving pictures illustrating the use of safety appliances.

James F. Callbreath, secretary of the Mining Congress, says with reference to the exhibition that:

> The mining industry in the past has been the victim of misunderstanding and ignorance. As a result of all this, serious problems have arisen and we are going to attempt to solve some of them at this great national rally. Because of this general misunderstanding, the burden of taxation upon the mining industry in recent years has been so largely increased in many states that the mining enterprises have ceased operation. In others an undue handicap has been placed upon competition with states operating under less burdensome conditions; and in other states a double system of taxation is required—first upon the total value of the property, and, second, upon the output. A careful discussion of this subject will be presented at the convention and after a thorough consideration it is hoped that the convention will agree upon a general theory upon which a proper system of taxation shall be based.

A Possible Dissolution

Attorney-General McReynolds has announced his intention to file a suit, under the Sherman law, attacking the Philadelphia & Reading Coal & Iron Co.'s control, through stock ownership, of the Central R.R. of New Jersey. He has already filed a suit against the Delaware, Lackawanna & Western R.R. Co. and the Delaware, Lackawanna & Western Coal Co. (a selling concern only—the Lackawanna mines are owned outright by the railroad) in an attempt to undo the steps by which the Lackawanna management sought to meet the requirements of the "commodities clause" of the Hepburn act. These two steps sufficiently indicate the desire of the Attorney-General not only to "get at" alleged railroad combinations in the anthracite field, but also to divorce the anthracite industry from transportation.

Any separation of the Reading railroad and coal properties would bring up problems in connection with that concerns general mortgage, under which stocks of both railroad and coal companies are pledged. Obviously these would not stay the hand of the court, if that body were convinced that existing relations were illegal. A way out of the mortgage difficulty would be found by the litigants or pointed out by the court. A more serious question for the company would be whether a purchaser could be found, and on what terms, for a property which pays only 1 per cent. to 2 per cent. on a debt of $73,000,000, or, including the money spent on "new work at the collieries," less than 4 per cent.

After freeing its coal-company stock from the lien of the general mortgage, the Reading company could distribute that stock, together with the coal-company debt, in the form of income bonds or stock, to its own stockholders, provided such a method were approved by the Supreme Court. It would evidently meet the opposition of the Attorney-General.

But, even if the company were compelled to sell its coal properties to strangers, it could probably do so without great loss of earning power. So far as either the Sherman law or the commodities clause is concerned, its rigid application would not necessarily be destructive of or injurious to the investment value of Reading shares. It probably would not, by itself, seriously impair earning power. A more serious possibility is that of a conjunction of such divorce proceedings and a general reduction of freight rates on the carriage of anthracite to market.

So long as the mines and the railroads are under a common corporate ownership, the individual owners of the combined properties remain immune from the effects of whatever coal freight-rate reductions may be made. As it stands the Reading company is prepared to gain as a coal merchant what the Interstate Commerce Commission may take from it as a railroad, except as to the minor portion of the coal it handles which the "independents" produce. The commission now has under way a broad inquiry into anthracite rates.

HARRISBURG, PENN.

Among the matters to be considered at the tri-district board meeting of the United Workers of the anthracite region, to be held at Wilkes-Barre is the enforcement of the anti-docking bill, which goes into effect the latter part of this month.

The author of the bill, Representative Lenker, of the Lykens Valley district, will probably attend this meeting and give the boards the intent of his bill, and the attorney of the union will give an interpretation of the bill, as to its legal status.

The question of presenting a demand to the coal companies for a "check-off" dues system will be discussed. However, none of the officials of the union will talk on this particular question. It is thought that the independent operators, at least some of them, are favorable to introducing the "check-off," as it will eliminate many petty strikes now arising over buttons, but not much hope is held out that the large companies will agree to the proposition.

A labor forward movement in the anthracite region was inaugurated recently at a mass meeting held at Pottsville. One of its purposes is to solidify the unions of the several craftsmen of this region. The miners are taking an active part in this movement, and it is expected that President White, of the United Mine Workers, will be in Pottsville on Labor Day, Sept. 1, to make an address.

The greatest interest is being shown, not only in labor circles, but by the public generally, in the contest about to be waged in Philadelphia between the American Federation of Labor and the Industrial Workers of the World for leadership among the wage earners.

The success achieved by the I. W. W. in some parts of the state gives cause for apprehension. While a good many people are not in sympathy with all of the methods pursued by the Federation, they are vastly preferable to the prepaganda set on foot by the I. W. W. This latter organization was not very successful in the anthracite region, but is now carrying on a strenuous campaign in the bituminous fields. It is, therefore, with no small degree of anxiety that the contest for supremacy in the principal industrial city of the state is being watched.

PENNSYLVANIA

Anthracite

Hazleton—G. B. Markle & Co., operators of the Jeddo, Highland, Oakdale, Ebervale and Harleigh collieries, among the largest in the anthracite region, have announced that they will erect a hospital at Highland for the temporary care of employees injured in their mines. The hospital will be equipped with modern first-aid appliances.

Wilkes-Barre—A settlement has been made between the Lehigh and Wilkes-Barre Coal Co. and the officials of the county, whereby the county pays back $9450 in excess taxes under the 1907 triennial assessment, while the company pays $18,042 as a balance due on the 1910 triennial assessment.

The trouble and dispute arose over the increase of coal-property assessment six years ago, when the value of coal was raised from $50 to $67 per foot-acre. In a case of appeal the local court reduced the valuation and it was further reduced by the Supreme Court to approximately $49 a foot-acre, or by the superficial acre from $2793 to $1920 an acre. An appeal was taken in the 1910 valuation, but was not tried out in the courts and the coal companies attempted to adhere to the value fixed by the court on the 1907 assessment, so after a long conference during the week the settlement was reached.

Pottsville—The Philadelphia & Reading Coal & Iron Co. has given its assurance to the widows of the men killed in the East Brookside mine on Aug. 2, that it will continue them upon its payroll indefinitely. The widows of the bosses who were killed will each receive $72 and the other women will each receive $40 per month. In addition also each widow will be given $80 in cash at once.

Bituminous

Charleroi—The work of building the new steel tipple for the Carnegie Coal Co., at Charleroi, to take the place of the structure destroyed some two years ago, when the property was owned by the Charleroi Coal Works, is progressing rapidly.

Myersdale—James A. Kirkpatrick and son, J. B. Kirkpatrick, who recently opened a new mine near Addison, on the C. & O. branch of the Baltimore & Ohio, report that the work is progressing rapidly and that they will soon begin shipping coal. Mr. Kirkpatrick was for several years superintendent of the Southern Coal Co., at Casselman.

Rockwood—The new mining operations of Black Brothers near Wilsoncreek is now placing its mined product in stock preparatory to shipping it over the branch road that is being constructed from the mine to the Baltimore & Ohio main line near McSpadden Station. Meanwhile, several hundred dwellings are being erected for the miners and their families and soon the place will have all the earmarks of a prosperous mining town.

Johnstown—For the first time since the purchase of the holdings of the Kelso Mining Co., the mines were operated by the J. Blair Kennerly interest on Aug. 11. These mines adjoin those of the Valley Smokeless Coal Co., which is a holding of the Kennerly company. The output of the Kelso mines is about 500 tons per day. Extensions will be made shortly, providing for the operation of some coal lying between the Valley Smokeless Coal Co.'s mines and those of the Kelso on a royalty basis.

WEST VIRGINIA

Eccles—The miners of the New River Colliery Co., at Eccles, had called a strike to take effect on Aug. 12, but representatives of the union instructed the men to return to work pending a hearing of their grievance by the Arbitration Board. The miners had been digging coal by the car and demanded that the company should put in scales and weigh their output.

Bluefield—It is stated on good authority that the Berwind-White interests have purchased the plant of the Piney Colliery Co., on Piney Creek, in Raleigh County. This property contains approximately 3000 acres of coal land and has been shipping about 25,000 tons monthly.

The Pocahontas Coal Mining Co., Inc., has been recently organized in Virginia. The general offices will be in the Seaboard Bank Bldg., at Norfolk, and Thmas T. Boswell will be president and Edward T. Boswell, vice-president and general manager. These latter gentlemen will, however, have their offices in Baltimore. The present plans of the new company include the opening of a mine in the seam now being worked, while three openings will be made in the celebrated Red Ash seam, which heretofore has remained untouched. A new power plant will be built at an early date and coal is expected to be shipped within a short time.

Charleston—A wage agreement has been signed between the Loop Creek Coal Co., of Page, Fayette County, and the officials of district No. 29 United Mine Workers of America. This gives the men a substantial increase in wages and other benefits including the abolition of the mine guards. About 600 men are affected by this settlement, which is undrstood is entirely satisfactory to employers and employees.

KENTUCKY

Middlesboro—The Wallen's Creek Coal Co., near Middlesboro, Ky., recently suffered the loss of its tipple by a fire of unknown origin, causing damage amounting to about $10,000. It will be some days before shipments can be resumed. F. P. Wood and other Pineville, Ky., men, were the owners of the property.

Masu—The discovery of two veins of what is reported to be the best coal in the Perry County field, neaer Masu, 12 miles south of Hazard, on the Brashear tract of 4000 acres, was somewhat surprising to those familiar with the field, as it was a mooted question whether there was any coal to be found in paying quantities on this tract. A. C. Rineheart, of the North Fork Coal & Timber Co., which controls the property, will at once take steps to open up operations, and will install a large plant.

Lexington—The board of examiners of the Kentucky Mining Department recently awarded first- and second-class certificates to a number of miners who took the examination for mine foreman at Lexington, six first-class and 27 second-class certificates being given. Twenty-nine of the 33 candidates examined had just completed the eight weeks' course for miners given in the College of Mines and Metallurgy of the State University. The board will hold its next examination Aug. 25.

OHIO

Columbus—Considerable development work is being done in the Pomeroy Bend district of Ohio. The Kanawha & Michigan R.R. Co. as well as the Hocking Valley is building a line into the heart of the coal fields and as a result three new mines will be opened in that section in the near future.

The Calvin-Essex Coal Co. is preparing to open two mines and the Peacock Coal Co. will soon open one. The latter concern was a small river proposition, but with the extension of the railroad lines will become a larger producer. The development of the Pomeroy Bend field in Ohio has just commenced.

INDIANA

Clinton—Shaft sinkers employed at the Ben R. Whitcomb mine, four miles northwest of Clinton, have passed through coal at a depth of 120 ft. The No. 5, or top seam, at this point is 4 ft. 8 in. thick, and has a roof of black slate 3½ ft. thick. Drillings have shown that there are two other workable beds below this one, No. 4, which is 4 ft. thick, 100 ft. below No 5; also No. 3, 6 ft. thick, 75 ft. below No. 4. With these prospects in view the above mine promises to be active for many years to come.

Terre Haute—The receivers and owners of the Chicago & Eastern Illinois R.R. have decided to abondon the extension of the St. Louis & Chicago division into Peoria. This branch left the main line at St. Elmo, and was to run 35 miles to Chatham, from whence to Peoria the Alton tracks were to be used. The receivers have, however, just made an appropriation of $3,000,000 for improvements, new locomotives, rails and general increase in freight facilities.

Linton—A force of men began work recently on the new Templeton mine, which, when completed, will employ two hundred men.

ILLINOIS

Duquoin—The Security mines here recently made another local record by hoisting 2250 tons of coal in one day.

Springfield—Superior facilities for mining coal in and around Springfield are blamed by northern Illinois operators for the gradual decline of the mining industry around Coal City and Wilmington. Many miners have left that section of the state to work in Central and Southern Illinois coal fields.

Belleville—Attorney T. R. Mould has filed suit in the Circuit Court for Mrs. Barbara Hildebrandt, executrix of the estate of the late Fred Hildebrandt, against the Colb Coal Co., of Mascoutah for $10,000. This suit arises over the death of Hildebrandt, who on June 3 last was caught under a fall of slate and coal and instantly killed. It is charged that the company failed to have a mine boss in the mine.

Chicago—The Pana Coal Co., of Pana, Ill., has passed into the hands of receivers, by order of the court. The action was made on petition of the Continental & Commercial Trust & Savings Bank, of Chicago. The company's failure to take up and cancel its original issue of $100,000 worth of bonds is understood to have brought about the action. The two mines of the company, which are valued at $400,000, and which are good producers, will continue in operation.

Harrisburg—Dillie Carter, formerly a mine inspector at the Seagraves Mine, north of here, was found guilty in the county court of violating the state mining laws. It was charged that Carter's violation caused the explosion at the mine last winter, in which four men were killed and a number seriously injured.

New Baden—The charter of the miners' local at New Baden, Ill., has been revoked on account of the miners' refusal to work in the two mines of the Southern Coal & Mining Co., after a fine had been assessed against the miners for their refusal to load pit cars above a certain weight. The state organization sided with the operator, but the miners refused to work. It is understood that a new local will be organized and work will be resumed in a short time.

MISSOURI

Moberly—The heirs of J. T. Smith, of Fremont, Neb., recently purchased 1000 acres of coal land belonging to the Eagle Coal & Mercantile Co., a Kansas corporation. The property will be developed at once. Headquarters of the new company will be in Moberly.

KANSAS

West Mineral—It has been known for years that an upper bed of coal of an average thickness of 24 in. underlies the surface of the entire northwestern quarter of Cherokee County. A few days ago a petition signed by 500 miners was sent to Alexander Howatt, president of District No. 14, United Mine Workers of America, asking him to meet the operators and endeavor to secure a scale of wages for working this seam of coal.

ARKANSAS

Little Rock—On Aug. 11, thirty miners and employees of the Arkansas Western Coal Co., with mines at Bates, filed with the State Commissioner of Labor a petition asking that he take action against the above named company on the grounds that it had failed to pay its men. The miners set forth that they had been employed by the coal company for four weeks since their first wage was due, and that two weeks more had passed since the date of their second pay-day, but on neither occasion had they received their proper remuneration.

COLORADO

Oak Creek—Shipments of coal from the mines of the Oak Creek district last month amounted to 827 cars, the largest amount ever shipped out of Routt County in the month of July and an increase of 61 cars over the record for the corresponding month last year. Another record was also broken in the fact that for the first time in the history of the district July showed an increase over the month of June.

Denver—It is expected that 10,000 miners employed in the southern Colorado coal field will go on strike unless negotiations between Frank J. Hayes, international vice-president of the United Mine Workers of America, and officials of the operating companies for recognition of the union are successful. Besides a recognition of their organization, the employment of check weighmen at the mines, the abolition of the contract system, and the dismissal of Baldwin-Felts guards, the men demand a more strict observance of the anti-scrip law and the right to openly attend meetings of their union.

WASHINGTON

Seattle—Seven hundred miners employed by the Pacific Coast Coal Co. in three collieries at Black Diamond, 25 miles southeast of Seattle, walked out Aug. 11 because the company refused to reinstate George Ayers, who was discharged after a quarrel with a foreman. Ayers is an organizer of the Industrial Workers of the World.

FOREIGN NEWS

Colon, Panama—After having had the anthracite deposits on the Rio Indio reported upon by engineers, J. M. Hyatt, former American vice-consul at this port, has left for New York to attempt the financing of this deposit.

Vancouver, B. C.—The provincial executive at a special session in Victoria on Aug. 13 decided to order several militia companies to Nanaimo. The striking coal miners at that place and also Ladysmith appeared to be pretty nearly masters of the situation; hence the decision to call out the provincial troops.

Tampico, Mexico—Rebel activities in the oil fields is curtailing activities greatly and it is feared that the railroad contracts cannot be supplied unless relief comes soon. While a number of engines on most of the roads have been reconverted to coal burners, serious tying up of traffic is certain. Another problem is the coal supply, which is not sufficient to take care of the suddenly increased demand.

PERSONALS

Charles Carrol, former superintendent of the Bunson Coal Co., at its Indiana mines, has been appointed assistant superintendent of the Granville district by Thomas Moses, general manager of the company.

Charles Hoebel, superintendent of Rex No. 2 coal mine of the LaFollette Coal, Iron & Ry. Co., resigned that position recently, and H. Bevan, superintendent of the Rex No. 1 mine was made superintendent over both operations.

Although his term of office expired some time ago, John Laing, state mine inspector of West Virginia, will remain in office until a man can be found to fill his place. There have been no less than 51 applications for this position.

After being threatened with total blindness for several years, John Markle, of Jeddo, Penn., is recovering his sight. He recently returned from Europe, where he has been taking special treatment and now declares that his sight is improving steadily.

CONSTRUCTION NEWS

Philadelphia, Penn.—The Pennsylvania Southern will expend $200,000 on an extension in Clarion County to tap newly opened coal fields.

Sonman, Penn.—The Sonman Shaft Coal Co. is carrying out a plan of extensive improvement at its operations here. A new B. & W. boiler of 500 hp. capacity is being installed.

Woodward, Ala.—The H. Koppers Co. is installing a second battery of 80 byproduct coke ovens at the plant of the Woodward Iron Co. at Woodward, Ala. Work on the battery of 68 ovens of the same type for the Republic Iron & Steel Co. at Youngstown, Ohio, is being rushed with a view to their being placed in operation in the early Fall.

California, Penn.—A company will be organized shortly for the purpose of building a trolley line from California to several mining towns along the Monongahela River, including Granville, Centerville, Vesta No. 5, Fredericktown and Millsboro in Washington and Greene Counties. Rights-of-way have already been secured for the greater part of the distance.

La Follette, Tenn.—The La Follette Coal, Iron & Ry. Co. is building a four-track steel tipple provided with shaking screen at its Rex No. 2 coal mine near La Follette, to replace the wooden structure burned at that place a few months ago. The steel tipple was designed by Myer & Whaley, of Knoxville, Tenn., is being fabricated in Pittsburgh and will be erected by the coal company.

Louisville, Ky.—Actual work on the pipe line which will convey natural gas to Louisville from the West Virginia field by way of Inez, Ky., has been begun at two different points in the state. Ground was broken simultaneously at the edge of the Kentucky River at Frankfort, and near Paintsville in the eastern Kentucky mountains. The proposed line will be about 200 miles long and will cost $3,000,000.

Connellsville, Penn.—F. J. Harry & Co. have been given contracts by the Pittsburgh Coal Co. for three shafts at Hill Staion, 17 miles from Pittsburgh, on the Washington branch of the Panhandle R.R. The contract includes the sinking of a shaft 200 ft. deep, the pumping of water out of two shafts that have been idle 15 years, the concreting of these two shafts and the driving of two main headings 1800 ft. long, and lining them with reinforced concrete.

Pottsville, Penn.—The Pennsylvania R.R. Co. has awarded a contract for building a track to extend from a point near Gilberton station, west to the new operation of Madeira, Hill & Co., between Frackville and Mahanoy Plane. The estimate calls for 300,000 cu.yd. of excavation, which, with grading, is to be finished by January, 1914. The new breaker which Madeira, Hill & Co. will build at the end of this line will prepare the output from the old Lawrence colliery and the Bear Ridge, which are being reopened in addition to that of the Brookwood mine, which is now in operation. This will mean a breaker of immense capacity.

NEW INCORPORATIONS

Paris, Tenn.—A new coal and ice company has been organized here. The capital stock is $20,000, and each shareholder is limited to four shares of $25 each.

Belleville, Ill.—The St. Clair County Coal & Mining Co. has been organized with a capital stock of $1500, to produce coal for local and shipping markets. The incorporators are Val. F. Lauf, Mary A. Lauf and F. Kissell.

Huntington, W. Va.—At a meeting of the officers of the Millard Creek Coal Co., with over two-thirds of the members present, it was decided to raise the capital stock from the present amount of $25,000 to $500,000.

Harrisburg, Penn.—A state charter has been granted to the Panther Creek R.R. Co. to build a 25-mile line from near Nesquehoning to a point near Tamaqua, with a capital stock of $250,000. S. B. Warriner, of Philadelphia, is president.

Terre Haute, Ind.—The Kettle Valley Mining Co. has been organized at Terre Haute for mining and trafficking in coal. Its capital stock is $75,000, and the incorporators are Cyrus E. Davis, Albert Seifert, Christian A. Hansing, Joseph W. Frisz, and Arthur L. Kelso.

Wheeling, W. Va.—The Virginia & Montana Mining Co. has been organized with an authorized capital of $10,000, to acquire mineral claims and develop mineral lands in Lewis & Clark County, Mont. The incorporators are John E. Schellhase, Wm. H. Pfarr, J. T. Goodwin, Geo. B. Maxwell and W. H. Chapman, all of Wheeling, W. Va.

Rivesville, W. Va.—Ohio capitalists have formed the Rivesville Coal Co. to mine coal in Marion County, W. Va. The authorized capital stock is $75,000, of which $7500 is subscribed and $5000 paid in. The incorporators are R. A. Pollock, of Massillon, Ohio; P. B. Pollock and Wm. Brogden, of Canton, Ohio; Frank Stoner, of Massillon, and Wallace Dixon, of Canton.

Ottumwa, Iowa—A new coal-mining company, to be known as the Bidwell Coal Co., filed articles of incorporation Aug. 11. The new corporation is established at Bidwell, Ia., and will do a general mining business. The capital stock of the company is $50,000, and the officers are: John Ramsey, president; John Shuler, vice-president, and Homer H. Harris, secretary and treasurer.

Blairsville, Penn.—The Wilbur Coal Co. has been incorporated with a capital stock of $100,000. This company was organized to develop about 1000 acres of coal lying on the east side of Stony Creek, about two miles from Hooversville and near the Otterbein church. The incorporators are: J. W. Campbell, of Philadelphia; James A. Hill, of New York; Telford Lewis, of Johnstown, and W. P. Graff and F. M. Graff, of Blairsville. The work of development has already been started.

INDUSTRIAL NEWS

Wellsville, Ohio—The new Salisbury Mine, together with the property of the Buckeye Clay & Coal Co., has been sold at private sale by Trustee Frank McCord, of Lisbon, to Henry W. Rumsey, of Chicago, for $23,200.

Pottsville, Penn.—The Lehigh Valley Coal Co., owner of the land occupied by Maysville Park, has discovered a rich bed of coal directly underneath the pavilion, and will prepare to mine the same in the near future.

Hatfield, W. Va.—The Mary Helen Coal Co. is installing a retarding conveyor to take the place of its present system. It is of the rope and button type, 150 ft. long on a slope of 33 deg., or 65% with a capacity of 60 to 100 tons per hour. This equipment was furnished by the Fairmont Mining Machinery Co., Fairmont, W. Va.

Denver, Colo.—Rumors that the coal road of the United States Smelting, Refining & Mining Co. has been sold to the Denver & Rio Grande R.R. Co. have been denied. Work on both ends of the line is going on, and only a tentative agreement with the Rio Grande has been entered into for the hauling of coal.

Careyville, Tenn.—The Sun Coal Co. will install a 375-k.v.-a. Curtis turbo-generator with 14-kw. exciter, one 150-kw. motor-generator set, switchboard and accessories, and will place in operation in the mines two new 8-ton electric mining locomotives. The equipment has all been ordered from the General Electric Co.

Unalaska, Alaska—A cargo of Australian coal has been recently delivered at Unalaska for the use of government vessels, and after a voyage of 8000 miles will cost approximately $15 per ton. A short distance inland from Unalaska lies the much talked of but undeveloped coal ranges which are supposed to contain coal of a superior quality.

Chicago, Ill.—Moving pictures are to be utilized by the Illinois Central R.R. to instruct its employees in the burning of coal to the best advantage. Last year the road used 4,400,000 tons. The saving of one shovelful in every ton of this fuel would have saved $88,000. Lessons will be given by the movies on the firing of locomotives and large amounts of time and energy thus saved.

Wheeling, W. Va.—Representatives of coal interests keeping in the background are taking up options on a considerable block of coal land in the southern part of Belmont County. They have been at work for some time past, and it is understood, have secured options on a considerable acreage, that has been overlooked by operators who have been buying coal in that section the past few years.

New Orleans, La.—With the withdrawal of the tug "Mamie Coyle" to Memphis, one of the landmarks of the coal trade in the harbor here has passed. The "Mamie Coyle" was sold recently to the Memphis Bridge Co. by W. G. Coyle & Co., local coal dealers. She had done duty in this harbor for 43 years. The boat was built in Chester, Penn., in 1870. Despite her long usage the tug sold for $12,000.

Washington, Penn.—J. Howard Clarke recently purchased the Pittsburgh vein of coal underlying the farm of his deceased uncle, the late Harvey H. Clarke, of South Franklin Township, the price paid being $200 per acre. The location of this coal is the upper Chartiers Valley on the Eastern side of and near the crest of the Washington anticline. As the area in question covers 260.66 acres, the consideration totalled $52,133.40.

Washington, D. C.—The Senate on Aug. 15 cleared the way for work to be started at the new site of the Bureau of Mines in Pittsburgh, when it authorized the Treasury Department "to accept such funds as may be received by contributions from the State of Pennsylvania, or from other sources, for the purpose of enlarging by purchase, condemnation, or otherwise, and improving the site authorized to be acquired by the Bureau of Mines."

Pittsburgh, Penn.—An agent, said to represent a prominent real estate dealer of Pittsburgh, has been at work in the Bradley Junction coal field, securing options on a large tract of coal that has not passed into the hands of any of the numerous companies doing business in that section. The field lies in corners of Cambria, Carroll and Allegheny Townships, and was under option to Kirsch Bros., of Nicktown, until a short time ago.

Pittsburgh, Penn.—The Rochester & Pittsburg Coal & Iron Co. will place in operation new electrical apparatus consisting of a 200-kw. rotary converter, twelve 40-k.v.-a. and three 75-k.v.-a. transformers, and a 100-hp. motor; also a 300-kw. rotary converter, three 110-k.v.-a. transformers, and fifty 5½-hp. and fifteen 7½-hp. motors. Thirteen new 6-ton and eleven 10-ton electric locomotives will be operated in the mines. All this apparatus has been ordered from the General Electric Co.

Washington, Penn.—C. N. Savage, on behalf of Wm. E. Jackman, a lunatic, has presented his petition to court, asking leave to enter into a lease for certain coal underlying Jackman's farm in East Pike Run Township. Among the assets of the estate is 7 acres of coal underlying the house, barn and other farm buildings, which has heretofore been reserved. It is desired to continue the mining of this coal upon the payment of the regular royalty of 1c. per bushel, the coal in that locality yielding about 10,000 tons to the acre, or 275,000 bushels.

Rio Janeiro, Brazil—American consular agents lean to the belief that a profitable market can be found by American coal operators along the Amazon River, suggesting that the coal be shipped in barges direct from the mines along the Ohio and its tributaries. Such barges would find profitable return cargoes of rubber and other products. The Amazon River industries are entirely dependent upon the extensive steamboat traffic necessary for the collection and marketing of their products. The rubber business alone is valued at $50,000,000 per year.

Louisville, Ky.—The prolonged drought in the Ohio Valley, in common with that in the Middle West generally, has resulted in a stage of the river too low for the movement of the larger steamers, and as a consequence, the towboat "Strague," coming up from the lower Mississippi, and bound for Louisville with 35 empties, has been forced to tie up at Cairo. Recent more or less general rains, however, have helped somewhat, and a navigable stage may be expected soon, which will enable something like 3,000,000 bu. of coal now tied up at Pittsburgh wharves to move.

Hazard, Ky.—R. D. Baker, of Big Stone Gap, Va., with local capitalists, at Hazard, Ky., will soon begin the construction of a four-story office and store building in that city, and S. A. D. Jones, manager of the Racoon Coal Co., is planning the erection of a three-story office building on the site of his office building, which was destroyed by fire some time ago. The demand for office and other business space caused largely by the continuing coal development around Hazard, has made the present buildings inadequate, and those indicated are the first of a number which will be built.

COAL TRADE REVIEWS

GENERAL REVIEW

Bituminous prices showing a tendency to soften. Recent tension in the trade much relieved. Market well maintained in the face of a temporary sagging tendency. Undertone excellent. Anthracite a trifle more buoyant.

Both the wholesale and retail hard-coal markets have experienced a slight impetus during the week, due partly to the beginning of the return of the summer vacationists and the preparations for starting up furnaces. The middle of September will see the winter trade definitely under way and indications point to an active business throughout the season. Some weak spots are still found occasionally where one of the individual operators has been attempting to force the market by cutting the regular company circular. Such business is not meeting with much success, however, and the trade is holding generally firmer than the average for this period.

While the soft-coal market continues to maintain its excellent position, conservative observers believe they see indications of an easing up. Buyers are showing a disposition to hold off until September, with the result that prices have softened in spots and sellers, who were slow about taking business earlier in the season, are now beginning to look for orders. The tension has been materially relieved generally, and indications point to a slight temporary, though probably unimportant, sag in the market. On the other hand, it is still a problem in some districts to obtain sufficient coal, although it is clear that there is more in the market than for some time.

Mines in the Pittsburgh district have a moderately large supply of both cars and labor, and production is very heavy. Substantial premiums are being obtained for any spot tonnages available of which there are only a few odd lots; indications are that there will be considerable buying in the prompt market up to Dec. 1 by dealers whose requirements are not covered for this period. The Ohio docks continue loading Lake coal at full capacity. The steam trade in the state is holding remarkably strong, and the large interests are anticipating an advance on this grade. The market is firm in all directions and indications are bright for an active fall and winter business. Demand and prices at Hampton Roads continue firm, but the vessel tonnage has been light, with the result that considerable coal has accumulated in the yards; this situation will be relieved shortly, however.

The situation in the Southern market is much improved, there being less coal on track and orders for prompt delivery more numerous. The heavy cotton crop is having a stimulating effect on coal. In the Middle Western markets, one of the principal features is a deadlock at Chicago, due to the buyers refusing to meet the new high prices on the domestic grades. Supplies are still further reduced and an advance in quotations is anticipated the first of the month. At St. Louis screenings are heavy, while the domestic grades are ruling firm; practically no smokeless is coming in, and the car supply has only been about 50 per cent. requirements.

BOSTON, MASS.

Pocahontas and New River coming forward more freely. Shippers begin seeking orders. A dull period looked for. Pennsylvania grades quiet but firm. Anthracite shows good prospects for September.

Bituminous—There are signs that the market is already somewhat easier. Pocahontas and New River are coming down more freely, and practically all the shippers have now caught up with their old obligations. Receipts here have been very heavy the past week, the vessels and barges that were detained at Hampton Roads having now arrived in squadrons. The agencies that took only a minimum of business early in the season are seeking orders and prices at New England distributing piers have softened on that account. Loading despatch at the Virginia terminals is prompt, and at all points there is a decided let-up after the tension of a month or so ago; f.o.b. prices are now only 5@10c. up from the $2.85 contract figure, and the expectation is that spot coal will sag off within a short time to the season price. Meanwhile there is little inquiry and the disposition of buyers who did not cover their requirements in the spring is to await developments at least until September. The off-shore demand is good, and that will do much to keep the tidewater market steady during the dull period that is looked for the next fortnight or so.

A quiet tone is also observed this week with regard to the Pennsylvania grades. Prices are still firm, but it will be strange if they are not modified in response to the better supply of West Virginia coals. Those from Pennsylvania come to this market in relatively smaller shipments, however, and it may be they will hold their strong position so long as their output continues less than normal. Buyers who are "hedging" are likely to buy Cambrias and Somersets for hand-to-mouth supply and reserve their purchases of Pocahontas and New River until the prospect is better outlined. Georges Creek continues with a steady demand. The output is rather smaller than usual and thus far is being practically all applied to contracts.

Anthracite—There is more impetus to retail trade and the wholesale demand shows some improvement. The scarcity of broken coal is a feature and by some is regarded as serious. There is good prospect of an active market beginning in September, and doubtless full time will then be resumed at the mines. Some of the individual shippers are trying to force coal on the market at prices somewhat off the circular, but their efforts do not seem very successful.

Wholesale quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.15@1.55	$1.35@1.70	$1.67@1.77	
Philadelphia*	2.40@2.80	2.60@2.95	2.92@3.02	
New York*	2.70@3.10	2.90@3.25	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.95
Boston†				3.83@3.88
Providence†				3.90@4.00

*F.o.b. †On cars.

NEW YORK

Bituminous a trifle easier, but with an excellent undertone. Buying slightly restricted. A temporary sag seems to be developing. Hard coal now over the dull period and beginning to tune up for the fall and winter.

Bituminous—There has been a slight tendency to ease up in the local market during the week, although no specific weakness has developed. There is probably a little more coal at tidewater than has been on hand for some time. This tonnage could be easily moved were the sellers inclined to recede from their high price level, but quotations are being firmly maintained and production moderately restricted in the mining regions.

There is an increase in the demand at tide, but prices are not quite so firm as before. However, the outlook for the winter trade is excellent. Close observers are agreed that there is a strong undertone to the market and a large consumption seems to be assured. The railroads have done very little buying so far, and will be an important feature in the situation. The car and labor supply continue to be the controlling features. Labor is fairly plentiful, but the car situation is showing a tendency to tighten, particularly at some points on the Pennsylvania R.R. The market is not quotably changed, and we continue last week's prices as follows:

West Virginia steam, $2.55@2.60; fair grades of Pennsylvania, $2.75@2.80; good grades of Pennsylvania, $2.80@2.85; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.25@3.30.

Anthracite—The regular August dullness prevails in the hard-coal trade, with everything moderately quiet. However, the market has now gone through the two dullest months of the year in remarkably good form; in fact, in much better condition than in previous pears. Many of the summer vacationists are returning, and steam-heating plants are beginning to make preparations for starting up, with the result that there is already some activity. There will also probably be a small rush for coal at the end of the month by consumers anxious to stock up before the full winter circular goes into effect Sept. 1. Indications point to a good stiff business during the winter.

Stove coal continues to be in short supply, as has been the case all summer, and broken is now a close second. A slight temporary shortage is even reported in pea. Chestnut appears to be the heaviest and most difficult to move. The new Pennsylvania State tax on anthracite is still creating great deal of confusion and some uncertainty. The companies charging this tax to the buyers are placing a severe andicap on selling agencies; this increase is tending to scare way what little demand there has been.

We quote the New York market on the following basis:

	Circular	Individual	
		Lehigh	Scranton
roken	$4.70	$4.45@4.85	$4.50@4.90
gg	4.95	4.95@5.10	5.05@5.15
tove	4.95	5.10@5.20	5.15
hestnut	5.15	5.25@5.35	5.40
ea	3.50	3.30@3.45	3.35@3.50
uckwheat	2.75	2.15@2.45	2.55@2.75
ice	2.25	1.70@1.95	2.25
arley	1.75	1.30@1.70	1.75

PHILADELPHIA, PENN.

Anthracite has shown little sign of improvement. Shipents to Northwest are growing less, owing to storage facilities there being well filled up. Broken coal about the only eature to the market. Bituminous still continues strong, vith prices firm, and coal hard to get.

The curtailed operations at the mines would seem to inicate that the near future does not seem to hold any prosect of any immediate increased demand for coal. As a mater of fact, the latter part of August finds the trade in this icinity in a very lethargic condition. The large tonnages hat have gone from this territory to the great lakes have bout filled the storage places there, and for some of the izes, the companies are finding themselves hard put to find n outlet. This applies particularly to chestnut coal; ever ince the increase in the price of this size to 15 to 25c. over he stove, there has been a gradual falling off in the demand. hree or four years ago, the demand for this size was far in xcess of the supply; as a deterrent, the price was doubtless aised, and it has had the effect of diverting the demand to ther sizes. Pea coal was the natural substitute for those eeking a cheaper fuel, as witnessed by the heavy demand or this size during the winter months. The demand for roken coal is unprecedented, and while most of this grade noves on contract, it is almost impossible to secure any uantity at less than the full circular price, and even at that arge orders are being turned down. It is unreasonable to uppose that the operators will work their mines for the production of this size, when the demand for the others is such hat it means stocking, and as a consequence, the market is uffering. This may be ameliorated when the full mining tarts in, but it is a fact now that the demand is far in excess of the supply.

Bituminous coal cannot be bought now at less than $1.25 t the mines, and one has trouble in securing supplies, even t the prices quoted. Operators are willing to name prices, ut they persistently refuse to guarantee any deliveries, alhough in the face of this, it may be paradoxical to remark hat there is reported to be coal on demurrage at tidewater. his is due, however, to the inability to secure transportaion facilities. Water freights are way up, and tonnage carce, and as the season for the resumption of anthracite ctivity approaches, the condition is not likely to improve.

BALTIMORE, MD.

Bituminous trade is strong, but coke demand has not reponded. Congestion at the piers for brief time. Anthracite all is improving.

The bituminous trade is strong and in many cases the call n contract is now exceeding the supply. The problem still ontinues to be one of getting out enough fuel in the face f a labor or car shortage; in West Virginia cars were somehat easier the early part of the week, but there was a ghtening up toward the close.

The steel industry is showing good form, according to reorts in coal offices here, but coke has not responded to the pward trend. Among the fuel that accumulated at tide durg the week was considerbale coke that did not find ready isposal. Probably a thousand cars of coal were also tied p here temporarily, but were finally disposed of to an adantage.

One of the encouraging features is heavy demand for ack from the cement industry. Other industries are also sking for screenings and prices have stiffened so that little offered at less than 70c.

The anthracite demand generally is improving. Not only re deliveries fairly heavy, but orders are being placed which ssure a fine latter September and early October delivery.

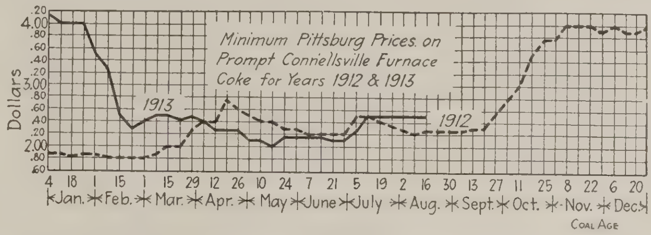
PITTSBURGH, PENN.

Extremely heavy Lake shipments. Slight car shortage. ittle free coal, and fancy prices paid. Coke supply larger, ut prices firm.

Bituminous—Coal shipments continue at the heaviest rate ossible, with mines working very nearly full. More labor ould be employed, but on the whole the supply is as good as it has been at any time lately. Several mines on the Monongahela division of the Pennsylvania lost time last week through car shortage, and a small wreck at the Conway yards made additional trouble. About 10,000 loaded cars are at the lake front. The car supply in general, however, is fairly satisfactory.

There is no free coal, except for occasional odd lots. Mine-run for spot shipment has brought $1.50 without difficulty, while 1¼-in. has sold to retail dealers at $1.75. The dealers were not eager enough to close contracts for the season, and many are indifferently provided. To take care of their trade up to December they will probably have to buy much coal in the open market at premium prices. It is practically impossible to shade 90c. on slack and despite the heavy lake shipments and consequent large production of slack there is very little being stocked, so that slack promises to command a premium in the winter. Reguar season prices remain nominally as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—There has been a plentiful supply of coke in the past week, shipments being better on contract, while it is relatively easy to pick up prompt and spot lots. Prices, however, remain absolotely firm and there is practically no prospect of the operators receding from their position of demanding $2.50 for furnace coke for any delivery. Demand has been very light since such furnaces as were not early covered for August made purchases for the month. In two or three cases there are negotiations on for September coke and for coke for the balance of the year, no prices being mentioned as likely under $2.50. Foundry coke continues very firm at $3 for both prompt and contract.



The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 9 at 392,825 tons, an increase of 7760 tons, and shipments at 397,362 tons, an increase of 31,309 tons.

BUFFALO, N. Y.

Still absolutely no coal in the open market. Contracts are being taken only when the seller obtains a concession from the buyer. Heavy movement, but market remains strong.

Bituminous—There is said to be rather more bituminous coal on the market than for some time, but not enough to weaken prices. In fact nobody appears to anticipate any weakness before the fall demand opens. There is all of the former complaint of slow work in the mines. The men have never before been called on to work steadily in summer and they cannot be made to do so now. On that account there are those who look for the coal prices to be no stronger in the fall than they are now, for the miners will go to work when the weather becomes unpleasant. On the other hand coal cars will become scarcer right along and the motive power of the railroads will be occupied with other freight, so that consumers will suffer if the consumption continues large.

It is a constant source of wonder that there is no coal on sale in the open market. Shippers who need a quick supply for loading lake vessels are often unable to buy enough to fill out their cargoes at any price. They sometimes offer more for the last of such a cargo than they are getting for it, but the coal is simply not to be had.

It is pretty certain that the consumers are going to be caught with small supplies this fall and winter, but they do not seem much disturbed about the situation and are merely running on a fine-weather schedule, apparently considering the reports of a coal shortage in midsummer as a device to sell coal on. The trade looks for higher prices and is obtaining them to some extent. The rule is not to take contracts unless something more than the current quotation can be obtained. Jobbers are not at all at ease over the outlook. They say it is going to be a difficult thing to buy coal on time and be assured delivery. The seller usually finds a better customer and makes some excuse for shipping the coal to him.

Bituminous quotations remain very strong at $2.90 for Pittsburgh select lump, $2.80 for three-quarter, $2.65 for mine-run and $2.15 for slack, with the latter stronger than formerly. The price of Allegheny Valley grades is about 15c. less than Pittsburgh.

Coke—There is a somewhat stronger feeling in all grades of coke. The efforts of consumers to cut the price down still further have not succeeded; producers maintain that prices are at the bottom and that they would shut down if they could not get present asking prices. Quotations are stronger at $4.60 for best Connellsville foundry, f.o.b. Buffalo and the Bridges.

Anthracite—There is a slight stir in the demand for anthracite, but it will be light until about another month passes. Shippers are still at sea over the Pennsylvania tax and consumers are holding off some on that account. The rail lines are doing a fair business, but all efforts are given to the lake trade, though some companies are running out of storage room at upper-lake ports. Shipments for the week were 210,000 tons.

TOLEDO, OHIO

Local trade anticipating an advance in quotations on the steam grades. Prices strong and the movement heavy. Docks loading Lake coal at full capacity.

Steam coal is moving remarkably well and is strong in price. In fact, nearly everybody connected with the coal business is looking for an increase in steam prices at an early date, both buyers and dealers alike. Domestic sizes for line shipment are also strong and there is no tendency toward weakness. There is more or less coal on track here which is being sold at less than circular prices to avoid demurrage, but this is purely a local condition and in no way indicates a weakness. Lake shipments continue strong and all the docks are busy loading coal as fast as the machines and men can work. Outside dealers are beginning to buy more freely and all express themselves as satisfied with the outlook.

Prices quoted here are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massilon	Pitts. No. 8	Cambridge
Domestic lump.........	$2.50	$1.70	$2.50	$1.75	$2.50	$1.35	$1.35
Egg.................	2.50	1.35	2.50	1.50	2.50	....	....
Nut.................	2.00	1.20	2.25	1.50	2.50	....	....
¾ lump..............	....	1.55	....	....	....	1.20	1.20
Mine-run............	1.60	1.35	....	....	....	1.10	1.10
Slack...............	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

The local coal trade is ruling strong in every way. Demand good for all grades, and the new circular prices are well maintained. Steam business is increasing in volume, and the lake trade is still active.

The trade during the past week has been active in every direction. Domestic demand is good and is gradually increasing from all sections. Steam business is also active and the same is true of the lake trade. Taking it all in all, the market is in excellent condition and future prospects are bright.

Domestic trade is increasing in volume as the fall approaches. Many of the larger householders have placed their orders and the retailer is busy making deliveries. Retail stocks are not heavy, and with the constant drain upon them, dealers are compelled to place orders for supplies. Most of the orders now placed by retailers are for immediate delivery, although there is some business being done for delivery in September. Operators and jobbers are loath to book orders for business any farther ahead than September. School and municipal contracts are now being filled.

Lake trade is strong, although the growing car shortage is cutting down the volume to a certain extent. The demand from the Northwest is still good, and activity will undoubtedly prevail in the lake trade up to the close of navigation. The interior movement from the upper lake ports is going on steadily.

The steam demand is also one of the strong points to the market. Manufacturing plants are taking a good tonnage and the same is true of railroads. One of the strong points of the steam trade is the good demand for the small sizes, such as nut, pea and slack and coarse slack, all of which are advancing in price. The supply of steam grades is not large.

The output during the week has been curtailed to a certain degree by the growing car shortage, and it is estimated that the state produced but 75 per cent. of normal. The car shortage was the most pronounced in Eastern Ohio, many of the mines there being compelled to close down for a portion of the week. The situation was the best in the Hocking Valley district, but even there some trouble over lack of transportation facilities was reported.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburg	Pomeroy	Kanawha
Domestic lump.....	$1.70 @ 1.65	....	$1.70 @ 1.65	$1.70 @ 1.65
3-4 inch............	1.55 @ 1.50	$1.30 @ 1.25	1.45 @ 1.40	1.50 @ 1.40
Nut..............	1.30 @ 1.20	....	1.35 @ 1.30	....
Mine-run...........	1.35 @ 1.25	1.20 @ 1.15	1.30 @ 1.25	1.20 @ 1.25
Nut, pea and slack..	0.70 @ 0.65	....	0.70 @ 0.65	0.65 @ 0.70
Coarse slack........	0.60 @ 0.55	0.75 @ 0.70	0.60 @ 0.55	0.55 @ 0.50

HAMPTON ROADS, VA.

Quite an accumulation of coal has developed at tidewater. A falling off in vessel tonnage. Market remains firm and prices stationary.

Dumpings over the Hampton Roads piers have not been as heavy as anticipated. Vessel tonnage was plentiful at the beginning of the week, but fell off completely toward the end and as a result there is quite an accumulation of coal in the various railroad yards. Contracted vessel tonnage due in the next few days, however, will greatly relieve matters and heavy loadings are expected during the next week.

The demand for coal inland has been fair and prices are remaining firm on both Pocahontas and New River grades, but there is little inquiry for Kanawha splint or gas coals as buyers seem to be well stocked with these grades.

Shipments both foreign and coastwise have been light. Foreign cargoes have been made to Genoa, Canal Zone, Jamaica and Rio de Janeiro.

LOUISVILLE, KY.

An abnormally heavy demand on the Kentucky operators. Producers cautious about further commitments. Car shortage developing and rumors of labor trouble are being heard.

The local market continues brisk, with the demand good on all grades and sizes. The eastern Kentucky operators, particularly, are experiencing one of the strongest demands in the history of the trade and are now inclined to be conservative about future commitments. There is distinct evidence that they are in fear of overselling and so are going very slowly in this respect. This unusual situation is due to an abnormally heavy demand, particularly from the North, and there does not seem to be any indication whatever of a letup in the consumption.

Another factor that may develop to serious proportions, is the persistent rumors to the effect that there are grave possibilities of labor troubles in the Jellico district, and other portions of the eastern Kentucky field. There are said to be a number of labor agitators in there, and there are many indications of unrest among the miners. In addition to this, operators have already experienced some difficulty in getting sufficient cars, and the situation in this respect promises to be serious before long. Shipments into Chicago are particularly difficult to negotiate, for the reason that the Louisville & Nashville R.R. positively refuses to accept consignments in their equipment because of the long delay in returning same. The heavy movement into the Northwest has taken a large number of cars, and even under the best conditions, the return of this equipment to the mining regions is slow. The new cars being supplied the roads do not seem to be relieving the situation materially.

Steam grades are unusually good in view of the fact that operations have been restricted in certain large consuming branches; operators and dealers are finding that they have none too much of this grade to meet the demand. The better grade eastern Kentucky screenings are in strong demand at 85 to 90c. with the western Kentucky at 55 to 65c., f.o.b. mine. Eastern Kentucky block is steady at about $1.85; block and lump, $1.60@1.65; round, $1.35@1.40, with a very strong demand from industrial plants for mine-run at $1.25. Prices are showing a strong upward tendency and September deliveries will take on a good advance over the above figures; new contracts are being uniformly made at an advance of 10c. over the last year's figures.

DETROIT, MICH.

Some further contracting at good figures. Demand for gas coals unusually strong. The railroad movement slow. Anthracite will advance Sept. 1.

Bituminous—Local wholesalers and dealers are expressing a great deal of satisfaction over the fact that the West Virginia labor situation has now been definitely cleared up. Indications point to a strong, active market, and dealers are anxious that the supply shall not be restricted. Several uncertainties in the situation have created an unusual activity in contract business, some of which for large tonnages, have been closed during the week; business in this line is particularly buoyant.

One of the unfavorable features in the situation is the apparent inability of the railroads affected by the Ohio floods to reëstablish normal conditions on their lines; from present indications, it is not at all improbable that the effects of this will be felt well into the winter months.

Orders for mine shipments, particularly for gas coal, are especially good; the minimum figure now quoted on Youghiogheny slack is 90c., f.o.b. mine, with only a little available at that figure; about the same situation is in effect on West Virginia gas coals. Several cars of slack, which were standing on tracks here a few weeks ago, have been cleaned up, and there are practically none of the smaller sizes in the spot market today. The Pocahontas grades are coming in slowly, and continue to maintain their former strong position; most of these are apparently being shipped either to Tidewater or the upper lake ports.

The local market is quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.60	....	$1.75	....	....	$2.50	$2.40
Egg	1.60	....	1.75	....	....	2.50	2.40
Steam lump	1.40	....	....	....	....	....	....
¾-in. lump	1.35	$1.20	1.25	$1.25	$1.25	....	....
Mine-run	1.10	1.10	1.10	1.10	1.10	1.50	....
Slack	0.85	0.90	0.75	0.75	0.75	....	....

Anthracite—While hard coal seems to be coming in freely, the demand is unusually heavy, and indications point to a scarcity this fall and winter. Local jobbers state that prices will be advanced 50c. per ton on Sept. 1.

BIRMINGHAM, ALA.

The local situation has improved during the week. Spot orders more numerous and there is less coal on track. Coke a trifle stronger.

A canvass of the principal operators here shows that the trade is somewhat improved over last week. The amount of coal on track has been reduced and spot orders are coming in at an increased rate. The principal cause for the change is the increased shipping instructions from the oil-mill trade whose busy season will begin in September.

In the domestic grades of standard coals it is found that all mines are practically sold up on No. 2 lump and nut, but fancy lump is moving slowly and it cannot be said that the market has improved on this special grade. Reports from some of the dealers indicate that fancy lump is heavier than customary at this season of the year owing to the increase of 25c. over last year's prices on nearly all standard coals in Alabama, while the lower grades of lump coal are being sold at about the same level as in 1912.

Due to a better pig-iron market furnace coke is stronger, although it is not believed that the furnaces recently put out of blast will go in again in the near future.

NEW ORLEANS

High fuel-oil prices increase demand for coal. Yard room filled to capacity. Tap-line orders placed.

The high price of fuel oil is greatly increasing the sale of coal. With the certainty of a large cotton crop and the probability of a heavy yield of sugar cane both ginners and sugar-mill men are buying largely. Every foot of room in the regular yards of the companies handling Alabama coal is filled, yet there is no interruption in the movement to take advantage of cars while they are to be had.

Announcement that extensive rebuilding will be necessary on one of the locks in the Warrior River will delay the coal-carrying experiment of the Alabama-New Orleans Transportation Co. until mid-winter at least, it is thought. Whether the power barges, which are over 200 ft. in length, can handle coal economically down the small Alabama rivers is yet to be proven, although coal men generally are preparing to meet a lower price that is likely to develop with the perfection of the lock system in the Warrior River. Several orders were placed this week by lumber and tap-line railroads.

The New Orleans Ry. & Light Co. will place their annual contract for 150,000 tons of coal in the near future.

ST. LOUIS

Only a 50% car supply furnished during the week. Screenings continue a drug, but domestic grades are ruling high. Hot weather affecting the market.

The only thing that has prevented the coal market from soaring for the past ten days has been the continued hot weather. There was everything to keep the price up; the mines in Williamson and Franklin Counties worked two days this week on commercial coal, on account of the car shortage. The Iron Mountain operators fortunately got about three days and the same applies to the Illinois Central. This is about 50% of the called-for equipment, and if this condition exists now, it is an easy matter to figure out what it will be with 60 days.

Screenings are still a drug on the market, although there has been little change in the price. However, if there is a flood of equipment for a matter of a week, the price will drop. Franklin County operators are rapidly advancing, quotations being oversold on account of the shortage.

Anthracite is absolutely a drug in the St. Louis market, and chestnut is sold as low as $7.05, whereas the circular, including the tax, is $7.44. There are between 50 and 75 cars of chestnut due in the next ten days that have not been sold, coming in on speculation.

The same thing applies to coke, and there is practically no smokeless coming in at all. The indications are that there will be no change in conditions for the next week, unless it is an advance in the price of high-grade lump and egg. Standard operators are selling their coal at the cost of production.

The market is now quotable on the following basis:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$0.95@1.00
3-in. lump	....	....	$1.30	....
6-in. lump	$1.40 @ 1.60	....	1.40	1.20@1.30
Lump and egg	....	$2.10	1.40	....
No. 1 nut	1.10 @ 1.20	....	1.05	0.87½
Screenings	0.65	....	....	0.80
Mine-run	1.50	....	....	0.75
No. 1 washed nut	1.50 @ 1.60	....	....	....
No. 2 washed nut	1.20 @ 1.30	....	....	....
No. 3 washed nut	1.10 @ 1.15	....	....	....
No. 4 washed nut	1.00 @ 1.10	....	....	....
No. 5 washed nut	0.70 @ 0.75	....	....	....

CHICAGO

Dealers refuse to meet the recent advance on domestic grades and buying has stopped. Further advance expected Sept. 1.

There is little activity in the Chicago market, so far as domestic coal is concerned, retail dealers, as a rule, refusing to purchase standard coals at present prices. Despite the fact that a car shortage is in sight and the coal supply will be decreased they contend that offerings at reduced prices will be made within a short time. On the other hand, the general trend of opinion among market observers is that there will be a sharp advance in the price of standard coals by Sept. 1.

It is also regarded as certain that a shortage in the supply of smokeless coal will soon develop. Smokeless mine-run is quoted at from $1.50 to $1.60 on the spot market and lump and egg is selling at $2.25 to $2.50 at the mines for spot shipment. An advance has been made by Hocking Valley operators on inch and one-quarter lump to $1.70 at the mines and on six-inch lump to $1.95, the mines. Coal operators in the Franklin County district are obtaining $1.60 at the mines for their product. Springfield operators have established a uniform price of $1.50 at the mines, so far as country sales are concerned. Concessions are being made, however, on Chicago shipments. There has been little change in the anthracite market, business remaining at a low level. Prices prevailing at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07@2.32	$2.45@2.65	$2.27	
Steam lump	1.92		2.07	
Egg		2.45@2.65		$4.30@4.55
Mine-run	1.82	2.30	1.87	3.55@3.65
Screenings	1.32@1.37	1.60@1.75	1.32@1.37	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-product, egg, stove and nut, $4.75@4.85; gas house, $4.65@4.75.

PORTLAND, ORE.

Situation unchanged. Imports light, but will increase in the fall.

The market in domestic coal is quiet and prices have shown no change although the wholesale price to dealers on Utah coal advanced 25c. per ton, Aug. 1, as has already been announced.

Coal has not been imported here in very large quantities so far this summer and there is reason to believe the shipments will be rapidly increased with the approach of fall. As much of the coal will move over the C. W. R. & N. lines, the additional equipment ordered for them is of importance to the coal trade.

FOREIGN MARKETS

AUSTRIA

The Austrian coal production for the first half of the current year was as follows:

Year	Coal	Coke	Liguite	Briquettes Coal	Briquettes Lignite
1913	8,086,786	1,247,050	13,840,183	97,452	118,167
1912	7,605,151	1,115,561	12,747,064	83,042	116,138

FRANCE

The following shows the production of fuel in the Pas-de-Calais and Nord districts during the first half of the current year and last year:

	Pas-de-Calais 1913	Pas-de-Calais 1912	Nord 1913	Nord 1912
Coal	11,039,919	10,798,746	3,906,105	3,742,998
Coke	810,445	786,080	429,917	423,950
Briquettes	286,648	316,207	605,804	565,134

GREAT BRITAIN

Aug. 8—Despite holiday influences there is a good demand for all kinds of large coal, and prices continue firm:

Best Welsh steam	$4.80@5.04	Best Monmouthshires	$4.08@4.20
Best seconds	4.56@4.68	Seconds	3.96@4.02
Seconds	4.32@4.50	Best Cardiff smalls	2.46@2.52
Best dry coals	4.32@4.56	Seconds	2.28@2.40

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for June, and the 12 months ending June 30, 1912-13, in short tons:

	June		12 Months			
Destination	1913	1912	1913	%	1912	%
Tidewater	253,448	307,023	3,531,202	22	4,324,397	24
East	192,316	152,020	2,549,552	16	2,164,960	12

American Coal—Dividends of 3% payable Sept. 1 to holders of records Aug. 30. Transfer books do not close for this dividend.

FINANCIAL DEPARTMENT

Lehigh Coal & N. Co.

President S. D. Warriner, of this company, says under date of Feb. 10:

Results—The net revenue of the company from the various sources increased or decreased as follows: Coal decreased $444,047; canals decreased $45,814; railroads increased $1752; miscellaneous income increased $163,196; total net revenue decreased $324,913.

The increase of $163,196 in miscellaneous revenue is mainly accounted for by the proceeds of the sale of the collateral trust power bonds being placed at advantageous rates of interest pending the need of the money for construction purposes. Another large item making up this increase was the initial dividend of 4%, received on 5079 shares of capital stock of the Lehigh & Hudson River Ry. Co., held by your company.

Coal-Mining Department—Coal tonnage from lands owned and controlled:

Mined by company..tons	3,275,585	3,615,141	3,375,541	2,828,788
Mined by lessees	181,505	215,887	285,822	224,927
By Alliance Coal Mining Co.	88,067	39,645	......	......
By lessees of Alliance Coal Mining Co.	71,776	130,334	188,492	134,264
Total commercial coal.	3,616,933	4,001,007	3,849,855	3,187,979

In addition there was consumed for power and other purposes at the mines 463,685 tons, making the total production from all sources 4,080,618 tons, against 4,515,906 gross tons in 1910.

The decrease in commercial production is accounted for mainly by the suspension of mining during April and part of May, pending negotiations with the United Mine Workers as to the terms of a renewal of the agreement which expired Mar. 31. The new agreement entered into provided substantial advances to the mine workers, and mining was resumed the latter part of May. Production was further curtailed by interruptions at several collieries which occurred in September and lasted for 19 days, due to trouble among the men over the question of union membership.

The decrease in production was general throughout the anthracite trade in 1912, as the official statistics show that the total shipments of anthracite during the year amounted to 63,610,578 tons, a decrease of 6,343,721 tons, as compared with 1911. The cost of mining increased on account of increased maintenance charges during the suspensions of work above referred to, as well as on account of increased wages and cost of supplies.

Market conditions were satisfactory during the year, excepting for the company's inability at times to supply the demand for its coal, owing to the suspension above referred to. The company sold its entire production during the year as well as its supply of stock coal. The tonnage sold was 3,646,431 gross tons, an increase of 58,967 tons compared with 1911.

Insurance and Coal Lands Sinking Funds—During the year the coal lands sinking fund has increased $51,434 and the insurance fund $17,580 from income on investments and interest on deposits, making the total amounts of securities and cash in these funds, Dec. 31, $1,082,565 and $488,639, respectively. During the year an exhaustive investigation was made into the operating and accounting methods, and, in accordance with the advice of certified accountants, your board are agreed on the wisdom of a policy of accounting under which there shall be established proper reserves for coal-lands depletion, depreciation of improvements, insurance, mining hazards and similar items entering into mining costs; and have, beginning with the current year, in accordance with this plan, transferred the securities and cash in the coal-lands sinking fund and the insurance fund into the general funds of the company, under appropriate accounts establishing the proper reserves, which will appear in the balance sheet for the year 1913.

Lehigh Navigation Electric Co. New Power Bonds—In January, 1912, the company received payment for and issued $3,000,000 collateral trust 4½% 10-year gold power bonds, due Dec. 1, 1921, which had been sold to provide for the financial requirements of the Lehigh Navigation Electric Co. in the construction of its power plant at Hauto.

The construction of the Lehigh Navigation Electric Co.'s power plant at Hauto, Penn., and the transmission lines radiating therefrom, is progressing rapidly. It is expected that the plant will be completed in the summer of 1913. The 38 electric companies chartered to operate in the several townships reached by the transmission lines were merged and consolidated by agreement dated Dec. 23, 1912, into a corporation under the title of the Lehigh Navigation Electric Co., and letters patent issued to the latter company under date of Jan. 6, 1913.

Extension of Lehigh & New England R.R.—The extension from Danielsville, Penn., to Tamaqua, Penn. (at which point connection is made with the Panther Creek R.R. of your company), some 32 miles in length, was completed and put in operation on July 8, 1912. The new line, in addition to proving a source of increased revenue to the railroad, affords a direct all-rail route to the Eastern markets as well as a physical connection with the main trunk lines.

Financial—Advances to Sub. Companies—The financial requirements of the Lehigh & New England R.R. Co. and the Lehigh Navigation Electric Co., in carrying on the work as above outlined, have been provided for by the purchase of their securities and by advances by this company amounting during the year to $1,754,766.

PRICES OF MINING SUPPLIES

THE MARKET IN GENERAL

The depth of pessimism, for the time being at least, seems to have been reached early in July and since then, there has been a steady gain in confidence among large business interests. Several reasons exist for this apparent sudden change of front, the principal one of which is the cessation of hostilities in the Balkan States with easier monetary conditions in France, Germany and England. It became evident, too, at about that time that the currency bill before Congress would not seriously affect American industries, and drive gold out of the country as was feared. After that, came excellent reports from the West regarding the crops, particularly wheat, which have stimulated enthusiasm, not later dampened by the deplorable shortage in corn, due to a severe drought in Missouri, Kansas and Oklahoma. The arrival of buyers in large numbers in New York from all parts of the country started business flowing in many channels, and their optimism was even more reassuring, for they told of excellent conditions at home, and how the consuming public of their section was in need of a large quantity of goods. For this reason, prices have not declined as it was feared they would, and while some readjustments have been made in the iron and steel market, these have been by no means general.

The steel situation shows little improvement. Steel companies are receiving orders for a larger product than was formerly the case, but at the same time their unfilled orders are decreasing, showing that plants are operating at a larger capacity than the country is consuming. There have been revisions in the price of wire and pipe and there will probably be lower prices for bars.

The market for metals shows a decided change for the better, and copper moved rapidly upward to 16c., while lead and spelter are likewise higher.

Business has apparently discounted any changes which are likely to occur through a revision of the tariff.

Labor

The situation has been much more peaceful. There have been few strikes of large import, increased pay for the railway trainmen still being under consideration by the Arbitration Committee, and the Paterson strike having fallen through. In other places, the demands of workingmen seem to be readily granted by employers when there is any sound basis for a revision. In some sections of the country, complaint is heard that there is a shortage of workers, this being particularly true of the agricultural districts where farm-hands are needed, and in New England, where mill operators are needed.

Immigration statistics show a remarkable gain in the number of immigrants coming into the country. The figures for June, which were recently published, there being delay in all government publications of this character, show that 176,000 aliens came to the United States in that month as compared with 92,000 last year, 71,000 in 1911 and 105,000 in 1910. For the first six months of the year the number of aliens coming into the country numbered 650,000, in comparison with 478,000 in the previous year, 423,000 in 1911 and 615,000 in 1910. Ordinary outside labor commands $2 a day.

Iron and Steel Products

A further reduction in the unfilled orders of the U. S. Steel Corporation was recorded during July, amounting to 5,399,000 tons, a reduction since January of 2,500,000 tons. At the same time, the production of pig iron has fallen off only about 10,000 tons per day from the maximum, and now is approximately 82,000 tons daily. The mills are curtailing their output slightly, but not to any great extent, and there seems to be no accumulation of supplies.

Some reductions have been made, principally in wire products and in butt-welded steel pipe. Pig iron is slightly higher than a month ago, and the demand shows some improvement. The recently issued report of the American Iron & Steel Institute shows that the production of all kinds of finished and rolled forms of steel in the year 1912 established a new high record, the total output amounting to 24,655,841 tons. Of this, the production of iron and steel rails aggregated 3,227,000 tons; plates and sheets 5,875,000 tons, a new high record; wire rods, from which wire products are drawn, 2,653,000; structural shapes, not including plates, 2,846,000 tons; bars, skelp and all other forms, 9,908,000 tons. It is interesting to know that the iron and steel products exported during the fiscal year ending June 30, 1913, amounted to $340,000,000, setting a new high record and also a new high proportion to the total exports of 12.4%.

Pig Iron—The output of pig iron in the United States by blast-furnace interests during July was computed as approximately 82,000 tons daily. This was a reduction of 10,000 tons compared with the high figures reached in February, but even with the curtailment in the output, there was an accumulation of stocks of pig iron in many quarters. On the other hand, some extremely good buying was reported during the month, notably, heavy sales of Southern foundry No. 2 by furnace interests in that district which were willing to make concessions, and book business at a low figure. The principal interest doing this had a goodly tonnage ordered on its books at the end of the month, and was able to advance quotations $1 per ton. Since July 1, there has been an advance in pig iron in almost all centers, averaging approximately 50c. to $1 per ton.

Steel Rails—The leading trunk lines of the country have not begun to make up their buying schedules for rails yet, and very little business is being transacted. Rolling mills, however, are actively engaged in turning out products, and will be for the next several months. No change has been made in quotations, nor is it believed that there is any likelihood of a revision in prices.

Quotations are unchanged at $28 per ton for standard sections of bessemer rails, and $30 for openhearth rails, f.o.b. Pittsburgh. These represent a quotation of 1.25c. per lb. for standard sections weighing from 50 to 100 lb. per yd.; 1.21c. for 40- to 50-lb. rails, and 1.30c. for 16- to 20-lb. rails. In Chicago 16- to 20-lb. rails are 1.30c.; 12-lb., 1.33c. Relaying rails are sold at $24 per gross ton in Chicago and in New York at $22.50.

Track Supplies—The demand is no larger than it was a month ago, as far as new business is concerned, but shipments on old contracts are active, and most of the mills are working full time. Spikes are not at all firm at $1.80, and concessions of $1 a ton are frequently made. Track bolts with square nuts are $2.30 to $2.40 per 100 lb. These quotations are f.o.b. Pittsburgh. In Chicago, railroad spikes are $1.75 to $1.80; track bolts with square nuts, $2.30 to $2.40 and tie plates are $32 to $34 per net ton.

Pipe—There has been an unusually large business transacted in line pipe, and some of the largest contracts ever made have been closed this summer. These have been from the oil companies. At the same time, the demand for smaller sizes of standard pipe has fallen off materially. The revision as announced, which is approximately one point, applies only to pipe ¾ to 2 in. in diameter, butt-welded.

Discounts and net prices are as follows:

	Black	Galvanized
¾- to 2-in. steel butt welded..........	80%	71½%
2½- to 6-in. steel lap welded..........	78%	69½%
7- to 12-in. steel lap welded...........	75%	64½%

At these discounts the net prices of pipe per foot at Pittsburgh are as follows:

Diameter	Cents Black	Cents Galvanized
¾-in........	2.30	3.26
1-in.........	3.40	4.83
1¼-in.......	4.60	6.60
1½-in.......	5.50	7.90
2½-in.......	12.90	17.80
3-in.........	16.80	23.30
4-in.........	23.00	33.20
5-in.........	30.50	45.00
6-in.........	42.25	58.25
7-in.........	59.50	85.00
8-in.........	62.50	89.00
10-in.......	$1.03	$1.46
11-in.......	1.13	1.64
12-in.......	1.27	1.82

Sheets—Continued pressure has been brought to bear on the sheet market, but without obtaining concessions of more than $1 a ton from the rollers, and in some cases it was impossible for buyers to secure even this advantage. Production has been rigidly curtailed, and the American Sheet & Tin Plate Co. is operating only 68% of its capacity. Within the last fortnight, there has been much better demand and some heavy inquiries have been received by the mills, buyers evidently being possessed by the idea that prices are about as low as thy will go, and nothing will be gained by waiting. The following quotations are for small lots of a few bundles or more, f.o.b. Pittsburgh and Chicago. The price for large lots is unchanged at $2.25, f.o.b. Pittsburgh, for No. 28 black.

	Cents per pound			
	Pittsburgh		Chicago	
	Black	Galv.	Black	Galv.
Nos. 22 and 24	2.70	3.50	2.65	3.45
Nos. 25 and 26	2.75	3.65	2.70	3.60
No. 27	2.80	3.90	2.75	3.85
No. 28	2.85	3.95	2.80	3.90

Structural Steel—With the railways practically out of the market, as far as buying bridge material and cars is concerned, building work in the East extremely quiet, and little new structural-steel business in sight, there is no end of complaint by fabricating works that business is dull. Some extremely low quotations were made for work when there was any chance of securing the business. Structural-steel shapes are unchanged on a basis of $1.50, Pittsburgh, for plates, beams and angles, and in Chicago, $1.68 to $1.73. These prices are per 100 lb. in carload lots. Some recent buildings in New York were erected complete on the ground for about $50 per ton for the structural-steel work. Light material, such as roof trusses, would command considerably higher quotations.

Spiral Riveted Pipe—Prices are without change. The following quotations are f.o.b. factory, freight equalized with New York, being figured at a discount of 50, 10 and 10% from list. These are for orders amounting to approximately $250. For large orders, prices are cheaper by 12½ to 20½%.

Diameter in in.	Thickness Birmingham wire gages	Net price per 100 ft. With bolted joints complete		
		Plain	Asphalted	Galvanized
4	18	$19.76	$21.48	$30.74
5	18	23.40	23.70	37.14
6	16	33.05	35.76	49.73
7	16	37.58	40.76	56.82
8	16	43.17	46.80	65.00
9	16	50.06	50.10	74.22
10	14	66.42	71.08	96.15
11	14	71.20	76.57	102.24
12	14	83.75	89.15	118.30

WIRE PRODUCTS

Wire—After considerable irregularity, the mills made an open reduction in quotations. Manufacturers applied this reduction to all shipments made since Aug. 1. Quotations are as follows: Annealed fence wire in large lots, $1.50; galvanized barbed wire, $2.15; annealed, $1.75. These quotations are per 100 lb., f.o.b. Pittsburgh. In Chicago, plain wire is $1.73; painted barbed wire, $1.93 and galvanized, $2.33, these quotations likewise being for large lots.

Copper Wire—A steady increase in business has been noticed in the last fortnight, and some good buying is reported, principally from trolley companies who believe that the market has turned permanently. Much of this business has been placed on a basis of 17.50c. per lb. The copper situation shows a decided improvement, and the wire trade has not been as hopeful for several months as it is at present.

Wire Rope—Quotations for the smaller sizes of cast-steel wire rope per foot, f.o.b. Pittsburgh, are as follows: 1¼-in., 23c.; 1-in., 15c.; ¾-in., 10c.; ⅝-in., 7c.; ½-in., 6c.

METALS

Copper—The price of copper advanced steadily during the month, and by the middle of August 16c. was paid for Lake, and 15.75c. for electrolytic. This was largely due to a strike of miners in the Lake regions curtailing the output of Lake copper, but the strong statistical position of the metal also influenced buyers. European consumers continue to buy very freely.

Tin—The market is steadier than last month, and most of the time it hovered between 40 and 42c. per lb. The price of 42c. per lb. prevails at this writing for large lots.

Solder—Strictly half and half solder is cheaper, in accordance with lower prices for tin, and can be had at 25 to 26c. per lb.

Lead—The advance in the quotation made by the American Smelting & Refining Co. brings the retail price of lead in New York to around 5c. per lb.

HARDWARE

Nails—Prices are lower and wire nails can be had at $1.75, Pittsburgh, and $2.05, New York, for kegs of 100 lb., in large lots. Business is not active, but stocks are sufficiently large to meet the demand. For small lots from jobbers' store, $1.95 is quoted in Pittsburgh and $2.15 in Chicago.

Bar Iron and Steel—Business of dealers is active, as many consumers who often buy in carload lots from the mills are drawing on stocks at warehouse. Prices are steady, and from store may be quoted as follows:

	Per lb.
Refined iron:	
1 to 1⅞ in., round and square	2.10c.
1½ to 4 in. x ⅜ to 1 in.	2.10c.
1½ to 4 in. x ¼ in. to 5/16 in.	2.30c.
Norway bars	3.60c.
Soft steel:	
¾ to 3 in., round and square	2.05c.
1 to 6 in. x ⅜ to 1 in.	2.05c.
1 to 6 in. x ¼ and 5/16 in.	2.20c.
Rods—⅝ and 11/16 in.	2.15c.
Bands—1½ to 6 3/16 in. to No. 8	2.35c.
Beams and channels—3 to 15 in.	2.15c.

Extras for triple B (BBB)

3/16 and ¼ in.	2c.
5/16 and larger	1.75c.

Chain—Ruling quotations per 100 lb., f.o.b. Pittsburgh, are as follows:

3/16 in.	$7.50
¼ in.	4.95
5/16 in.	3.95
⅜ in.	3.40
7/16 in.	3.20
½ and 9/16 in.	3.00
⅝ and 11/16 in.	2.90
¾ and 13/16 in.	2.80
⅞ and 15/16 in.	2.70
1 to 1¼ in.	2.60

Extras for BB

3/16 in.	1.50
¼ in.	1.50
5/16 and larger	1.25

MISCELLANEOUS

Brattice Cloth—The reduction of price which was noted about the middle of July, has been followed by an advance, and prices are now as high as they have beeen at any time. Advices from manufacturers abroad are to the effect that market conditions there are very firm, and no reduction in price is expected. The demand is fully up to normal and stocks are sufficient to meet the inquiry resulting from this.

Portland Cement—Business has been steady, deliveries large, and the market is well sustained. The manufacturers of portland cement will have all the business that they can take care of for the next few months, but it is doubtful if this will last during the winter. In the East, the greater amount of business in New York in connection with the building of new subways is making up for the loss sustained in building construction, but elsewhere in the country, there has not been the same demand. Prices show no change. In Pittsburgh, the quotation is 90c. to $1; in Chicago, $1.25; Detroit, $1.34; St. Paul and Minneapolis, $1.45. These quotations are f.o.b., but do not include the cost of the package. In general, consumers have to pay about 40c. per bbl. for the package, also freight to destination. Quotation in Pittsburgh and New York is $1.58 with the usual allowance for bags returned, of 7½ to 10c. per bag.

Bars, Concrete Reinforcing—A reduction amounting to $1 a ton was made early in August. Quotations for small lots from Pittsburgh warehouses are as follows:

PITTSBURGH, CENTS PER POUND

	Warehouse Stock
¾-in.	1.95@2.05
⅝-in.	2.00@2.10
½-in.	2.05@2.15
⅜-in.	2.20@2.30

Asbestos—Building felt and sheathing, in small lots, is 3½c. per lb. for the light, weighing from 6 to 30 lb. per 100 sq.ft. and 4c. per lb. for the heavy, weighing from 45 to 56 lb. per 100 sq.ft.

Millboard sells at 5c. per lb. in lots of 100 lb. and over. This price applies only to sheets of standard size.

Miscellaneous Metals—Small lots of brass, bronze and other metals can be obtained in New York at the following quotations per lb.:

Bismuth	$2.25
Brass tubes, iron-pipe sizes:	
½-in.	.21
3¾- to 3-in.	.20
3½-in.	.20
4-in.	.20
Brass rods	.16⅜
Brass sheets	.16⅝
Solder, half and half guaranteed	.30
Zinc sheets	.08¾
Manganese bronze rods	.16¾
Manganese bronze in crucible form	.15

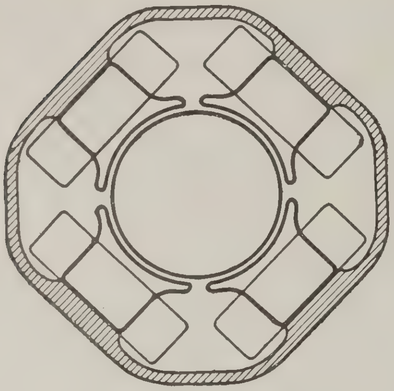
The Reason for the Commutating Poles

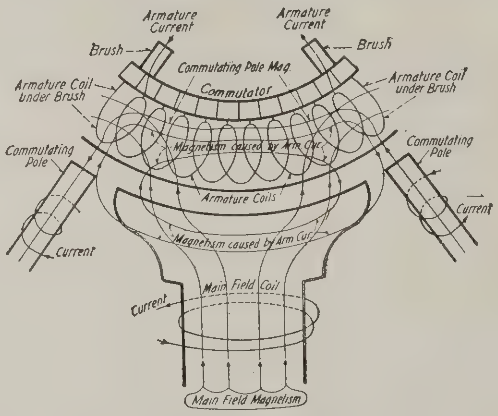
In the Motors Used on

Baldwin-Westinghouse

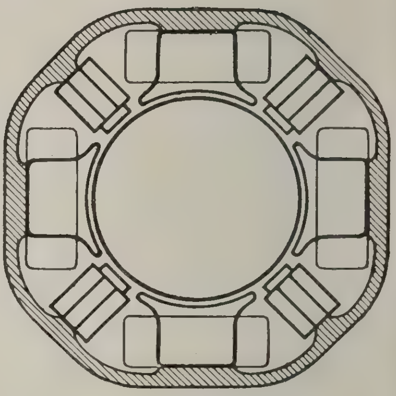
Electric Mine Locomotives



The above sketch shows the general arrangement and proportions of a non-commutating pole motor.



Diagrammatic Sketch of Magnetism and Current in a Westinghouse Mine Motor.



This sketch shows general arrangement and proportions of a commutating pole motor.

In the non-commutating pole machine, the armature current generates magnetism which passes through the armature iron and the pole, as shown in the drawing. Part of the magnetism caused by the armature current passes through the two armature coils under the brushes and through the pole tips. This is the magnetism that makes the machine spark, and is strongest when the armature current is strongest, so the machine sparks the worst on heavy loads.

In the commutating-pole motor, the commutating coils are designed to send magnetism through the armature, which will kill the magnetism caused by the armature current and furnishes enough additional magnetism to give perfect commutation of the armature coil under the brush. The same current flows through the armature and the commutating coil, so that the magnetism of the commutating pole kills the armature magnetism at all loads and just furnishes enough additional for perfect commutation. This is the reason why the commutating pole machine does not spark on heavy overloads.

The motor will operate without sparking at all loads and voltages found in service. The commutator is always bright and polished. All bucking or flashing is eliminated. The commutator shows hardly any wear at all. Brushes wear very slowly, often lasting for years. Brush-holders do not deteriorate from flashing. Commutators do not burn out from short circuits due to flashing. There is less likelihood of breakdowns of insulation in armature, fields and brush-holders, as the carbon or copper dust in the motor is practically eliminated.

The commutating-pole motor is one of the most important factors entering into the success of Baldwin-Westinghouse Mine Locomotives. There are many other desirable features, full information on which may be obtained by addressing either Company.

Honesty Is The Most Profitable Policy

The Weekly Ad-Talk Page

Here is a statement recently issued by the Wichita (Kans.) "Beacon" which illustrates how the demand for *truthful* advertising is being met by publishers throughout the country.

"The 'Beacon' is going to make an effort hereafter to be responsible for the character of advertising which appears in its columns. The paper will endeavor to educate the public to believe that what it sees in the news columns and in the advertising columns is alike worthy of serious attention as truthful statements."

From the fake mining schemes and doped patent medicine advertisements of ten years ago to the above is a far cry.

But publishers and advertisers have realized for some time that advertisements must tell the truth if the business of both is to prosper.

For the success of any business depends upon the confidence the public has in it.

Confidence begot of the truth found in its advertisements.

And to so great a degree is this true that a single untruthful statement contained in an advertisement may be the little pill with which the Advertiser commits Business Suicide.

We know of a merchant who for 12 years conducted a prosperous business because he held the confidence of the public.

Until one morning, partly because of some freak stunt on the part of a competitor, and partly because he wanted to take advantage of the Tariff agitation, he wrote an advertisement in which the public was informed that owing to the *passage* of the Tariff Bill by Congress, he was able to quote bargains out of the ordinary.

Just three men responded to the ad—and one didn't buy.

Some of his customers who had seen the ad wanted to know whether the business had changed hands, because up to that time they had thought the advertisements of this concern reliable.

We think that the publishers of the paper in which this advertisement appeared are as much to be censured as the merchant who tried to "put one over" on the buyer.

We realized long ago that in admitting a fraudulent advertisement in its columns a publication is fouling its own nest.

That possible purchasers come to regard its advertising columns with suspicion because some of the advertisements contained therein are untrustworthy.

We went further. Since the subscriber of this publication buys it because he knows it helps him in a business or professional way, we decided that no product that could not be used toward this end should be admitted in the Selling Section of Coal Age.

That perfumes, crackers and steam yachts, being products which have no place in the solving of coal mining problems, are debarred from our advertising columns because they don't "belong."

And this has resulted in the formulating of the Hill Advertising Code which, briefly, declares that:

No advertisement can appear in Coal Age which contains misstatements, gross exaggerations, "knocking" copy, fake "free" offers, products not ready to be marketed, or behind which the necessary finances to advertise it profitably are lacking; and products which cannot be used in a business or professional way by the reader.

All of which assures you of the reliability of the manufacturers whose products, truthfully advertised, you find in the Selling Section of Coal Age.

COAL AGE

Vol. 4 NEW YORK, AUGUST 30, 1913 No. 9

Just Between Friends

Doubtless your pay isn't highly luxurious,
  Surely your job isn't easy or light,
Doubtless your life is a trifle penurious
  Still—are you doing your labor all right?
Have you been fair to the man who is paying you—
  Have you been honest and square with the boss?
Isn't your laziness often delaying you—
  Hasn't your carelessness caused him a loss?

No one denies that your task is laborious,
  No one denies that you're often oppressed;
Still we would ask—though in no wise censorious,
  Have you been faithfully doing your best?
Haven't you wasted a lot of coal needlessly—
  Haven't you tried to get credit for slate?
Haven't you monkeyed with peril quite heedlessly—
  Dallied with danger and frivoled with fate?

While you are thinking of grievances various,
  Maybe the boss has a grievance or two,
Maybe his business is mighty precarious
  Simply because of the things that you do;
Bosses there are who are wrong in their attitude
  Greedy and selfish and crazy for pelf,
But—have YOU really shown fairness and gratitude—
  Have you been doing the square thing yourself?

IDEAS AND SUGGESTIONS

Cleaning Coal

By Josiah Keely*

A story is told by a mine foreman on his old boss, who now holds high office in one of our largest bituminous-coal companies:

"Talk about cleaning coal—we had to clean it when I dug coal for Old Man ————. I was driving one of the best headings in the mine, and there were a dozen other fellows waiting for my place. He came in one morning and began looking up and down the sides of the track like he had lost a dime. Pretty soon he stopped and held his light up into my face and said: 'Where are you throwing your dirt?' 'I says, 'There ain't no dirt in this coal.' He didn't even look at the coal, but said, 'Young man you want to find something by the time I come around again.'

"Now, I knew two things: First, the Old Man would be back, and second, if there were no bands and sulphurs scattered back along the ribs, I would take my tools and hike. I didn't want to lose that place, and there was not a scrap of bad coal in it. But next morning I went in early (you could go in as early as you was a mind to in those days), and I took an old sack and gathered up bands and sulphurs as I went along. In a day or two the Old Man came in. I didn't look around, but kept digging like h—. He never said a word, but grunted and went out. And, don't you know, I had to keep carrying them bands in for three months. Believe me, we had to clean 'er in those days."

To those of us who are "up against" the proposition of cleaning coal today, this story, though perhaps embellished, illustrates a number of things: The attitude of both boss and miner fifteen years ago in regard to cleaning coal on the inside, the abundance of labor then, and the method of getting things done. How many mine foremen now make a systematic examination of the ribs to see what is being thrown back? How many miners make a regular practice of throwing back their dirty coal? To say nothing of carrying in dirt to satisfy the inspector. However, there is nothing more futile than dwelling on early methods of getting things done. Human nature has not changed; industrial conditions have. The demand for clean coal is greater than formerly, so, what are we to do?

Begin at the Proper Place

We can still imitate our old friend, the Boss, in going to the proper place to begin. Clean coal still depends, not so much on what is picked out at the tipple, as what is thrown back in the working places, and, on the whole, it is perhaps not much harder to require the proper service from inside men than from those outside at the tipple. Of course, the daylight is an advantage, but a handful of tipple men handling large tonnage can hardly be expected to do all the cleaning for the hundred miners loading up everything that is shot down.

We might turn again to our story of the early days for a lesson in fixing individual responsibility. We will probably not be able to dispense with the man who gives the final inspection to the railroad car, nor those who pick slate as the coal is dumped; and it looks as though any future improvement in cleaning would have to come from a closer inspection of the coal on the car of the miner. Dockages are too often spasmodic and out of proportion to the impurities. Too little is known of the real inside conditions producing the dirt found.

Again, when the miner is able to "put over" a lot of bad stuff without hearing from it, and then gets a dock on something not nearly so bad, he is apt to remark cynically that the company needs the money. The fear of losing miners by requiring too much inside cleaning is greatly exaggerated. Miners who quit on account of dockages have either a real or a fancied grievance. An old-time school master is said to have called up all of his smaller pupils and given them a "licking," partly for fear that some had broken a rule without detection, and partly to intimidate the older children. If the docking has been done on this principle, some of the grievances are probably real. If dirty coal has been allowed to pass until the miner has only a hazy idea of the standard, and then is given all his docks in a bunch, he is not much to blame if he feels that some injustice has been done.

We Are All About Alike

The lower animals require systematic discipline to develop a standard of efficiency. Even human actions and habits are formed the same way, but with a difference. One shock of the wire will sometimes break a mule from carrying his head high in the mine, while "gee" and "haw" were probably repeated a thousand times and emphasized with sundry knocks with a sprag before action conformed to word. The miner who drops a spark in a powder can will probably not do so again, yet you would hardly advocate this method of teaching men not to fill cartridges under an open light.

We are all alike when it comes to learning to do things in a required way, so the only hope of rescuing these remarks from a mere pronouncement of platitudes is the earnestness to secure something like patient, consistent, daily attention to the root of the difficulty. There will probably not be so many dockages necessary, but that a considerable number of them can be taken up with the miner on the next day after the dirt is discovered, and it is possible that the cases for individual attention may become less frequent, but this will only be in proportion to the regularity of the attention. Results can not be brought about without certain penalties, but results are not of necessity in proportion to the number of penalties.

I am aware that an appeal for closer supervision may be along unpopular lines, because this involves daily vigilance and an attention to the job that is not always realized from a salaried position. The man who reads coal journals to discover short cuts and easy methods need read no farther than the opening anecdote, but there are still some men on small salaries who are conscientious enough to realize not only that eternal vigilance is the price of clean coal, but that the bands and sulphurs along the ribs tell the story better than the pile of refuse at the tipple.

---

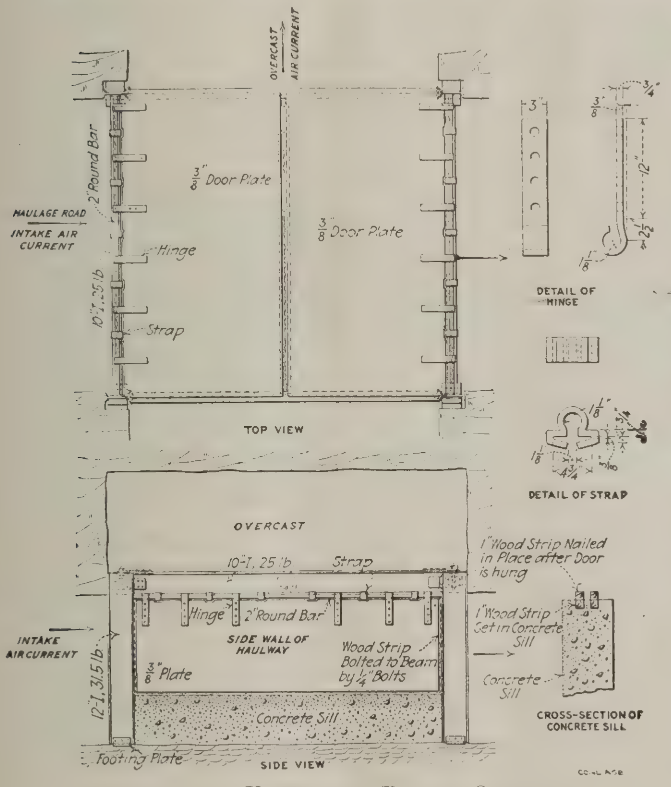
⁂

An Automatic Fireproof Overcast

The accompanying illustration shows what is designed to be an automatic, fireproof overcast, as invented by John C. Duncan, Supt., Mine Rescue Station, Benton, Ill.

The object sought in this construction is to provide swinging sidewalls of sheet steel, which are held in place, at the bottom, by wooden strips. A concrete sill 2 ft. wide is first constructed on each side of the roadway, across the crosscut opening. These sills are imbedded deep enough in the floor to give a substantial support. Two wooden strips 1 in. square, are imbedded in the top of each concrete wall, as shown in the detail sketch.

The steel doors forming the sidewalls of the haulage road are made of 3/8-in. boiler-plate steel. These are hung from two 2-in. round bars, spanning the crosscuts and supported by the 12-in. I-beams set at the four respective corners of the overcast. The round bars are hung from two 10-in. I-beams, by the straps shown in detail, while the doors are swung from these bars by the hinges, which are also shown in a detail sketch. After the doors forming the sidewalls are in place, 1-in.-square wooden strips are nailed on each side of the door and over the strips imbedded in the concrete. These light strips are sufficient to hold the doors in place, except when acted upon by the force of an explosion.



Details of Explosion-Proof Overcast

Above the haulage road and forming the floor of the overcast are, likewise, two doors of 3/8-in. boiler steel that are free to open upward, under the force of an explosive blast. These doors are hinged respectively to two 2-in. round bars, supported by the 10-in. I-beams spanning the haulage road, as shown in plan and elevation.

The purpose of this design is to provide an overcast that will permit of the expansion of air and gases, during an explosion, and, at the same time, will not be destroyed by the force of the blast. It is expected that both the side doors and the top doors will assume their original position after the force of the explosion has passed. The main posts and concrete sills should be hitched securely into the sides and floor of the entry.

⁂

Nitric Acid from Coke-Oven Gas

The engineering supplement of the *Times*, of London, says:

The latest addition to the interminable list of byproducts obtainable from coal is nitric acid, and apparently large quantities of this substance can be obtained with the aid of coal gas, unless the researches of German investigators prove to be in error. The recovery is made by exploding a definite mixture of gas and air in a special "bomb." Oxides of nitrogen are evolved, with the consequent deposition of nitric acid. In one form of plant the gas and air are compressed to from four to six atmospheres, and the mixture is strongly heated before explosion. The products of combustion are rapidly cooled down by passing through a special condenser, finally finding their exit through an oxidizing tower.

It is stated that by adding pure oxygen to the gas in the proportions of one of the former to two of the latter, and heating the mixture to about 500 deg. F. before combustion, a yield of 12½ lb. of nitric acid can be obtained from 1000 cu.ft. of gas. The process, however, would appear to be somewhat costly, for, assuming that gas were obtained and treated for the moderate figure of 50c. per 1000 cu.ft., the cost of nitric acid works out at nearly $90 per ton, against an average figure of $85 for that produced by ordinary sodium-nitrate methods. At a coke-oven plant the case would, of course, be different, and there seems little reason why such concerns should not deal with a portion of their gas, which to them is a byproduct, in this way. A factory for the purpose of generating nitric acid by this method has recently been erected at the Wendle colliery in Westphalia, to deal with 170,000 cu.ft. of gas a day. Pure oxygen is supplied by a Linde plant, and coke-oven gas is used. [If this information is reliable, the products of all explosions will bear closer examination.—Ed.]

⁂

Salt in Coking Coal

The *Gas World*, of London, Eng., says that in certain districts of England, and also in Germany much trouble is experienced owing to the corrosion of the walls of the ovens. After a comparatively short period of use, the brickwork in the interior of the ovens becomes friable and detaches with the coke during the coke-pushing operation. This corrosion is attributed largely to the deleterious effect of the salt in the coal on the silica contained in the bricks. Much of this salt can be removed by careful attention to the washing. Various preparations have been put forward for lining the interior of the ovens, but none of these has so far proved satisfactory.

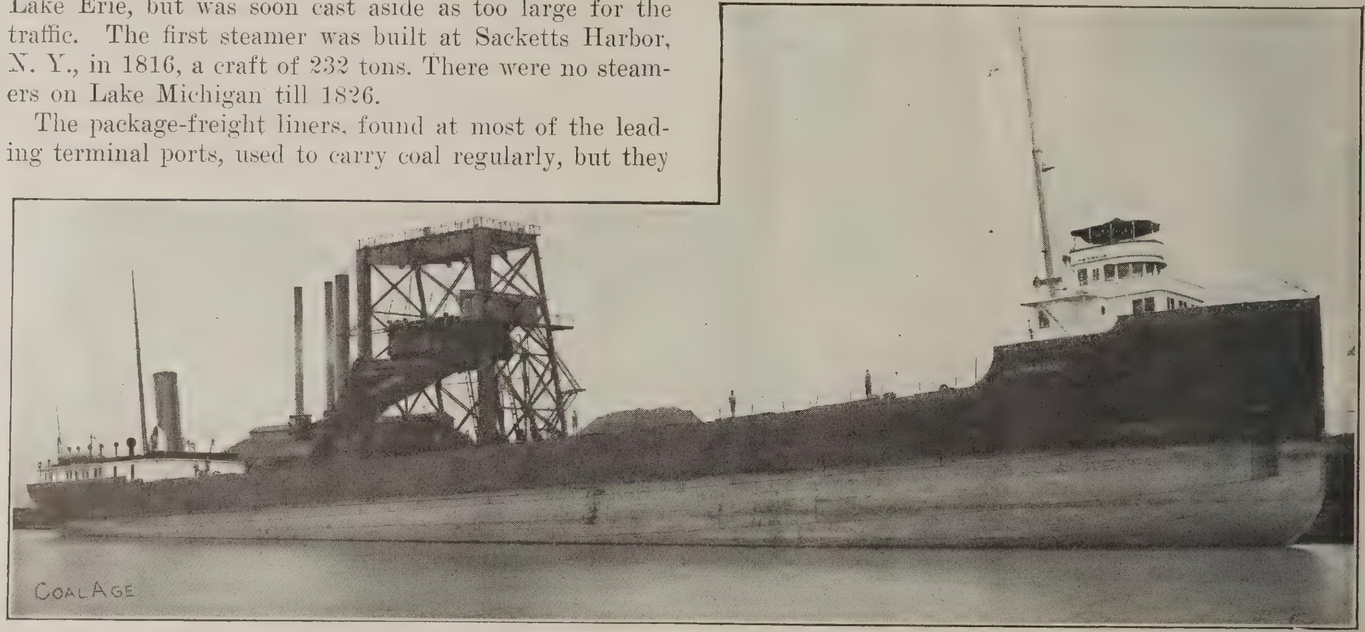
Coal Shipping on the Great Lakes

By J. W. Chamberlain*

SYNOPSIS—This installment of the Lake article takes up the gradual development of the coal freighters. The necessity of rapid loading and unloading, together with the comparative shallowness of the Lakes, has resulted in a distinctive type of vessel for this service. The modern boat is constructed of steel and has a capacity ranging up to 15,000 tons.

⁂

Perhaps no industry of its day has come up so fast as the trade on the Great Lakes. In 1679 the "Griffon," a 60-ton ship, was built near Buffalo, but she was a mere toy. She sailed as far as Green Bay, and was lost the first fall, with all on board. Development followed this pioneer very slowly; in 1814 a 96-ton brig was built on Lake Erie, but was soon cast aside as too large for the traffic. The first steamer was built at Sacketts Harbor, N. Y., in 1816, a craft of 232 tons. There were no steamers on Lake Michigan till 1826.



Freighter "Wainwright" Loading at the Pittsburgh Coal Co.'s Dock in Ashtabula Harbor

The package-freight liners, found at most of the leading terminal ports, used to carry coal regularly, but they have not done so in the past 20 years or so. Sailing vessels were at their maximum in the "sixties," with steam just beginning to assert itself. David S. Bennett, who built the first grain elevator in Buffalo, said to the writer that once in 1863 he saw more than 60 sailing vessels off that port at the same time. They carried a very small amount of grain, often less than 10,000 bushels. This capacity finally ran up to something above 3000 tons for wooden sailing vessels, but none of that class, even as consorts, has been built since 1897. Steam began to supersede them in the "seventies."

While it is common for the Lake Ontario schooner to load as little as 150 tons of coal at a cargo the steamer "St. Joseph," which ran for a long time from Oswego to Toronto, carrying about 600 tons of Ontario & Western anthracite, is a good type of that trade. She is 260 ft. long, has no hold compartments and only four hatches, which are 9x11 ft., with stanchions at each end of the hatches. A former wooden arch at the sides later on gave way to steel arches that do not extend above the rail. Her keelson is only about 2½ ft. high, but on other vessels it was sometimes 5 ft. high, so that the cargo space was a terror to any sort of unloading apparatus and was not tolerated long after horse hoists began to give way to steam hoists. At first these latter were merely a stationary engine on the dock with rope attachments, but these have now in turn given way to the clam-shell hoists, though even Chicago used horse hoists as late as 1875.

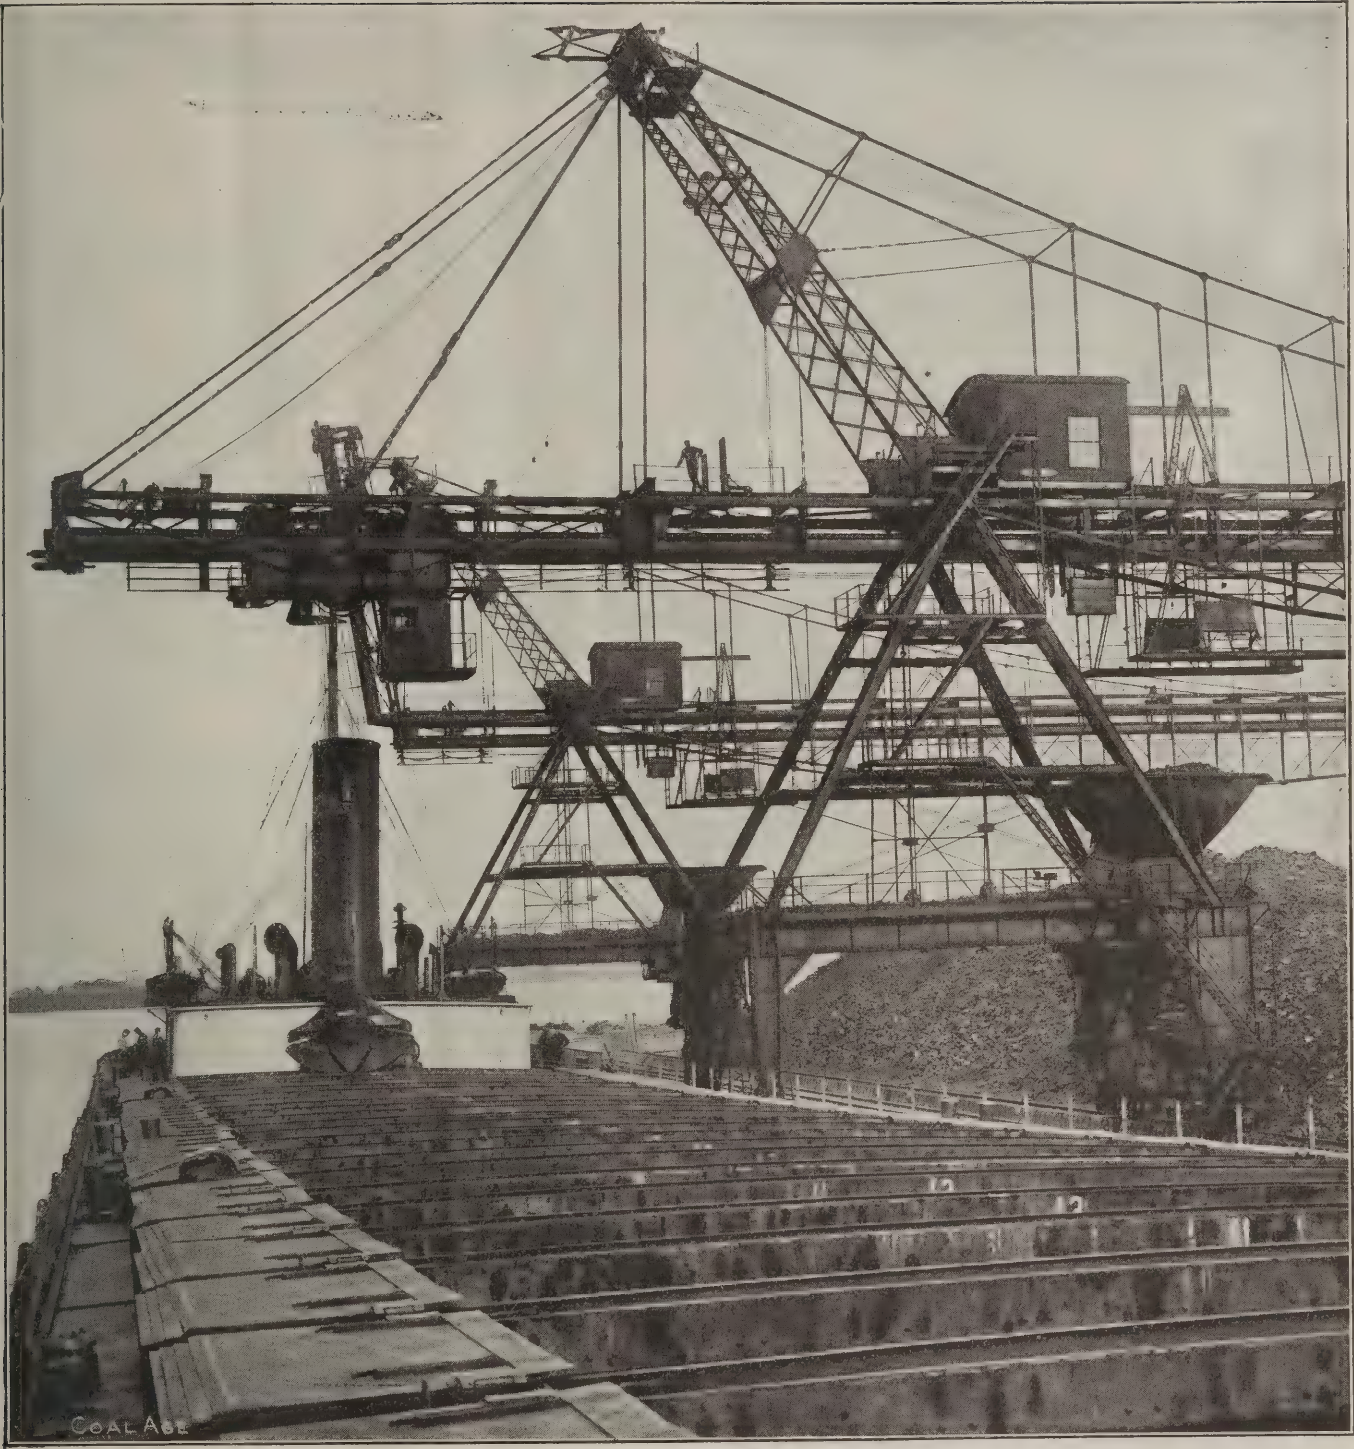
The Evolution of the Lake Freighter

At first the clam-shell hoist found a host of difficulties in the hold of a vessel but it has worked such a revolution in vessel construction that it is now dictating size as well as build of the hold. A coal operator lately undertook to sell a 2000-ton cargo to a Western jobber, but found that his dock had an 8-ton clam-shell for unloading and it would not work on such a cargo. So something had to be done with the older vessel holds. The stanchions were moved, the hatches increased and enlarged, and the keelsons cut down where possible. These latter are not a part of the frame, but merely a beam running longitudinally along the hold and bolted to the middle of the floor frames, all this new construction being previous to the water bottoms or side tanks.

The first big revolution of bulk-freight carrying on the lakes came with the steamer "Onoko" in 1882, built of iron. Though not the first metal craft on the lakes, it had such an enormous capacity as compared with most wooden vessels that there was a rush for this new type. Older metal crafts had solved few problems, the first of them being the "Merchant," built in Buffalo in 1862. The "Onoko" merely showed the new possibilities in the size; she had two decks and the old-style stanchions to interfere with bulk-freight handling. In 1889, the "America" appeared, provided with deck beams, but no between decks. Her cargo of 3100 tons was all in a sin-

---

*90 Johnson Park, Buffalo, N. Y.



A Brownhoist Unloading a Vessel on the Upper Lakes. This Shows the Typical Open Hatch, Characteristic of the Coal Freighters

gle space, though that has since been divided into three permanent compartments, two of 900 tons, the third of 1300 tons capacity. This division was in part to strengthen the hull and also to facilitate the getting of cargoes. Except for iron ore it was difficult for a long time to get large cargoes of one commodity for the same consignee and port destination. Steamers of this class were derisively called "tin pans" and it was predicted that they would collapse in stress of weather. They did not, however, and soon a further step was taken, all in the interest of less obstructed holds to facilitate unloading bulk freight.

The Modern Type of Vessel

The steel steamer "A. B. Wolvin" was built in 1904, answering to the following description: Gross tonnage 6585 tons; capacity, 10,300; length, 540 ft.; keel, 56 ft.; beam, 32 ft.; hold, 33 ft. having 9-ft. hatches with 12-ft. centers; one compartment and arch construction. It has been found that something must be done to strengthen the deck of a vessel about her hatch openings before it was safe to remove the stanchions and to lessen the number of beams in order to increase the size of the hatches. So the arch was put in crosswise between the hatches and tied to the beams that support the deck; it was also attached to the belt frame that runs up from the high floor inside of the side tanks, for by this time not only had water bottoms been devised, but there were side tanks of about 5 ft. in thickness running up to about the load line and affording additional protection to the cargo, but not interfering with the openness of the hold.

The improvements in the hold of the "Wolvin" worked well, but the change of hatches from 24-ft. centers to 12-ft. was not all that was required. The main beams and center stanchions were already dispensed with, the first to leave them out being the steamer "James H. Hoyt," built in 1902. The "Hoyt" also appreciated the value of transverse bulkheads, both for strengthening the vessel and for dividing the cargo into suitable lots, so that special bulkheads would not be required. This boat is 404 ft. long, with a carrying capacity of 6700 tons. She has twenty-three 8-ft. hatches with 12-ft. centers, so that, like the modern lake bulk freighter in general, she is fairly all hatch in place of deck. She also has six compartments of from 1000 to 1300 ton capacity each, so that she might be called six vessels in one, as compared with the coal carrier of the '80's, when an average cargo was less than 1000 tons.

The increase of size in lake steamers has been rapid, but the limit is now probably about reached. In 1895 the average iron-ore cargo was only 1800 tons, in 1909, it was 7178 tons and had been 8325 tons the season before on account of an extra depth of water in the harbors and inter-lake passages.

Since the introduction of the transverse arch and the increase of hatch capacity the Isherwood longitudinal construction has come in, but that is a mere matter of economy in hull frames. So far only a few lake vessels have been built on this plan. The arch, however, has so entirely met the needs of shippers and especially receivers of bulk freight, that every winter a number of steamers are changed over from the old beam-and-stanchion style. Were the vessels built of wood it might not be economy to rebuild their interiors, but the lake fleet is now nearly all of steel construction, the life of which is quite indeterminate so that any desired change is usually made unless the cost is too heavy.

For some time after the opening of navigation to Lake Superior it is said that all the tonnage of that lake could be put into the hold of a single first-size freighter of today. There are now on the lakes about 1250 bulk freighters of cargo capacity running up to 15,000 tons and 225 passenger steamers, many of them also freight carriers, not to mention a host of small local craft and tugs. For a score of years Detroit has seen the largest fleet pass her doors of any port in the world. In the season of 1910, 25,578 vessels passed that port in 235 days, 160 in one day, the aggregate tonnage for the season being estimated at 75,000,000 tons.

The lake coal carrier and bulk freighter is now a strong, steel-clad seaworthy box, and such it is likely to remain indefinitely. The machinery has also about reached its maximum development. The triple-expansion engine and Scotch boiler came in quite a long time ago and efforts to supersede them have not succeeded. Power needed and crew required have not increased with the later increase of carrying capacity. With reference to the coal trade it should be said that the amount offering for shipment has not kept pace with the increase of tonnage and it is doubtful if it ever will again.

Railroad-Car Ferry "Ashtabula," Which Makes Two Trips a Day out of Ashtabula, Across to Canadian Ports

For a long time the main bar to the coal trade was the lack of storage capacity on the upper lakes, but that is increasing fast. For awhile the coal shippers tried to oblige consumers to buy enough in summer to keep the moderate-sized receiving docks moderately free during the active season, but they have about given that up as impracticable. People will buy when they want the coal and not much before that time. So when the shippers, especially of anthracite, have begun to erect vast storage docks at the chief upper-lake ports and it is now stated that a winter's supply can be laid down at more than one of these ports, if only a small percentage is shipped out before winter. The other ports are following.

But it is somewhat different with bituminous coal. The consumer is a more constant quantity than a railroad company or a manufacturer, with a large storage capacity. The amount of bituminous is, however, much greater than of anthracite, so that dock storage is in that case also, a large factor.

The Coal Output of Alaska

The production of coal in Alaska in 1912, as stated by E. W. Parker, of the U. S. Geological Survey, was 355 tons, valued at $2840, a decrease from 900 tons, valued at $7200 in 1911. The production in 1912 does not include the coal mined under the direction of the U. S. Bureau of Mines for testing purposes, which amounted to 900 tons, but, of course, no commercial value can be placed upon this coal.

A little coal was mined in Alaska prior to 1884 by the crews of vessels that ran short of fuel, but this probably did not aggregate more than a few hundred tons. The total output of coal prior to 1889, including that mined by the Russians, was probably less than 10,000 tons.

⁂

The 1912 Coal Production

The production of coal in the United States during 1912 reached the grand total of 534,466,580 short tons, valued at the mines at $695,606,071, according to the figures of E. W. Parker, of the U. S. Geological Survey.

In 1882, the first year for which statistics are available, the total coal production of the United States had reached what was then considered as about high-water mark, 103,551,189 short tons. In 1912, the production of bituminous coal in the State of Pennsylvania alone exceeded that figure by nearly 60 per cent. and the combined production of bituminous and anthracite in Pennsylvania was 2¼ times the total production of the United States in 1882, while the total production of the whole country for 1912 was more than five times what it was in 1882. The United States is at present contributing 40 per cent. of the world's supply of coal, and is consuming over 99 per cent. of all the fuel it mines.

In 1912, the production of coal in the United States not only passed all previous tonnage records, but the average value per ton exceeded that of any normal year in the 33 years for which statistics are available. There has been only one year when prices generally were higher than in 1912 and that was 1903, the year of a fuel famine.

The gain in output in 1912 over 1911 was 38,095,554 short tons, and the increase in value was $69,040,860. The production of bituminous coal increased from 405,907,059 short tons to 450,104,982 tons, a gain of 44,197,923 tons, with an increase of $66,607,626 in value. The decreased production of anthracite, amounting to 6,102,469 short tons was due entirely to the suspension of mining in April and May, when practically the entire region was idle.

Those factors which contributed to the increased output of bituminous coal were first the revival in the iron and steel industry, which stimulated production in the Eastern states, the coal made into coke alone showing an increase of nearly 6,000,000 tons; second, bountiful crops of grain and other agricultural products, which gave prosperity to the farming communities of the Middle West; third, decreasing supplies of natural gas and fuel oil in the Mid-Continent field and their consequent lessened competition with coal from the Southwestern states; fourth, increased consumption by railroads and in nearly all lines of manufacturing; fifth, activity in the mining and smelting of the precious and semi-precious metals in the Rocky Mountain and Pacific states.

Of the twenty-seven states in which coal mining may be considered to be conducted on a commercial basis, there were twenty-one in which the output of 1912 showed an increase over that of 1911, and in all but two of the important states the increase in value was greater than the increase in tonnage.

In the production of bituminous coal, Pennsylvania in 1912 showed an increase of 17,304,231 short tons. West Virginia's increase in 1912 was 6,955,107 tons. Illinois increased its production by 6,206,108 tons; Ohio by 3,768,741 tons; Kentucky by 2,440,818 tons; Indiana by 1,084,363 tons; Alabama by 1,079,179 tons; Virginia by 981,971 tons; Colorado by 820,441 tons and Kansas by 807,454 tons.

⁂

A Small Peat Production

While the United States is the richest country in the world in deposits of peat, little active work is being done in mining or digging it, and so far as is known, very few of the peat-fuel plants established have gone beyond the experimental stage, and many of them have never been equipped with essential machinery. Reports from all known peat-fuel plants in the United States, according to Charles A. Davis, in his Mineral Resources in 1912, show that with one exception they were idle during the summer of that year. The only plant reporting production made air-dried cylindrical peat blocks which, when thoroughly dry, were about six inches long and two inches in diameter, dense and hard and stood handling well. The output of peat fuel was reported as about 1300 tons, valued at $4550. All of this peat was sold.

The production of peat for fertilizer was, so far as reported in 1912, 41,080 short tons, of which about 8000 tons was reported as sold air-dried, that is, not dried by artificial heat. The value of this material at the selling prices reported was $186,522.

The amount sold for mixing with prepared stock feed was reported to be 3000 short tons, bringing an average price of about $6 per ton. An increased production of paper stock from peat fiber over that of 1911 was reported by the only company producing this material. The output for 1912 was reported to be 3000 short tons. The production of peat-moss stable litter in the United States in 1912, so far as could be learned, was suspended. As in past years peat-moss was imported from Holland, the importation last year being 9053 short tons, valued at $39,867, almost exactly the same as in 1911. This material is used almost exclusively as bedding for horses in stables in the thickly populated parts of large cities. It is especially adapted to this purpose on account of its absorbent and deodorizing properties.

⁂

Natal Coal

According to the Daily Consular and Trade Reports, coal is the only mineral mined in Natal to any extent. The industry is at present in a better condition than during 1912, because of an agreement which was entered into among a majority of the operators to coöperate instead of acting independently, and which has resulted in higher prices. A difficulty in the way of great expansion in the near future is the inability of the Government to meet all demands of the operator for rolling stock to transport coal from the mine to the port.

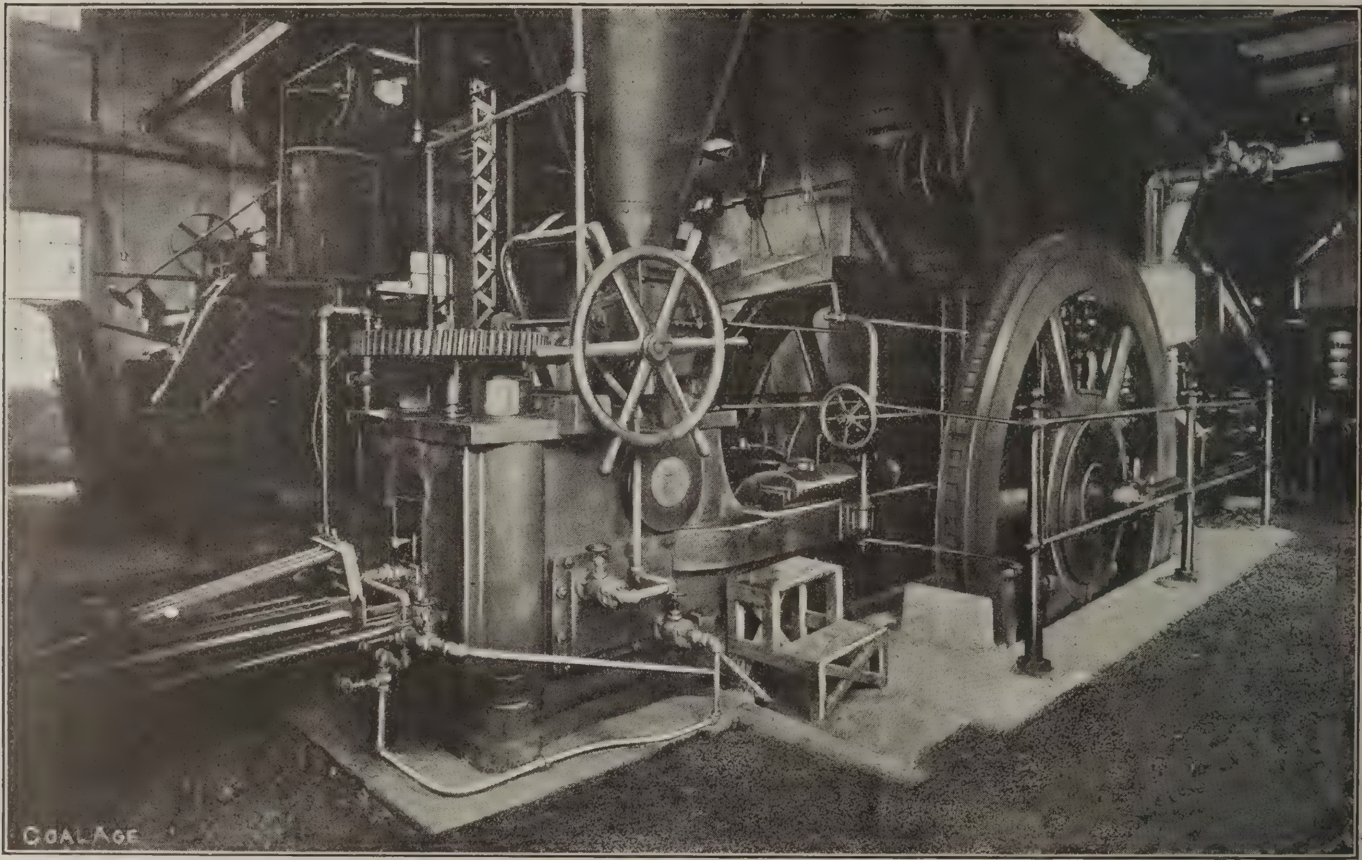
Some Notes on Briquetting Methods

By C. L. Edholm*

SYNOPSIS—A few remarks on some of the results obtained in briquetting. The possibilities of briquetting are touched upon and some interesting photos given.

⁂

The low-grade Western lignites have only one redeeming quality—they are unusually cheap, having a value per ton at the mine of 90c. in Texas, $1.45 in North Dakota and $2.46 in California. Furthermore, there are enormous supplies of them, 150,000 square miles or so of our Western states contain deposits of lignite and the government owns millions of acres of such lands, probably because no one cared enough for them to take them up.



General View of German Briquetting Apparatus Showing Presses

With the advancing cost of high-grade coal the Bureau of Mines has turned its attention to the possibilities of this inferior product and the results have been highly satisfactory. Not only was a furnace developed on one of the Western reclamation projects which solved the problem of burning the lignite as it came from the mine, but experiments were made with foreign and American briquetting machines; these show that lignite can be compressed into excellent fuel, in some cases without the addition of a binding element to make the particles cohere. Where a binder is required, it has been found that sulphite-pitch, a product of the waste of paper mills, can be utilized to good advantage; this is a profitable discovery, inasmuch as the disposing of this waste material has been a serious problem in the past.

Briquettes have various advantages over the lignite as it is mined. By the drying, which is one of the processes of manufacturing, the heating qualities are tremendously increased. The elimination of moisture also makes for economy, in that the shipper does not have to pay for transporting so much useless water. The briquettes have been tested for both exposure to the weather and the rough handling, by dropping and revolving in a tumbler to show that they will stand transportation and storage.

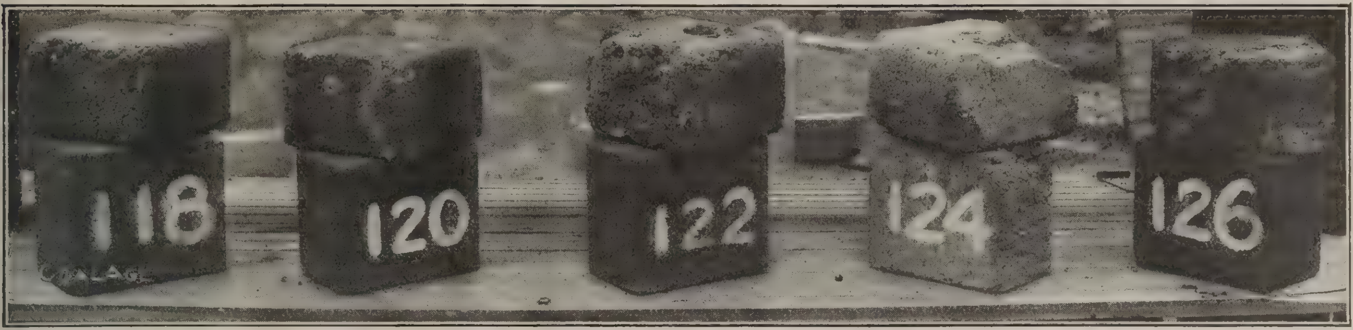
Another advantage for household use is that the briquettes develop no offensive gases in burning, whereas the lignite has an unpleasant odor. They burn brightly with a yellow flame and the smoke is not black, like that of bituminous coal, but thin and yellowish. For many years such briquettes have been in use in Germany and the comparative cleanliness of Berlin and other German cities is ascribed partly to the use of this fuel.

The German and English Machines

A German briquetting machine and one of English make have been installed at the experimental station of the Bureau of Mines at Pittsburgh. Carloads of lignite from various parts of the country were shipped in and tested separately with widely differing results, but with a satisfactory average. It was found that lignite from each of the various states from which samples were received could be compressed into briquettes without the use of a binding material; but the manufacture of briquettes with

---

*4624 Figueroa St., Los Angeles, Calif.



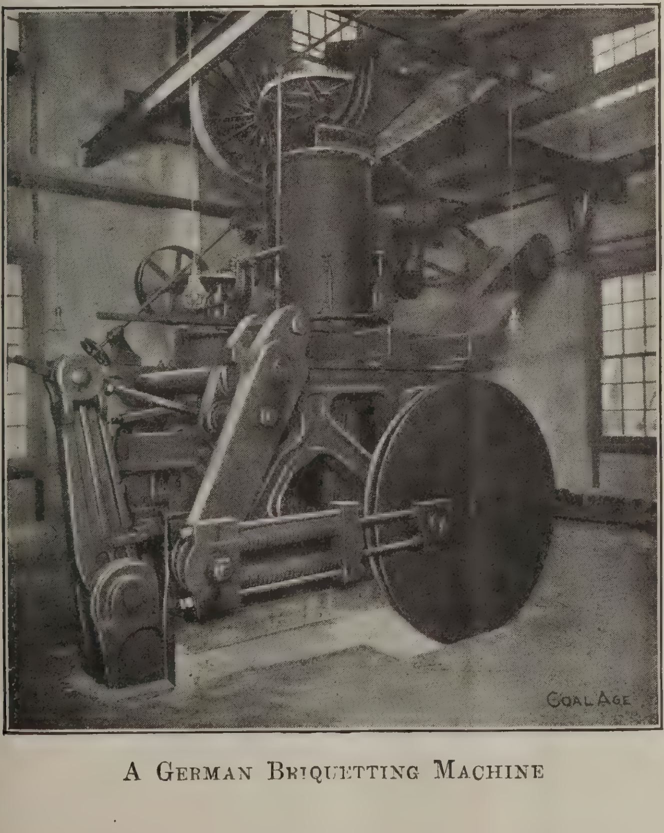
Samples of Briquettes, Showing Effects of Weathering on Different Types

an addition of binding material, such as sulphide-pitch, coal-tar pitch, water-gas pitch, and some form of starch offered encouraging possibilities for further experiments.

The English machine was used for making briquettes with the addition of a binder, while the German apparatus was adapted for those made without such binding material. In addition to the experiments made at Pittsburgh, tests were made with a privately owned briquetting machine, of American make, operated by a fuel company in Indianapolis; the fact was here demonstrated that briquettes of good quality could be made of American lignite with a machine designed and constructed in this country.

Variously shaped briquettes are produced by the different machines, cylindrical, brick-shaped with rounded ends, and cubical, and they range in weight from one to three pounds. The surface is smooth and the best of them do not lose their glossy finish and sharp edges after exposure to the weather, although this varies greatly with the different fuels used. Combustion tests were made in a range and a heating grate with satisfactory results.

The cost of the manufacture of briquettes (in addition to cost of lignite) is estimated at from $1 to $1.72 per ton, according to the local conditions, cost of labor, etc., in the various states where lignite is mined. The cost of installation is placed at $56,000 for the German plant and between $18,000 and $19,000 for the English plant, the former producing 25 tons of lignite briquettes in a 10-hour day while the latter has a capacity of 38 tons in the same time.



A German Briquetting Machine

American Coal in Sweden

There is great opportunity for American coal in Sweden, according to the Daily Consular and Trade Reports. The only difficulty to be solved is the question of freight. The shortcomings in this respect may be said to be all our own for the reason that we have no ships; and what is true of the coal situation is true in many other branches of trade.

Sweden imports something like $16,000,000 worth of coal annually, chiefly from England. American coal producers could have half of this trade if they could free themselves from English domination in the question of tonnage. The chief obstacle that American coal merchants have to contend with today in shipping coal to Mediterranean countries and to South America is not the price or quality of the fuel, but purely and simply the ability of English ship owners to raise or cut the price of coal freight at will, or as suits their purpose in controlling these markets.

How much more difficult is it therefore to pass by England to the Swedish market? Sweden is dependent at present upon England for coal, at the same time the country's state railways and industries are entirely at the mercy of strikes in England, which fluctuate the market and even jeopardize many manufacturing plants by threatening coal famines. Swedish manufacturers would gladly free themselves from such conditions by importing American coal if they were able to do so.

Coal in North Manchuria

The only coal mine in operation in North Manchuria, according to the Daily Consular Report, is located at Djalainor, near Manchouli. It is owned by the Chinese Eastery Ry. and leased to a Harbin capitalist under agreement to supply coal to the Chinese Eastern Ry. at 70.8c. per ton, and to the Trans-Baikal Ry. at $2.266 per ton, delivered to Manchouli.

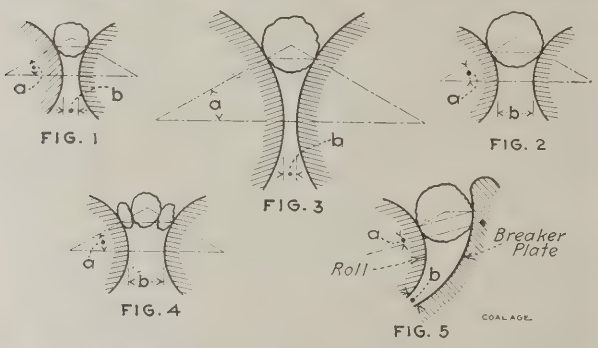
During 1912, the Chinese Eastern Ry. took 142,880 tons, amounting to $101,159, and the Trans-Baikal Ry. 35,720 tons, at $80,942. The sales of coal from the Japanese mines in Fusan have greatly increased during 1912, the principal consumer being the Chinese Eastern Ry.

A New Single-Roll Crusher

A patent was recently issued to the Jeffrey Mfg. Co., of Columbus, Ohio, for a new type of single-roll crusher. This promises to be of considerable value to coal producers, since it embodies a practical machine capable of reducing run-of-mine coal to stoker size in a single operation.

The double-roll crusher, heretofore generally used for such work, is limited in its scope by the following considerations. Fig. 1 shows a pair of smooth rolls acting on a lump of material lying between them. Such rolls will not pinch the lump unless the angle *a* becomes less than the angle of repose of the material. Roughening the surface of the rolls, or providing them with tooth projections, will, of course, increase the angle of repose, and hence enable the rolls to grip larger pieces than would be otherwise possible.

Fig. 2 shows how, with the same rolls, larger pieces may be handled by simply placing the rolls farther apart. This, however, leaves a larger gap between them, and hence the product will contain larger pieces.



The Action of Double-Roll and the New Single-Roll Crusher

Fig. 3 illustrates how, by increasing the diameter of the rolls, larger pieces of material may be handled without increasing the gap. The rolls here shown would handle as large pieces as those in Fig. 2, and reduce them to the same size as those shown in Fig. 1. For hard, tough coals, like Indiana block, the gap must be brought down to the size desired in the product. For soft, friable coals, like Pocahontas, a slight pressure on the side of the lump will result in reducing it to small pieces.

Fig. 4 shows how two or three pieces of such coal may become wedged in a wide gap, and all be properly reduced. Consequently, crushers handling very soft coal may be run with a wider gap, and will have a correspondingly greater capacity than will obtain with the same crusher operating upon a tougher material.

Fig. 5 shows how the new single-roll crusher with concave breaker plate is able to diminish the pressure angle, and thus reduce the larger lumps to a smaller size than would be possible with any two-roll crusher.

The face of the drum is covered by renewable iron segments. Fig. 6 shows these segments to be covered with a system of tooth projections of three different sizes and shapes, whose office will be readily understood. If the breaker plate is so set that the gap between it and the drum be of a certain width, it is evident that all coal passing through this gap must be reduced in one of its dimensions to this size. The coal, however, may come through in large slabs of this thickness.

Teeth Are Required on the Drum

The friction of the coal on the breaker plate will be more than the traction of the drum, hence the numerous hook teeth shown in Fig. 6. These teeth should be far enough apart to engage the coal between them, and must not extend radially from the drum farther than the width of the gap. Spaces exist roughly in the form of squares inclosed between the various teeth, which will contain slabs of coal not thicker than the gap. In order to break these slabs up pyramidal teeth are placed in the center of the squares formed by the hook teeth. We now have a combination of projections that will reduce whatever may pass through the machine to a product not larger than the gap.

The retarding action of the breaker plate is, however, so great that the machine will not readily grip large pieces. Hence a set of large thin hook teeth are placed at intervals around the drum, and narrow grooves are cut in the breaker-plate shoe to clear them. These serve the purpose of engaging the larger pieces and breaking them up, or forcing them through the machine without passing any material which has not been reduced to the required size.

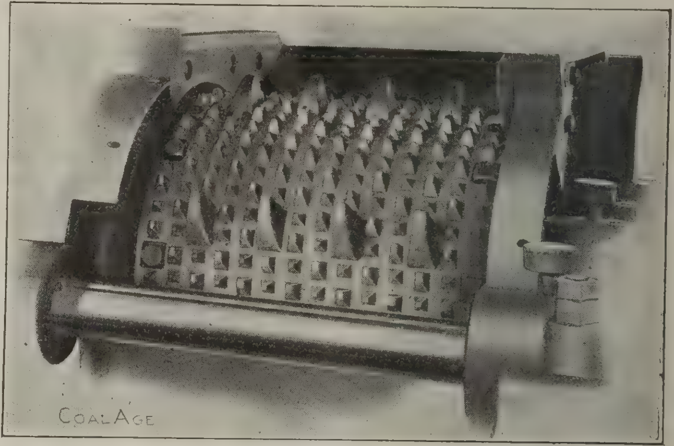


Fig. 6. Arrangement of Teeth upon Roll

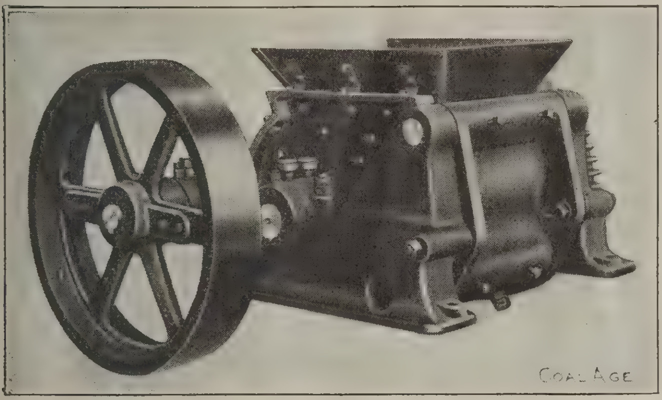
The degree of reduction to be had with any size of this crusher depends in a great measure on the adjustment of the breaker plate. This is also affected, however, by the character of the coal. A soft, friable coal will, under similar conditions, split into smaller pieces than harder and tougher varieties.

The capacity of these crushers depends on the size of the product, the speed of drum rotation, and the friability of the material. The power required to operate when making a fine reduction will vary with the kind and condition of the coal reduced, but will average about one-third horsepower per ton per hour. These machines are manufactured in three standard sizes, namely, 30x30 in., 24x24 in., and 18x18 in. The larger size will handle any coal up to 20-in. cubes, while the smaller takes lumps up to 8 in. They are primarily built for belting to an electric motor, and this appears to make the most desirable installation whenever possible. The heavy band-wheel carries the machine over the peak loads and makes a smooth, quiet-running equipment. When desired, however, a geared-motor drive is substituted for the pulley and belt, with quite a saving in room where space is valuable.

Each machine is provided with a self-contained countershaft, which drives the roll through a pair of heavy gears, thus giving so heavy a starting torque that it may readily be put in motion even when the machine is full of coal. In many cases this is a great advantage, as coal may be received directly from a large hopper or bin without any auxiliary feeder.

An Efficient Safety Device

The belt wheel is not keyed directly to the countershaft, but drives it through a hub, over which it is fitted. This hub has a pair of radial arms, so attached to the arms of the band wheel, that a system of wooden pins serve to make the driving connection between the two. When any undue strain comes upon the drive, as by a piece of steel or other foreign material getting into the throat of the machine, these wooden pins shear off, and thus prevent injury to the more important parts of the mechanism.



General View of Crusher

The breaker plate is heavy, and is lined with a hard iron renewable shoe. It swings on a top pivot, and is held up to its adjustment by steel tension rods. The nuts for this adjustment are conveniently located and accessible at all times, and the adjustment for position of the breaker plate may hence be varied if desired, even while the machine is in motion. The springs under the adjusting nuts are heavy enough to resist the action of the crusher when doing ordinary work, but sufficiently elastic to allow the breaker plate to give way slightly when abnormal strains come upon it. This allows the stress to come gradually upon the wooden safety pins until the load is more than they can stand, when they give way.

Throughout the design and construction of these machines durability and accessibility have been considered constantly of prime importance. All parts have been so constructed that they will not only wear well, but may be easily and quickly replaced, should occasion such as the failure of a plate or segment, demand their renewal.

⁂

The quantity of air circulating in a mine should be measured at the foot of the downcast or at the main intake and, also, at the foot of the upcast or in the main return, at least once each week, and the quantity recorded in the mine-report book. The quantity of air passing in the last crosscut, in each split, should also be measured, so as to ascertain that a sufficient quantity of the air reaches the men.

Transporting Coal through Pipe Lines

The method of transporting coal by water pressure through a pipe has been suggested by E. G. Bell, engineer for the Hammersmith Electricity Works of London. By this method from 30 to 60 tons of coal per hour can, it is claimed, be forced through an 8-in. pipe leading from the Thames and under Chancellors' Road to the yard of the power plant on Fulham Palace Road, a distance of 600 yards.

If the scheme is adopted, a large mixing tank will be erected beside the wharf. The coal will be lifted from the barge by a mechanical grab, and after passing through an automatic weighing machine, it will be filtered into the mixing tank, which will contain approximately 15 per cent. of coal and 85 per cent. of water. A powerful electrically driven pump will then force the mixture of coal and water at high velocity through the transmission tube to a reception tank at the works.

The coal will sink to the bottom of this tank and another pump will drive the water through a return pipe to the mixing tank. Another grab will lift the coal out of the reception tank into the storage yard.

Although the initial cost of such a plant might be high, it is believed that it would eventually be a paying investment, since the present cost of transportation is approximately 14c. per ton, or somewhat over $3500 for the 25,000 tons which are used annually.

⁂

Coal Consumption of the Iron Industry

The production of pig iron by means of bituminous coal and coke amounted in the first half of 1913 to 16,075,264 tons or 97½% of the total, according to the American Iron & Steel Institute. The amount of mixed anthracite and coke iron was 225,665 tons. The production with anthracite coal alone was 11,491 tons, and the production with charcoal was 176,182 tons, including a small quantity made with charcoal and electricity.

The production of iron by the various fuels for whole years since 1877, in which year the total production first exceeded 2,000,000 tons, is herewith shown.

	Anthracite	Charcoal	Bituminous and Coke	Total
1877	834,640	283,789	948,165	2,066,594

Twelfth International Geological Congress

By Phillips Thompson*

SYNOPSIS—The congress has signalized its Toronto meeting by the publication of a monumental book on the Coal Resources of the World. This monograph contains the cheering information that there are seven trillion tons of coal awaiting the miner. The delegates seemed to think that the chemists should no longer be allowed to classify coals but that such fuels should be examined microscopically in order to determine their petrographic characters for the purposes of classification.

⁂

The Twelfth International Geological Congress began its sessions on Thursday, Aug. 7, in the Convocation Hall of the University of Toronto, Toronto, Can. About 500 delegates, speaking 25 different languages and coming from all parts of the world, were in attendance. The formal opening meeting was held at noon. Sir Charles Fitzpatrick, administrator of the Canadian government in the absence of the Duke of Connaught, welcomed the delegates on behalf of the government. In his address, which he delivered in French, he called the attention of his auditors to the many features of special geological interest in Canada, including the Laurentian plateau, the nickel, silver and gold deposits of Ontario, and the extensive coal beds of Saskatchewan and Alberta. Addresses of welcome were also delivered by A. W. Hearst, Ontario Minister of Mines, Controller Thomas Church, representing the city of Toronto; and President Falconer, of the University.

The newly elected president of the Congress, Dr. Frank D. Adams, of McGill University, Montreal, then took the chair and briefly thanked the Congress for the honor conferred upon him. R. W. Brock, of the Canadian Geological Survey, addressed the Congress, stating that the Executive Committee had arranged excursions so that the delegates might have the opportunity to visit localities of special geological interest. The excursion routes arranged covered a total distance of 20,000 miles. Dr. Emil Tietze, of Austria, replied on behalf of the delegates.

An Encyclopedic Record of Coal Reserves

At the afternoon sitting, over which T. Tschernyschen, director of the Russian Geological Survey, presided, R. W. Brock formally presented to the Congress the elaborate monograph on the "Coal Resources of the World," the result of an investigation made on the initiative of the Congress. It is intended to form a companion work to the "Iron Ore Resources of the World," published under the auspices of the Eleventh Congress, and consists of three quarto volumes, containing in all 1360 pages, illustrated by upward of 175 maps and figures and accompanied by a 68-page atlas of maps, colored so as to show geologic features.

The preparing and publication of the monograph was entrusted by the Executive Committee to a Coal Resources Committee, consisting of G. G. S. Lindsey, Convenor; F. D. Adams, R. W. Brock, D. B. Dowling, Charles Fergie, James McEvoy, J. B. Porter and William McInnes, and the actual editing was done by William McInnes, D. B. Dowling and W. W. Leach, of the Geological Survey.

In the main body of the monograph, reports on 64 countries are included, some of which contain over 100 pages. The greater number of the reports are in English; ten are in French and six in German. In the "summary," which appears in the first volume, all the reports are reviewed by the editors, in English.

Coal Classification

Owing to the lack of uniformity in the usage of the different countries of the world in regard to the commercial classification of coals into anthracite, bituminous coal and lignite, it was found necessary to adopt an arbitrary classification which might be used by all and thus make the results more easily comparable. The Coal Resources Committee drew up a scheme of classification, dividing the coals into A, B, C and D groups, with various subdivisions, based mainly on composition and heating value. In this scheme A roughly corresponds to anthracite, B and C to bituminous coal and D to subbituminous coal, brown coal and lignite.

With few exceptions, the reports submitted conform to the classification prescribed as they do also to the other requirements regarding the depths to which computations were to be carried and the division of the reserves into actual, probable and possible reserve, though in some cases the information at hand has not been full enough to warrant strict compliance with the specified form on all these points.

The Geological Range of Coal Beds

In the introduction, Mr. Dowling summarizes the results, dealing first with the distribution of coal in the various geological series. The range of important fields in the Paleozoic extends from Lower Carboniferous, in the case of the fields of Central Russia, Scotland and the Arctic Islands through Upper Carboniferous, to which the large deposits of Western Europe and Eastern America appertain, to Permo-Carboniferous, in which are embraced most of the very extensive fields of China, India and Australia. The Mesozoic, though not so widely spread, contains important coal basins in Europe, Western America and Asia. The Tertiary contains deposits of importance in most parts of the world, including fields in Central and Western Europe, in Japan, in New Zealand and throughout the great plains region of North America.

Seven Trillion Tons of Coal

The total reserves of the world, compiled from all the reports received, amount to 7,397,533 million tons, of which nearly 4,000,000 millions are bituminous coals, nearly 3,000,000 millions are brown coals of various grades and nearly 500,000 millions are anthracite coals. Of the latter, Asia, which includes the great Chinese coal fields, has by far the largest supply of any of the great continental divisions, furnishing 407,637 million tons; in bituminous coals America, with 271,080 million tons, leads by a great margin, as she does also in the various grades of brown coals. The world's production of coal for the year 1910 was about 1145 million tons, so that, though much must be allowed for loss in mining, and for areas that for various reasons cannot be economically mined, there still remain many hundreds of

---

*Box 497, Oakville, Ont.

years before the exhaustion of the supply will occur. Taking up the individual countries, however, it is found that in more than one case the end is in sight.

CHEMIST VERSUS PETROGRAPHER

An interesting discussion followed the presentation of the monograph. J. M. Gordon, of Montreal, objected to the method of classification of coal adopted in its preparation. He urged that there was no certain significance in the relation between fixed carbons and volatile matter. Many attempts had, he said, been made to classify coal, but there is no classification today that can be said to have any degree of accuracy. The classification by length of flame was only comparative. No division into classes by chemical analysis was possible, and the quality of coal could only be determined with a microscope.

A. Defline, of Paris, gave a paper setting forth in detail the coal resources of France. Professor Krusch, of Germany, read a paper prepared by Mr. Bokar, upon the subject of classification. The writer maintained that an ideal division into classes was not possible, because enough was not known about the genesis of coal and the chemical changes through which the original vegetation passed after deposition.

A. E. Kitson, of the West African Gold Coast Survey, gave an interesting description of the brown-coal deposits of Victoria, which attain the extraordinary thickness of from 808 to 1110 ft. He was disposed to agree with Mr. Gordon as to the unreliability of present methods of classifying coal as the character of the fuel depends largely on its origin. The Congress disbanded on Aug. 14.

⁂

The Illinois Mining Board

The following resolutions were passed at a recent meeting of the Illinois State Mining Board, held at Springfield, as a tribute of high esteem and respect for the former president of the board, Richard Newsam, who died Aug. 5, 1913:

Whereas, it has pleased an allwise Creator to remove from our midst Richard Newsam, who for a number of years was the president of the State Mining Board; and

Whereas, by his ability and honesty the stand and efficiency of the State Mining Board and state mine inspection service has been raised until we are second to no similar board in the United States of America; and

Whereas, the deceased, by his wide knowledge of mining matters, practical and theoretical, and his aptness and ability in imparting such knowledge to all who were seeking the same, was a valued and competent presiding officer of the State Mining Board; therefore be it

Resolved, that we pay a just and fitting tribute to his ability and memory when we mourn for him as one in every way worthy of our respect and esteem.

Resolved, that we sincerely condole with the widow and family of the deceased, and commend them to the keeping of Him who looks with tenderness on the widow and fatherless.

Resolved, that these resolutions be spread on the records of the State Mining Board, and that copies of the same be forwarded to the widow of our late friend, to the newspapers and mining journals of the state, and that the same be made a part of the thirty-second annual coal report.

STATE MINING BOARD:
Evan D. John, Actg. Pres.
Martin H. Linskey, H. E.
S. M. Duggan, Secy.
Wm. Spenny, Member.
Martin Bolt, Chief Clerk.

A Mining Class

One of the most practical examples of the effective instruction given by many mine foremen to their employees, is that of Foreman Evan W. Evans, mine foreman of the Capouse Colliery, of the Scranton Coal Co. Mr. Evans was formerly (1896) one of the brightest students in the Y. M. C. A. mining class, taught by J. T. Beard, at Scranton, Penn. Since that time, Mr. Evans has continued his mining studies and has performed many practical experiments in the application of theory and principles to mining practice. He has prepared and read many interesting papers on subjects of mining.

We are glad to be able to reproduce here a recent photograph of a mining class, organized and conducted by Mr. Evans, as an evening school. For two years this class was conducted at the Evans home, until its increasing numbers required larger accommodations. Through the generosity of the School Board, permission was obtained to hold the class twice a week in one of the classrooms of No. 18 school. This class is attended by earnest, hard-working mining men, who are making every effort to better their own conditions and secure greater safety in the mines, for themselves and their fellow workers, by increasing their knowledge of mining principles and conditions. The regular attendance upon the sessions and the work performed by the class show the appreciation of the men for the disinterested efforts of their foreman, who receives no pay for his services other than the hearty good will of the men.

THE EVANS MINING CLASS

The members of the class represent all grades of workers in and about the mines, including hoisting engineers, firebosses, "nippers," timbermen, tracklayers and miners. Their ages range from 25 to 50 years. One of the practical features of the class is the illustration of the principles taught by practical experiment. The example of this faithful mine foreman is worthy of emulation by others who are capable and in a position to give instruction to mine workers, along similar lines. The class and its conductor have the best wishes of COAL AGE for the success of their efforts.

POWER DEPARTMENT

Purchase of Electrical Apparatus

By Henry D. Jackson*

SYNOPSIS—Simple suggestions are here given concerning the details of construction and installation of electrical machines and switchboards. The selection and placing of indicating instruments receive particular attention.

⁂

In purchasing alternating-current generators, it is advisable to examine carefully all constructional details, particularly with reference to the methods of insulation and the windings of fields and rotors, as well as the manner of applying the exciting current. The windings of the rotors are especially important with direct reference to the ease of repair and the means of fastening the coils in place in the slots, as well as securing their ends against the effects of short-circuit. The field coils should be examined for methods of fastening in place to prevent the possibility of movement and also with regard to ease of replacement.

The flywheel effect on alternating-current machinery is of considerable importance, particularly when it is necessary to operate generators in parallel, as the combined flywheel effect of engine and generator must be large in order to insure a constant turning moment. It is advisable that the turning moment of all machines should be practically the same, so that there will be no interchange of current between them when they are operated in parallel.

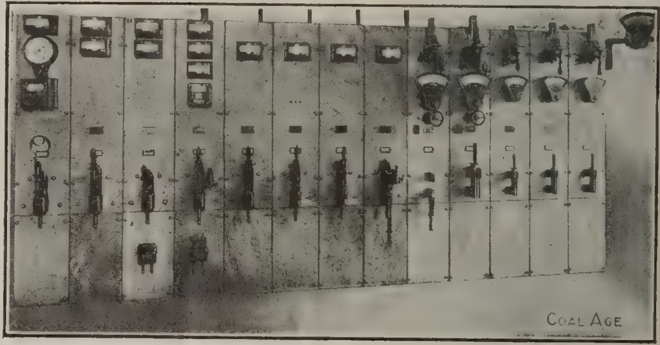
In most mine work it is not advisable to have a generator of inherently good regulation, in fact, it is better to have one of rather poor regulation, because in case of short-circuit, the machines, having a high self-induction, will prevent current reaching any excessive value. If good voltage regulation is absolutely necessary or desirable, this can be obtained through the use of a Tirrell or some other regulator.

Temperature guarantees are of extreme importance, and figures should be obtained at unity, at 80 per cent. and at or about the power factor at which the plant may be expected to operate. This figure in many cases is low. There is, however, no reason why, with a proper design of the plant—by which is meant the entire outfit, generators, motors, rotary converters, etc—the power factor should be low; and for the best interests of the owners, care should be taken to keep this figure as high as possible in order to get maximum output from both engines and generators, and thus decrease the operating costs of the plant.

Twenty-Five Cycles Is Best for Mine Work

For mine work, a frequency of 25 cycles is to be recommended, principally owing to the greater stability of the rotaries and synchronous motors at this frequency, particularly if the former supply direct current at over 500 volts. The usual practice calls for three-phase transmission, and this is for general purposes by far the best. There are plants at present installed using quarter-phase, but as the amount of copper used by the transmission line is thereby considerably increased without any compensating gain, it is not to be advised.

Attention has already been called to the fact that for voltages up to 13,200 it is probably as satisfactory to purchase generators which will produce this voltage direct, as it is to use lower-voltage generators and step-up for the line. Machines of this character are perfectly reliable; and by purchasing them one will be relieved of the necessity for the use of step-up transformers with their additional cost. Above this voltage, however, owing to the increased cost of construction, it is probably better to buy generators which will give a lower voltage, and step-up through transformers to the potential of the line.



A Well Designed Switchboard

The voltage at which to generate would depend upon a number of considerations; but is is usually kept low enough so that it may be carried direct to the board, if desired, without danger. It may be noted here that in case it is desired to run the generators in parallel, the engines should be provided with a device operating on the governor, by which their speed of rotation can be controlled.

This device is used for paralleling the machines and also for their control when it is desired to divide the load between them and to drop one out of service, since the generators of this character do not divide their load in proportion to the voltage generated but in proportion to the power delivered by the prime mover. This condition has not infrequently been lost sight of and has been the cause of considerable difficulty in operating generators satisfactorily in parallel. For the same reason it is advisable to watch closely the type of engines purchased, in order to see that they too operate with reasonable uniformity.

The above outline will show the necessity for a thorough knowledge of the strength of materials, the conditions of operation, and the features of design both of the engines and generators, in order to be certain that

---

*88 Broad St., Boston, Mass.

the best types of both are selected for mine service. In purchasing motors or rotary converters, the same general characteristics have to be taken into account as in buying any other A.-C. apparatus, the principal features being a careful examination of the materials and methods of construction, and the ease of repair.

Material and Arrangement of the Switchboard

The switchboard may be of slate or marble, depending upon the voltage employed, and also whether or not it is desired to make a "show" plant. For all practical purposes with voltages up to 500 or 600, a well selected slate board is quite as good as marble, and has the advantage of being considerably cheaper and far easier to keep neat. Above this voltage, owing to the possibilities of metallic veins in the slate, marble is to be preferred.

For the best results and for ease in adding future sections, the slate or marble should be supported on pipe framework, as this is cheaper, stronger and more readily handled than angle iron. In laying out the switchboard, it is usually advisable to figure on the future, because it is necessary for the best results in operation that the panels of similar character should be bunched together, that is to say, generator panels should all be in one line, the exciter panels in another, and the line panels in another, each set complete in itself, making, however, one continuous switchboard.

This can be secured by leaving blank places for future generator and line panels, and installing the exciter panels at one end of the board and the line panels at the other, leaving those for generators between. If it is desired, as it frequently is, for purposes of record, to have a totality panel or one on which all the power generated can be recorded, this can readily be inserted between the generator and line, and upon this panel can be installed, if desired, the power-factor meter, frequency indicator and synchronizing device.

With direct-current switchboards, the same reasoning holds true. For best results in operation, the generators should be bunched on one end of the board, and the line bunched on the other end, here again using, if desired, a totality panel between the two.

In direct-current work, owing to the fact that the main leads are usually carried direct to the board, it is more or less frequently necessary to work behind it, and consequently sufficient room should be left for easy working with the necessary tools, without danger. This means that the board should be at least 2 ft. and preferably 4 ft. from the wall.

The Instruments Required

The instruments required on a direct-current board depend upon the information which may be desired; but in general it may be stated that an ammeter is all that is necessary for the generator panel, provided that a voltmeter is so located as to be available for this generator and future installations. It is, however, not unwise to install a voltmeter and an ammeter on each generator panel, arranging the voltmeter so that it can be plugged to the generator, and another instrument on a swinging bracket which will show at all times the voltage on the main bus. In this way there is always a voltmeter showing the condition of the line and at hand another which will show the voltage on the generator as it is being built up ready to be put into service. This will enable the machine to be put into service promptly and accurately without any unnecessary plugging. It will also serve to prevent the throwing on to the line of a generator, in case the machine happens to be reversed by any accident. This is only true, however, in case the voltmeter used is one having a marked polarity, so that there is no danger of its indicating the voltage in case the machine happens to be reversed, as would be the case if the voltmeter were of the solenoid type. Where a single generator is used, the recording wattmeter, if one is installed, should be placed upon the generator panel.

Other Instruments Are also Advantageous

Another instrument which frequently serves a good purpose is a ground detector, as this will enable one at any time to discover whether or not the line is grounded. In mine work it is not infrequent to find grounds which, while not being excessive, might still be the cause of considerable leakage and, therefore, lost power which may eventually cause a station blowout with more or less disastrous results.

Another device of value is a switch whereby a voltmeter may be connected to various points upon the system, enabling the operator at the station to determine at any time the condition of the transmission line as to whether or not the drop over it is too great for successful operation of the machinery. If this voltmeter is connected at times of heavy load to various sections, the condition of the line can be readily obtained accurately without calling in outside assistance, and may serve to prevent considerable trouble with the mining machinery. It will also obviate the necessity for sending men into the mine for making these tests, which, while giving an indication, are by no means satisfactory owing to the possibility of the readings being taken at different intervals.

It is neither wise, nor good practice, to rely upon inferior instruments on the switchboard. They may be cheap in first cost, but are usually expensive in the end, first, because they are not accurate, and second, because the current required to operate them will in less than a year frequently cost much more than the interest charges on the difference between their cost and that of better-quality instruments.

Use Switches of Ample Capacity

Each machine should be provided with main switches of ample capacity and also with a switch connecting the equalizer. This latter may or may not be at the board. If the run from the switchboard to the generator is long, it is cheaper and on the whole frequently far more satisfactory in operation to have the equalizing switch at or near the generators, although there are reasons for objecting to this, particularly if the employees about the station are not careful men. The objection is that a three-pole switch on the generator will insure that the equalizer switch be closed when the main line is closed. If, however, the equalizer switch is at the machine, it is not uncommon to find that the operator forgets to close it, with the result that one or both machines may drop out of circuit or that there will be great and sudden fluctuations in voltage at the two machines.

The switches should be of ample capacity for the service. There is frequently a tendency to buy switches having a small copper section, on account of the cost.

A little thought will show that those switches having a small copper section, have a comparatively high resistance. This resistance will cause a loss of power, and this loss over a switch of high resistance as compared to one of low resistance, may be sufficient to much more than pay for the difference in cost of the two switches. Further, the heating may result in melting out the contacts back of the board and shutting down the station. Small switch area also means small contact area, which has a similar effect, and, therefore, it is unwise to attempt to economize along these lines.

Use Two Circuit-Breakers

A circuit-breaker should be installed on both line and generator, though frequently the latter is neglected. if the line breaker is particularly adapted to the service rendered. It is, however, a safety feature well worth keeping in mind, to place these breakers on the generator, as mine loads are greatly fluctuating, "shorts" are not uncommon, the line breaker may "hold over" and on a heavy short the generator, unless protected by a circuit-breaker, may be burned out. Attention should be paid to purchasing breakers whose continuous capacity is sufficient to carry the heaviest steady load which is ever likely to come upon them, and to operate the plant with the breakers set at the highest possible *safe* point. It is cheaper to have the breaker blow than to burn out the machine.

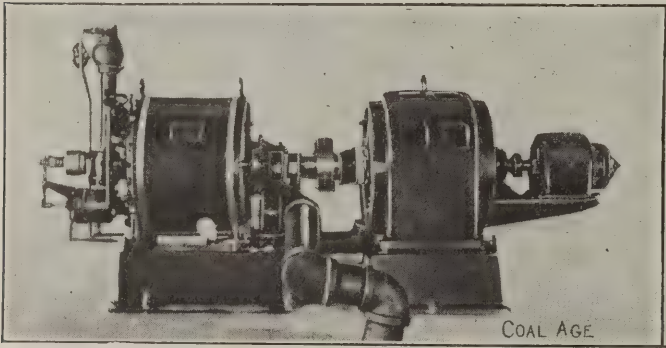


Fig. 1. 15-Kw. Turbo-Generator at Bearcreek, Mont.

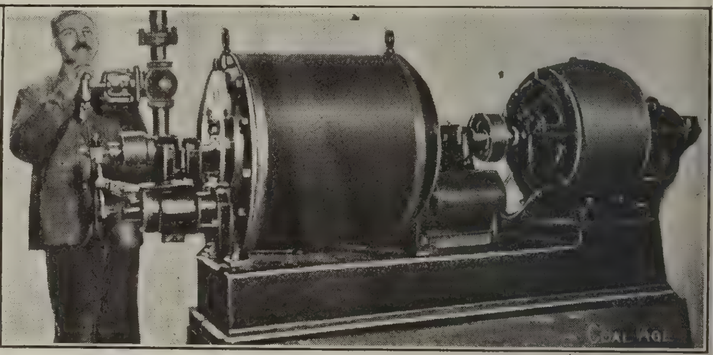

Fig. 2. 35-Kw. Machine at Sunshine, Colo.

In this connection it is worth while to note that a delayed-action circuit-breaker is better than a breaker set to a danger point. Mine overloads and peaks are usually sharp and sudden, but not long lived, and a load may come instantly which is not beyond the capacity of the generator for the time it may be on, but which might readily throw the breaker if it is not provided with some means for delaying the trip. This can be accomplished by the use of dash-pots or other means. Attention to details of this character will insure continuity of operation is cases where the plant would otherwise be shut down temporarily.

⁂

Coal Production of British Columbia

British Columbia stands second among the Canadian provinces in the production of coal, and third in the manufacture of coke. The Coast District produced 1,533,000 tons of coal in 1912, the West Kootenai District, 1,299,000 tons, and the Boundary District, 214,000 tons.

Small Steam Turbines in Coal Mines

Special Correspondence

The increased use of alternating current at collieries has brought the small turbo-generator into considerable prominence. Its compactness, ease of installation and comparative good economy, together with fine running qualities, peculiarly adapts it for the rough service required around coal mines. The accompanying illustration shows two of these small generators.

Fig. 1 is a 15-kw. unit at the Bearcreek Coal Co.'s plant at Bearcreek, Mont. Fig. 2 shows a 35-kw. machine at the Midland Mine, of the Rocky Mountain Fuel Co., at Sunshine, Colo.

In both of these installations the prime movers are Kerr turbines. While the steam consumption of these small machines is not quite as low as that of four-valve or compound engines, their compactness, small installation cost and the fact that a large amount of skilled attendance upon them is unnecessary, is bringing them rapidly into favor.

⁂

Colliery Notes

Great consideration should be given to the valves of an air compressor. Inlet valves should be as large as possible; in practical work they are not more than 15 per cent. of the sectional area of the cylinder. On the other hand the outlet valves should be as small as possible and should open as soon as the required pressure has been reached.

⁂

In mining work, multiple-stage air compression is not of much practical advantage for pressures under 60 lb., but it is increasingly advantageous for higher pressures; in the use of the latter there is a proportionately increased loss from leakage. An additional advantage in stage-compression is gained by intermediate cooling between the cylinders.

⁂

If the initial pressure remains constant while a volume of compressed air is being discharged through a pipe, the loss of pressure is proportional to the length of the pipe. As the air increases, the velocity becomes greater and the friction increases as the square of the velocity. Hence, where compressed air is to be used, large sized pipe is often a matter of economy.

⁂

Unused slack means a waste of from 5 to 50 per cent. of the total output of different mines. Coking slack is easily disposed of. Noncoking, readily caking slack, is good for use under boilers, as it fuses easily and is capable of being burned with but little loss. Medium coking slacks demand specially constructed grates; even then the percentage of waste is higher than when coal is used.

EDITORIALS

The Schaefer Method

In the contest for supremacy between the Sylvester and Schaefer methods of resuscitation, the latter system appears to be winning. The former was adopted by the Red Cross society and was by them engrafted in the rescue service of the Bureau of Mines without the opportunity for extended consideration. At the time there was an immediate demand for action, and deliberation on methods of first aid had to be left to the future.

The Committee on First Aid Methods at the Mine Rescue and First Aid Conference declared that "the Sylvester method of artificial respiration is preferable, provided that no injury to the person to be resuscitated prohibits its use." Evidently the Schaefer method obtained at least a foothold by this declaration of faith. For if the Sylvester system is not always applicable, some alternative treatment will have to be taught, though none except the pulmotor method can be applied alike to all the cases which are amenable to treatment.

The advantages of the Schaefer treatment over the Sylvester are: (1) It is easier to learn; (2) it can be performed by a boy or an adult for an unlimited time without exhaustion; (3) it supplies more "tidal air"; (4) it places the victim so that his tongue naturally falls from the back of his mouth; (5) it enables secretions, excessive or otherwise, and leaking serum to pass away by gravity so that the patient does not need to be rolled in order to prevent him from drowning in his own secretions; (6) it is available even when the muscles of the arms are contracted tetanically; (7) it does not put the man in an unnatural position so as to cause an increase in hemorrhages in the brain and cord.

Against these arguments the advocates of Sylvester's method urge that the face of the victim is apt to be plunged in the mud and some declare, we think wrongly, that the ribs of the patient may be broken by the pressure.

The reasons we have given for preferring the Schaefer method are those urged by Dr. Charles A. Lauffer in his "Electrical Injuries," but we think he has omitted one argument which his lack of knowledge of mining methods has caused him to overlook.

The Sylvester method is a purely external system of operation. The arms are raised. The moving of these pulls on the muscles and raises the ribs which thus produce an enlargement of the chest. Then the arms are lowered and doubled against the ten upper ribs. The chest is thus reduced in size and the "tidal air" is driven out.

In these actions many muscles are brought into play, some indeed which do not have any effect on the dilation or compression of the chest cavity, muscles, for instance, which run from the shoulder and arm to the back of the victim, the extension of which while entirely unbeneficial in the restoration of breathing, may be accompanied by extreme harm to the man being resuscitated.

It is no less essential to remember that whether any thoracic muscle actually tends to produce the heaving of the chest is not important as far as the resulting injury is concerned; an unfunctioning tension or compression is as detrimental as one which performs the objects sought.

It is true that those pectoral muscles (*pectoralis minor*) which are much strained in the Sylvester method lie for the most part below muscles not so strained, but everything outside the chest including the inclosing ribs may be regarded as external and much subject to injury. Consequently, as a general principle, not, of course, without numerous exceptions, we may suspect that a man injured by a blow is not a fit subject for the Sylvester treatment, because the latter utilizes muscles and ribs which may be injured. Furthermore, that method is usually undesirable in case of burns, because it strains and compresses muscles which are likely to have been injured by fire, though the muscles affected do not function most actively in the recovery of the respiratory action.

On the other hand, the Schaefer method utilizes the floating ribs. These are forced inward so as to press the internal organs, the stomach, spleen and liver up against the diaphragm. Thus the chest is crowded into a small space without pressure on any of its parts, other than on the one wall which is not external. Hence, Schaefer's method is an internal operation in comparison with that of Sylvester.

F. L. Hoffman, in our issue of Aug. 9, shows that in the anthracite mines, 5.5 per cent. of the serious accidents affect the "trunk," while 26.7 per cent. affect the shoulder, arms, wrist, hand, collarbone and ribs. A less marked difference is shown in the accidents of the bituminous field of Pennsylvania. There, 10.5 accidents to the trunk occur to 21.4 in the regions of the body moved during the Sylvester treatment.

It must be conceded that the figures given are not used with entire fairness because blows on the arms and wrist are not likely to inhibit the action of the diaphragm and so the lesser number of injuries on the abdominal regions may nevertheless merit the greater consideration.

But, conversely; as it is in burning accidents that asphyxiation occurs, demanding the restoration of breathing, the location of burns is worthy of consideration. It is more important to consider the parts which are most affected by these specific accidents than to enumerate the frequency with which the various parts are affected by injuries in general.

As a miner works with a low shirt and short sleeves and sometimes without any sleeves at all and as his clothes are gathered tightly around his waist by his belt, it is probable that he is burned in even greater proportion in what for brevity of speech we will designate the Sylvester regions.

When a man stands in inflammable gas, the upper part of his body is in a richer mixture than his waist and consequently more severe burns are likely to be found there; moreover, the gas will not be ignited by a hand lamp where the gas accumulation is small unless one of the man's hands is raised to convey the light to the gas. Hence burns are generally in the head, chest and arms.

These considerations make us view the Schaefer method as the one more suited for use in instruction. Where it cannot be used, we fear that all hope is in vain. The man is probably dead, not merely stunned into inaction; he is burned to a crisp or injured internally so that the undertaker has more interest in the matter than the first-aid man.

One further consideration puts the statistical argument more definitely in favor of the Schaefer method: It must be granted that, as Mr. Hoffman has deduced his figures from the reports of the inspectors, the word "trunk" has an uncertain statistical meaning and though it is likely in some cases to mean the abdominal regions, it probably even more often refers to the chest and back. In fact, we are informed that injuries to these parts are included in the enumeration of trunk accidents. Consequently, the ratio between the injuries declared to affect the Sylvester regions and those recorded as involving the "trunk" must be smaller than that existing between injuries of the Sylvester regions and accidents involving the abdominal regions only.

If we figure on the interesting data given by Mr. Hoffman, inadequate as they are for our special purpose, we shall probably err to the disadvantage of the Schaefer method and give those who differ from us the best of the argument. But we quote the figures for what they are worth. The percentage of availability of the Schaefer system in the anthracite region would be 82.9 per cent. and in the bituminous coal fields of Pennsylvania 67.1 per cent. The Sylvester method would be of service, therefore, in only 17.9 and 32.9 per cent. of the cases. Why teach a system so rarely available in mining practice and why declare that its use is to be preferred?

⁂

From Panama to Alaska

That enterprising senator, for the state of Washington, Miles Poindexter, has a brilliant idea which he intends to embody in a bill for introduction into the United States Senate. This new motion of the senator will appeal to the humor of mining men, though we can well conceive that the ordinary citizen, unacquainted with mining and dazzled by modern engineering achievement may believe the scheme feasible. Poindexter desires to utilize the machinery which excavated the Panama canal to mine coal in the Alaska fields.

These coal areas have caused vehement discussion for a long time, and a just solution of this troublous problem would be welcome, except to those who make capital by keeping the debate alive. Of late the coal beds have not figured so prominently on the political horizon as they did a few years ago, and meanwhile accurate knowledge concerning them has been more generally disseminated. But they may now reappear as star performers in the political arena with the senator from Washington as stage manager.

It is apparent to all those interested in mining that the machinery which has been used in Panama is not adapted to underground work. A large steam shovel could not be taken into a mine to work beds such as are ordinarily encountered. Even in some of the seams of Alaskan coal, which are popularly reputed to be one hundred feet thick without a slate parting, it would be difficult to work any large machine on account of the width of the opening necessary and the weakness of the roof.

Much of the coal could be mined with a steam shovel were it only clean, level and safe for such operation, but the last two desiderata are more conspicuously absent in the coal of Alaska, than in perhaps any other known field. The only use for the shovels and excavators would be in the building of the railroad or in open cutting for coal. Just how large a tonnage could be economically obtained by a removal of the surface is doubtful and the demand for coal is not such that the whole Panama paraphernalia could find appropriate use.

Among the many features in this bill is one outlining a profit-sharing plan between the government and its mine employees. It is by no means certain that the federal authorities can with advantage enter the competitive field and sell coal at a profit and the proposal that the government should only mine half the coal, leaving the rest for individual exploitation is an equally questionable policy. Any mining man knows, to state the question in the form of an Irish bull, that one cannot tell what is in the ground until it has been taken out.

A waiter once demanded "which side?" when a finical customer called for an egg fried on one side only. It might be permissible to inquire of Poindexter "which half that hapless operator is to control who takes up the burden of competing with the boundless resources of the government?"

⁂

Coal Shipping on the Great Lakes

We call particular attention to the series of articles dealing with coal transportation on the Great Lakes now appearing in Coal Age. It is our purpose to cover the subject in great detail, so that when completed, the full discussion will form the most exhaustive treatise ever published on this topic.

The importance of this subject will be better appreciated when it is remembered that during 1912, there were over 23 million tons of bituminous coal shipped by way of the Lakes, in addition to some 4 million tons of anthracite. One of the most singular features of the Lake trade, however, is the remarkable rapidity at which it is increasing. A decade ago the movement of soft coal *via* the Lakes was only one-third the present tonnage.

Thus it will be seen that the water shipments have trebled during the past ten years, while the country's production during the same period has only doubled. The inference is plain. Water transportation of bulk freight, where available, has proved an economically sound principle, and will be an important factor in determining the geographical distribution of the coal markets of the future.

⁂

One Way to Avoid Trouble

The crying need of mine management is a greater knowledge of common law. In this issue we have started a "Legal Department" to aid coal officials in mapping out a proper course of action in their everyday work. Study the articles in this new department and thus acquire knowledge that will enable you to avoid annoying collisions with legal obstacles.

LEGAL DEPARTMENT

Are Contracts to Abandon Coal Trade Valid?

By A. L. H. Street*

SYNOPSIS—The decisions, while somewhat variant, agree in endeavoring to insure the purchaser in the possession of the good will purchased. In all decisions it is ruled that the territory over which the restriction is applied must be the same as that over which the trade thus restricted has already been established and in many cases the judges have ruled that the time should also be limited.

⁂

May one previously engaged in the coal trade, as producer or dealer, legally bind himself not to re-engage in business in competition with a person, firm or corporation to whom he has sold his business and good-will? The business advantages accruing to the purchaser from such an agreement are obvious, but the exact limits set by the law on contracts intended to secure those advantages are, perhaps, not generally understood; and the question becomes particularly interesting when it is considered that such an agreement may become wholly void through an attempt to secure greater rights to the purchaser than the law gives him.

Is It Invalid to Sell Good Will?

Formerly it was held uniformly by the courts that any contract whereby one purported to preclude himself from engaging in any legitimate pursuit anywhere or at any time, no matter how limited, was void. The reasoning upon which this holding was based was that the public is entitled to the fullest possible competition between business men in their chosen vocations; otherwise monopolies would be created. But this rule was gradually modified as the courts came to recognize the injustice of permitting one who has sold a valuable good will to deprive the purchaser thereof by reëntering the trade, especially before the latter has had an opportunity to fortify himself against such competition by acquaintance and course of dealing with his new trade.

Accordingly, it has now become a general rule of law that a contract by the seller of a business not to engage in competition with his successor will be enforced by the courts, by awarding damages for breach of the agreement and by enjoining further violation of the contract, if the agreement be limited to the territory in which the seller established his trade; but in some states it is held by the courts that there must, also, be a reasonable limitation as to the time during which the seller's competition is to be barred. The test of validity usually applied is whether the contract is reasonably necessary to secure the purchaser in the enjoyment of the good will of the business bought.

In a case which arose in the coal trade (George & Chapman vs. East Tennessee Coal Co., 83 Tenn. Supreme Court Reports 455), the rule is thus summarized: "A contract not to carry on one's business anywhere is void, but a contract not to carry it on in a particular place, or within certain limits is valid." And, according to a decision of the Minnesota Supreme Court, sale of the good will of an established business, in connection with the sale of that business, is not, if reasonable in other respects invalid because unlimited as to time. (Southworth vs. Davidson, 118 Northwestern Reporter 363.)

On the other hand, the Appellate Division of the New York Supreme Court holds that a contract not to engage in a business, not limited as to time and place, is void as being against public policy (Von Bremen vs. MacMonnies, 122 New York Supplement 1087); and that a contract purporting to obligate the seller of a business not to engage in a similar business will not be enforced, unless the restrictions are limited as to time and territory, and the agreement is necessary in order to give the purchaser the benefit of his bargain. (Fries vs. Parr, 139 New York Supplement 220.) The Michigan Supreme Court has applied a similar test. (Weickgenant vs. Eccles, 140 Northwestern Reporter 513.)

Reasoning along the same lines, the Kentucky Court of Appeals holds that a contract, made upon selling the good will of a business, not to again pursue it in the country, is unenforceable, but that a contract is valid, if it restrains the conduct of the business to such an extent of territory only as is necessary to protect the purchaser. (Linneman & Moore vs. Allison & Yates, 134 Southwestern Reporter 134.) In Louisiana, the rule is thus broadly stated: "One may bind himself never to pursue a particular calling within reasonable geographical limits, or not to pursue such calling at all within a reasonable time." (Louisiana Supreme Court, Moorman & Givens vs. Parkerson, 54 Southern Reporter 47.) In Alabama, such agreements are sustained if limited to the city in which the business sold is conducted, though not limited in duration beyond the time that the purchaser shall remain in the trade. (Alabama Supreme Court, Smith vs. Webb, 58 Southern Reporter 913.)

Contract of Restriction Not Invalid though Entered Into with Several Competitors

The principles above stated, as applied especially to the coal trade, are well illustrated by the following summaries of decisions handed down by the highest courts of the country: A person who owned coal lands, mines and boats sold them to a company, agreeing not to engage within ten years in the business of mining or shipping coal in the territory traversed by the Monongahela, Ohio and Mississippi rivers and their tributaries. This contract was upheld by the Pennsylvania Supreme Court in the case of Monongahela River Consolidated Coal & Coke Co. vs. Jutte, 59 Atlantic Reporter 1088, as being a reasonable contract and not violative of public policy, though the company had similar contracts with a large number of other coal operators who had previously done business in the Monongahela Valley in Pennsylvania.

---

*Attorney and Counselor at Law, St. Paul, Minn.

Another contract by a retail dealer, in selling his business at Auburn, Neb., not to reëngage in business directly or indirectly, in that town or in the vicinity thereof, except that if his successor should discontinue a lease on the seller's yard at the expiration of five years, the seller might reënter the trade, was upheld by the Nebraska Supreme Court in the case of Engles vs. Morgenstern, 122 Northwestern Reporter 688, as against objection that the contract violated the statutes of that state directed against combinations in restraint of trade. In a Michigan case, the lessee of a dock upon which he conducted a coal business sold nearby land, on which was located another dock, under agreement that the purchaser should conduct no business that would conflict with the seller's trade. The United States Circuit Court of Appeals sustained the validity of the agreement, as limited to the property sold. (Hitchcock vs. Anthony, 83 Federal Reporter 779.)

The Illinois Supreme Court holds that a contract is not in unlawful restraint of trade by which one agrees to buy the business of a particular coal merchant and then to buy coal at wholesale from the other party to the contract, in consideration of which the latter binds himself not to sell coal at wholesale to any other dealer at the place; it not appearing that the output of any other wholesale dealer or purchaser of coal was in any way affected, or that there is anything to establish the price of coal at that place. (Superior Coal Co. vs. E. R. Darlington Lumber Co., 86 Northeastern Reporter 180.)

AGREEMENTS ON DISSOLUTION OF PARTNERSHIP

As a general rule, the principles above stated are applicable to the sale by a partner of his interest, under agreement with the continuing partner that he will not reëngage in business in competition with the latter. It is, also, held that a seller of a business cannot avoid the effect of a contract of this kind here discussed by transacting a competing business under the name of a third person who was not a party to the contract.

It will be noted that the observations here made are limited to cases in which promises to refrain from competition are made in connection with the sale of a business or property. The writer leaves closely related questions concerning joint-selling arrangements between producers or dealers as the subject of an independent article.

Time for Delivery of Coal Sold

Contracts to sell 600 tons of coal were recently construed by the St. Louis Court of Appeals, in the case of Big Muddy Coal & Iron Co. vs. St. Louis-Carterville Coal Co., 158 Southwestern Reporter 420, with reference to the seller's duties and rights concerning the time of delivery. The first contract bound the seller to ship 300 tons of screened coal for delivery at Illinois points on board cars, "shipments to be made during the following months: July, 20 cars; August, 40 cars; September, 60 cars; October, 80 cars; November, 40 cars; December, 40 cars; and January, 20 cars." The other contract called for the same total quantity, distributed throughout specified months in quantities varying from 20 to 80 carloads per month.

Neither agreement expressly required the buyer to give orders for shipments, nor contained shipping directions beyond specifying the destinations and the railway company whose cars were to be used, but the seller furnished a blank order book to the buyer. It also appeared that the seller was advised that the coal was bought for resale to a third company under contracts, which made the same provisions as to the times for delivery as the contracts above referred to.

DEFENDANT TRIED TO ENFORCE DELIVERY WHEN PRICES WERE HIGH AND REFUSED COAL WHEN SELLING AT A LOW PRICE

Defendant buyer ordered out less coal than was provided for by his contracts, and the quantities so ordered were shipped. When plaintiff sued defendant for the price of the coal delivered, it appeared that 284 carloads called for by the contracts had not been delivered, and defendant counter-claimed for damages claimed to have resulted to it from failure to ship that quantity.

But, on the facts above stated, the Court of Appeals decided that the contracts between plaintiff and defendant should not be interpreted as binding plaintiff to ship the coal, except as ordered out by defendant buyer, and that was admitted to have been done. In other words, the seller was not bound, under the wording of the contracts and the course of dealings between the parties, to tender deliveries in the quantities and during the months mentioned in the agreements.

It was further held that in such contracts the time of delivery is of the essence of the contract, and that the provisions for delivery of the specified quantities each month would be construed to require delivery of that amount upon orders received during the month, and not to permit the buyer to order a less quantity in the earlier months when the price was low, and then require deliveries of the remainder of such quantities just before the termination of the contracts when the price was high, especially where the buyer had written a letter reducing quantities previously ordered, on the ground that former orders had exceeded the amount provided for by the contract for that month.

Legal Decisions

Effect of Bankruptcy of Company on Lease—Where a coal-mining lease provided for payment of royalties to be suspended in the event of strikes, car shortage, etc., and the lessee company became bankrupt and the lessor accepted a surrender of the property, he is not entitled to enforce a claim against the estate of the company for royalties claimed to have accrued after the bankruptcy of the company. (United States District Court, Northern District of Alabama; in re Gallacher Coal Co.; 205 Federal Reporter 183.)

Liability for Injury to Minor Employee—A mining company operating in Pennsylvania is not relieved from liability for injury to a minor employee, due to failure to warn him against a danger, because it employed a certified foreman as required by the laws of that state. (Pennsylvania Supreme Court, Bogdanovicz vs. Susquehanna Coal Co., 87 Atlantic Reporter 295.)

Terms of Payment for Goods Sold—If nothing is said when a contract of sale is made as to when the price is to be paid, it will be presumed that the parties intended that payment should be made by the buyer on delivery, and on his failure to pay then the seller will be entitled to reclaim the property. (Arkansas Supreme Court, Hamilton vs. Rankin, 158 Southwestern Reporter 496.)

Duties of Mine Owners—Under the laws of Pennsylvania, it is the duty of a mine owner to provide proper passageways in tunnels, for the safety of miners, and liability for breach of this duty cannot be avoided by delegating its performance to a mine foreman or other employee. (Pennsylvania Supreme Court, Simmons vs. Lehigh Valley Coal Co., 87 Atlantic Reported 568.)

DISCUSSION BY READERS

Mixed Lights in Mining

Letter No. 13—I have been greatly interested in the iscussion on the use of mixed lights in mining and, paricularly, in Letter No. 9, by R. Z. Virgin, Coal Age, Aug. 16, p. 244. An experience of 26 years has convinced me that no miner can be trusted with an open light in a mine generating explosive gas; and I fully agree with the statement that no naked light should be allowed in any mines where gas has been detected or may be reaonably expected.

There are two other statements made by Mr. Virgin, however, that I must say most emphatically are contrary o my own experience. He states: 1. The safety lamp has no ill-effect on the eyesight of the miner compelled to use it in his work. 2. A miner using a safety lamp an produce as much coal, in a day, as one using an open ight.

In reference to the first point mentioned, I can speak rom sad experience; and, let me say, my case is by no means an isolated one. In the district where I was born and raised, Hamilton, Scotland, the safety lamp has been used almost exclusively, for many years, and this practice still continues. My use of the safety lamp began at the age of 11 years and continued for a practically unbroken period of 16 years.

The first serious results developed during the fourteenth year of my use of this lamp. I was attacked, in the mine, by a severe vertigo and twitching of the eyeballs. I sought the Glasgow Eye Infirmary and was told by the consulting physician that mine was a well developed case of miners' nystagmus, which was recognized by medical men in that district, as being caused by the constant use of the safety lamp. I was informed that my only salvation was to give up the use of the lamp. The trouble continued to increase from that time. Later, about nine years ago, I came to this country and have worked with an open light ever since. For the past three years I have used the carbide lamp and can truthfully say that my eyesight is much improved, being practically 100 per cent. better than when using the safety lamp, in the old country.

In reference to Mr. Virgin's second statement, that the use of a safety lamp does not lessen the miner's producing power, I would ask if it is sensible to suppose that a man burdened with the care of a safety lamp can compete with another man using an open light hung on his cap. In my opinion, no man who has used both of these lamps would agree with Mr. Virgin in his last statement. That the lamp is a burden to the user no one will deny, as it must be handled carefully and watched continually.

In conclusion, I wish to say that, where conditions demand, safety lamps should be used, unquestionably; but, at the same time, the miner must be made acquainted with the ill effects produced by the continued use of the safety lamp.

John Mac Nicol.

Seanor, Penn.

Mine Development

Referring to the mine map shown on p. 211, Coal Age, Aug. 9, which is a good one, permit me to make one or two suggestions how I think it can be improved.

The triple-entry system, shown on the main entries and the first two pairs of cross-entries, is an important feature; and I would suggest that the next two pairs of cross-entries, inby from these, should also be driven on the triple-entry system, while all other cross-entries can be driven on the double-entry system.

Again, it would greatly increase the output, for the same amount of entry driven, if the cross-entries were driven further apart and rooms turned to the right and left of each pair of entries. This plan would give double the number of rooms and would double the output of coal, for the same cost of entry driving and operation. The rooms should be driven right-hand on one entry and left-hand on the other entry. The tracks in each room should be carried along the straight rib. As soon as the first two or three rooms are driven up, the work of drawing back the pillars should be commenced, so that the rooms can be finished while the tracks and timber are good, which will decrease the cost of moving slate and keeping up track in the rooms. All rooms and entries should be driven on centers, so that the pillars will be of uniform thickness. If the roof is good, the cross-entries can be driven 600 ft. apart, making the rooms 100 yd. deep; but this will depend wholly on the condition of the roof and floor.

It is a good plan to drive the crosscuts as shown at the mouth of each pair of cross-entries; but I would suggest, further, that another crosscut should be driven at, say No. 10 room. This would provide an empty and a loaded track and avoid any loss of time from mules or motors waiting on each other.

In my opinion, all mines should be opened on a plan that will provide for the handling of gas, if this should be found later. Good ventilation should be provided by placing doors, stoppings, regulators and overcasts as quickly as needed. Where gas may be expected, brattices and curtains should be arranged to keep the working face clear.

While the present plan will, undoubtedly, provide for an output of 1000 to 1200 tons per day, this output could be increased to 2400 tons per day, for practically the same expense of entry driving and operation, by turning rooms off both entries, as suggested. While there may be no water to handle in this mine, I believe it is always best to provide a sump for draining; and this should be located between the first two pairs of entries, unless the mine drains naturally. I would also suggest putting a fan at both the right and left entries; that is to say, installing two fans instead of one. This would provide reliable ventilation and guard against a possible breakdown, which is liable to happen at any time.

Samson Smith.

Mineral, Va.

The Training of Miners

Much is written lately on the education and training of mining men, particularly the miner at the working face. Many suggestions of more or less merit have been made in reference to how this work can be best accomplished; and, in this connection, the recent article of State Mine Inspector Nesbitt, Coal Age, Aug. 9, p. 206, has attracted my attention.

Mr. Nesbitt advocates, in his article, placing a safety inspector and instructor in each coal mine, for the purpose of instructing the miners in reference to safety and economy. In my opinion, this suggestion of Mr. Nesbitt does not get at the root of the matter. There is an old and true saying, "Train up a child in the way he should go and when he is old he will not depart from it." This applies as well to mining. The best miners, and, indeed, the only practical miners are those who have been taken into the mines by their fathers and trained in the work.

There is, today, too much "wildcat work" in coal mining. Grown men who have never handled a pick or seen the inside of a mine are employed today as miners. They go into the mine because they cannot get work at any other trade. They are filled with horror and fear and, because of their lack of knowledge of mining conditions, they are wholly incapable of taking care of themselves while at work. Many of them, after working a day in the mine, fail to return to their work, and the next day it is found that they have left their place in bad shape.

There are many things a miner should know before he is permitted to work in a mine. He should understand the principle of the safety lamp and how to use the lamp at his work. He must be taught the practical work of putting up a brattice, hanging curtains, laying tracks, handling cars; and, particularly, how to keep himself safe while at work, by properly timbering his place. He must know how to take down a loose piece of slate and set posts required to make the place safe. He should learn these things when he is young. The way to reduce accidents is to employ more practical miners—men who understand good mining and have mined coal all their life.

The world takes notice of great mine accidents where many lives are lost at a time; but the constantly recurring daily accidents, when a single man, or two or three are killed, excites little interest and the death list grows. Who or what is responsible? It is the insatiate greed for coal and the common disregard for the safety of the worker, for which, in many cases, the inexperience of the fireboss or mine foreman is responsible. Train the miner when young.

SAMSON SMITH.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

MINE VENTILATION

The ventilation of a mine, as the term implies, involves the supply and maintenance of a sufficient current of air throughout the mine to render the same healthful and safe.

Requirements of Ventilation—The quantity of air in circulation must be sufficient to comply with the state mining law, and to dilute, render harmless and sweep away the gases that would otherwise accumulate in the mine. The air current must be conducted so as to sweep the entire working face and all void places with a moderate velocity sufficient to remove the gas without danger to the lamps or inconvenience to the workmen.

The Circulating System—In order to circulate a current of air through a mine, it is necessary to provide two separate openings, one for the air to enter, called the "intake opening," and the other for it to leave the mine, called the "return" or "discharge opening." Two distinct air passages or airways are also required, leading from these openings into the mine, in order to conduct the air current to and from the working face. These are called, respectively, the "intake" and "return" airways. These openings and airways form a part of the circulating system in the mine, similar to the arteries and veins of the human body.

Kinds of Ventilation—There are three different kinds of ventilation, in mining practice, known as "natural ventilation," "furnace ventilation" and "fan ventilation," according to the agency employed for its production.

Natural Ventilation—Ventilation is natural when it is produced by any natural agency, such as surface winds, falling water or the natural heat of the mine. The accompanying diagram illustrates the manner in which the natural heat of the mine produces a warm upcast air column, in either a drift mine or a shaft mine.

In the drift mine shown on the left, the warmer air column in the shaft only partly balances the cooler outside air. Above the level of the top of the shaft the two air columns are of equal temperature and equal weight, and, therefore, need not be considered since they balance each other. The same is true in the shaft mine shown on the right, whenever the two shafts have the same elevation at the surface.

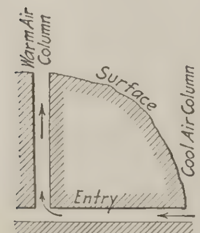

DIAGRAM OF A DRIFT MINE

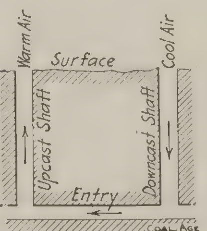

DIAGRAM OF A SHAFT MINE

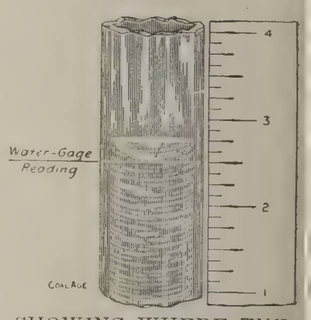
The Coal Age Pocket Book

Reading the Water Gage—In the common use of the water gage, in mine practice, the scale is not read closer than ⅛ in. In all engineering practice, however, and whenever accuracy is desired the decimal scale, previously shown, is used and the reading taken to hundredths of an inch.

There are several sources of possible error in reading the mine gage. If the gage is not truly vertical the reading will not be correct. Error often occurs from the cupping of the surface of the water in the tube. As shown in the accompanying figure, the reading should be taken at the bottom of the concave or bowl. This will give greater uniformity in the results obtained.

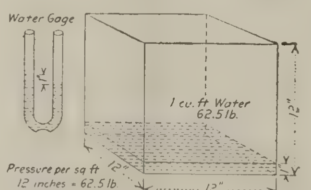
In fan ventilation, especially when the reading is taken in the fan drift, there is a constant oscillation of the water level, which makes it difficult to decide on the true reading. The oscillation is much reduced when the tube of the gage is contracted at the bend. The best gages are provided with a stop-cock in the bend by which the connection between the two arms can be closed. The gage can then be carried to a more convenient place to be read.



SHOWING WHERE THE WATER GAGE IS READ

Unit of Ventilating Pressure—In mine ventilation, the unit of ventilating pressure or the unit pressure producing the circulation is estimated in pounds per square foot. This is calculated from the reading of the water gage by multiplying that reading, in inches, by 5.2.

The accompanying figure shows clearly how the constant 5.2 is derived. The weight of 1 cu.ft. of water is, practically, 62.5 lb. This cubic foot represents a cube that measures 12 in. on each edge; the base of the cube being 1 sq.ft. Since the weight of 12 in. of water, resting on this square foot, is 62.5 lb., the weight of 1 in. of water covering the same area is 62.5 ÷ 12 = 5.2 lb., which represents the pressure, in pounds per square foot, due to 1 in. of water column. The principle involved is that the pressure exerted on a given area of surface depends only on the height of water column the pressure supports.



RELATION OF WATER-GAGE READING TO PRESSURE

INQUIRIES OF GENERAL INTEREST

Another Hoisting Problem

At one of our mines, the opening is a shaft 220 ft. deep. We are using a 1¼-in. cable, which winds on a drum 7 ft. in diameter. We contemplate using a 1⅛-in. cable on one side of the drum, while still hoisting with the 1¼-in. cable on the other side of the same drum. What effect will this have on the hoist?

J. B. Morris,
The Cambridge Collieries Co.

Cambridge, Ohio.

When a cable is wound on a drum, what is called the "diameter of winding," or the diameter measured from center to center of the rope wound on the drum, is greater than the diameter of the drum, by the diameter of the rope. The diameter of the drum, in this case, is 7 × 12 = 84 in., which makes the diameter of winding 85¼ in., for the 1¼-in. rope; and 85⅛ in. for the 1⅛-in. rope. Since the circumference of a circle is proportional to its diameter, the distance of hoist, for the same number of revolutions of the drum, is as 85¼ : 85⅛. The distance hoisted by the 1⅛-in. cable while the 1¼-in. cable is hoisting 220 ft. or the depth of the shaft, is determined by the proportion:

$$85.25 : 85.125 : : 220 : x = 219.67 \textit{ ft.}$$

This shows that while the 1¼-in. cable is making a single hoist of 220 ft., the 1⅛-in. cable will only hoist 219 ft. 8 in., which lacks 4 in. of making the upper landing. This difference is so slight, however, that the stretch of the hoisting rope and some slack will take care of the same. Caution will be needed in starting the next hoist from the bottom, owing to the slack rope. The difficulty can be overcome to some extent by lining the drum with canvas on the side on which the lighter rope winds, or, by shimming the lagging on that side to increase the diameter of the drum.

Method of Working

We are working a 7-ft. seam of coal overlaid with a sand slate from 4 to 7 ft. thick. Above the sand slate is a thin seam of good coal, 21 in. in thickness. The first mining has been done on the room-and-pillar system; the waste has been stored in the chambers. The workings have been extended, in this manner, to the extreme end of the property. The question is now: What is the best method to employ for the extraction of the pillars in the 7-ft. seam and the thin coal overlying the roof slate? What method will give the greatest safety and economy, in drawing back this work? Perhaps some readers have had a similar proposition and can give their experience.

J. H. S.

Bernice, Penn.

Assuming that there is a large area worked out and standing on pillars, in the 7-ft. seam, the question presented is how to draw back the pillars in the lower seam and secure the 21 in. of coal overlying the roof slate, which varies from 4 to 7 ft. in thickness. The size of opening, width of pillars and depth of cover are not given; and the character of the strata overlying the thin seam is not mentioned. These data together with the character of the coal in both seams will determine whether or not it is practicable to attempt to mine this thin seam of coal.

If the coal in the upper seam is an excellent quality, and other conditions are favorable, it may be practicable to undertake its extraction. If, however, the coal is of poor quality or the conditions in the overlying strata are unfavorable the expense attending the mining of this coal will be too great to make it an economical proposition. There may be water overlying the upper seam that would entail a large expense in pumping; or the strata immediately above this seam may be soft and friable, making the expense of working prohibitory. All of these conditions must be carefully considered, before the questions asked by the correspondent can be intelligently answered.

With what information is at hand, the only safe method that suggests itself is to flush the workings in the lower seam, except the entries. Then, beginning at the boundary line, start an upraise to the overlying seam and determine whether or not it will be practicable or possible to mine the overlying seam, independently. If it is practicable to mine this thin seam, the coal can be dropped through openings in the floor to the roadways in the seam below and taken out on these roads.

The feasibility of this method can only be determined by trial. It is probable that the coal in the upper seam will not pay the handling of the intervening 4 to 7 ft. of sand slate; and, for this reason, the upper seam, if mined at all, must be mined independently, by some method similar to that described. The pillars in the lower seam should not be drawn until the overlying seam has been worked back. The work should be conducted on the retreating plan.

Weight of Water in Air Current

Kindly show what weight of water is contained in 100,000 cu.ft. of air at a temperature of 60 deg., assuming the air to be completely saturated.

Pumpman.

Punxsutawney, Penn.

In order to calculate the weight of aqueous vapor contained in this volume of air, it is necessary, first, to know the tension of the vapor at the given temperature, which is found from psychrometric tables to be, for 60 deg., 0.2545 lb. per sq.in. The required weight of water carried in the air current is then

$$w = 100{,}000\left(\frac{0.6235 \times 0.2545}{0.37\,(460 + 60)}\right) = 82.47 \textit{ lb.}$$

This amount of water is equivalent to two and one-half tons per hour.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—When is a safety lamp safe, and why?

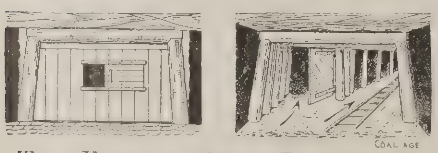
Ans.—A safety lamp of any approved type is only safe when handled by a competent person, in a proper manner. The reason is that the principles on which safety depends must be understood and closely observed by the one using the lamp. The lamp must be held in an upright position, must be kept clean, must not be exposed to a strong blast or current of air, and must be removed cautiously and promptly from a body of gas as quickly as observed.

Ques.—The hand of a Biram anemometer turns 3.75 times a minute. At the point where the reading is taken, the airway measures 5.5 by 9 ft., in cross-section. What is the velocity of the air current, allowing 3 per cent., for the resistance of the instrument?

Ans.—The sectional area of the airway is $5.5 \times 9 = 49.5$ sq.ft. The anemometer is graduated to indicate a velocity of 100 ft. per min., for each revolution of the large hand. In this case, the velocity of the air current is $3.75 \times 100 = 375$ ft. per min. Allowing 3 per cent. for the resistance of the instrument, the actual velocity of the air current is $375 \div 0.97 = 386.6$ ft. per min. The volume of air in circulation is then $386.6 \times 49.5 = 19{,}136+$ cu.ft. per minute.

Ques.—What is a regulator and where can it be used to advantage?

Ans.—A regulator, in mine ventilation, is a device used for dividing the air proportionately between two air splits. The common form of regulator is that known as the "box regulator." This is shown on the left of the accompanying figure. It consists of a brattice or partition of wood or concrete built in an entry, which is generally the return airway of a pair of entries or section of the mine. In the center of the brattice is provided an opening, the area of which can be increased or decreased by moving the sliding shutter or door shown in the figure. By this means, the quantity of air in that split and passing through the regulator can be increased or decreased as desired. The regulator is commonly placed at the return end of that split which naturally takes more air than its desired proportion. The action of the regulator is to decrease the proportion of air in that airway or split, which increases the proportion for the remaining splits.



Two Forms of Mine Regulators for Dividing the Air

Another form of regulator is that shown on the right of the figure, and which consists of a door swung so as to divide proportionately the intake current. This regulator is usually placed at the intake end of the two airways and can be set so as to divide the air in any desired proportion between the two splits.

Ques.—Where would you expect to find nitrogen and carbon dioxide, in a mine? Give their symbols, weights and specific gravities; and state how the presence of these gases is detected in the mine.

Ans.—Nitrogen and carbon dioxide are the two principal products of combustion. For this reason, they are to be found in those portions of the mine where the ventilation is slack and the various forms of combustion are in progress. The burning of lamps, breathing of men and animals, burning of powder, slow combustion of coal and decay of wood, continually taking place in the mine, consume the oxygen of the air and leave nitrogen and carbon dioxide as a result.

The symbols, specific gravities and molecular weights of these gases are as follows. Nitrogen; symbol, N_2; sp.gr., 0.97; mol.wt., 28. Carbon dioxide; symbol, CO_2, sp.gr., 1.529; mol.wt., 44. The presence of these gases is detected by the dimness of the lamps and the difficulty of keeping a light. Carbon dioxide is most apt to accumulate in the low places or swamps and dip workings of the mine.

Ques.—If there is 5000 cu.ft. of air passing per minute through the last cut-through, in an entry, and this current contains 5 per cent. of marsh gas, how much air should be added to the current to reduce this amount of gas to 1 per cent.?

Ans.—The volume of gas in this current is $5000 \times 0.05 = 250$ cu.ft. per min. If this amount of gas is to be 1 per cent., the total volume of gas and air, in that case, would be $250 \div 0.01 = 25{,}000$ cu.ft. per min. Now, assuming that the original current was mixed air and gas, the volume of air required to be added to reduce the gas to 1 per cent. is $25{,}000 - 5000 = 20{,}000$ cu.ft. per min.

Ques.—What are the necessary qualifications to make an efficient mine foreman, outside of those required by law?

Ans.—Beside the mining experience, necessary age and citizenship and the theoretical knowledge of mining principles, required by law, a mine foreman must be a good judge of men and the work they can do. He must be able to handle men so as to maintain the discipline of the mine and produce the daily tonnage at a reasonable cost of operation.

Ques.—In the case of an explosion of firedamp in which 8.4028 lb. of marsh gas are concerned, assuming that all of the hydrogen combines with the oxygen of the air to form water (H_2O); what weight of water vapor will result from this explosion?

Ans.—The chemical equation representing the reaction that takes place and the molecular weights of the several gases are

$$\begin{array}{llllll} \text{Reaction,} & CH_4 & + \; 2\,O_2 & = \; CO_2 & + \; 2\,H_2O \\ \text{Mol.wt.,} & 16 & 64 & 44 & 36 \end{array}$$

Since the relative weights of marsh gas and water vapor concerned in this reaction are expressed by the ratio 16 : 36, the weight of water vapor formed is

$$16 : 36 : : 8.4028 : x = 18.9+ \ lb.$$

BOOK REVIEW DEPARTMENT

RESUSCITATION. A treatise on electric shock, traumatic shock, drowning, asphyxiation from any cause by means of artificial respiration by the prone-pressure (Schaefer) method with anatomical details of the method and complete directions for self instruction. By Charles A. Lauffer, medical director, Westinghouse Electric & Manufacturing Co., East Pittsburgh, Penn. v + 47 pp. 4x6⅝ in.; 7 ill. John Wiley & Sons, New York. Cloth boards, Price 50c.

This little volume by the American apostle of prone pressure methods of resuscitation; should be read with care by first-aid men and by many others who possibly are not sufficiently well qualified to be entitled to that designation.

Dr. Lauffer is the author of a little volume on "Electrical Injuries." That book did not give such practical details of the prone-pressure method as does this little volume nor did it show the physiologic significance of the system of treatment. This brochure leaves the reader in no doubt as to just what is needed, and it certainly lines out a large field of usefulness for prone pressure. It is valuable to remember that it is available not only for electric shock and for asphyxiation by irrespirable atmospheres or by drowning but is to be recommended in all cases where a shock, such as a blow under the belt, on the jaw or neck or upon the head, has stopped ("inhibited") the movement of the diaphragm. Any shock which "knocks the breath out of a fellow" is a subject for resuscitating treatment if severe enough to need treatment of any kind.

The illustration on page 12 and the description of the bell-jar experiment are both unconvincing. The author could have used the figure in Hermann's "Physiologic des Menschen" with advantage as it is much more complete and illuminating. The other illustrations, which were prepared for another book, do not meet the needs of the author, but still if the reader does not become annoyed by the difficulties in pp. 11 to 22, he will arrive eventually at a clear conception as to the position of the floating ribs and the diaphragm and will comprehend the means by which the pressure on the former is transmitted to the latter.

THE ANALYSIS OF BLACK POWDER AND DYNAMITE—Bulletin 51. By Walter O. Snelling and C. G. Storm. 76 pp. and index. 5¾x9⅛, 5 plates, 5 ill. Paper cover. Bureau of Mines Bull. 51.

The public has long been expecting this bulletin. Its slowness in publication is an evidence of the dilatoriness of the government printing press, overburdened with the duties of reproducing in sheaves the matchless eloquence of the national legislature. The authors have produced, as might have been expected, a careful monograph on the analysis of dynamite and black powder, the first explosive having both precedence and more lengthy treatment, despite the title of the brochure.

Messrs. Snelling and Storm have checked their work with a great deal of care and their methods on the same sample would give concordant results. But they themselves would be willing to admit that concordance and correctness are not synonyms. The figures obtained for moisture are possibly too high in so far as they are raised by the loss in weight, due to vaporization of nitroglycerin yet it is possible that they are too low because complete dessication may not be obtained in 3 days at room temperatures.

We wish now before the reader gets a wrong impression to declare that what is said about this matter, can be paralleled in speaking of any proximate analysis. If we may be pardoned the pun, such a determination is usually not so "proximate" as it is "approximate." As A. C. Fieldner of the Bureau of Mines pointed out in his address before the Coal Mining Institute of America, the chief services of the chemist have been to render proximate analyses of coal concordant rather than determinatory of the actual proximate condition of the body tested. This is the extent of the work done in analysing dynamite. Rough indications are obtained of the moisture content and probably more accurate determinations are made of the quantity of nitroglycerin.

These results for any two samples of the same dynamite when in the same condition are made to check just as the traverse of a survey can be made corroborative of the accuracy of the measurements, even when the temperature of the uncompensated tape is known to be 100 or 105 deg. F. and the tape is only correct when the heat is less severe.

We cannot agree with the authors that moisture determinations of samples can be made with accuracy whenever atmospheric conditions are normal, seeing that the authors show that when the dynamite is stirred for 10 min. in an atmosphere 75 per cent. saturated, the determination is raised 14 per cent. higher than when the saturation is 19 per cent. The result at the lower saturation is equal to the correct moisture content according to the authors. Therefore the other result in an atmosphere 75 per cent. saturated must be too high and such a saturation of the atmosphere is fortunately for the mining industry, very common in the United States. Thus at normal saturations, the moisture content is apt to figure too high if the sampling is not executed with dispatch. The lower saturation is common in certain restricted parts of Colorado and the arid West and possibly is not uncommon in office buildings in the winter.

We do not wonder that the introduction of nitroglycerin into the dessicator produces no influence on the results. It is unlikely that the space in the apparatus is 100 per cent. saturated with nitroglycerin by this system. Moreover the fluid was introduced at the same time as the dynamite and could not have had any effect at early stages even if the vapor tension of nitroglycerin were abnormally low. But the experimenters appeared to have followed the recognized practice and amply showed that the introduction of nitroglycerin failed to modify the results.

It seems that a measurement of the increment in weight of the dessicating substance would give a more accurate determination than a reweighing of the dynamite if a dessicator were chosen which would not combine or dissolve nitroglycerin or nitrogenous fumes. Perhaps P. Litherland Teed's system of gaging the moisture in coal could be duplicated with dynamite and a slightly higher temperature of dessication adopted. The drying could take place in a vacuum, and the evaporated bodies drawn through a dessicating tube heated to a higher temperature than the dynamite so that they would not condense. The increase in weight of the dessicator would measure the moisture evaporated.

Nitroglycerin has the following formula, $C_3H_5(NO_3)_3$. There are other bodies known as nitro-substitution compounds $C_3H_5\ (NO_3)_2OH$ and $C_3H_5(NO_3)(OH)_2$. These bodies are formed in the manufacture of nitroglycerin and may not be wholly eliminated. Moreover there is a possibility that some nitroglycerin may replace a molecule of NO_3 with OH. It is to guard against this that the potassic iodide tests are made and the stabilizers are added. In case either of these less nitrified bodies were formed, a determination of the NO_3 content in the "nitroglycerin" of the dynamite will not connote the quantity of glycerin compounds. For instance, if it was all mononitroglycerin the result will be one-third as large as it should be. Of course the error would be normally small especially in a good article which has been well handled but it is not such dynamites which it behoves us to eliminate.

Doctors Snelling and Storm have prepared a bulletin of great value. The difficulties faced perhaps cannot be met by any refinement of method. It is not too much to hope that in a few years the shadow now thrown on the proximate analysis will be removed by the earnest work of enterprising chemists.

THE HISTORY OF THE E. I. DU PONT DE NEMOURS POWDER COMPANY. 224 pp., 6x9¼ in., copiously illustrated. "Business America," New York, Fabricoid boards.

The writer of this most readable and valuable record of powder manufacture withholds his name. The reader who follows his narrative from one end of the volume to the other will agree with him that he has recorded a century of success and will concede that he has made that success as interesting as it is remarkable. The du Ponts built their first mill in America in 1802 and since their venture commenced, the stories of powder and of the du Ponts have been identical. The book is essentially historical and does not venture on technical ground, but incidental reference is made to all the many lines, in which powder is used. Originally an instrument of war, it is today an important agent in every civil development.

COAL AND COKE NEWS

Washington, D. C.

Some interesting orders relating to rates on coal have been issued by the Interstate Commerce Commission within the past few days. One of the most important relates to an application which requested permission to establish a rate of $2.85 per gross ton on prepared sizes of anthracite coal all-rail from mines to various points in Massachusetts while maintaining a higher rate to intermediate points.

In the application it is stated that the New York Central & Hudson River R.R., in connection with its Boston & Albany division, is about to establish a rate of $2.85 to Allston and Newton Lower Falls. Dealers located at the latter points are in competition with those located at Newton Upper Falls, Needham, and Needham Heights, and it is stated that unless the New Haven road can name as good a rate to the points in its line these dealers will be forced to go out of business. Some time after the filing of this application the Commission was notified that the New York Central did not propose to put in the rate of $2.85, and that, therefore, the New Haven road desired to withdraw its application with respect to Newton Upper Falls, but desired to have the application stand with respect to Needham and Needham Heights.

It was also stated that coal reached Boston at a lower rate than the rail carriers published, and was carried from tidewater by automobile trucks to Needham and Needham Heights at a rate less than $3, and to meet this competition it was proposed to put in effect the rate of $2.85. The Commission denied this application under Fourth Section Order No. 230, stating that sufficient justification had not been shown for the relief sought.

Since then the Commission has conducted a hearing with reference to this application, at which the New Haven road and the hard-coal dealers of Boston were represented. Substantially the same reasons were advanced at the hearing as were set forth in the application, but with more detail.

The rail-and-water rate from the anthracite regions to Boston is $2.55; the all-rail rate $2.65. Coal dealers of Boston who receive coal by water at the $2.55 rate make deliveries by automobile trucks in the suburbs of the city, including Needham, Needham Heights and Newton Upper Falls, and the carriers allege that the present rate of $3 per ton is not sufficiently low to meet this competition, and the testimony so indicates.

In this connection there was also filed with the Commission applications setting forth the effect of water competition at Boston as justifying a lower rate than exists at interior points. In consequence the Commission has finally issued the following order covering the situation complained of:

> Application No. 774 asks, among other things, for authority to continue to charge lower rates on anthracite coal from points in the anthracite coal region of Pennsylvania to Boston, Roxbury, Boylston Street, Forest Hills, and Mount Hope, Mass., and other points adjacent thereto taking the same rates, than the rates concurrently effective on like traffic to intermediate stations;
>
> Application No. 5301 asks for authority to establish a rate of $2.85 per gross ton on prepared sizes of anthracite coal, all-rail, from mines in the anthracite region of Pennsylvania located on the rails of the Pennsylvania R.R. Co., the Central R.R. Co., of New Jersey, Philadelphia & Reading Ry. Co., New York, Ontario & Western Ry. Co., Erie R.R. Co., and Lehigh Valley R.R. Co., to Needham and Needham Heights, Mass., lower than rates concurrently in effect to intermediate points;
>
> A hearing having been held upon these applications, in so far as they relate to rates on anthracite coal from and to the points hereinbefore described, and full investigation of the matters and things involved having been had, and the Commission having, on the date hereof, made and filed a report containing its findings of fact and conclusions theron, which said report is hereby referred to and made a part hereof:
>
> It is ordered, That Fourth Section Order No. 230 be, and it is hereby, vacated.
>
> It is further ordered, That the petitioners herein be, and they are hereby, authorized to continue to charge as at present lower rates on anthracite coal from points in the anthracite coal region of Pennsylvania to Boston, Roxbury, Boylston Street, Forest Hills, and Mount Hope, Mass., and other points adjacent thereto taking the same rates, than are concurrently in effect on like traffic from the same points of origin to intermediate points; and to maintain higher rates to intermediate points, provided that the present rates to said intermediate points are not exceeded; and provided further, that the rates to Needham, Needham Heights, and Newton Upper Falls, Mass., shall not exceed the rate to Boston, Mass., by more than 20 cents per gross ton.
>
> The Commission does not hereby approve any rates that may be continued or established under this authority, all such rates being subject to complaint, investigation, and correction if in conflict with any other provision of the act.

The Prospects Are Good

According to all information received here, the prospect for Fall trade in coal is of the best. General trade during the summer, it is reported by those who are looking into the situation for the Federal Government, has been entirely healthful, while it is the opinion of the investigators that demand has on the whole been tolarably well supplied. The prospect however that Fall and Winter demand will add to prices for coal and the consequent necessity of filling orders early if all demand is to be gratified has, however, caused continuous anxiety on the part of those who do not wish to see the matter remain a political issue.

Representative Murray continues his demand for a thorough inquiry into the coal situation, with a special view to ascertaining why the requirements of Massachusetts have not been fully met and at lower prices. The general coal situation is causing in another way fresh demands for Government action as it is now insisted that the proposed Alaskan railway, to be built with public funds appropriated for that purpose shall be constructed at an early date in order that full advantage may be taken of this source of supply by shipments through the Panama Canal.

HARRISBURG, PENN.

The tri-district executive board of the anthracite region adjourned on Thursday, Aug. 21, after a lengthy discussion of plans to submit to the operators a demand that the "check-off" system be established throughout the region.

It is understood that sub-committees were appointed as part of a plan to submit the demand in the routine and orderly way, taking the matter up with the representatives of the companies with whom they have heretofore negotiated for the settlement of local colliery grievances.

The "check-off" system has never been employed in the anthracite region, though it is in force in the bituminous field of this state. Under its operation the companies collect dues from the members of the organization and turn the money over to the union officials. It has been indicated that the proposition will be opposed by the operators.

The importance of the demand and its far-reaching effects prompted National President White of the United Mine Workers to counsel delay, and is deemed responsible for his message, received shortly before adjournment, saying he would confer with the board at its meeting in Shenadoah during September. It is intimated that, pending the arrival of the head of the organization only a perfunctory demand will be presented, through the usual channels, the outcome to determine future action.

The Lenker dockage bill was also discussed at the meeting. The most salient features of this bill are the provisions which declare that the operators shall not dock the men for refuse, which is part of the natural formation broken down with the coal, and that the cars must be accounted for inside the mine instead of at the breaker or other outside points. The bill, however, provides that practices already in vogue will not be affected and that agreements may be entered into between the operators and the miners regarding the latter point. The enforcement of the law is being opposed by the operators on the ground that it interfers with existing agreements. The miners' leaders themselves are not particularly anxious to push this measure, as it threatens to annul some of the advantages which the men now enjoy.

Action Against Mine Cave Bill

The action instituted in the Scranton Courts against the "Davis Mine Cave Bill" was not unexpected, as this measure has a vital bearing upon the future mining of anthracite coal. The Davis bill is far less drastic than the Catlin bill, which was vetoed by Governor Tener. The Davis Bill provides that municipalities shall have the right to regulate mining under the highways for their protection. Since the highways cover a large part of the area of a municipality that safeguard is of considerable importance. In order to protect the highawys it would be necessary to leave surface support under adjoining property to prevent lateral sliding. In that case a large part of the private property in a municipality would have to be protected in order to carry out the provisions of the bill.

The controversy is different from that involved in the protection of private property from cave-in damages, as the public can claim rights and immunities which a private person may not urge. The highways are used by public utilities for running street cars, wires, gas and water pipes, etc., and in view of this the bill may be sustained.

There is a possibility that the courts may decide that surface support must be provided under streets that were laid out and accepted before the coal under them was secured and mining begun, but that the municipalities took the risk when they laid out the streets over coal that had already been contracted, with a waiving of damage claims.

The remedy proposed by the Mine Cave Commission appointed by Governor Tener has fallen flat. All that remains is a decision of the Supreme Court denying property owners the right of redress in case of damage. There is a strong sentiment through the region that the Commonwealth should invoke the police powers, but a suit along these lines has never been tried out in the courts.

PENNSYLVANIA

Anthracite

Hazleton—The miners of this region are making a determined effort to have President Kennedy of the district union appointed to membership on the board of trustees of the State Hospital. A mammoth petition is being circulated, for this purpose, and pressure is being brought to bear upon Governor Tener to make the appointment from among the miners.

The Dodson Coal Co. has posted notices at its Beaver Brook Colliery stating that work will be suspended until further orders, and thus about 1200 men and boys are idle. This is the first time that the colliery has been idle in the past eight years, and many of the men claim that the shutdown was ordered because the employees had intended to start a button strike.

Scranton—Seven hundred miners went on strike recently at the Peckville colliery of the Laskawanna Coal Co., because the company contracted with outside men for the removal of pillars. The officials of the union tried to prevent the men from walking out because such action is in violation of the agreement signed with the operators. The vote to strike was unanimous. The agreement between the mine workers and the operators makes it imperative that the companies pay a certain minimum wage for the removal of pillars, but does not state that the work must be done by the members of the miners union.

Wilkes-Barre—What promises to be another important lawsuit is the tresspass action filed by the trustees for the proprietors of Kingston Township against the Kingston Coal Co., in which $300,000 is asked in damages for coal mined under land in certain sections of the township. The case is similar to that of the trustees for the proprietors of Kingston Township against the Lehigh Valley Coal Co. for mining coal under 34 acres of land in Forty Fort, for which the township secured a verdict for $101,000, and a retrial of which has been ordered by the Supreme Court, and which suit comes up in October. The suits date back to 1769, nearly 150 years ago.

Carbondale—Sinking to his waist line while playing in the vicinity of the Watt-Scurry mine fire zone, a six-year-old boy was nearly burned to death when the crust caved beneath him. This tract has been ablaze for the last 10 years, and an appropriation was made by the last legislature to extinguish it, but Governor Tener vetoed the measure.

Shamokin—Alaska Colliery, of the Philadelphia & Reading Coal & Iron Co., is showing signs of being flooded and has been shut down until further notice as a protection to employees. The condition has arisen because a fire is burning in the Enterprise mine, further down stream. To quench this Shamokin Creek was turned into the Enterprise slope, and it has been discovered the water was escaping through the 50-ft. barrier pillar which separates the two mines. Danger exists of a sudden flood sweeping through all the Alaska workings, and it is not practical to keep pumping the water, for it must go into Shamokin Creek, and thence into Enterprise mine again.

Bituminous

Latrobe—Robert McGinnis of East Latrobe was killed by an explosion of dynamite in front of Superior Mine No. 1 of the Latrobe-Connellsville Coal Co. on Aug. 21. He was carrying a quantity of dynamite and caps and also had a battery in the package. Just how the explosion was caused is not known.

Kittanning—The Allegheny River Mining Co. has discovered two veins of coal which are considered to be unusually thick on the Fleming Farm in East Franklin Township. Some time ago a seven-foot bed of coal known as Upper Kittanning was found on this farm and lately at the same place, an eight-foot bed of Lower Kittanning was discovered.

Morrellville—E. W. Tuge, of Johnstown has opened a new mine at this place.

Carnegie—The coal industry in this vicinity is brisk this summer and almost every mine in the Chartiers Valley and the Panhandle district is beiog pushed to its utmost capacity to supply the demand for coal from the Northwest and Canada. The prospect now indicates steady work throughout the entire Fall and Winter.

Punxsutawney—Coal is once more being taken from the old No. 7 mine at Horatio which was abandoned two years ago. This coal is being taken from the fanway and is being mined at the rate of about a car load per day. Six or seven months will be required to finish up.

WEST VIRGINIA

Charleston—The case of J. H. Kidwell versus the Piney Mining Co. was decided by the arbitrators on Aug. 21. The decision reached by the Board of Arbitration was to the effect that miners should be paid at least twice monthly, that is: That the wages of employees earned up to the 15th of any month shall be paid in full not later than the last of the same month.

That miners in the New River fields who struck pending the adjustment of a grievance are violating the contract made with the operators July 1, is the substance of a statement recently made by Governor Hatfield. Several New River operators called upon the Governor and made complaint that at several mines the men refused to work pending the arbitration of their claims of unjust treatment. The Governor points out that one of the clauses of the agreement provides that miners shall remain at work pending the settlement of a controversy.

Bluefield—The Winding Gulf Colliery Co., has just opened a new shaft and tipple at Winding Gulf on the White Oak branch of the Chesapeake & Ohio R.R. The shaft is the only one on Winding Gulf, all other mines in that field being worked by drift. The steel tipple has a capacity of 2000 tons in eight hours, is equipped with the most modern machinery including automatic cut-off and self dumping cages. Electric power is furnished from another plant on the Winding Gulf.

TENNESSEE

Covington—The city of Covington has filed with the Interstate Commerce Commission a complaint against the Illinois Central R.R., in which it is represented that the railroad discriminates unjustly against Covington in the matter of freight rates on bituminous coal from Beaver Dam, Central City and western Kentucky points. It is alleged that the rate from western Kentucky mines to Memphis is $1.10 a ton, the shipments passing through Covington, which is 38 miles closer to the mines than the larger city, although the rate to Covington is $1.35 a ton. An adjustment is asked.

KENTUCKY

Hazard—Hazard is working hard for the proposed government hospital which is to be located in that section of the state to aid in the treatment of trachoma, which has become prevalent in several of the mountain counties. The growing importance of the city as a coal-mining center is expected to weigh heavily in its favor, as the disease is said to be economically important on account of its effect on industrial workers.

Pineville—The offices of the Wallins Creek Coal Co., which have been located at the mines in Harlan County since the company was organized, have been moved into Pineville, in charge of F. D. Wood, president, and S. G. Gray, secretary-treasurer of the company.

OHIO

Columbus—Smith M. Comley, receiver for the Carding Coal Co., of Columbus, has filed a report with the court showing receipts of $22,148 and disbursements of $19,503, leaving a balance of $2645 to be distributed among the creditors.

McArthur—Dayton Dickson has leased the coal rights on the Dana farm, near this place, and will start at once to drive an entry to develop the property which contains a good vein of coal.

Athens—Steps are being taken by the residents of Athens and vicinity to stop the flow of poisonous mineral waters from

Bellaire—The largest tipple in this county is in course of construction at the No. 6 mine of the Rail & River Coal Co. a few miles west of this city. During the improvement at this mine which is a part of the large improvement now being effected, the mine is idle and will remain so until all outside work is completed. It is thought it will be the 1st of September before this is done.

INDIANA

Linton—The Monon Coal Co. will sink a new shaft six miles southwest of Linton.

Sullivan—Unofficial announcement has been made that the Vandallia Coal Co. will take over the holdings of the Sunflower Coal Co. near Dugger and will open up a number of mines which have been partly abandoned.

Petersburg—After five months of steady pumping the S. W. Little Coal Co. owner of the Blackburn Mines which were flooded during the March freshet has cleared the mines of water and they will be opened early in September with the employment of something over 300 men. The Hartwell mine in the southern part of the county after an idleness of several years will also open about the same time giving employment to about 250 men.

Indianapolis—Jacob P. Brown, smoke inspector, is trying to induce the railroads owning round houses within the city limits to follow the practice recently started by the New York Central Lines at the Chelsea round house of firing locomotives with coke and oil soaked shavings instead of coal. Since the new system of firing has been started at the Chelsea St. round house conditions have been improved greatly and the smoke inspector says that he has received no complaint from persons residing near the place.

Jasonville—It is said that the Island Valley mine of the United Fourth Vein Coal Co. will resume operations shortly. This mine has been closed since March. It is one of the best equipped mines in this field and gives employment to about 200 men.

ILLINOIS

Springfield—The Jefferson mine, which has been closed for some time, will reopen soon, as a force of men are at work cleaning up the same. This mine is located southeast of Springfield and is the property of the O'Gara Coal Co.

Livingston—The mine known as No. 1, of the New Staunton Coal Co., located at Livingston, Madison County, Ill., made the following daily hoisting averages since July 1, 1913: July 1 to 15, 4132 tons; July 15 to 31, 4179 tons; Aug. 1 to 15, 4200 tons. The above mine produced 848,715 tons of coal from July 1, 1912, to July 1, 1913, and from the present indications this is the largest production for the year and it is believed the largest amount of coal ever produced from one mine in Illinois in a year.

Cardiff—The village of Cardiff will soon pass out of existence. The owners, the Cardiff Coal Co., have sold the various mine buildings including the tipple, to R. W. Powell and Fred G. Snow, who will remove them to Kankakee. The mine has been closed for several years following an explosion of gas in which a number of miners lost their lives. The bodies of these men are still in the mines.

Chicago—The first National coal trade Golf Tournament will be held at the Homewood Country Club on Sept. 8 to 10, 1913. Make your entry as early as possible.

IOWA

Des Moines—The Norwood-White Co. of Des Moines is opening a new mine at Burwick, Ia. This will be electrically equipped and will be one of the largest in output in the state. Power will be purchased.

ALABAMA

Birmingham—The Maryland Coal & Coke Co., which recently began operating on a large tract of land in the Sipsey Valley on the Black Creek Seam, reports that it is getting about 400 tons per day, which will be increased to 800 tons by December.

ARKANSAS

Russellville—A Coöperative Co. has been formed for the purpose of working the old Humphrey-Smith coal mine north of Russellville after an idleness of several years. The new concern will be known as the Acme Anthracite Coal Co., and will operate the mine under lease.

Midland—The Mammoth Coal Vein No. 6 located at Midland has resumed operation after being idle for a period of 18 months. This mine has given employment to over 40 miners and its resumption is welcome news to Midland.

TEXAS

Flatonia—A lignite deposit has been discovered on the H. Harrison farm, three miles north of the city. The discovery was made during the sinking of a well at a depth o 23 ft., the deposit proving to be five feet thick. Mr. Harrison at once made investigations relative to the area of th deposit and a number of wells were sunk at different place This showed that there are about 20 acres underlain wit lignite of a workable thickness.

San Antonio—Two beds of what is said to be a hard grad of bituminous coal are reported to have been struck o property belonging to the McMullen Townsite Co. One vei 40 ft. below the surface is 15 ft. thick. The other lies 80 ft down and is five feet thick, both, however, are considere paying veins. The property is situated only 12½ mile from Crowther where there is oil in paying quantities.

COLORADO

Trinidad—An indorsement of the efforts now being made by the United Mine Workers of America to procure the recognition of the coal operators in District No. 15 was embodied in an emergency resolution passed by the Colorad State Federation of Labor Aug. 19.

WASHINGTON

Kopiah—Fifteen men are now at work on the 200 acres of coal land recently bought by the Monarch Coal Co. on the line of the Eastern Railway & Lumber Co. and one mile west of Kopiah. The management is erecting bunkers and putting in switching facilities and expects to be shipping 10 tons of coal per day as soon as these improvements are completed, which will be inside a month.

Mendota—Much development work is being done at the old mine here and new timbers are being put in place. The mine has been idle for a number of years but much money is now being spent in development work, under new ownership.

Spokane—The Mcgillvray Creek Coal & Coke Co., having its headquarters in Spokane marketed 135,912 tons of coal during its last fiscal year, according to a report just issued by E. W. Cullen, secretary of the company. The mine worked 256 days. The product was sold in Alberta, Saskatchewan, Washington and Idaho. In addition to this quantity sold, 264,650 tons were made ready for immediate production.

Harrington—In drilling a well at Harrington, Wash., Bart Schmidtz has encountered a large vein of high-grade coal. Further developments will be made.

OREGON

Portland—The Monarch Coal Co., of Portland, which has just begun the development of a mine eight miles east of Centralia, Wash., in the Hannaford Valley district, expects to take out 50 tons of coal daily after Oct. 1. The spur is now being built to the mine and bunkers are being constructed. The tunnel is driven where the coal outcrops and hence the operation is not a difficult one. The coal is soft and of good grade.

Coos Bay—Smith-Powers mine, recently opened, is on Isthmus Inlet, a navigatable arm of Coos Bay, and the management can load direct into vessels or on cars. The mine is equipped with electrical machinery, for mining and handling the output, and is prepared to supply coal cheaply. The mine is owned by the C. A. Smith Lumber Co.

FOREIGN NEWS

Vancouver, B. C.—John Place, socialist member of the British Columbia parliament, Arthur Jordan, secretary of the Naniamo coal miners local, and Joe Angelo, leader of the foreign element in the strike at Naniamo, were arrested Aug. 18 with about 40 other men implicated in the strike disturbances.

PERSONALS

At a meeting of the directors of the Maryland Coal Co. of West Virginia, President Ziegler proffered his resignation which was accepted.

Jones Moore, one of the best known coal men in the Birmingham District, has announced his candidatecy for sheriff of Jefferson County, Alabama.

A. Kauffmann, formerly assistant to the president of the Link Belt Co., has been made General Manager of the Philadelphia Works at Nicetown, Philadelphia, Penn.

H. McKean Conner, who recently has been general superintendent in charge of all operations and engineering for the Continental Coal Corporation has severed his connection with that firm.
